2261. Experts for the United States, as well as one of Defendants' experts, Dr. Peter Rowell, agreed that based upon Defendants' knowledge at the time, as well as documents revealing this knowledge, these statements were knowingly false and misleading when made by Ms. Boyse. Rowell TT, 3/22/05, 16549:23-16650:15; 3/23/05, 16625:12-15, 16632:4-7, 16632:23-16633:10, 16685:5-16687:19; 3/24/05, 16790:4-16; Offer of Proof In Connection with Redirect Examination of Jack Henningfield, Ph.D. Pursuant to Order #471, 12/3/04 (R.4434).

2262. Also in 1994, BATCo spokesperson Michael Prideful stated that BAT's current position on nicotine was that cigarette smoking was habit forming, but not addictive. "British Tobacco Companies Hushed up Health Dangers," The Independent, June 19, 1994 502576028-6030 (US 86882) (O).

2263. In a March 21, 1997 statement posted for its staff on the British American Tobacco electronic bulletin board, BATCo again criticized Liggett's concession that nicotine was addictive, stating that Liggett's CEO was "simply brokering this deal in a desperate attempt to force one of the cigarette manufacturers to take over his financially troubled and failing tobacco interests." The statement added that "Liggett's action is not based on any new scientific discovery and does not affect British American Tobacco's attitude to its defense of litigation in either the US or other parts of the world." 321007261-7262 (US 46651) (O).

(iv) American Tobacco Company

2264. On April 14, 1994, the Chief Executive Officer of American, Donald S. Johnston,

testified under penalty of perjury in a nationally televised hearing before the House Subcommittee on Health and the Environment. During this hearing, Johnston affirmatively denied that nicotine is addictive:

> Rep. Ron Wyden: Let me ask you . . . . Do you believe that nicotine is not addictive?
>
> Mr. Johnston: And I too, believe that nicotine is not addictive.

Regulation of Tobacco Products (Part I) Hearings before the Subcommittee on Health and the Environment of the Committee on Energy and Commerce, House of Representatives, 103rd Congress April 14, 1994, 2023195738-5892 at 5780-5781 (US 21990) (A).

(v) Brown & Williamson

2265. While B&W knew internally that smokers were addicts who smoked for nicotine, the company understood that their and the industry's "free choice" arguments in litigation would be undermined by any suggestion that smoking and nicotine were addictive. In the words of long-time general counsel Ernest Pepples, who described in a February 14, 1973 "Confidential" memorandum to public relations director John Ballock, one of the "salient problems now facing the cigarette industry" was:

> ADDICTION - Some emphasis is now being placed on the habit forming capacities of cigarette smoke. To some extent the argument revolving around "free choice" is being negated on the grounds of addiction. The threat is that this argument will increase significantly and lead to further restrictions on product specifications and greater danger in litigation.

696001196-1199 at 1198 (US 85346) (O).

2266. On April 14, 1994, the Chairman and Chief Executive Officer of B&W, Thomas Sandefur, also testified under penalty of perjury in a nationally televised hearing before the House Subcommittee on Health and the Environment. At this hearing, Sandefur, consistent with

his industry brethren, affirmatively denied that nicotine is addictive:

> Rep. Ron Wyden: Let me ask you . . . . Do you believe that nicotine is not addictive?
>
> Mr. Sandefur: I believe nicotine is not addictive.

Regulation of Tobacco Products (Part I) Hearings before the Subcommittee on Health and the Environment of the Committee on Energy and Commerce, House of Representatives, 103rd Congress April 14, 1994, 2023195738-5892 at 5780-5781 (US 21990) (A).

2267. In a 1994 press release entitled "The Media Frenzy. Truth Vs. Distortions," B&W attacked the press coverage of its CEO's testimony before Congress, stating that he was merely providing his personal opinion that nicotine is not addictive. 800335973-5975 (US 31913) (O).

2268. In its January 2, 1996 supplemental submission to the FDA in opposition to FDA jurisdiction over tobacco products, B&W (speaking for itself and BATCo) denied addiction and the prominence of nicotine in the smoking habit. The supplemental comments, signed by B&W's Director of Scientific and Regulatory Affairs Scott Appleton, stated, "[U]nder scientifically verifiable criteria, neither cigarette smoking nor the nicotine in smoke is addictive." 490107317-7366 at 7364 (US 87152) (O).

2269. In 1999, B&W posted on its website a contradictory and confusing document called "Hot Topics: Smoking and Health Issues." While this document did admit that "by some definitions, including that of the Surgeon General in 1988, cigarette smoking would be classified as addictive," it went on to state that:

> Brown & Willliamson believes that the relevant issue should not be how or whether one chooses to define cigarette smoking as addictive based on an analysis of all definitions available. Rather, the issue should be whether consumers are aware that smoking may be difficult to quit (which they are) and whether there is anything in cigarette smoke that impairs smokers from reaching and implementing a decision to quit (which we believe there is

not.)

Response of Brown & Williamson Tobacco Corporation to the United States' First Set of Requests for Admission to All Defendants, RFA# 390, April 19, 2002, USX6390001-0400 at 0094 (US 89555) (O).

2270. As Jeffrey Wigand testified, upon the commencement of employment with B&W, he was coached by lawyers on the "company line" for addiction - that "nicotine had not been shown to be addictive." Wigand WD, 30:10-19.

(vi) Lorillard

2271. On April 14, 1994, the Chairman and CEO of Lorillard, Andrew H. Tisch, also testified under penalty of perjury in a nationally televised hearing before the House Subcommittee on Health and the Environment. During this hearing, Tisch also affirmatively denied that nicotine is addictive:

Rep. Ron Wyden:	Let me ask you . . . . Do you believe that nicotine is not addictive?
Mr. Tisch:	I believe that nicotine is not addictive.

Regulation of Tobacco Products (Part I) Hearings before the Subcommittee on Health and the Environment of the Committee on Energy and Commerce, House of Representatives, 103rd Congress April 14, 1994, 2023195738-5892 at 5780-5781 (US 21990) (A).

2272. In a proxy statement filed with the Securities and Exchange Commission ("SEC") on May 14, 1996, the Board of Directors of Loews Corporation publicly made a false and misleading statement to its shareholders and to the SEC. A group of shareholders filed a proposal to the Board relating to nicotine in tobacco products in which it they stated, "virtually every major health organization in the United States of America as well as throughout the world has concluded that cigarette smoking and smokeless tobacco-use [sic] are addictive." In

responding to the proposal, the Board countered, that "the use of the term 'addiction' ignores the well-known fact that millions of people have stopped smoking in recent years." Schedule 14A of Loews Corp., - Proxy Statement, Dated 5/14/96, Disclosure, 91762567-2592 at 2586-2587 (US 22080) (A).

2273. In an October 1, 1997 letter to Senators Edward Kennedy and Orrin Hatch, Lorillard Chairman and CEO Alexander Spears disputed the need for a warning on cigarettes stating that cigarettes are addictive. Spears wrote, "Although Lorillard does not believe that cigarettes are 'addictive' in a stricter pharmacological sense, as the use of cigarettes does not result in euphoric intoxicating effects, we have no desire to engage in a public debate over the definition of the word 'addiction.'" 83699666-9668 (US 85348) (O).

2274. According to Lorillard CEO Martin Orlowsky, Lorillard's recent "acceptance" that cigarette smoking is addictive is dependent on a loose definition that includes any "pleasurable activity that can be difficult to stop." Orlowsky WD, 116:14-23.

2275. Dr. Christopher Coggins, Lorillard's Senior Vice President of Science and Technology agreed that cigarette smoking falls only within this loose definition of addiction at his deposition in this litigation, adding that cigarette smoking is only as addictive as "sugar and salt and Internet access." Coggins PD, United States v. Philip Morris, 8/16/01, 116:22-117:14.

2276. With respect to nicotine, CEO Orlowsky stated that Lorillard does not "take a public position one way or the other" on whether nicotine is an addictive drug and that the company still does not know whether nicotine is addictive or not. Orlowsky WD, 121:15-22.

2277. Coggins claimed the same lack of knowledge of whether nicotine was addictive at his deposition, adding that nicotine may or may not be an addictive agent in tobacco. In fact, according to Dr. Coggins, the addictiveness of smoking may be the result of a "simple physical

repetitive pleasurable activity." Coggins PD, United States v. Philip Morris, et al., 8/16/01, 117:15-120:11.

(vii) Liggett

2278. On April 14, 1994, the Chairman and Chief Executive Officer of the Liggett Group, Inc., Edward A. Horrigan (formerly of RJR), also testified under penalty of perjury in a nationally televised hearing before the House Subcommittee on Health and the Environment. During this hearing, Horrigan affirmatively denied that nicotine is addictive:

Rep. Ron Wyden:	Let me ask you . . . . Do you believe that nicotine is not addictive?
Mr. Horrigan:	I believe nicotine is not addictive.

Regulation of Tobacco Products (Part I) Hearings before the Subcommittee on Health and the Environment of the Committee on Energy and Commerce, House of Representatives, 103rd Congress April 14, 1994, 2023195738-5892 at 5780-5781 (US 21990) (A).

(viii) Tobacco Institute

2279. The Tobacco Institute was by far the Defendants' most vocal spokesperson in the industry's quest to deny addiction and conceal internal research and knowledge. Over the decades, the Tobacco Institute, on behalf of the Cigarette Company Defendants, publicly disseminated countless false, deceptive, or misleading statements disputing the addictiveness of nicotine and cigarette smoking. Denial was a large part of its mission. The following are representative of the role of the Tobacco Institute's statements in denying and distorting the truth.

2280. When the Director of NIDA, Dr. William Pollin, testified before Congress in 1982 that the Tobacco Institute had concluded that nicotine met all the standard criteria used by NIDA, the Drug Enforcement Administration ("DEA"), and the WHO to define a dependence-producing drug, Defendants did not come forward with their corroborative evidence. Instead, Defendants,

through the Tobacco Institute and outside counsel, sent representatives and paid researchers to testify that NIDA was wrong and that nicotine did not cause addiction or dependence. Defendants made statements and sent their own experts to testify that nicotine was more like hamburgers than an addictive drug. Henningfield WD, 132:10-134:22.

2281. One of the witnesses Defendants produced to the Congressional subcommittee was Theodore Blau, who stated on behalf of the Tobacco Institute and its members that, "There is no scientific basis for a statement that cigarette smoking is addictive." 680584197-4204 at 4201 (US 85349) (O); TIMN0170757-0765 (US 85351) (O).

2282. On March 12, 1982, the Tobacco Institute's William D. Toohey authored a press release summarizing the tobacco company-funded testimony of Blau before a Congressional subcommittee. According to the release, Blau criticized the characterization of smoking as addictive, claiming that he placed the "attachment" to smoking in the same category as "tennis, jogging, candy, rock music, Coca-cola, members of the opposite sex and hamburgers." The press release went on to claim that "removal of these activities, persons or objects can cause sleeplessness, irritation, depression and other uncomfortable symptoms, similar to those felt by some with abstinence from tobacco." TIMN0120729-0730 (US 65625) (O).

2283. The March 1982 Tobacco Institute press release was misleading in that it wholly omitted the fact that Blau was paid by the Cigarette Company Defendants to testify, and that he was a member of, in Tobacco Institute President Sam Chilcote's words, the "Tobacco Institute Team." Instead, the press release indicated only that Blau was a "Florida psychologist," creating the false impression that he had no tie to the tobacco industry. TIMN0120729-0730 (US 65625) (O).

2284. In fact, Blau was a Special Account 4 recipient of thousands of Cigarette

Company Defendant dollars through the law firm of Shook, Hardy & Bacon. Also, he was one of the many industry-funded scientists whose testimony was reviewed and approved by Shook, Hardy & Bacon prior to presentation before Congress. 1005125796-5796 (US 36096) (A); 01335087-5087 (US 85352) (O); 01335086-5086 (US 26842) (O); TIMN197541-7581 (US 85353) (O); 1005064612-4612 (US 85354) (O); 01335102-5102 (US 26483) (O); 1005061616-1625 (US 35959) (O); 03746309-6316 (US 85355) (O); 503655215-5215 (US 85356) (O); 1005125795-5795 (US 85357) (O).

2285. The April 1982 edition of TI's newsletter, *The Tobacco Observer,* also quoted Dr. Blau's addiction denial before Congress in an article entitled "Smoking Said Not Addictive." TIMN0126427-6438 (US 85358) (O).

2286. When the Department of Health and Human Service's Office on Smoking and Health produced a pamphlet stating that cigarette smoking was addictive, the Tobacco Institute went to the media with the statement denying addiction. The Tobacco Institute President informed industry general counsel in a memorandum dated March 7, 1983, that the Tobacco Institute "drilled" the media with the industry message that cited "substantial refutation of the addiction claim," including the 1982 testimony of Blau. Once again, the Tobacco Institute press release failed to acknowledge that Blau was an industry paid spokesman for the Tobacco Institute and its members. TIMN0350773-0775 at 0773 (US 85359) (O).

2287. The Tobacco Institute then sent Curtis Judge, Lorillard President and Chairman of the Tobacco Institute Executive Committee, to speak for the industry before a Senate subcommittee on March 12, 1983, in opposition to legislation that would require additional warnings on cigarette packages, including a warning that smoking was addictive. Accompanying Judge were several industry-paid scientists, including Blau, who once again denied and disputed

addiction and the mounting scientific evidence behind the NIDA pamphlet and the basis for the warning. TIMN0049411-9548 (US 85360) (O).

2288. Blau also submitted a March 17, 1983 written statement denying addiction, free of tobacco industry attribution, to a House subcommittee considering the same issue. TIMN0384222-4231 (US 85361) (O).

2289. On the same date, the Tobacco Institute distributed a press release to newspapers and other news outlets across the United States, and quoted Blau, with no industry attribution, disputing the addictiveness of cigarette smoking. TIMN0138444-8446 (US 85362) (O).

2290. A May 12, 1983 Tobacco Institute press release quoted Dr. Blau's apparently "independent" denial of addiction again, who had yet again been paid by the industry to testify before a Senate committee: "Dr. Theodore H. Blau, a clinical psychologist in Tampa, Florida, and past president of the American Psychological Assiciation, sharply disputed an assertion in pending legislation that cigarette smoking is 'addictive.'" The Tobacco Institute did not provide the general public with the fact that Blau had testified on behalf of the tobacco industry and the Tobacco Institute. TIMN0120772-0773 (US 85363) (O).

2291. In a November 21, 1983 letter to Patrick Sigrid, a lawyer from Shook, Hardy & Bacon (outside Lorillard counsel), Arthur Stevens, Lorillard's Senior Vice President and General Counsel, criticized a Tobacco Institute addiction position paper drafted by the firm, calling it "poorly written; awkwardly phrased in places; highly technical in some parts for the intended 'common sense' approach; and so overly lawyer-like in its basic approach as to defy acceptance or understanding by the lay audience to whom it would be addressed." This letter demonstrates that instead of having its scientists draft its position denying nicotine addiction, Defendants chose to have their lawyers complete the task, thus ensuring unity in their categorical denial: "Some

anti-smoking government officials and others have gone so far as to brand smoking a 'drug addiction.' This claim is clearly false." 508074767-4771 at 4768 (US 85364) (O).

2292. In conduct reminiscent of 1982 and 1983, the industry again denied addiction through the TI in its submissions and testimony leading up to the 1988 Surgeon General's Report. Henningfield WD, 134:23-136:1.

2293. In 1988, the Surgeon General released a report entitled "The Health Consequences of Smoking: Nicotine Addiction." The Tobacco Institute quickly responded with a series of advertisements, press releases, and public statements attacking and denying the Surgeon General's findings, findings that reflected the overwhelming medical and scientific consensus on the subject. For example, the Tobacco Institute, on behalf of the Cigarette Company Defendants, immediately issued a May 16, 1988 press release stating:

> CLAIMS THAT CIGARETTES ARE ADDICTIVE CONTRADICT COMMON SENSE . . . Smoking is truly a personal choice which can be stopped if and when a person decides to do so. . . . The claim that cigarette smoking causes physical dependence is simply an unproven attempt to find some way to differentiate smoking from other behaviors. In fact, any feelings persons might have upon giving up smoking are those that would be expected when one is frustrated by giving up any desired activity . . . . The claims that smokers are 'addicts' defy common sense and contradict the fact that people quit smoking every day.

TIMN0019963-9963 (US 21239) (A); Dawson WD, 38:18-23.

2294. A second Tobacco Institute press release dated May 16, 1988 carried the headline, "CLAIMS THAT CIGARETTES ARE ADDICTIVE IRRESPONSIBLE AND SCARE TACTICS." This press release also attacked the Surgeon General's Report and specifically denied any dependence on nicotine, stating:

> After years of well-funded research, it has not been established that cigarette smoking produces a physical dependence to nicotine. In fact, it has been impossible to establish that the feelings persons

> have upon giving up smoking are anything but that which would be expected when one is frustrated by giving up any desired habit.

