APPENDIX A

The term "HHII" means the Herfindahl-Hirschman Index, a commonly accepted measure of market concentration. The HHI is calculated by squaring the market share of each firm competing in the market and then summing the resulting numbers. For example, for a market consisting of four firms with shares of 30, 30, 20, and 20 percent, the HHI is $2,600 (30^2 + 30^2 + 20^2 + 20^2 = 2,600)$. The HHI takes into account the relative size distribution of the firms in a market. It approaches zero when a market is occupied by a large number of firms of relatively equal size and reaches its maximum of 10,000 points when a market is controlled by a single firm. The HHII increases both as the number of firms in the market decreases and as the disparity in size between those firms increases.

Markets in which the HHI is between 1,500 and 2,500 points are considered to be moderately concentrated, and markets in which the HHI is in excess of 2,500 points are considered to be highly concentrated. *See*U.S. Department of Justice & FTC, *Horizontal Merger Guidelines* § 5.3 (2010).

Transactions that increase the HHI by more than 200 points in highly

concentrated markets presumptively raise antitrust concerns under the Horizontal Merger Guidelines issued by the Department of Justice and the Federal Trade Commission. See id.
