---

I am writing because I am concerned about the lack of competition in agricultural markets. Genetically modified foods should be labeled as such. Monsanto has modified seeds so that the plant gives off pesticides. Such crops produce the pesticide continuously in every cell. Some of these crops (the Bt potato, for example) are actually classified as pesticides by the EPA. The net outcome of sowing pesticide-producing crops is an vast increase in pesticides.

Just try to by groceries without fructose corn syrup as an added ingredient.  
Thank you for giving me the opportunity to comment.

Sincerely,  
Ron Anderson