TIMN0019964-9965 at 9964 (US 85366) (A).

2295. Tobacco Institute President Samuel Chilcote reported to the member companies that same day that its "staff responded to just over 50 media inquiries, having earlier distributed our brief and carefully cleared response statement. . . . Media handling of our responses at this hour remains to be seen of course. But the staff reports seemingly fair and understanding reception of a 'contradiction of common sense' approach." TIMN214666-4667 (US 85367) (O).

2296. In a July 29, 1988 press release, the Tobacco Institute stated that the Surgeon General's declaration that smoking is an addiction was "[an escalation of anti smoking rhetoric . . . without medical or scientific foundation." TIMN0125189-5189 (US 77065) (A).

2297. The 1988 press release utilized Tobacco Institute spokesmen/scientists Blau and Stephen Raffle to deny addiction as well. For example, Tobacco Institute quoted Raffle in the press release, stating, "Clinically, cigarette smoking does not result in addiction-like behavior." Blau was quoted in the press release as saying that the Surgeon General's report was "misleading and unfortunate." TIMN00125189-5189 (US 77065) (A).

2298. Blau and Raffle were internally referred to by Samuel Chilcote in a memo to the Executive Committee as members of the "Tobacco Institute Team." 506615894-5896 (US 85368) (O). Raffle also provided a statement to the House subcommittee denying addiction. The statement was made at the Tobacco Institute's request, but omitted any Tobacco Institute connection or sponsorship. TIMN207378-7384 (JD-080049) (A).

2299. The July 29, 1988 press release failed to indicate in any manner that Raffle and Blau were industry selected, managed, and paid consultants to Defendants and their law firms, and that their statements to the House subcommittee had been reviewed by Covington & Burling

and several Defendants prior to being delivered to Congress. Instead, the press releases implied that both scientists testified independently before the House Subcommittee. TIMN0125189-5189 (US 77065) (A); 506419103-9103 (US 85372) (A); 87701893-1903 (US 32065) (O); 2025875995-5997 (US 85375) (O).

2300. The Tobacco Institute's use of Blau and Raffle was done with the knowledge of the Cigarette Manufacturer Defendants. 2025875995-5997 (US 85375) (O).

2301. An industry-funded June 13, 1988 report written by consultant Gerald E. Wagner, Ph.D., entitled "Health and Smoking Nicotine," rejected the findings of the Surgeon General's 1988 Report, where Dr. Wagner claimed the addictive properties of nicotine could not be proven "scientifically." 511068152-8176 (US 20835) (O).

2302. In a 1989 nationally broadcast interview on "Good Morning America," Tobacco Institute spokesman Brennan Dawson stated: "I can't allow the claim that smoking is addictive to go unchallenged. . . . The majority of people who smoke make that decision, they can quit if they want to do it. It's a matter of willpower." TIME 389474-9479 at 9476 (US 21286) (A).

2303. The Tobacco Institute published a brochure in March 1989 entitled "The Anti-Smoking Campaign: Enough is Enough." In this document, the Tobacco Institute denied that smoking is addictive, emphasizing as "a fact" that: "The fact is that there is nothing about smoking, or about the nicotine in cigarettes, that would prevent smokers from quitting. . . . If a smoker wants to quit, it may take will power, but that's all it takes." TIMN0130559-0578 at 0574 (US 85376) (A).

2304. In another nationally-broadcast interview, in 1990 on "Larry King Live," Ms. Dawson stated on behalf of the Tobacco Institute:

> [About 95 percent of those people have quit cold turkey. They've walked away from cigarettes and they've not gone through formal

> treatment centers or anything else. It's not like alcoholism or drug abuse. It's not an addiction. . . .
>
> There's nothing about nicotine that prevents you from quitting. And that's the whole difference.

TIMN341405-1422 at 1420 (US 21363) (A).

2305. On February 20, 1990, the Tobacco Institute issued a press release stating that Charles Whitley had appeared before the Senate Committee on Labor and Resources on behalf of Tobacco Institute, had criticized proposed legislation, and had stated that requiring an addiction warning label on cigarette packages and advertisements "defies all logic, when, according to the Surgeon General, nearly half of all Americans who ever smoked have quit and most of the 41 million smokers who quit did so without formal treatment programs or smoking cessation devices." TIMN341503-1504 (US 85377) (O).

2306. During a February 27, 1990 appearance on the program, Nightwatch, Ms. Dawson stated on behalf of the Tobacco Institute that

> Well, the fact is that now in the United States there are as many ex-smokers as there are smokers. And 95 percent of the people who have quit smoking have done it cold turkey. That is, they've just put down their cigarettes and walked away. And that's not the picture of the addictive drugs that we see, at least certainly not with the illegal substances, much less alcohol, that we see in terms of problems in society.

CORTI1731-1738 (US 87735) (A).

2307. The Tobacco Institute published another press release dated July 12, 1990, a document stating that Blau had once again testified before a House subcommittee denying the addictiveness of cigarettes. The Tobacco Institute provided the following in its press release, once again omitting any tie between Blau and the Cigarette Manufacturer Defendants:

> The proposed "addiction" warning label is likewise unjustified. Dr. Theodore H. Blau, a practicing clinical psychologist from

> Tampa, Florida, said that, "In my view, labeling tobacco use 'addictive' is misleading and potentially harmful to the American public." Blau noted that - unlike heroin addicts, cocaine addicts and alcoholics who are in the process of giving up these drugs - the alleged "withdrawal symptoms" which some smokers report when giving up smoking are "generally the same kinds of frustrations that one would expect to see when someone discontinues any well-established and well liked habit. Such symptoms as missing the habit and mild irritability are similar to the reactions experienced by those who give up coffee or sweets.

TIMN0026755-6757 at 6757 (US 85379) (A).

2308. The Tobacco Institute paid Dr. Raffle to speak out again in 1994 following the sworn testimony of FDA Commissioner Dr. David Kessler that smoking was addictive. In a March 25, 1994 Tobacco Institute press release, the Tobacco Institute Media Relations department restated Raffle's industry-funded and industry-prepared comments that smoking was not "truly addicting" and that "in order to include smoking as an addiction, one must redefine that term, water down its meaning, and ignore critical differences involving every aspect of these behaviors." The press release did not disclose any connection between Raffle and the Tobacco Institute or the Cigarette Manufacturer Defendants. TIMN328214-8215 (US 77090) (A).

2309. During the nationally broadcast news show "Crossfire" of March 10, 1994, Brennan Dawson, Vice President of Public Affairs at the Tobacco Institute, was asked by host Michael Kingsley, "Is nicotine addictive?" Dawson responded, "Absolutely not. Nicotine is first of all- I mean nicotine occurs naturally in cigarettes. Nicotine is also found in things as scary as potatoes." TI10720452-0464 at 0455 (US 87155*) (A).

2310. During this same interview, Ms. Dawson admitted making the following statement regarding the addictiveness of nicotine:

> Well, first of all, let’s understand that – that sometimes we use the word "addiction" in very broad terms. We talk about being, you know, news junkies. We talk about being chocoholics. We – you

> know, we – we put all these broad terms[.] . . . But when we talk about addiction in a classical sense, we're talking about things like, you know, heroin and alcohol, for example, where you're either intoxicated and you can't make a decent decision, or you're in such physical withdrawal that you're probably in the hospital. And there's nothing about nicotine specifically that classifies it as such.

TI10720452-0464 at 0459-0460 (US 87155*) (A); Dawson WD, 45:7-48:23.

2311. She added that "[t]here is no chemical addiction" to nicotine. TI10720452-0464 at 0460 (US 87155*) (A), Dawson WD, 45:7-48:23.

2312. During the nationally broadcast news show "Face the Nation" of March 27, 1994, Ms. Dawson of the Tobacco Institute was asked by host Robert Schieffer, "[D]oes the industry take the position that cigarettes are not addictive?" She responded, "The industry does take that position." (US 89319) (A).

2313. During an April 1, 1994 appearance on the MacNeil/Lehrer Newshour, when asked, "[d]o you - do you, in the industry, concede that nicotine is an addictive drug?" Ms. Dawson responded, "[n]o we don't." (US 89300) (A), Dawson WD, 45:7-48:23.

2314. On April 13, 1994, Dawson again appeared on the CNN program "Larry King Live." When she was asked whether nicotine was addictive, she responded, "No, nicotine is not addictive." TIMN0010649-0650 at 0650 (US 62778) (A).

2315. In this case, Ms. Dawson testified that the Tobacco Institute's public position was that smoking and nicotine were not addictive and that this position remained unchanged over the years. Dawson WD, 36:8-13; Dawson TT, 1/12/05, 9938:3-9940:19.

2316. Dawson, on behalf of the Tobacco Institute, also testified that there was no scientific basis for the public statements denying the addictiveness of nicotine, Dawson WD, 49:5-50:4, and that the Cigarette Manufacturer Defendants never provided the Tobacco Institute with information that nicotine was a drug with a variety of physiological effects and was thought

to be responsible for the addictive properties of cigarette smoking. Dawson WD, 53:9-12, 54:8-12, 55:10-14, Dawson TT, 1/12/05, 9958:1-11.

2317. The Tobacco Institute joined Defendants Philip Morris, RJR, B&W, Lorillard, and Liggett to oppose Food and Drug Administration jurisdiction over cigarettes as drug (nicotine) delivery devices in 1996. In Volume III of the filing prepared and submitted on behalf of the Tobacco Institute and the Cigarette Manufacturer Defendants, the group denied that nicotine in tobacco was addictive, denied any significant pharmacological effects of nicotine, denied that smokers smoke primarily for nicotine, denied any "threshold" amount of nicotine necessary for addiction, and denied compensation by smokers of low tar products. 2505597781-7998G (see e.g. 7793-7795) (US 23028*) (A).

2318. The submission of the Tobacco Institute and the five manufacturers named above was publicized via a Tobacco Institute press conference on the morning of January 2, 1996. While the Tobacco Institute's Brennan Dawson led the press briefing, she was accompanied by Philip Morris's Steven Parrish, RJR's Charles Blixt, and Lorillard's Arthur Stevens. TI01750819-0820 (US 87156) (A).

(ix) CTR

2319. Sheldon Sommers, Research Director of CTR and member of CTR's Scientific Advisory Board, told a Congressional subcommittee in hearings held in April 1969 that "smoking tobacco is not considered an addiction." 500925974-5998 at 5976 (US 85382) (O); BWX0007189-7297 (US 36237) (O).

2320. Robert Hockett, a subsequent CTR Research Director, stated during Congressional hearings held October 5 and 6, 1978, that while "there is an adjustment " to smoking over time, the issue of tobacco dependence was "a very tough question." 500925974-

5998 at 5976 (US 85382) (O).

2321. Statements such as these, frequently repeated by Defendants, their surrogates, and their agents, were misleading and intentionally deceptive when made. These statements are contradicted by decades of scientific research conducted by or funded by Defendants, and by a myriad of internal statements by company representatives.

(d) Defendants' Misrepresentations and Attempts to Confuse the Public as to the Facts of Cigarette and Nicotine Addiction Continue Today, Even Following the MSA

2322. Even today, although certain Defendants have acknowledged, to varying degrees, the overwhelming evidence that smoking is addictive, no Defendant accepts the Surgeon General's definition of addiction and no Defendant admits that nicotine is the drug delivered by cigarettes that creates and sustains addiction.

2323. On its website, Philip Morris states that "[w]e agree with the overwhelming medical and scientific consensus that cigarette smoking is addictive" and that it can be difficult to quit smoking. However, there is no mention of the established fact that the nicotine in cigarettes is what causes the smoker's addiction. TLT0770066-0088 (US 72408) (A); Szymanczyk WD, 63:3-7; Parrish TT, 1/25/05, 11038:23-11039:8.

2324. On its website, BATCo states that "[w]e accept the common understanding today that smoking is addictive." Yet, when discussing quitting smoking, the company makes no mention of the role nicotine plays in maintaining the addiction, downplaying the success of nicotine replacement therapy in helping smokers quit, and stating that the most important factor in successful quitting is "having the motivation and the self-belief that you can quit." http://www.bat.com/oneweb/sites/uk3mnfen.nsf/wwPageswebLive/BEDB4BB/FDD4F7CE80256BF4000ee157?open document, TLT0231984-1984 (US 86692) (O); (US 89563) (O).

2325. On its website, RJR states that, "Many people believe that smoking is addictive, and as that term is commonly used, it is." However, RJR later equivocates on this statement, stating its disagreement with the opinion in the health and scientific communities that smoking is as addictive as heroin or cocaine. RJR does not disclose the role of nicotine in the addiction. TLT0770095-0128 (US 72410) (A); Beasley WD, 67:16-23.

2326. On its website, B&W recites its new public position that it "agrees that, by current definitions of the term 'addiction,' including that of the Surgeon General in 1988, cigarette smoking is addictive." Two paragraphs down from this, however, B&W reverts to its former denials, omitting any reference to nicotine and stating the following :

> Although smoking can be very difficult to quit, we do not believe that the term "addiction" should be used to imply that there is anything in cigarette smoke that prevents smokers from reaching and implementing a decision to quit. Smoking may indeed be difficult to quit, but people can quit and do so in large numbers. The scientific literature demonstrates that smokers who believe they can quit, and who believe that the benefits of quitting outweigh the enjoyment of continuing to smoke, can do so.

TLT1020158-0158 (US 87157) (A). Ivey WD, 94:16-96:1.

2327. B&W's current Nicotine and Addiction section does not even discuss nicotine or its effects on the human body. In sum, the B&W current, post-MSA position continues to deny that any aspect of smoking "prevents" a smoker from quitting. Moreover, the position continues to confuse and distort the facts on addiction, namely that smoking is very difficult to quit primarily because of nicotine. At the same time, the position refers to "the enjoyment of continuing to smoke," suggesting that smokers smoke simply for continued "enjoyment," as opposed to a craving or need for nicotine. TLT1020158-0158 (US 87157) (A); Ivey WD, 94:16-96:1

2328. In her live testimony, Susan Ivey, former president and CEO of B&W and current

CEO of RJR and Reynolds American, stated that while B&W believed that nicotine is a "significant contributor to addiction," it would not agree that nicotine is an addictive drug. Ivey TT, 11/16/04, 6194:21-6195:5.

2329. Lorillard's current position is that smoking is addictive but only in the same way as "repetitive pleasurable activities that can be difficult to stop." Lorillard believes that smoking is not addictive in a "pharmacological sense." Orlowsky WD, 116:14-117:18. With respect to nicotine, President and CEO Martin Orlowsky stated, on behalf of Lorillard, that the company does not take a public position" and does not know if nicotine is an addictive drug or not. Id., at 121:15-22.

2330. The Lorillard website has recently added a statement from Orlowsky on its website that includes the sentence, "Cigarette smoking can also be addictive." However, this statement does not define the term "addictive," and omits any reference to nicotine. (JD-024979) (A).

2331. In a May 28, 2003 press release on the Louisiana Scott verdict, also made available on Lorillard's website, company general counsel Ron Milstein contradicted the statement that smoking can be addictive by stating that simple willpower "always works" for those who want to quit smoking: "Liability to fund smoking cessation programs should not be tried in class action lawsuits. Research has shown time and time again that willpower is the only smoking cessation aid that always works." TLT0961610-1610 (US 86693) (A).

2332. In his testimony, Martin Orlowsky demonstrated Lorillard's evasiveness on this issue, testifying that while Lorillard's position was that smoking is addictive, he "did not know what a 'drug addiction' is." Orlowsky WD, 119:21-121:6.

2333. Orlowsky also would only say that "nicotine is an important part of smoking,"

refusing to accept that nicotine was the ingredient in cigarettes that made cigarette smoking addictive. Orlowsky WD, 119:21-121:6, 121:15-122:6.

2334. While Philip Morris has now superficially accepted that smoking and nicotine are addictive, its new position surfaced for the first time relatively recently after the filing of this lawsuit. After decades of consistent corporate public denials, Philip Morris USA President and CEO Michael Szymanczyk first stated in June 2000 that nicotine was addictive during the damages phase in Engle v. Liggett. Philip Morris USA subsequently added a statement on their website in October 2000 agreeing that "cigarette smoking is addictive, as that term is most commonly used today." That statement has since been modified to read, "We agree with the overwhelming medical and scientific consensus that cigarette smoking is addictive." However, the Philip Morris USA website omits any information on nicotine, and Philip Morris still publicly states that smoking does not meet the "traditional definition" of addiction. Szymanczyk PD, United States v. Philip Morris, et al., 6/13/02, 249:15 - 254:8; 267:10 - 270:3.

2335. The website language acknowledging that smoking is addictive was developed by Mark Berlind and distributed on the Philip Morris Law Department Intranet as a PMC Statement of Position. 2085189723-9724 (US 86925) (O).

2336. Geoffrey Bible, former CEO of Philip Morris Companies, was the ultimate authority on the content of public statements on smoking and health made by Philip Morris Companies' subsidiaries, including Philip Morris USA. Bible PD, U.S. v. Philip Morris, et al., 8/22/02, 83:9-84:9, 85:22-86:25.

2337. Philip Morris International changed its public position to agree with the public health community's conclusions that smoking is addictive at the same time (October 2000) that Philip Morris USA did so. 2078850517 (US 45218) (O).

2338. Philip Morris adopted its current position that nicotine in cigarette smoke is addictive for the first time in January 2003, in a supplemental response to a United States Request for Admission in this case. USX639001-0400 (US 89555) (O). Philip Morris's 30(b)(6) deponent, Richard Carchman, stated that the company's definition of addiction is "a repetitive behavior that's associated with an adverse outcome." The "adverse outcome" is disease associated with smoking; according to Carchman, Philip Morris believes that if the risk of disease were eliminated, cigarette smoking would no longer be an addiction. In addition, Philip Morris continues to dispute that nicotine is addictive outside of smoking. Carchman PD, United States v. Philip Morris, et al., 6/6/03, 14:6-15:12, 22:3-23:3, 23:19-20, 25:4-26:24, 29:1-13, 85:17-86:10.

2339. In this case, Denise Keane, general counsel for Defendant Philip Morris USA, testified that Philip Morris never publicly stated that cigarette smoking was not addictive because it should properly be characterized as a drug dependence. Keane TT, 1/18/05, 10447:23-10448:7.

2340. Ms. Keane also testified that when Philip Morris purchased three Liggett brands, L&M, Lark and Chesterfield, it removed information from the packages that stated that smoking is addictive. Keane TT, 1/18/05, 10457:5-10460:16.

2341. While Philip Morris had placed fact onserts on these packages, these onserts did not contain the statement that Philip Morris agrees that smoking is addictive, even though Philip Morris had publicly stated this agreement in 2000. Keane TT, 1/18/05, 10460:17-10462:15.

2342. Ms. Keane testified that while Philip Morris had told people that it agrees that cigarette smoking is addictive, it has not told people that it agrees that the nicotine delivered in cigarette smoking is addictive, a fact that Ms. Keane herself admitted was material information

that the public should possess. Keane TT, 1/18/05, 10533:5-10534:4.

2343. Ms. Keane also admitted that nowhere on the Philip Morris website's link to the FDA's findings related to addiction, appears the fact that nicotine is a drug and that nicotine is not addictive. Keane TT, 1/19/05, 10643:3-10649:17.

2344. In spite of the overwhelming medical and scientific evidence, only one cigarette manufacturer defendant, Liggett, has placed a warning on its packages stating that nicotine is addictive. Liggett advertising and packaging state, "Smoking is Addictive." LeBow TT, 2/7/05, 12375:21-12376:1.

2345. Moreover, no Cigarette Company Defendant other than Liggett and Philip Morris, has admitted that nicotine in cigarette smoke is addictive. Liggett is the only Defendant to do so publicly.

(e) Internal Documents and Statements Reveal That Defendants Concealed and Suppressed Research and Other Evidence Consistent With Nicotine Addiction

2346. Not only have Defendants' conduct and research reflected a sophisticated understanding of nicotine and its role in smoking addiction, but Defendants have also deliberately withheld such information from the general public. It is clear that Defendants intentionally withheld from public dissemination, and from public health authorities, accurate information regarding the addictiveness of nicotine in cigarettes. Henningfield WD, 87:10-88:20, 161:23-167:6.

2347. Defendants accomplished this through the suppression of their own critical and corroborative research findings and by fostering controversy about the scientific knowledge concerning nicotine and its addictive effects that was publicly available. Henningfield WD, 134:23-136:9, 161:23-167:6.

2348. Defendants have offered a misrepresentation of the history of tobacco-dependence related research by implying that the scientific basis for understanding tobacco dependence was known for many decades, if not centuries, and that until recent years, organizations which considered the question appropriately, concluded that the evidence was not sufficient to draw such conclusions. Henningfield WD, 87:10-88:20, 102:21-104:13.

2349. In fact, Defendants themselves possessed, from their own experiences and research, internal studies and other information that led them to conclude, long before public health bodies did, that the primary reason people keep smoking cigarettes is to obtain the drug nicotine, which has addictive effects. Defendants intentionally withheld this data (including many of studies on the physiological effects of nicotine in animals and humans, and much of its research on the determinants of nicotine dosing in cigarettes) when there were major public efforts to review and synthesize all available information, such as Surgeon General's Reports or congressional investigations. Defendants also engaged in a public relations offensive, relying on self-serving definitions of addiction, to deny the consensus conclusion that smoking is addictive primarily because cigarettes effectively deliver nicotine. Henningfield WD, 87:10-103:13, 104:14-110:8, 134:23-136:1, 150:14-159:8, 161:23-167:6. See also 490010042-0044 at 0043 (US 79285) (A) (presenting "Addiction Statement," prepared by Shook, Hardy & Bacon, concluding that smoking is not addictive and that, as crafted, "Statements in company documents cannot refute this conclusion.").

2350. The 1988 Surgeon General's Report, entitled "Nicotine Addiction," affirmed the conclusions of the clinical community that nicotine in cigarettes is an addictive drug. Had Defendants disclosed their internal knowledge, research results, and conclusions, this information would likely have permitted nicotine to be placed into the addiction category far

earlier. Henningfield WD, 149:12-20.

2351. Defendants publicly denied the addictiveness of smoking and nicotine's role therein, because they feared that public acknowledgment of what was so well documented and widely accepted internally would potentially expose them to governmental (FDA) regulation and adverse liability judgments from addicted smokers. Defendants thus took steps to limit the nature and dissemination of nicotine-related research.

2352. A September 9, 1980 Tobacco Institute internal memorandum revealed the recognition by the member companies that a public admission that nicotine was addictive would undermine their litigation defense that a person's decision to smoke is a "free choice": "[T]he entire matter of addiction is the most potent weapon a prosecuting attorney could have in a lung cancer/cigarette case. We can't defend continued smoking as 'free choice' if the person was 'addicted.'" TIMN0107822-7823 at 7823 (US 21275) (O).

2353. Another reason Defendants denied addiction was to avoid regulation by the FDA. Not surprisingly, none of the companies' internal research and evidence suggesting (or finding) addiction was submitted in 1996 when the FDA sought to assert jurisdiction over cigarettes as drug (nicotine) delivery devices. Instead, Defendants (including Liggett) vigorously denied every aspect of addiction. 25055597781-7998G (US 23028*) (A).

2354. The following are examples of the scope of the actions Defendants undertook to strike and limit the nature and dissemination of nicotine-related research, as well as any evidence suggesting addiction.

(i) Philip Morris

2355. Philip Morris studied nicotine and both its pharmacological and physiological effects on smokers - sometimes called addictive, dependence-producing, or reinforcing effects -

intensively in an effort to increase its market share within the industry. However, Philip Morris's internal knowledge and acceptance that smoking, through nicotine, was addictive was kept from the public. Similarly, Philip Morris's research demonstrating the addictive impact of nicotine on the bodies of animals and humans was suppressed, and in some cases terminated.

2356. In a 1992 memorandum entitled "Philip Morris Behavioral Research Program," the company's long-time outside counsel, Shook, Hardy & Bacon, reviewed and summarized much of Philip Morris's nicotine research conducted from 1969 to 1984 under the direction of William L. Dunn. The research into nervous system effects and smoking behavior was conducted both internally (by scientists such as Dunn, Berntson, Gullotta, DeNoble and others) and by outside researchers (including scientists Hutchinson, Abood, Egle and others). 2021423403-3497 at 3406-3409 (US 36743) (A).

2357. The funding for the Behavioral Research Program, or Nicotine Program as it was sometimes called, was terminated in 1984. According to a Shook, Hardy & Bacon report, "**Philip Morris cancelled the Nicotine Program in spring 1984. The decision to cancel the program may have been the result of outside counsel's legal advice**." 2025768108-8166 at 8113 (US 36743) (A) (emphasis added).

2358. As explained below, the decision to abort the Nicotine Program, muzzle its scientists, and suppress much of its research was intentional and indeed driven by legal concerns.

2359. Discussing Philip Morris's research into the pharmacological effects of nicotine, Principal Scientist and psychologist William Dunn wrote the following in a "CONFIDENTIAL" memorandum to Research & Development Vice President Helmut Wakeham on February 19, 1969: '[D]o we really want to tout cigarette smoke as a drug? It is, of course, but there are dangerous F.D.A. implications to having such a conceptualization go beyond these walls."

1003289921-9922 at 9921 (US 20167) (A).

2360. Dunn wrote a "CONFIDENTIAL" memorandum dated October 19, 1977 entitled "Smoker Psychology Program Review" summarizing his program for Tom Osdene. Dunn made three observations that represented the Philip Morris position on smoker behavior and nicotine research. First, the mission of the Philip Morris program was to "study the psychology of the smoker in search of information that can increase corporate profits." Second, Dunn admitted that while "[t]here is a general realm of psychological inquiry that would not make our lawyers nervous were the findings to be made public," there is "legal concern" with any scientific inquiry into the dependency-producing compound, or "reinforcing mechanism," of smoking. Third, Dunn stated that his research assumed that nicotine was the compound in question, a compound that without which "the cigarette market would collapse, P.M. would collapse, and we'd all lose our jobs and consulting fees." 1000046538-6546 at 6538-6542 (US 26074) (A); 2021423403-3497 at 3488 (US 36743) (A).

2361. Dunn also compared smokers seeking nicotine to Pavlov's dogs and to hungry laboratory rats who press levers seeking food pellet "rewards": "Consider the smoker. Smoking the cigarette is the lever press. The effect of that smoking act upon the person is the reward. That effect reinforces the smoking act. He comes to push the smoking lever 10 to 60 times per day." 1000046538-6546 at 6543 (US 26074) (A); 2021423403-3497 at 3485 (US 36743) (A).

2362. Shortly thereafter, in a November 3, 1977 memorandum, Dunn provided his strategy for concealing any unfavorable nicotine research results. Regarding a proposed study of nicotine withdrawal in rats to be undertaken by Philip Morris scientist Carolyn Levy, Dunn stated that he approved the study. However, he cautioned that, "If she is able to demonstrate, as she anticipates, no withdrawal effects of nicotine, we will want to pursue this with some vigor. **If,**

however, the results with nicotine are similar to those gotten with morphine and caffeine, we will want to bury it." 1003293588-3588 (US 20168) (O) (emphasis added).

2363. The terms of Levy's "Proposed Study of Nicotine Withdrawal in Rats" are contained in a November 1, 1977 memorandum from her to Dunn, where Levy states that her intent was not to conduct objective research but to generate favorable evidence in support of the external industry position that there are no withdrawal symptoms associated with nicotine. Levy intended to compare known morphine and caffeine withdrawal symptoms to nicotine's effects. Levy stated, however, that while she predicted favorable results, she understood that "it is dangerous to set out to prove the null hypothesis." 1003293589-3591 (US 21421) (A).

2364. In a November 29, 1977 memorandum to Bob Seligman, Philip Morris Scientific Director Tom Osdene stated his concerns with the direction CTR was taking with its research into nicotine, saying that with "the progress that has been claimed, we are in the process of digging our own grave," adding that he feared that "the direction of the work being taken is totally detrimental to our position and undermines the public posture we have taken to outsiders." 2022246952-6952 (US 36865) (O).

2365. The industry's goal was to stop the public health community from concluding that nicotine was addictive. Seligman wrote a memorandum to company general counsel Alex Holtzman dated June 27, 1978, attaching Dunn's report of a conference Seligman and Dunn attended called "Cigarette Smoking as a Dependence Process." The conference was apparently put on by the National Institute on Drug Abuse. Seligman prophetically warned Holtzman that:

> It is my impression that at some time in the future, nicotine will be listed as a dependency drug (or smoking will be listed as a dependence process). Thus, it might be wise to contemplate the future <u>legal</u> ramifications of such an inevitability. Additionally, you might want to consider some mode of action which might forestall such a designation by the drug abuse community.

1003726420-6420 (US 85384) (O) (emphasis in original).

2366. BATCo scientist D.G. Felton summarized a visit to Philip Morris in a report on his visit to North America in October 1979, part of which was devoted to the industry's nicotine research efforts:

> During the trip, I also responded to an invitation from Drs. R.B. Seligman and T.S. Osdene to visit the Philip Morris Research Center. The terms of the visit were that I should take no notes and make no report. I can merely record that the discussions were very open and helpful on the subjects covered during the visit.

650032772-2786 at 2775 (US 85385) (O).

2367. Dunn wrote an internal memorandum to Seligman dated March 21, 1980, describing Philip Morris's "Nicotine Receptor Program," an internal company research program focusing on the psychopharmacology of nicotine. The research was "aimed at understanding that specific action of nicotine which causes the smoker to repeatedly introduce nicotine into his body." While Dunn stated that the nicotine research would likely produce "significant scientific developments," he noted that it was "a highly vexatious topic" that company lawyers did not want to become public because nicotine's drug properties, if known, would support regulation of tobacco by the FDA. Dunn wrote, "Yet this is where our attorneys least want us to be." Moreover, lawyers were concerned that new "knowledge of nicotine" might permit "therapeutic breakthroughs to reduce the incidence of smoking." 0000127789-7792 (US 35152) (O).

2368. Consequently, Dunn observed that while Philip Morris would continue its research program "to study the drug nicotine, **we must not be visible about it.**" And while the program depended on a "heavy commitment" by Philip Morris, Dunn wrote that "**our attorneys, however, will likely continue to insist on a clandestine effort in order to keep nicotine the drug in low profile**." Dunn mentioned Shook, Hardy & Bacon's Don Hoel and Jacob &

Medinger's Ed Jacob by name in his memorandum. 0000127789-7790 (US 21794) (A) (emphasis added).

2369. A memorandum to Seligman from J.I. Seeman, dated March 18, 1980, provided additional commentary on the Philip Morris "Nicotine Receptor Program." In Seeman's memorandum, he implied that any outside scientist working with Philip Morris had to share the company's interest. He wrote that, "An additional, and perhaps fundamental, requirement was that the individual(s) chosen to work with us is acceptable from a 'political' perspective." 1003289974-9975 (US 87078) (O).

2370. In a December 4, 1981 article, George Macklin, Director of Sales for Philip Morris in the United Kingdom, summarized and published a presentation he had made to a Retail Confectioners and Tobacconists convention. In the article he said that "cigarettes are not just habit forming – the body builds up a requirement for them," and that if it was raining, a smoker would still stop to buy cigarettes because "he is addicted to cigarettes." In response to an angry inquiry from Don Hoel of Shook, Hardy & Bacon about this public admission, Jules Hartog at Philip Morris Europe wrote that he had explained to Macklin's boss that "this sort of mistake could create a lot of problems for us" and that he had been promised that "such unfortunate incidents will not happen again" 2501013567-3568 (US 27920) (O); 2024950721-0721 (US 20404) (O); 2024950723-0723 (US 37175) (O).

2371. A March 16, 1983 memorandum from researchers James Charles and Victor DeNoble concerning their critiques of the Public Health Service's Report entitled "Why People Smoke" acknowledged that Philip Morris had research results with implications contrary to Philip Morris's publicly stated opinions on nicotine, but that Philip Morris had not disseminated its findings publicly: "Recent experiments in Vic's [DeNoble's] project have shown that there is

a behavioral component to tolerance (a learned phenomenon), but this work has not been published." 1005061346-1346 (US 20199) (A). This was the work, led by Dr. Mele and described in his testimony, that Philip Morris actively precluded him from publishing. Mele WD, 11:6-15:4.

2372. In at least one case, Philip Morris threatened to take legal action against scientists who sought to publish their research on addiction. Philip Morris had developed an important method for demonstrating that rats press levers and work for nicotine. Such studies had earlier been done with monkeys, but there had not previously been a good rat model. Philip Morris was one of the first to develop a valid rat model of nicotine intravenous self-administration.

2373. Yet, Philip Morris prevented the publication and presentation of this work. Henningfield WD, 161:23-167:6; DeNoble WD, 17:1-18:6, 22:6-23:18, 39:12-45:11; Mele WD, 20:3-22:12, 28:13-32:4.

2374. Under the guidance of Dr. Paul Mele, a former Philip Morris research scientist, the Philip Morris Biochemical Research Division demonstrated that tolerance to nicotine occurs. Dr. Paul Mele WD, 11:6-12:11. By administering nicotine to rats, Dr. Mele's study demonstrated both physiological and behavioral tolerance. Id., 11:13-13:5. Behavioral tolerance - when tolerance develops to a behavioral effect of a drug - had not been shown prior to Dr. Mele's research. Id. at 12:16-13:10. When Dr. Mele sought to publish this groundbreaking research in 1983, Philip Morris informed him that the tolerance study could not be published "because the study showed tolerance and physical dependence to nicotine." Id. at 14:2-10. Instead, Philip Morris would only allow Dr. Mele to write an internal paper. Id.; 1000413881-3964 (US 20100) (A). Dr. Mele's testimony was unchallenged by Defendants, as they elected not to cross-examine him.

2375. A 1983 memorandum written by a Shook, Hardy & Bacon lawyer working for Philip Morris provided comments relating to "several reports (unpublished, published or in press) from the Philip Morris Research Center." Regarding an unpublished manuscript from Drs. DeNoble and Mele entitled "Development of Behavioral Tolerance Following Chronic Nicotine Administration," the memorandum commented that "[t]he bottom line is that the authors are maintaining that there is tolerance to nicotine, which involves both behavioral and physiological factors." The memorandum noted that such a finding would be detrimental to the cigarette industry:

> It is obvious that such a report has undesirable implications for smoking and health litigation. Tolerance is frequently cited as one of the hallmarks of addiction. It is the industry's position that one of the classic criteria for addiction is tolerance, and that such has not been demonstrated in the case of nicotine. While it is true that the Mele and DeNoble paper does not discuss smoking in particular or attempt to extrapolate their experimental findings beyond the laboratory, there is nevertheless the implication simply by the fact that Philip Morris is doing this research, that it is viewing this research as relevant to smoking behavior.

2021424402-4412 at 4404-4405 (US 22847) (A).

2376. This same Shook, Hardy & Bacon memorandum arrived at the following assessment of the "unfavorable" Philip Morris internal nicotine research:

> **Research engaged in, as well as some possibly under consideration, by Philip Morris has undesirable and dangerous implications for litigation positions the industry takes in regard to smoking behavior.** The pharmacological nature of the research implies strongly a view of the importance of nicotine. What is worse, research reports under Philip Morris' sponsorship contain claims of unequivocal demonstrations of reinforcement by nicotine in animals. This kind of research is a major tool of our adversaries on the addiction issue; the irony is that industry-sponsored research is honing that tool. **In the final analysis, the performing and publishing of nicotine related research clearly seems ill-advised from a litigation point of view.**

2021424402-4412 at 4412 (US 22847) (A); 2021423403-3461 at 3422 (US 87038*) (A) (emphasis added).

2377. DeNoble testified in this case that the intravenous self-administration rat model is a classical hallmark to indicate that a substance has abuse potential; and that the significance of his self-administration research finding was due, in part, to the fact that it was a rat model. Indeed, the Philip Morris DeNoble study predicted nicotine abuse potential with the exact same procedure that NIDA uses to demonstrate a drug's abuse potential. DeNoble WD, 17:9-20:2; See also, 2023963269-3341 at 3312-2213 (US 20398) (A) (DeNoble testimony at 1994 Waxman hearings).

2378. DeNoble also testified that prior rat self-administration studies had a compounding variable of inducement that made interpretation of their results unclear with respect to whether nicotine is truly a reinforcing agent. DeNoble WD, 17:9-18:6. Therefore, his own study succeeded where others had failed and clearly was very significant at this point in history. As DeNoble put it in 1994:

> The work that we did with nicotine was clearly some years ahead of the external community, scientific community. It wasn't until 1989 that Bill Corgal (sp) demonstrated that nicotine would function as an intravenously delivered reinforcer for rats, using the same models that I used – that Paul [Mele] and I used. The work that we did on self administration, on dependence, on tolerance, on frustration, clearly would have moved the scientific community much further along than it had been moved by that work not getting out.

2023963269-3341 at 3285 (US 20398) (A). Dr. Henningfield testified about the significance of the DeNoble and Mele self-administration research and the adverse impact of Philip Morris's concealment of this work on the scientific research community. Henningfield WD, 162:10-167:6.

2379. DeNoble's former research colleague at Philip Morris, Paul Mele, added these points:

> . . . [S]ome of these studies were the first to be done with nicotine. I have no doubt that other people would have performed these studies subsequently just as has been done recently in Toronto. But they weren't being done at the time, and to quote a recent review article in Science . . . it basically took six or seven years for the nicotine self-administration model to be developed and come out. Whereas, it would have been out much earlier had this work been allowed to go out and stay out.

2023963269-3341 at 3286 (US 20398) (A).

2380. Philip Morris management clearly knew the scientific significance of the DeNoble rat self-administration nicotine study. In fact, approval was obtained to submit it to a leading peer review scientific journal, *Psychopharmacology*, and plans were in place to have the study presented at the 1983 American Psychological Association meeting in Anaheim. 2023963269-3341 at 3303 (US 20398) (A).

2381. Jack Henningfield, an addiction researcher at NIDA during the period that DeNoble and Mele were performing this research at Philip Morris, has testified as to the significance such work would have had to the scientific and medical communities had it been published in 1983. Henningfield WD, 103:22-103:13.

2382. Prior to publication, however, at a New York briefing designed for the purpose of having DeNoble report on the activities of the behavioral pharmacology laboratory, including the results of the rat self-administration nicotine study, DeNoble was asked only one question, by the President and CEO of Philip Morris, Ross Millhiser:"Why should I risk a billion-dollar industry on rats pressing a lever to get nicotine?" DeNoble WD, 24:8-25:1.

2383. The saga of the Philip Morris Nicotine Program is described in detail in a lengthy 1992 document prepared by outside counsel Shook, Hardy & Bacon entitled "Philip Morris

Behavioral Research Program." In this report, counsel summarize many aspects of the program and cite specific documents showing a major internal research initiative that lasted from 1969 to 1984 involving many scientists, including DeNoble. The report acknowledged that DeNoble was terminated in 1984, the year the entire program was ended. 2021423403-3497 at 3408-3409 (US 36743) (A).

2384. With respect to the reasons why the Nicotine Program was terminated, the 1992 report prepared by outside counsel Shook, Hardy & Bacon makes clear that the program generated results and was still generating data in 1984 related to nicotine receptors, analogs, peripheral nervous system effects, central nervous system effects, effects on animal behavior, and differences between high nicotine delivery and low nicotine delivery cigarettes. The report ominously stated the following: "For reasons never stated in any internal documents, Philip Morris cancelled the Nicotine Program in spring 1984. The decision to cancel the program may have been the result of outside counsel's legal advice." 2021423403-3497 at 3408 (US 36743) (A).

2385. In fact, in a July 27, 1983 letter to the head of Philip Morris, Shook, Hardy & Bacon attorney Patrick Sigrid summarized the nicotine research being conducted by DeNoble and recommended its suppression. 2046754720-4731 (US 20476) (A).

2386. In April 1984, a few months after a top Philip Morris executive and lawyer visited the behavioral pharmacology lab, his laboratory was suddenly shut down and the animals killed. DeNoble WD, 38:4-16, 39:3-9; Mele WD, 25:19-26:21. In DeNoble's own words, "[O]ur laboratory was terminated in one day." 2504099642-9666 at 9660 (US 22708) (A).

2387. Subsequently, DeNoble was told by several representatives of Philip Morris management that his lab was generating information that the company did not want generated

internally. As DeNoble testified:

> Apparently, at that same time, some litigation had come out, some law suits, and we were told that the data we were generating, the types of studies that we were doing would not be favorable in that litigation. . . . They just said that if the work were removed from the company connecting it back to the company would be, you know, more difficult to do than if it's being done right in the company itself.

2023963269-3341 at 3305-3306 (US 20398) (A); See also, DeNoble WD, 38:12-14.

2388. In 1986, Dr. DeNoble and Dr. Mele presented their findings on behavioral tolerance development to nicotine in rats to the Federation of American Societies for Experimental Biology in St. Louis, Missouri. Subsequently, Philip Morris Companies Assistant General Counsel Eric A. Taussig sent each scientist a letter which stated in part:

> As you are aware, upon your employment at Philip Morris . . . you signed an agreement (a copy of which is enclosed) requiring you to keep confidential, unless expressly permitted otherwise, research developed while an employee of the Company. The disclosure of such information as a result of your employment at Philip Morris without permission constitutes a breach of your agreement with the Company. In the future, you are expected to comply with the terms of the agreement.

DeNoble WD, 39:12-42:20; Mele WD, 28:13-30:22; 2047340350-0350 (US 22772) (A); 2077541354-1354 (US 44603) (A).

2389. In a September 10, 1986 letter, Taussig again threatened DeNoble and Mele with suit if they published, or presented, their findings on nicotine self-administration and brain effects, accusing DeNoble of disclosing "information relating to research on a project entitled 'Brain Sites Involved in the Mediation of Behavioral Effects of Intraventricularly Administered Nicotine." Taussig wrote that Philip Morris was aware that they had on two occasions presented the results of their nicotine research, allegedly in violation of their employment termination agreement. He informed them that "the Company cannot tolerate this type of conduct," and

reiterated that "if you wish to publish or otherwise utilize research from Philip Morris, you must request and receive permission from the Company." He ended the letter by stating that "[a]ny further breach of your agreement will result in action being taken." 2023192361-2362 (US 20380) (A).

2390. An April 6, 1994 Shook, Hardy & Bacon document entitled "Philip Morris Research of Nicotine Pharmacology and Human Smoking Behavior" described the DeNoble controversy and admitted, via marked "CAVEATS," the evidence showed admission of nicotine's addictive effects by Philip Morris or suppression of important research. 2046819241-9268 (US 85265*) (O)

2391. For example, the 1994 Shook, Hardy & Bacon memorandum stated that the Philip Morris research into smoker "Motivation/Quitting" from 1964-1981 was "concerned with motivations sustaining the smoking habit" and "marketing the ultimate cigarette." The research concluded: "[M]ost smokers can be considered nicotine seekers, however, psychosocial and cultural factors are involved." Moreover, from its "Human Smoker Simulation Studies," Philip Morris determined that "standard [FTC] smoke test conditions are not indicative of how people smoke." 2046819241-9268 at 9242-9243 (US 85265*) (O).

2392. The 1994 report described how the outside research was ended in 1983 and 1984. In fact, portions of Dunn's own research was inexplicably discontinued. Dunn explained in the Cipollone litigation was that "all the people who were working with him were reassigned to other functions," and that he "had no idea why they [Philip Morris] made [the] reassignments." 2046819241-9268 at 9245 (US 85265*) (O).

2393. The 1994 report pinpoints exactly which research was suppressed and the relationship of the research to Philip Morris products. When describing the

"Nicotine/Acetaldehyde" research conducted by DeNoble in 1982, research that showed that acetaldehyde and nicotine functioned as "positive reinforcers," the Shook, Hardy & Bacon report admitted that the research was never published:

> CAVEAT: This research has never been published. There is nothing in the literature regarding the synergistic effects of nicotine and acetaldehyde. In addition, see description below re: Frank Ryan data on predicting sales.
>
> Upon learning that acetaldehyde functions as a positive reinforcer, they endeavored to study the combined effects of nicotine and acetaldehyde on self-administration. Results indicated that reinforcing effects of these agents are additive.
>
> Research done by Frank Ryan indicated that acetaldehyde and nicotine data could be used to predict cigarette sales at a 96% accuracy. . . . Frank Ryan ran a program and was able to predict blindly which cigarettes would sell and which wouldn't based on the combination of nicotine and acetaldehyde delivery.

2046819241-9268 at 9249-9250 (US 85265*) (O).

2394. In a later section of the 1994 report, Shook, Hardy & Bacon wrote the following to illustrate how nicotine research was stopped because it undermined Philip Morris's public position denying addiction, and because it may have invited regulation by the FDA:

> D. Why Was Research Stopped
>
> 1. Sensitivity. [CAVEAT: Significance is self-evident.]
>
> According to DeNoble, "we were the only tobacco company that I knew of, or that anybody else knew of, doing work with whole animals, live whole animals, and because of the nature of the research, that is, looking at self-administration, looking at the effects of nicotine on the brain function, the research was held restricted to upper management only."
>
> DeNoble discussed the effect of his research on the company with Dr. Charles, Dr. Osdene, Dr. Pages, Mr. McDow, Max Hausermann, Mr. Pollock, and Jim Remington. . . . "The downside was that we were doing whole animal research, which looked to them like we were doing Federal Drug Administration [sic]

> research."
>
> DeNoble understood that the research he was doing could undermine the public posture Philip Morris was taking with outsiders.
>
> **DeNoble discussed with Jim Charles and Tom Osdene the potential damage to the company of continuing animal research**.

2046819241-9268 at 9256 -9257 (US 85265*) (O) (citations omitted) (emphasis added).

2395. The 1994 Shook, Hardy & Bacon report also acknowledged the sudden DeNoble "Laboratory Shutdown," adding "[CAVEAT: Significance is self-evident.]". The report does not deny or even attempt to explain this event. The report then acknowledges that DeNoble's research was suppressed: "[H]e was not allowed to publish the research regarding the effects of nicotine and acetaldehyde." This occurred "after a letter from Shook, Hardy to the Philip Morris Legal Department and discussions between [attorney] Alex Holtzman and [scientist] Jim Charles." 2046819241-9268 at 9258-961 (US 85265*) (O).

2396. None of the results or conclusions from the Philip Morris Nicotine Program or Behavioral Research Program were included in Philip Morris's and the industry's collective submission to the FDA in 1996. In fact, Volume III of the industry's "Comments" deny and respond to FDA assertions and research showing that nicotine is addictive. 2505597781-7998G (US 23028*) (A).

2397. In addition, Philip Morris's innovative research in the area of the physiological brain effects of nicotine was withheld from publication or distribution. In a February 9, 1983 memo from William Dunn to Max Hausermann, Philip Morris's Vice President of Research & Development, Dunn critiqued a paper on smoking, nicotine, and brain effects, and stated:

> We know here at R&D that for work on the immediate neural effects of smoking the most promising area for investigation is the

> average evoked potential. Edwards and Warburton [the authors of the critiqued report] mention the phenomenon but **(thanks to our tight security)** are unaware that a relationship has been demonstrated (repeatedly) between the latency of the response and smoke inhalation.
>
> **The results to date of our own electrophysiological research program (Frank Gullotta's work) are substantive and if published would 1) constitute a contribution to knowledge** and 2) be, in my judgment, in the best interest of P.M. I would recommend, therefore, in the context of considering the significance of the Edwards/Warburton paper, that **the legal feasibility of publishing our own findings be reevaluated.**

2022252842-2842 (US 87162) (A) (emphasis added).

2398. Philip Morris was not only interested in suppressing research that suggested nicotine addiction, but consumer products that combated nicotine addiction as well. In 1984, Philip Morris became aware that one of its major humectant suppliers, Merrell Dow Pharmaceuticals, was marketing a new smoking cessation product called Nicorette. Philip Morris understood the threat Nicorette posed, namely allowing nicotine-addicted smokers to quit, and took action:

> **Dow was told that we were discontinuing all humectant purchases because of Dow-Merrell's attack on cigarette smoking associated with the introduction of Nicorette**, a nicotine-containing prescription chewing gum which reportedly aids patients in quitting smoking. . . .
>
> Through a series of meetings over the past few years, Dow had been repeatedly advised of our displeasure over the anti-smoking nature of Dow-Merrell's Nicorette Program. . . . Dow was informed that the recent spate of activity can only be interpreted as a conscious corporate decision that Nicorette is more important than the Philip Morris (and other tobacco) business. That is, they cannot realistically expect a customer to spend millions of dollars for materials, when the profits from those sales, directly or indirectly, are used to attack that customer's product and perhaps reduce the customer's sales.

2023799799-9800 at 9799 (US 26801) (O) (emphasis added).

2399. Philip Morris's representatives met with Merrell Dow on several occasions and attempted to shut down the marketing and sale of Nicorette. An October 25, 1984 Philip Morris document recorded the following threat at one of the Philip Morris/Dow meetings: "It was reiterated that Dow had been a superior supplier and that we desired to maintain our relationship. However, future purchases would be predicated on Dow's performance as a supplier as well as the course of the Nicorette program." 2023799801-9802 at 9802 (US 37048) (A); Henningfield WD, 167:7-168:22.

2400. Philip Morris's threats against and intimidation of Merrell Dow are described in other documents as well. 2023799804-9804 (US 26802) (O); 2023799803-9803 (US 37049) (O).

(ii) R.J. Reynolds

2401. According to a May 24, 1977 memorandum entitled "Research Department: Long Range Planning Phase I," a key goal of the RJR R&D department was to combat scientific literature unfavorable to smoking and to generate data favorable to smoking: "Protection against the claims of the professed enemies of the tobacco industry." It was hoped that if RJR took the offensive in presenting information favorable to both RJR and the industry as a whole, "the impact of the oft-repeated arguments of anti-tobacco forces may be partially offset." 502314530-4547 at 4531, 4533 (US 21917) (O).

2402. An October 7, 1988 report entitled "An Integrated Research Program for the Study of Nicotine and Its Analogues," drafted by RJR researchers, indicated that RJR was well aware of the importance of nicotine in cigarettes and promoted the development of an extensive in-house program for the detailed study of the drug. 514894567-4676 (US 20862) (A).

2403. In the mid-1990s, RJR took steps to promote its claim that smoking was not

addictive. RJR's longtime nicotine science expert Donald DeBethizy organized and led a "Positive Aspects of Nicotine Team." This team was established to "defend the industry" by creating a debate around the issue of why people smoke, and had the main goal of fighting efforts to classify nicotine as addictive. 514829670-9670 (US 20861) (A); DeBethizy PD, United States v. Philip Morris, et al., 4/17/02, 164:7-21, 170:14-177:15, 177:21-179:12, 184:19-189:1.

2404. In addition, RJR carried out public opinion and communications work, the goal of which was to communicate the positive role of smoking. To this end, RJR did not hire a neutral survey research company, but rather an organization run by a noted pro-smoking activist, David Warburton. 514829670-9670 (US 20861) (A); DeBethizy PD, United States v. Philip Morris, et al., 4/17/02, 185:1-189:1

(iii) BATCo

2405. BATCo's concealment of its nicotine research carried out at Battelle Labs dates back to at least 1963. In a May 29, 1963 letter to the Tobacco Research Council ("TRC"), Sir Charles Ellis enclosed several nicotine research reports, but stated that the BATCo Board "wish me to ask you that these reports should be kept strictly confidential" by the TRC executive committee. Ellis' letter is marked "STRICTLY PERSONAL AND CONFIDENTIAL." 105620759-0761 (US 85387) (A).

2406. In an October 25, 1978 memorandum entitled "Notes on BAT/ITL Joint Meeting," Ed Jacob, a longtime tobacco industry counsel in the United States, advised that there be "a total embargo on all work associated with the pharmacology of nicotine and the benefits conferred by smoking for three reasons," including "a pending California lawsuit which indicted nicotine as an addictive substance," and another lawsuit "against [HHS Secretary] Califano to show cause why tobacco should not be brought under the powers of the FDA." 110083647-3650 at 3649-3650

(US 76174) (O).

2407. Jacob apparently was the emissary from the United States industry sent for the specific purpose of stopping nicotine research in Europe. The BAT/Imperial Tobacco meeting also stated that "ICOSI had agreed with this policy and Jacob had been sent to stop the Verband programme on nicotine." 110083647-3650 at 3650 (US 76174) (O).

2408. At a February 16, 1983 meeting of tobacco company directors, attended by Manny Bourlas of Philip Morris, L.C.F. Blackman, a BATCo board member and former head of research, and representatives from several European tobacco companies, the participants discussed how to respond to the impending Independent Scientific Committee on Smoking and Health ("ISC") Report. The participants agreed upon several schemes for the tobacco industry to conceal scientific information and expertise from the government (and indeed, to respond to government requests by falsely stating that it had no relevant expertise), as well as to emphasize the imperative for the industry to avoid any "tricky" or "sensitive" studies, including research into nicotine's role in "perpetuating the smoking habit":

> 3. <u>The effect of nicotine at the levels achieved through smoking.</u> While animal experiments could probably be designed to study the effect of nicotine (either by itself or as 'spiked' additions) our response to the ISC should be that we have nothing to offer. The little information we have is already in the public domain, and we have no idea as to a worthwhile research programme . . .
>
> 5. <u>The role of nicotine, at the relevant lower range of nicotine dosage, in perpetuating the smoking habit</u>. While much information already exists in the literature (Russell, Ashton and Stepney etc) this is a particularly sensitive area for the industry.
>
> If any future study showed that nicotine either was, or was not, associated with perpetuating the smoking habit, industry could well be called upon to reduce or eliminate nicotine from the product. (A heads we lose, tails we cannot win situation!)
>
> We must not become involved in any collaborative study with the

ISC.

109840698-0702 at 0699-0700 (US 21733) (A).

(iv) Brown & Williamson

2409. Defendants argue that they justifiably relied on the 1964 Surgeon General's conclusion that nicotine was "habituating" rather than "addicting," and that the 1964 Surgeon General's report excuses all of the industry's false denials of the addictiveness of smoking and nicotine. The fundamental factual flaws in this argument are that (1) Defendants internally knew the truth as to the addictiveness of smoking and nicotine; and (2) the 1964 conclusion was in large part the product of Defendants' intentional concealment of their extensive nicotine knowledge and research from the Surgeon General's Advisory Committee.

2410. An understanding of the role of B&W in 1963, acting in concert with its parent BATCo and RJR, in concealing nicotine and addiction research from the Surgeon General's committee is necessary to appreciate how the 1964 Surgeon General's addiction conclusion was the product of Defendants' fraud and concealment.

2411. The 1959-1964 BATCo nicotine research, carried out under code names "MAD HATTER," "HIPPO," and "ARIEL," was provided to B&W. This was research that, in the words of BATCo's lead scientist Sir Charles Ellis, was designed to determine "what constitutes the hold of smoking, that is, to understand addiction." 301083820-3835 at 3826 (JE-46579) (A). Ellis also stated that the BATCo secret nicotine research gave the industry "knowledge of the effects of nicotine far more extensive than exists in published scientific literature." 301083820-3835 at 3828 (JE-46579) (A).

2412. Moreover, B&W executives were present at a 1962 BAT research conference where Ellis declared the group's position that "smoking is a habit of addiction." This copy of the

conference report is stamped "Property of Brown & Williamson Research Department." 650344433-4493 at 4439 (US 53468) (A).

2413. PROJECT HIPPO I was completed in January 1962, finding that rats developed tolerance to nicotine and that nicotine shared many similarities with tranquillizers. The final report on PROJECT HIPPO II was dated March 1963, finding that nicotine had many beneficial physiological effects over tranquillizers, benefits that support "the pleasure of smoking" and lead to withdrawal. 105620620-0683 (US 20247) (A); 105620569-0605 (US 20246) (A).

2414. B&W acknowledged a close review of PROJECT HIPPO I and II in a "STRICTLY PRIVATE AND CONFIDENTIAL" memorandum dated July 17, 1963 by general counsel Addison Yeaman, in which he agreed that "nicotine is addictive" and "we are in the business of selling nicotine, an addictive drug." He also advised that the company should develop filtered products that still delivered the necessary "nice jolt of nicotine." 682764441-4461 at 4455 (US 21030) (A).

2415. B&W's President William S. Cutchins acknowledged a request for information from the Surgeon General's Advisory Committee to the manufacturers regarding its inquiry on smoking and health in a letter to the Assistant Surgeon General James Hundley, dated May 14, 1963, stating simply that B&W contributed to smoking and health research via its contributions to the TIRC. 680249780-9781 (US 85390) (O); See also, 680249799-9799 (US 85389) (O).

2416. Cutchins' letter was the carefully crafted product of industry legal advice. In a letter dated May 6, 1963, to B&W in-house counsel DeBaun Bryant, outside counsel J.M. Johnson recommended that the company respond to the Surgeon General's Advisory Committee in an intentionally vague and confusing manner:

> I am of the further opinion that any description in the letter to the Committee of the methods and steps involved in the various scientific research programs

> conducted by Brown & Williamson must necessarily be so vague and incomplete as to be irksome to the reader. . . . Therefore, **it is my suggestion that we state simply that we have conducted no medical research**, having left that to TIRC . . . . I repeat **it is unfortunate that Brown & Williamson must submit anything,** but this approach seems to me to be the most innocuous of the alternatives.

680249785-9786 (US 85391) (O) (emphasis added).

2417. Johnson concluded his letter with the advice that B&W's submission to the Surgeon General's Advisory Committee must protect the company's litigation position, and must only contain material that has already been published: "From a litigation standpoint I believe it is axiomatic that it is best to submit the least scientific material possible consonant with the objective of not irritating the Committee. As I mentioned on the telephone I would prefer to see only previously published material submitted . . . ." 680249785-9786 (US 85391) (O).

2418. In a June 19, 1963 document entitled "Note for Mr. Cutchins," BATCo president Ed Finch told his counterpart at B&W that BATCo had sent B&W copies of all the BATCo-sponsored nicotine research conducted at the Battelle labs. Finch stated that because the reports were "sound piece[s] of research . . . it might be desirable to get them submitted to the U.S. Surgeon General's Committee." Finch also informed Cutchins that the Tobacco Research Council in Britain was sending copies of the nicotine research reports to the TIRC (CTR's predecessor) as well, "with a request that they consider whether it would help the U.S. industry for these reports to be passed on to the Surgeon General's Committee." 689033429-3429 (US 54274) (O).

2419. A letter from BATCo's Sir Charles Ellis to B&W's Yeaman dated June 28, 1963 recalled that B&W had already received the "HIPPO" research reports, and enclosed the May 1963 BATCo report from Dr. Haselbach entitled "A Tentative Hypothesis on Nicotine Addiction." MTP0013569-3569 (US 76159) (O).

2420. The "Tentative Hypothesis" document is quoted in detail above and closed with the following: "In conclusion, a tentative hypothesis for the explanation of nicotine addiction would be that of an unconscious desire to restore the normal physiological equilibrium of the corticotropin releasing system in a body in which the normal functioning of the system has been weakened by the chronic intake of nicotine." 536480912-0914 (US 20928) (A).

2421. BATCo and B&W shared their PROJECT HIPPO I and II reports with RJR General Counsel Henry Ramm and outside industry counsel Ed Jacob. In an August 5, 1963 letter from B&W General Counsel Addison Yeaman to Ramm and Jacob, B&W enclosed "herewith the three volumes of "Project HIPPO I and II." 689033411-3416 (US 31044) (O).

2422. B&W considered providing BATCo-funded Battelle research on the addictiveness of nicotine to the Surgeon General prior to the first Report on Smoking and Health in 1964. However, in a July 3, 1963 cable to BATCo Chairman A.D. McCormick, B&W General Counsel Addison Yeaman stated his intention to withhold the research results from the Surgeon General:

> Hoyt of TIRC agreed to withhold disclosure Battelle report to TIRC members or SAB until further notice from me. Finch agrees submission Battelle or Griffith developments to Surgeon General undesirable and we agree continuance of Battelle work useful but disturbed at its implications re cardiovascular disorders . . . .
>
> We believe combination Batelle work and Griffith's developments have implication which increase desirability [of] reevaluation [of] TIRC and reassessment fundamental policy re health.

689033422-3422 (US 22734) (A).

2423. BATCo also forwarded its report entitled "The Fate of Nicotine in the Body" to B&W under cover letter from Sir Charles Ellis to chairman Bill Cutchins (stamped "Received") on July 1, 1963. In his cover letter, Ellis wrote:

> I feel sure you will agree that a knowledge of the fate of nicotine in the body is a necessary accompaniment to studying the

> physiological effects that nicotine can produce. I hope you will be interested in the experiments which in my opinion add considerably to the published knowledge in this subject.

689033419-3419 (US 54271) (O).

2424. Despite BATCo and B&W's keen interest in nicotine and its impact on smokers' bodies, B&W never disclosed to the Surgeon General its knowledge that nicotine was addictive, or the research it possessed showing craving, tolerance, withdrawal, and many physiological effects of nicotine on the body.

2425. The 1964 Surgeon General's Report was published in January 1964. The report did not identify nicotine as an "addiction," finding instead that nicotine was a "habit." This finding was based on the Surgeon General's Advisory Committee's conclusion (1) that smoking created a "desire" but not a "compulsion;" (2) that smoking did not result in a "tendency to increase the dose;" and (3) that smoking did not create a psychological and physical dependence on nicotine. Report of the Surgeon General (1964) at 350-51, VXA1601844-2232 (US 64057) (A).

2426. These findings of the Surgeon General's Advisory Committee, and the ultimate characterization of smoking as a "habit" instead of an "addiction," were contradicted by the sophisticated nicotine research in the possession of B&W in 1963, research intentionally kept from the Advisory Committee. Moreover, the 1964 finding of "habituation" is contradicted by the internal company position of both BATCo and B&W, as stated by Sir Charles Ellis, Addison Yeaman, and company scientists, that nicotine and smoking produced an "addiction."

2427. It is highly plausible that had the Surgeon General's Advisory Committee had full knowledge of what Defendants knew and Defendants conclusions from what they knew, that information would have tipped the balance and placed nicotine in the addiction category much

earlier. Henningfield WD, 114:13-122:19.

2428. Instead, B&W denied addiction and played down the impact of smoking at every turn. In a May 19, 1972 letter to McCormick, counsel for BATCo, Yeaman recommended that in a BATCo statement being prepared in response to a British Government statement concerning cigarette smoking and health issues, the word "habit" should be changed to "practice." 680248768-8769 at 8769 (US 20993) (A).

2429. B&W's involvement in nicotine research, in particular research studying the effects of nicotine on the central nervous system, was intentionally confined to Europe via BATCo. This was done because of B&W's concern that research demonstrating nicotine addiction or dependence contradicted the industry's public position and might lead to regulation.

2430. Following a visit to B&W in October 1979, BATCo scientist D.G. Felton described the situation as follows:

> There is said to be a general nervousness in the U.S. Tobacco Industry (apart from Philip Morris) in working on the effects of nicotine, because of the risk of demonstrating nicotine dependence or addiction. There are fears that this would result in the Industry coming under the Food and Drug Administration. This view was given me both by the CTR administration and separately by [outside industry counsel] Mr. Tim Finnegan. In the latter's opinion, any work concerned with the central effects of smoking or of nicotine would run this risk legally.

650032772-2786 at 2783-2784 (US 85385) (O).

2431. In an August 16, 1984 memorandum to BATCo counsel Earl Kohnhorst, B&W Senior Vice President and General Counsel Ernest Pepples advised against the use of a report by BATCo scientist R.P. Ferris entitled "The Functional Significance of Smoking in Every Day Life" due to the report's concession that "many potential criteria for addiction identification are met by smoking behavior," and its reference to smoking as "one form of 'drug usage',

'psychoactive substance usage', or 'psychoactive drug usage.'" Pepples called any use of the report by the company "not appropriate or advisable." 682015254-5255 at 5254 (US 23022) (O); 650000563-0740 (US 85393) (A).

2432. In his memorandum to Kohnhorst, Pepples described the "more serious problems" with the Ferris report, which referred to nicotine as a drug, admitted "tolerance and withdrawal," and concluded that the pharmacological effect of nicotine is the "primary motivation" for smoking. Overall, Pepples was very concerned that the report would be used in litigation as evidence that cigarette smoking is addictive, and as a basis for regulation by the FDA. 682015254-5255 (US 23022) (O).

2433. B&W's efforts to block the presentation or use of Ferris's study went further. Soon after, in a August 28, 1984 letter to BATCo deputy chairman Ray Pritchard, Pepples expressed B&W's objection to using the study, its concern that the Ferris study could seriously harm the industry, and its recommendation that BATCo legal counsel be involved in the planning of further research and drafting of reports related to nicotine and addiction. In his letter, Pepples implicitly asked Pritchard to conceal the Ferris study, and stop Ferris from making a presentation on the report at an upcoming research conference, in light of "the current legislative and litigation environment in the U.S." and "the possibility for involvement by the U.S. Food and Drug Administration." Pepples explained that the industry needed to oppose any concessions that nicotine and smoking are addictive "in order not to give a claimant an unjustified weapon to use against the company or the industry." 680583069-3070 (US 23024) (A).

2434. Similar to Pepples' earlier memorandum to Kohnhorst, Pepples' letter to Pritchard expressed "great concern" about Ferris's report because it conceded that smoking is addictive. Pepples did not deny any of Ferris's observations or conclusions regarding nicotine and smoking;

indeed, he admitted that Ferris's use of authorities and references was "generally accurate." Fearing involvement by the FDA, Pepples then recommended closer involvement by lawyers in scientific projects in the future. He wrote:

> [T]he report seems to concede that many potential criteria for addiction identification are met by smoking behavior. For example, the report urges the position that the primary motivation for smoking is ultimately tied to a pharmacological "psychoactive" function of nicotine . . . .
>
> Throughout the report, unfortunate concessions appear regarding "tolerance and withdrawal." The report frequently expresses that smoking has certain "therapeutic properties" and nicotine is compared to the action of tranquilizers, alcohol, etc. In addition, smoking is referred to as one form of "drug usage," psychoactive substance usage," or "psychoactive drug usage."
>
> As you know in the current legislative and litigation environment in the U.S., claims of addiction have been and will be used against Brown & Williamson by our adversaries. Such claims have been vigorously opposed in order not to give a claimant an unjustified weapon to use against the company or the industry.
>
> In addition, the possibility for involvement by the U.S. Food and Drug Administration would be heightened by company or industry promotion of the theme of this report, as it will be generally perceived.
>
> If such matters as the 'Functional Significance' document and the Conference binders, enclosed herewith, are not already routinely vetted with BATCo lawyers, you may want to consider involving them more closely in both the conceptual and the drafting stages of these projects. Thank you very much for your help in this area of great concern for us.

521016786-6786 (US 22129) (A).

2435. With respect to the Ferris report, B&W attorney J. Kendrick Wells emphasized in a November 12, 1984 letter to BAT attorney Anne Johnson why the BAT study must not be publicized:

> A plaintiff in a smoking and health products liability lawsuit in the

> U.S. could use the paper to support its argument that smoking is difficult to quit ("Addiction"). The plaintiff could argue that the paper contradicts the voluntary assumption of risk defense. It is doubtful whether editing can transform the paper into one which would not be helpful to the plaintiff in a products liability action.

680583045-3045 (US 85395) (A).

2436. Around this same time, B&W intervened to edit adverse references to addiction out of another BATCo report, entitled "The Controversy on Smoking and Health - Some Facts and Anomalies" by BAT scientist Dr. L.C.F. Blackman. By letter dated October 25, 1984, B&W attorney J. Kendrick Wells wrote BATCo counsel Alec Morini that "review" of BATCo publications by B&W was necessary in light of ongoing smoking and health litigation; Wells went on to provide 45 paragraphs of revisions to Blackman's draft report in a marked-up report These included:

> 2. Delete Donald Gould reference. The article identifies cigarettes as a drug.
>
> 3. Delete reference to Dr. W.S. Cain. The article identifies short term and longer term pharmacological and physiological factors as important in the derivation of "habitual cigarette smoking" . . . .
>
> 5. Delete. The point made here might be said to run counter to arguments that cigarette smoking is not addictive . . . .

680582499-2507 at 2500 (US 54052) (A).

2437. The marked-up report was produced by BATCo in this litigation, with additional comments and markings from BATCo showing that BATCo acted on Wells's letter. Specifically, the three paragraphs quoted above bearing adversely on the company's position on addiction were ultimately stricken from the report. 107332541-2574 at 2545 (US 26281) (O); compare to 680582512-2512 (US 85396) (A).

2438. In a May 10, 1994 B&W press release, the company made the following false

claims, claims that are remarkable in light of the company's internal acceptance of addiction prior to 1964 and the company's efforts to insure that the Surgeon General never received the BATCo internal nicotine research showing addiction prior to the 1964 report:

> It has always been B&W's position - and still is - that cigarette smoking is not addictive under the standards set forth in the 1964 Surgeon General's Report. Calculated misrepresentations of the company's position merely encourage ill-informed grandstanding.
>
> Brown & Williamson was acknowledged by the Surgeon General for its "substantial cooperation and assistance" in connection with the 1964 Report. Contrary to the recent media reports, B&W had not concluded that cigarette smoking was addictive prior to the release of the 1964 Report.

202337394-7394 (US 21965) (O).

(v) American Tobacco Company

2439. American attempted to keep its limited nicotine research hidden as well. For example, in a September 16, 1938 letter, H.R. Hanmer of American's R & D Department informed George W. Hill, an American Vice President, that research performed on dogs had demonstrated an increase in blood pressure due to the cigarette's nicotine. Mr. Hanmer added that while this was "very clear-cut biological evidence," "nothing of this sort could ever be used in presenting facts to the public." MNAT00115492-5499 (US 21401) (O).

2440. In a May 14, 1969 memorandum, John Ashworth, of American's R&D Department, ordered that nicotine was to be referred to as "Compound W" in all "experimental work, reports, and memorandum, either for distribution within the Department or for outside distribution." Further, Ashworth directed that nicotine as a salt would be called "Compound WM" and nicotine as a citrate salt would be called "Compound WS" in all research reports. MNAT 00533224-3224 (US 21220) (O).

(vi) Lorillard

2441. In a November 9, 1976 memorandum, Lorillard researcher R.E. Smith urged that an industry-wide effort to offer a product with 50% less nicotine should be discontinued despite "considerable consumer trial appeal" because such a cigarette could not deliver sufficient "smoking satisfaction" for its purchasers. 01244504-4504 (US 20042) (O).

(vii) Tobacco Institute

2442. The Tobacco Institute attempted to suppress nicotine and addiction research as well. In a May 17, 1983 memorandum from Fred Panzer to David Henderson, Panzer wrote that certain legislation needed to be amended to make it favorable to the industry by preventing addiction research: "We need language for a rider to the appropriation bill for the National Institute on Drug Abuse (NIDA) that would prevent the use of appropriated funds for a study of the addictive properties of tobacco." TIME 370968-0968 (US 62769) (O).

(viii) CTR and Other Defendant Funded Research Groups

2443. In a May 19, 1967 letter to Philip Morris counsel Alex Holtzman, Shook, Hardy & Bacon attorney William Shinn, discussed special projects, including one to support and publicize research advancing the theory that smoking is beneficial to smokers as a stress reducer, even for "coronary prone" persons, because stress, rather than nicotine addiction, is the cause of health problems in smokers. LG2002520-2524 at 2521 (US 21594) (O).

2444. CTR-selected and funded nicotine research was intended to be favorable to the industry. Lawyers played an important part in carefully considering all nicotine and "psychopharmacology" research before it was started to insure it would stay "pro-industry." Nicotine/behavioral research as discussed by the CTR Director and industry counsel at a July 28, 1976 meeting of the industry Research Liaison Committee, where long-time industry counsel

Dave Hardy (Shook, Hardy & Bacon), American Tobacco counsel Cyril Hetsko, and others commented:

> Little has been done on multiphasic tests to study pleasure, etc. (benefits of smoking).
>
> Suggested working conference in late 1977 or 1978 to get all those involved . . .
>
> Hardy: We want to be sure to include benefits of smoking. Is that included?
>
> Gardner: We hope not to show any prejudices.
>
> Hetsko: Concerned that such a study might play into hands of F.T.C. subpoena fishing for information [regarding] smoker motivation. Would like to see conference proposal checked out before we go ahead. This program goes beyond the organizing committee and should be considered by "committee of counsel."
>
> Hardy: Smoking behavior should be part of C.T.R. program as long as it is not "pro-company" but is kept "pro-industry."
>
> Hetsko: No problem if it is generated by SAB. This is a totally different area from what SAB has been dealing with. Doesn't want another book "to haunt us," as the one from the "Caribbean Caper" did.
>
> Yeaman: We take our direction from our members – the industry members. C.T.R. so far is clean of F.T.C. investigation, except possibly for the St. Martin conference.
>
> Hardy: Dr. Gardner should proceed with planning but not take any action.
>
> Hetsko: Decision for action should be made by lawyers, not C.T.R. or Organizing Committee. Chronologically, this meeting might be occurring just at a time that some of these experts are also being questioned by F.T.C. about motivation. This convergence might result in intensification of the conflict. Suggests Dr. Gardner present his program for review by all the lawyers. No records of such a review are to be kept.

1003719175-9179 (US 86406) (O).

2445. The book from the "Caribbean Caper" that, according to Hetsko, "haunted" the tobacco industry, was a book edited by Philip Morris's Dunn and entitled "Smoking Behavior: Motives and Incentives." The book was the result of the 1972 nicotine conference on the Caribbean island of St. Martin, where Dunn recalled that, "The majority of the conferees would go even further and accept the proposition that nicotine is the active constituent of cigarette smoke. Without nicotine, the argument goes, there would be no smoking." 2023193286-3304 at 3289 (US 22967) (A).

2446. The book, while not as frank as Dunn's comments, nonetheless contained some outside researchers' views that smoking and nicotine had characteristics suggesting addiction. For example, Murray Jarvik's article in the book acknowledged evidence that nicotine was "the chemical underlying the smoking habit," and stated his personal opinion that "nicotine is the reinforcing agent in smoking." Another writer, Caroline Thomas, recognized "addictive smoking" as one type of smoking. A third author, Neal Miller, alluded to "anecdotal evidence" that nicotine administration in rats leads to withdrawal symptoms. The conference and the book were sponsored by CTR. LD90011031-0330 (US 87320) (O).

2447. In a November 22, 1977 CTR Associate Research Director Donald H. Ford stated the following with respect to nicotine in a proposal for in-depth CTR-funded nicotine research:

> [I]t now seems evident that nicotine, like narcotics, influences the CNS in multiple ways involving effects related to most known neurotransmitters Further, the dependence which develops tobacco in humans (and withdrawal symptoms during the cessation of smoking) and the degree of tolerance to nicotine which occurs in certain animal paradigms strongly suggest that nicotine is a habituating agent.

1000041912-1918 at 1912 (US 20073) (O).

2448. Dr. Ford presented his nicotine observations at a November 1977 CTR meeting.

His proposed avenues of research related to "Receptors and sites of nicotine action," neurochemical studies, the effects of nicotine on fetal development, neuroendocrinology, and behavioral responses to nicotine. 1000041912-1918 (US 20073) (O).

2449. In response to Dr. Ford's presentation and other CTR nicotine research, Philip Morris's Tom Osdene wrote to Robert Seligman on November 29, 1977, that "we are in the process of digging our own grave." He wrote further: "I am very much afraid that the direction of the work being taken by CTR is totally detrimental to our position and undermines the posture we have taken to outsiders." 2022246952-4952 (US 36865) (O).

2450. Janet Brown, long-time outside industry counsel for American, reported on Ford's CTR research in her minutes of a February 1, 1978 meeting of industry counsel. Her detailed notes of the meeting revealed Defendants' knowledge about the importance of nicotine for smoking, and the importance of stopping Ford's nicotine research, when she discussed her opposition to Ford's central nervous system study. She wrote that while CTR President Addison Yeaman told her that Ford's nicotine research, whose objects included finding a "nicotine blocker or substitute," was "mere speculation," she nonetheless responded as follows:

> I said the 'speculation' was dangerous and the work had some important commercial implications. A nicotine 'blocker' or 'substitute' could put the industry out of business overnight. Any information about it, or about CNS reasons 'why people smoke,' reaching one member before the others could give that member an enormous competitive advantage in developing a 'blocker' for the 'blocker,' or in producing a 'substitute' product, or a purely 'tranquilizing' or purely stimulant product. I do not know what all the commercial ramifications are, but they suggest themselves to me as vast. These are arenas that CTR has traditionally steered well clear of and it must continue to do so.

968148608-8639 (US 88840) (O).

2451. Industry counsel quickly made sure that Dr. Ford's proposal never received

funding. As recited in the May 10, 1978 notes of the Industry Technical Committee Chairman Preston Leake (scientific director for American) to Arnold Henson (General Counsel for American), the proposed nicotine work was "ruled out" by outside counsel Ed Jacob. 955017148-7154 at 7149-7150 (US 87172) (O).

2452. Philip Morris's Osdene and Seligman met with CTR Directors Gardner and Hockett at CTR in New York on January 5, 1978. Osdene's memorandum of the January 5 meeting states:

> Dr. Seligman brought up the [CTR] grant by Dr. Abood in which one of the stated aims was to make a clinically acceptable antagonist to nicotine. This goal would have the potential of putting the tobacco manufacturers out of business.

1000286213-6214 at 6213 (US 35204) (O).

2453. A series of CTR documents illustrate the attempts, and ultimate failure, or Dr. Avram Goldstein and Dr. Leonard Cornell to obtain CTR funding for a new addiction research facility. Dr. Goldstein's and Dr. Cornell's research specifically proposed an investigation by his Addiction Research Foundation of "nicotine receptors in the brain" and "the mechanism(s) of dependence on nicotine." It was the opinion of CTR chairman Addison Yeaman that "Dr. Goldstein's scientific credentials are of the highest." Dr. Seligman of Philip Morris was impressed by Dr. Goldstein's objectivity and intelligence. 03740559-0567 (US 88548) (O); 686052326-2335 (US 88549) (O); 686052262-2263 (US 88550) (O); BBAT 026474-6475 (US 88551) (O); 1003177412-7413 (US 88552) (O); 1003728001-8007 (US 88554) (O); 686052267-2289 (US 88555) (O); 85681034-1034 (US 88556) (O); 686052258-2259 (US 88557) (O); 686052293-2296 (US 88558) (O).

2454. However, the industry decided not to support Dr. Goldstein, Dr. Cornell, and the Addiction Research Foundation at all. The rationale for the decision was spelled out in a

September 19, 1978 memorandum from C.I. Waite to H.R. Kornegay (of the Tobacco Institute), with copies to Bill Shinn (Shook, Hardy & Bacon) and Ernie Pepples (B&W):

> Mr. Cornell's foundation actually assumes tobacco (nicotine) is addictive and costs the U.S. citizen 42 billion dollars a year.
>
> He also believes tobacco causes 300,000 premature deaths each year.
>
> And he wonders if this is why we might not be interested.

686052246-2246 (US 88559) (O).

2455. BATCo scientist D.G. Felton visited CTR in October 1979, where he was escorted by industry counsel Tim Finnegan from Jacob & Medinger. In his typed notes of the trip to CTR, Felton recorded the following: "I then asked about possible legal problems arising from work on beneficial effects of smoking. In Mr. Finnegan's opinion, any work concerned with central effects of smoking or nicotine would run the risk that FDA would become involved with tobacco, something that was to be avoided, if possible." 100651251-1312 at 1299 (US 85402*) (O).

2456. Shortly thereafter, in a larger meeting with CTR President Yeaman, Scientific Director Gardner, and CTR scientists, Felton also inquired into Leo Abood's nicotine work. He was told of the Defendants' decision to terminate his research given the risk of demonstrating addiction:

> The discussion passed to effects of nicotine and the reasons why CTR did not continue their grant to Leo Abood. There is a general nervousness in the US Industry (apart from Philip Morris) in working on the effects of nicotine, because of the risk of demonstrating nicotine dependence or addiction.

100651251-1312 at 1299-1300 (US 85402*) (O).

2457. A June 20, 1984 memorandum written by Shook, Hardy & Bacon attorney

Wendell L. Stone chronicled much of the CTR-funded nicotine research, and concluded that Defendants' termination of Abood's "nicotine receptor" work could be used by plaintiffs "to make a point regarding CTR that when research by its grantees appeared to be incriminating of smoking, then the CTR grants were terminated." 515709297-9340 at 9299 (US 20866) (O).

2458. On the other side of the Atlantic, the industry's Tobacco Advisory Council (TAC) was active as well. One particular example is worth describing in detail.

2459. Long-time tobacco industry-affiliated/funded scientists Francis Roe and Jeffrey Cohen were tasked to prepare a "Nicotine Monograph" in 1977 for the member companies of the Tobacco Advisory Council (including Philip Morris, RJR, and BATCo). 2501160364-0371 at 0369 (US 87173) (O).

2460. Dr. Roe forwarded the first draft of the monograph to D.H. Beese at the TAC under cover letter dated July 30, 1979, for review by the member companies; BATCo produced a copy of the draft "monograph" and Roe's letter, which stated that "It may well be that parts of the text will need to be expanded and the 'conclusions' section given a new title or omitted. . . . I shall look forward to hearing from you and having a reaction from the Companies in due course." 1000138177-8237 at 8177 (US 87174) (O).

2461. Roe and Cohen stated the following in a draft "Monograph" section entitled "Smoking Behaviour: Role of Nicotine in the Smoking Habit":

> There is now increasing evidence that the presence of **nicotine may be the major factor responsible for the widespread use of tobacco in all human societies**. . . Whilst smoking fulfils a psychological need in certain individuals **it is only the inhaling cigarette smoker who is likely to gain psychopharmacological satisfaction from nicotine and become dependent on it.** Nicotine has been described as a psychoactive agent with tranquillizing, antianxiety, stimulant, depressant, antiagression, mood stabilizing and stress-attenuating properties.

1000138177-8234 at 8219 (US 87174) (O) (emphasis added).

2462. In the "Conclusions" section of Roe and Cohen's draft "Nicotine Monograph," the authors emphasized that:

> The present worldwide campaign toward low-tar, low nicotine cigarettes faces the problem that **nicotine-seeking smokers will need to inhale more smoke to obtain their nicotine requirement** and in doing so inhale more tar. . . . Because of the weak absorption of nicotine from buccal and alimentary systems, chewing nicotine gum as a possible alternative vehicle to smoke inhalation would prove much less satisfying to the **craving cigarette inhaler**.) .

1000138177-8234 at 8221 (US 87174) (O) (emphasis added).

2463. These frank observations and conclusions did not survive review by the TAC and its member companies. Roe and Cohen's "Nicotine Monograph" was eventually published in 1981 by the TAC on behalf of its tobacco industry under the title "Monograph on the Pharmacology and Toxicology of Nicotine." In the published version of the "Monograph, the "Smoking Behaviour" section quoted above was edited dramatically. For example, the acceptance of nicotine as the "major factor responsible for the widespread use of tobacco in all human societies" was deleted entirely. The fact that an "inhaling cigarette smoker" will become "dependent" on smoking was deleted. In the "Conclusions" section, there is no mention of "nicotine-seeking smokers" or the "craving cigarette inhaler." Thus, the TAC and its member companies controlled the "Monograph" scientific review, and made sure that Roe and Cohen's document was industry-favorable on the issues of nicotine and addiction. 2021585328-5378 at 5365-5368 (US 87175) (A).

(f) Conclusions Concerning Defendants' Nicotine-Related Misconduct

2464. Defendants have known for decades that cigarette smoking was addictive and that nicotine maintained the addiction; however, Defendants hid this information from the public, and

falsely denied the addictive quality of their products in many public statements. Defendants' false statements related to addiction continue even today.

2465. I find that the above conduct, including Defendants' false, misleading, and deceptive statements as well as Defendants' concealment and suppression of information, was material to the decisions of smokers and prospective smokers, and influenced the decisions of persons to initiate, continue, or quit smoking, as well as the decisions of others to initiate, forgo, or otherwise affect efforts to address smoking and health issues, thus increasing the number of cigarettes sold.

2466. But for Defendants' misconduct, fewer people would have begun to smoke, and those who had begun but desired to quit would have realized that the task might involve professional and/or medical assistance. Knowledge that a product is highly addictive is a severe deterrent to consumption. The length of time in which, and the vigor with which, Defendants pursued their campaign of obfuscation, misrepresentation, and concealment leads this Court to the conclusion that the profitability of the misconduct was high.

(2) Nicotine Manipulation: Defendants Have Fraudulently Denied That They Manipulate the Level of Nicotine Delivered to Smokers To Ensure Smokers Can Obtain Sufficient Nicotine to Create and Sustain Addiction

2467. Defendants have manipulated nicotine content and nicotine delivery in their cigarettes since at least 1954 and continue to do so. As demonstrated in US FF § III.C(1), supra, Defendants have long known that nicotine is responsible for keeping people smoking. Accordingly, Defendants have undertaken extensive research of nicotine and how cigarette physical and chemical design parameters influence nicotine's delivery to smokers. Defendants exploited their understanding of nicotine and cigarette design to manipulate nicotine and nicotine delivery levels in their cigarettes in order to assure that their commercial products would deliver a dose of nicotine sufficient to create and sustain addiction in cigarette smokers. At the same time, Defendants have concealed both their nicotine-related research and their actual manipulation of nicotine from the public, and instead have publicly denied these actions. Defendants recognized that disclosing such information would reveal their internal understanding of nicotine's central role in smoking addiction and undermine their public denial of nicotine addiction, would negatively affect the market for cigarettes, and would increase the risks of litigation for Defendants.

2468. Individually, jointly, and through third parties, Defendants have extensively studied smoking intake and inhalation, compensation, addiction physiology, smoker psychology, the pharmacological aspects of nicotine, the effects of nicotine on brain waves, and similar matters, with the goals of finding and developing cigarette design and processing methods to induce individuals to smoke and to keep smokers addicted to nicotine, leading to successful sale of their products. Based on this research, Cigarette Company Defendants have been aware for decades that cigarettes are addictive and that smoking addiction is caused primarily by the

delivery of dependence-producing levels of nicotine.

2469. As demonstrated herein, Cigarette Company Defendants have taken advantage of the knowledge obtained from this extensive research by designing their cigarettes with the purpose of ensuring optimum delivery of doses of nicotine sufficient to create and sustain addiction among individuals who smoke, including youth. Defendants have intentionally manipulated the content and form of nicotine in their cigarettes, and the physical design of the cigarettes themselves, to make them more easily inhalable and so that smokers can easily obtain nicotine.

2470. The typical cigarette contains far more nicotine than an individual will inhale as he or she smokes the cigarette. Thus, the challenge for the Cigarette Company Defendants has not been simply to add more nicotine to the cigarette in its unsmoked form. Rather, it has been to use the various product design techniques discussed below in order to assure that an amount of nicotine sufficient to create and sustain addiction is transferred from the unsmoked tobacco to the mainstream cigarette smoke inhaled by the smoker. Farone WD, 86:16-19; Henningfield WD, 35:16-36:16.

2471. Defendants have developed and continue to use highly sophisticated technologies designed to deliver nicotine in ways that are more than sufficient to create and sustain addiction in the vast majority of individuals who smoke. Every aspect of a cigarette involves extensive engineering that relates to nicotine dosage and dosage control, ensuring that a cigarette smoker can pick up virtually any cigarette on the market and get an addictive dose of nicotine. Although cigarettes may appear to simply be tobacco rolled in fine papers, most cigarettes are manufactured using reconstituted tobacco material, additives, burn accelerants, ash conditioners, and buffering substances. Other cigarette design features used by Defendants to manipulate

nicotine delivery include filter design, paper selection and perforation, ventilation holes, leaf blending, and use of additives (such as ammonia) to control the acidity or alkalinity of cigarette smoke. As a result of the combination of these cigarette components and design, cigarettes are extremely effective drug delivery devices – the drug being nicotine.

2472. Notwithstanding the substantial evidence that Defendants designed their products to deliver doses of nicotine sufficient to create and sustain addiction, Defendants have publicly and fraudulently denied that they manipulate nicotine. Defendants have sought to mislead the public about their manipulation of nicotine by publicly and fraudulently maintaining that the level of nicotine in a cigarette is inextricably linked to the cigarette's tar level, that nicotine delivery levels follow tar delivery levels in cigarette smoke, and that nicotine is an essential flavorant. Through these and other false statements, Defendants have furthered their common efforts to deceive the public regarding their manipulation of nicotine.

(a) Defendants Have Made False and Misleading Public Statements Regarding Their Control of the Nicotine Content and Delivery of Their Products and Their Efforts to Control or Optimize the Amount of Nicotine Delivered to Smokers

2473. In furtherance of their fraudulent scheme, and contrary to the overwhelming evidence in the trial record of Defendants' research and utilization of methods to control the amount and delivery of nicotine in cigarettes, Defendants have denied, repeatedly and publicly, that they manipulate nicotine content and delivery in cigarettes in order to create and sustain addiction. Defendants also repeatedly and publicly have claimed that the levels of nicotine delivered by their cigarettes is determined by the levels of tar delivery in their cigarettes.

(i) The Waxman Hearings

2474. In 1994, the United States Congress held a series of public hearings regarding the addictiveness of cigarettes and the tobacco industry's design of cigarettes and manipulation of

nicotine. These hearings, before the Subcommittee on Health and the Environment, later became known as the "Waxman Hearings," after Subcommittee Chairman Henry Waxman of California. The Chief Executive Officers of six Defendant cigarette manufacturers – Philip Morris, B&W, RJR, Lorillard, Liggett, and American, appeared voluntarily at a Subcommittee hearing on April 14, 1994. The CEOs testified under oath and before television cameras with every reason to believe that their testimony would be made available to the American public.

2475. As proven by the evidence introduced at trial and described infra, the CEOs' sworn testimony was both false and misleading. During the April 14, 1994 hearing:

- Philip Morris did knowingly cause to be transmitted the testimony of President and Chief Executive Officer William I. Campbell. Campbell denied that nicotine is addictive, denied that Philip Morris research establishes that smoking is addictive, and denied that Philip Morris manipulates the amount of nicotine contained in cigarettes.

- RJR did knowingly cause to be transmitted the testimony of Chairman and Chief Executive Officer James Johnston. Johnston denied that nicotine is addictive and denied that RJR manipulates the amount of nicotine contained in cigarettes.

- American did knowingly cause to be transmitted the testimony of its Chief Executive Officer, Donald S. Johnston. Johnston denied that American manipulates the amount of nicotine contained in cigarettes.

- B&W did knowingly cause to be transmitted the testimony of Chief Executive Officer Thomas Sandefur. During this hearing, Sandefur made material misrepresentations regarding B&W's control of the amount of nicotine contained in its cigarettes.

- Lorillard did knowingly cause to be transmitted the testimony of Chief Executive Officer Andrew H. Tisch. During this hearing, Mr. Tisch denied that Lorillard manipulates the amount of nicotine contained in cigarettes.

- Liggett did knowingly cause to be transmitted the testimony of Chairman and Chief Executive Officer Edward A. Horrigan, Jr. Horrigan denied that Liggett manipulates the amount of nicotine contained in cigarettes.

TLT0730001-0850 (US 77011) (O).

2476. In a written statement submitted by Philip Morris on March 25, 1994, to the House Committee on Energy and Commerce in connection with the Waxman Hearings, Philip Morris asserted that it "does nothing in the processing of tobacco or the manufacture of cigarettes that increases the nicotine in our products above what is naturally found in tobacco." Philip Morris also stated that the FTC testing method provided consumers with "information concerning the relative nicotine yields of products that permit them to make an informed choice." TLT0730001-0850 at 0362–0363 (US 77011) (O).

2477. On April 14, 1994, William I. Campbell, President of Philip Morris U.S.A., testified at the Waxman Hearings that "Philip Morris does not add nicotine to our cigarettes. Philip Morris does not manipulate nor independently control the level of nicotine in our products." In his written statement to the Committee of the same date, Campbell stated that "[w]hen creating a cigarette for a tar category, we select a particular tobacco blend and flavors to provide ‘uniqueness' for a product. . . . So, how do we ‘manipulate' or independently ‘control' nicotine as our critics charge? The answer is we don't. We accept the nicotine levels that result from this process." TLT0730001-0850 at 0546, 0556 (O) (US 77011) (emphasis in original).

2478. Campbell also testified that the amount of nicotine measured by the FTC testing method accurately reflected the amount of nicotine that a smoker of its low tar cigarettes receives. After acknowledging that Philip Morris manufactured its Merit Ultima low tar cigarette using, for 40% of the blend, a tobacco that had a nicotine content higher than that used for the manufacture of some of its other products, Campbell contended that the reason for selecting the high nicotine tobacco was for taste and flavor. Campbell was asked, "You may think that's for taste, but it also produces a higher nicotine level. Isn't that what's happening in your products?" Campbell responded: "No, it isn't. . . . We compensate in our ultra low tar cigarettes by using

reconstituted tobacco and expanded tobacco. So that what the smoker gets is what we . . . say in our FTC advertisements, 0.1 milligram of nicotine." TLT0730001-0850 at 0768 (US 77011) (O).

2479. Although Campbell acknowledged that Philip Morris intentionally used tobacco blends with higher nicotine concentrations in the manufacture of "ultra low tar" cigarettes, Campbell testified that Philip Morris did so only for taste. Campbell was asked by a Member of Congress: "I'm asking about the concentration of nicotine in the tobacco. You have blended tobacco. I want to know if there's a higher concentration in that tobacco in the Ultima [an "ultra low tar" brand] than there would be in a regular cigarette?" Campbell responded, "It's there for taste, yes, sir." Additionally, Campbell was asked, "For whatever reason, do you occasionally decide to use a higher nicotine content tobacco leaf to manufacture one brand than you do to manufacture another of your brands?" Campbell testified in response: "That's the end result. As I say, we do not design the product that way. We design the product for its category in the market, which is generally a tar category." TLT0730001-0850 at 0768, 0769 (US 77011) (O).

2480. In a written statement submitted by RJR on March 24, 1994 to the House Committee on Energy and Commerce in connection with the Waxman Hearings, Reynolds stated that it "does not . . . establish specific nicotine yields or manipulate nicotine to create, maintain or satisfy ‘addiction.' . . . It is a simple fact that reducing ‘tar' yields automatically results in proportional reductions in nicotine." In a February 28, 1994 letter mailed to FDA Commissioner Kessler in advance of the Waxman Hearings, Reynolds's CEO James W. Johnston claimed that "R.J. Reynolds Tobacco Company does not increase the nicotine in its cigarettes above what is found naturally in tobacco." TLT0730001-0850 at 0368, 0370 (US 77011) (O).

2481. On April 14, 1994, Reynolds's CEO James Johnston testified at the Waxman Hearings that RJR does not "add, or otherwise manipulate nicotine to addict smokers. . . . [W]e

do not do anything to hook smokers or to keep them hooked." In his written statement to the Committee of the same date, Johnston claimed that the level of nicotine contained in a cigarette is proportional to and linked to the level of tar. Johnston also stated that the level of nicotine present in a cigarette is not "a result of a decision to ‘manipulate' nicotine levels to some carefully controlled ‘addictive level.' The concept of an ‘addictive level' [of nicotine] . . . is not a concept known to or understood by Reynolds Tobacco." TLT0730001-0850 at 0562, 0576-0577, 0579 (US77011) (O).

2482. Johnston further testified on April 14, 1994, that Reynolds did not "design our cigarettes with any nicotine levels in the specifications. We design our cigarettes . . . for tar levels, usually within a band. It might be a light cigarette within that band or sometimes a specific tar level objective and the nicotine flows from there. . . ." TLT0730001-0850 at 0722 (US 77011) (O).

2483. In a written statement submitted by B&W on March 25, 1994 to the House Committee on Energy and Commerce in connection with the Waxman Hearings, B&W stated that "[t]he only direct source of nicotine in cigarettes manufactured by Brown & Williamson Tobacco Corporation is the tobacco that is used in the cigarettes." B&W also asserted that "[t]he filtering and ventilation techniques that are utilized by B&W result in the smoker's receiving only a small fraction of the nicotine contained in the tobacco that was used to produce the cigarette." TLT0730001-0850 at 0381 (US 77011) (O).

2484. In an April 14, 1994 written statement submitted to the House Committee on Energy and Commerce in connection with the Waxman Hearings, Thomas E. Sandefur, Jr., Chairman and CEO of B&W, stated that "Dr. Kessler suggested that cigarette manufacturers ‘commonly add nicotine to cigarettes to deliver specific amounts of nicotine.' Brown &

Williamson has never done that." Sandefur also stated that B&W "believe[s] that smokers can expect to receive lower amounts" of nicotine from cigarettes that yield lower amounts in FTC testing. TLT0730001-0850 at 0594-0595 (US 77011) (O).

2485. Sandefur was accompanied at the Waxman Hearings by Tilford Riehl, B&W's Vice President of Research and Development. In response to questions concerning B&W's "ultra light" Barclay cigarette, which used a tobacco with a nicotine concentration of 2.3 percent (35% higher than the average amount of nicotine found in tobacco), Riehl did not deny that B&W used a tobacco with a high nicotine concentration to manufacture Barclay cigarettes. Riehl testified, however, that B&W selected the tobacco used for Barclay for its taste. Specifically, Riehl stated: "We blend for taste, not nicotine." TLT073 0001-0850 at 0767 (US 77011) (O).

2486. When asked by a Member of Congress, during a continuation of the Waxman Hearings on June 23, 1994, whether B&W believed "that nicotine is present for taste or is it in cigarettes for its drug-like qualities," Thomas Sandefur, then-Chairman and CEO of B&W, stated under oath, "we very strongly believe that nicotine is a very important constituent in the cigarette smoke for taste." TLT0730851-1975 at 1584 (US 77012) (O).

2487. Sandefur further testified at the same hearing that he did not believe that nicotine is a drug. TLT0730851-1975 at 1585 (US 77012) (O).

2488. Sandefur testified at the June 23, 1994 Waxman Subcommittee hearing, that B&W added ammonia to commercially produced cigarettes only "[f]or the benefit of taste, to improve the taste characteristics of our cigarettes." TLT0730851-1975 at 1620 (US 77012) (O).

2489. Sandefur also testified to Congress on June 23, 1994, on behalf of B&W, "We do not manipulate the nicotine levels of our cigarettes. . . ." TLT0730851-1975 at 1673 (US 77012) (O).

2490. In a written statement submitted by American on March 25, 1994, to the House Committee on Energy and Commerce in connection with the Waxman Hearings, American stated that it "does not use nicotine in the manufacture of its cigarettes" and that "nothing is done in the tobacco processing or manufacture of cigarettes by the American Tobacco Company to increase nicotine beyond that naturally occurring in tobacco." TLT0730001-0850 at 0378-0379 (US 77011) (O).

2491. On April 14, 1994, Donald S. Johnston, Chairman and CEO of American, testified at the Waxman Hearings that:

> the American Tobacco Company does not use nicotine in the manufacture of its cigarettes. . . . American has no desire or intent to manipulate nicotine. At no time has the American Tobacco Company attempted to market a cigarette based on its nicotine content. Or more generally, has it ever designed or marketed a cigarette with the purpose or intent of selling nicotine.

TLT0730001-0850 at 0597, 0599 (US 77011) (O).

2492. On March 25, 1994, Alexander W. Spears, Vice Chairman and Chief Operating Officer of Lorillard, testified at the Waxman Hearings that "[w]e do not set levels of nicotine for particular brands of cigarettes." Spears further stated that "[n]icotine follows the tar level," and the correlation between the two "is essentially perfect," and "shows that there is no manipulation of nicotine." In a 1981 study, however, Spears had previously stated explicitly that "low-tar" cigarettes used special blends of tobacco to keep the level of nicotine up while tar is reduced: "[T]he lowest tar segment [of product categories] is composed of cigarettes utilizing a tobacco blend which is significantly higher in nicotine." Spears did not inform Congress of his earlier statement. TLT0730001-0850 at 0148-0149, 0382-0383 (US 77011) (O); 82495618-5628 (US 86932) (O).

2493. To the contrary, in response to questioning by the panel concerning data he

submitted at the March 25, 1994 hearing, Spears again contended in testimony on April 14, 1994, that the level of nicotine found in cigarette products is a function of the level of tar in those products. Spears testified that "the statement that nicotine follows tar" is true from the 1950s to 1990 and that he "stick[s] with that statement and [he] believe[s] it is accurate." TLT0730001-0850 at 0707, 0719 (US 77011) (O).

2494. On April 14, 1994, Andrew H. Tisch, Chairman CEO of Lorillard Tobacco Company, testified at the Waxman Hearings that "the level of nicotine in the products manufactured and sold by Lorillard is solely determined by the tobacco that we buy and the blending of different tobaccos used in our manufacturing. . . . Nicotine levels follow tar levels and are not raised or reduced for particular brands." Tisch also testified that "Lorillard does not take any steps to assure a minimum level of nicotine in our products. Lorillard does not add nicotine to cigarette tobacco for the purpose of manipulating or spiking the amount of nicotine received by the smoker." TLT0730001-0850 at 0596, 0597 (US 77011) (O).

2495. In a written statement submitted by Liggett on March 24, 1994, to the House Committee on Energy and Commerce in connection with the Waxman Hearings, Liggett stated: "we do not increase the nicotine level of our cigarettes beyond that found naturally in the tobacco from which our cigarettes are made. . . . We do not artificially increase the level of nicotine in our cigarettes to allegedly ‘addict' smokers or otherwise influence our consumers." TLT0730001-0850 at 0380 (US 77011) (O).

2496. On April 14, 1994, Edward A. Horrigan, Jr., Chairman and CEO of Liggett, testified at the Waxman Hearings that "Liggett does not increase the nicotine level of our cigarettes beyond the level of nicotine found naturally in the unprocessed tobacco that we use to make our cigarettes. . . . Liggett does not manipulate the level of nicotine in our cigarettes to

hook or addict smokers." Horrigan, who formerly had been Chairman and CEO of RJR, also testified that "[i]n all my years in this business world-wide, I have never known of a product-designed [sic] objective or goal that included even the notion of spiking the amount of nicotine in a cigarette to achieve a level that would hook or addict smokers." TLT0730001-0850 at 0600, 0601 (US 77011) (O).

2497. Following Horrigan's testimony at the Waxman Hearings, Representative Waxman sent a request for information to Liggett on May 25, 1994, seeking additional information concerning its use of nicotine in the design of its cigarettes. In its response to a request for information concerning which methods of controlling nicotine it used in its products, Liggett responded:

LDOJ9511212-1230 at 1216, 1218 (US 86933) (O) (Confidential).

2498. In response to Representative Waxman's letter, Liggett also stated that:

LDOJ9511212-1230 at 1220, 1221, 1222-23 (US 86933) (O) (Confidential).

2499. The Tobacco Institute also made a statement before Congress in connection with the Waxman Hearings. On March 25, 1994, the Tobacco Institute's spokesperson, Charles O. Whitley, testified that "nicotine levels are a function of tar levels. Over the past 30 years or so, the consumer demand for lighter cigarettes has led the tobacco manufacturers to reduce tar levels . . . and the nicotine levels have dropped correspondingly." Whitley further testified that "we do not add nicotine, have not added nicotine, we do not manipulate nicotine." In the written statement submitted by Whitley in connection with his testimony, Whitely stated that FDA Commissioner Kessler's suggestions that cigarette manufacturers add nicotine to cigarettes to produce and sustain addiction were "unequivocally . . . false," and that "when . . . 'tar' levels" are reduced, "nicotine is reduced automatically." TLT0730001-0850 at 0146, 0350, 0157 (US 77011) (O).

2500. Defendants also conducted a misinformation campaign in the print media and in their statements to public health authorities in and around the time of the Waxman Hearings.

2501. In an advertisement in the *New York Times* released the day following the CEOs' 1994 Congressional testimony, entitled "Smokers and Non-Smokers: Facts You Should Know," Philip Morris stated: "Philip Morris does not 'manipulate' nicotine levels." The advertisement claimed that Philip Morris's methods of "quality control [do] not constitute 'manipulation.'" 2023011263-1263 (US 20371) (A); Farone WD, 98:22-99:17.

2502. On February 28, 1994, Philip Morris distributed a public statement that stated:

> There is nothing done in the processing of tobacco or manufacture of cigarettes by Philip Morris that increases the nicotine in the tobacco blend above what is normally found in tobacco. . . . Philip Morris provides its consumers with a range of choices in tar and nicotine levels in its products. As a matter of fact, over the years, consumer taste preferences have resulted in products with lower levels of both tar and nicotine. For many years, nicotine levels for all cigarettes have been measured pursuant to FTC methods and

publicly displayed in every cigarette advertisement.

682637639-7640 at 7639 (US 30999) (O).

2503. In a June 14, 1995, letter to the editor of *The New York Times*, written by James Morgan, then President and CEO of Philip Morris, criticizing an article that *The Times* had published regarding Philip Morris's research and marketing practices, Morgan claimed that "basic research regarding ‘tar' and nicotine ratios was never used in the company's manufacturing processes to alter, much less ‘manipulate,' the natural ratio of ‘tar' to nicotine in the cigarettes the company sells." 2505560444-0447 at 0445 (US 86934) (O).

2504. On June 23, 1994, after a connection between the use of ammonia technologies and increased nicotine deliveries was publicized, Philip Morris released a press statement that included, "[t]here is no indication that ammonia compounds in our cigarettes alter the amount of nicotine the smoker inhales. . . . [T]he presence of ammonia compounds in cigarettes does not support Dr. Kessler's allegation that cigarette companies manipulate nicotine levels to ‘addict' their customers." 2076733633-3633 (US 43887) (O).

2505. An October 18, 1995 Philip Morris press release stated, in part, "Philip Morris U.S.A. does not use ammonia in the cigarette manufacturing process to increase the amount of nicotine inhaled by the smoker or to ‘affect the rate of absorption of nicotine in to the bloodstream of the smoker,' or to ‘increase the potency of the nicotine a smoker actually inhales.'" 2076733634-3634 (US 43888) (O).

2506. Defendants have also prepared internal "talking points" documents to prepare its spokespersons for public comment on important smoking and health issues. For example, on July 8, 1994, Christopher Proctor sent to all General Managers, BAT Corporate Affairs Managers, and BATCo Board members a memorandum including "Questions and Answers

related to U.S. hearings." Recipients were told to use the materials in response to questions from media and staff. Regarding nicotine, BATCo's response was that "BAT does not 'manipulate' the level of nicotine in its products." Recipients were also instructed to respond to questions regarding addiction that "BAT does not 'spike' its tobaccos with nicotine. Smoking is not an addiction." 800335882-5886 at 5884 (US 31906) (O).

2507. B&W issued a press release in 1994 that stated: "B&W does nothing in the manufacture of its tobacco products that increases the level of nicotine above that which is naturally found in the tobacco plant, nor does it artificially increase nicotine." 202337394-7394 (US 21965) (O).

2508. A June 22, 1994 *Newsday* article quoted Tom Fitzgerald, spokesperson for B&W, as claiming, "'What Dr. Kessler called manipulation was an effort on our part to lower the tar levels in our brands and provide the taste that consumers were expecting.' . . . [S]everal of the brands using Y-1 tobacco 'actually deliver less nicotine than the non-Y-1 blends for the same products.'" USX3552053-2055 at 2054 (US 76211) (O). Y-1 is genetically engineered high-nicotine tobacco. See US FF § III.C(2)(c)(ii), infra.

2509. In a June 1994 article, BAT spokesman Ralph Edmonson stated, "It is nonsense to say we want to make people more addicted to nicotine." 502575988-5988 (US 86884) (O).

2510. In a February 28, 1994 letter to Surgeon General David Kessler preceding the Waxman Hearings, James Johnston, Chairman and CEO of RJR, stated that "R.J. Reynolds Tobacco Company does not increase the nicotine in the tobacco we use in the manufacture of our cigarettes." TLT0730001-0850 at 0798 (US 77011) (O) (emphasis in original).

2511. In 1994, Reynolds placed an advertisement in national media in response to allegations that the company had controlled the amount of nicotine delivered by its cigarettes in

an effort to keep smokers addicted to cigarettes. The ad featured a photograph of RJR's Chairman James W. Johnston holding a burning cigarette with the following quote in large lettering under the photograph: "WE DO NOT 'SPIKE' OUR CIGARETTES WITH NICOTINE." In the text of the advertisement, Reynolds claimed that:

> Recently, a TV show accused tobacco companies of somehow 'spiking' the level of nicotine in our products to 'addict' smokers. As Chairman of a tobacco company and a smoker, I want America's 45 million smokers to know that this is sheer nonsense. At R.J. Reynolds we do not increase the level of nicotine in any of our products in order to 'addict' smokers. Instead of increasing the nicotine levels in our products, we have in fact worked hard to decrease 'tar' and nicotine. Much of the recent controversy has focused on our use of various techniques that help us reduce the 'tar' (and consequently the nicotine) yields of our products.

525722360-2360 (US 86935) (O) (emphasis in original).

2512. In a June 21, 1994 press release, RJR contended that its use of ammonia or ammonia compounds in processing tobacco "do[es] not have any technical or function effect in the finished product." RJR000000526009069700493448-3448 (US 86936) (O).

2513. The Tobacco Institute also drafted a 1994 press release that stated: "Cigarette manufacturers do not 'manipulate' the level of nicotine in various brands. Nicotine levels follow 'tar' levels – as manufacturers have reduced 'tar' levels and yields over the years to satisfy changing consumer tastes, nicotine levels and yields have fallen correspondingly." TIMN328214-8215 (US 21284) (O).

2514. On a March 27, 1994, airing of "Face the Nation," Brennan Dawson, Vice President of the Tobacco Institute, stated, "The industry does take the position that . . . not only do they not add nicotine, but they don't manipulate nicotine. So Congress has been told formally by every cigarette manufacturer in the United States that this claim is without foundation." TLT0730851-1975 (US 77012) (O).

(ii) Defendants' False and Misleading Public Statements Continued After the Waxman Hearings

2515. On October 18, 1995, BAT falsely denied in the press that it had "doctored its cigarettes" based on reports from America that ammonia could boost nicotine delivery. BAT stated that "[t]here is no way we add anything to enhance the nicotine." ARU6532615-2615 (US 86883) (O).

2516. In a proxy statement filed with the Securities and Exchange Commission ("SEC") on March 7, 1995, the Board of Directors of RJR Nabisco Holdings Corp. publicly made a false and misleading statement to its shareholders and to the SEC. A group of shareholders filed a proposal to the Board that the company issue a public report regarding "whether nicotine content in and absorption from its tobacco products are deliberately controlled by the Company and if the reasons for any such control include the delivery of a reliable dose of nicotine to and/or the promotion of nicotine absorption by the customer." The Board recommended a vote against the proposal, stating that "RJRT does not add nicotine to any of its tobacco products and does not manipulate the amount of nicotine in any of its products to create, maintain, or satisfy an 'addiction.'" The overwhelming evidence cited herein (Section III.C(2)(c)), demonstrates RJR undertook extensive efforts to study and manipulate nicotine delivery of its cigarettes. Thus, the Board knew these public statements were false and misleading. 525735695-5730 at 5709-10 (US 88004) (O).

2517. Defendants' public denials were likewise reflected in submissions to government bodies. For example, on January 2, 1996, RJR submitted its "Comments of R.J. Reynolds Tobacco Company Concerning FDA's Jurisdictional Analysis" to the Food and Drug Administration. Reynolds stated in its comments that its decades of research concerning nicotine "**[did] not reflect an intent to provide smokers with pharmacologically active 'doses' of**

nicotine. . . . Reynolds's cigarette design research and the cigarettes that Reynolds has marketed and advertised to smokers demonstrate an intent to provide smoking taste and pleasure." 515639064-9121 at 9070 (US 86939) (O).

2518. In a proxy statement filed with the Securities and Exchange Commission ("SEC") on May 14, 1996, the Board of Directors of Loews Corporation, parent to Defendant Lorillard, publicly made a false and misleading statement to its shareholders and to the SEC. A group of shareholders filed a proposal to the Board relating to nicotine in tobacco products in which they proposed that Loews "develop and publicize nicotine ratings for each of our cigarette brands and to make this available in accurate information to our customers about how much nicotine they consume when smoking." The Board recommended a vote against the proposal, arguing "information regarding nicotine levels in cigarettes is readily available to the public through prominent disclosure in cigarette advertising, as required by the Federal Trade Commission." The overwhelming evidence cited in Section III.C(2)(c), infra, demonstrates Lorillard was aware that FTC ratings did not accurately cite the amount of nicotine delivery received by smokers of its cigarettes. 91762568-2569 (US 22080) (A).

2519. In the late 1990s, an RJR scientist gave a presentation to the World Health Organization in which he denied that Reynolds was using ammonia to manipulate nicotine deliver in its cigarettes. Suber PD, United States v. Philip Morris, 7/18/02, 47:15-48:18.

2520. In a July 28, 1997 press release, RJR claimed that the findings of a study concerning the addition of ammonia to cigarettes might demonstrate that addition of ammonia actually **decreased** the amount of nicotine that reaches a smoker's brain – the opposite of what the scientist who conducted the study concluded. Reynolds claimed in the press release that an increase in "vapor nicotine" or "free nicotine," accomplished by the addition of ammonia or

ammonia compounds, could result in less efficient delivery of nicotine to a smoker because "'vapor nicotine' doesn't make it past the upper airways before it is absorbed by the body." RJR000000041506872170032018 5-0185 (US 61964) (O); 2076733657-3658 at 3657 (US 86940) (O).

2521. A spokeswoman for RJR told *The New York Times* in February 1998 that "nicotine levels were not a 'design characteristic' in developing cigarettes . . . [and that its] 'research through the years has focused on reducing total tar and nicotine yield.'" RJR000000141023624700466952-6957 at 6954 (US 86941) (O).

2522. On January 29, 1998, Altria CEO Geoffrey Bible testified before the House Commerce Committee in hearings that were televised nationwide. During the hearing, Bible misrepresented the effect of ammonium compounds on the delivery of 'free' nicotine. Bible testified:

> I'm told that ammonium compounds are used in two ways in our products. In the first instance they are used as a blending agent in the manufacture of what is called sheet tobacco, which is included in the cigarette. . . . It is also used as a flavor. But I'm also told that the ammonium compounds that are used in the cigarettes we sell do not cause the amount of nicotine in smoke to rise. It does not change the form of the nicotine that goes to the brain. And it may result in a slight increase in the amount of nicotine in the mouth, . . . but that the nicotine absorbed through the mouth reaches the brain more slowly than nicotine absorbed through the lung.

MTP0030945-0986 at 0969 (US 76202) (O), 2078124371-4372 at 4371 (US 86938) (O).

2523. In a February 24, 1998 letter to *The New York Times* written by Peggy Roberts, Director of External Relations, Philip Morris stated that "its use of ammonia compounds in the cigarette manufacturing process does not increase the amount of nicotine delivered to the smoker, does not increase the amount of nicotine absorbed in the lungs of the smoker, and does

not affect the form of nicotine delivered to the smoker's brain." 2076733606-3607 at 3606 (US 43886) (O).

2524. In the 1990s, Brennan Dawson, Tobacco Institute Senior Vice President of Public Affairs, publicly communicated Defendants' public position that "nothing in the cigarette manufacturing process is done with an eye toward manipulating nicotine levels. . . . It's all done with taste in mind." Dawson WD, 63:8-18; BWC3930802-0806 at 0803 (US 86937) (A). Dawson told the *Wall Street Journal* that nicotine levels "follow" tar levels. BWC3930802-0806 at 0803 (US 86937) (A).

2525. Defendants' public denials of nicotine manipulation continues to this day. Philip Morris's current public Internet website states that: "[S]ome have alleged that we use specific ingredients to affect nicotine delivery to smokers. That is simply not true." ARG0540406-0407 at 0406 (US 88058) (O).

2526. RJR's public Internet website states that RJR "do[es] not add nicotine or any nicotinic compounds to any of our cigarettes, nor do we do anything to enhance the effects of nicotine on the smoker." This statement has been found on RJR's website for several years. TLT1020067-0069 at 0067 (US 86942) (O); JD-068012 at p. 108 of 569 (A).

2527. B&W's current public Internet website states that: "Brown & Williamson does not in any way control the level or nature of nicotine in cigarettes to induce people to start smoking or to prevent people from quitting." TLT0770044-0049 at 0044 (US 86656) (A).

(iii) Testimony Consistent with Fraudulent Public Statements

2528. In deposition and trial testimony, and in discovery responses, Defendants have made the same or corresponding statements denying their ability and efforts to control nicotine.

2529. On June 21, 2002, Hector Alonso, Vice President of Product Development and

Technology at Philip Morris, when asked "Does Philip Morris exercise any control over the level of nicotine in the cigarettes that it sells," Alonso answered unequivocally "No." Alonso further testified that Philip Morris controls tar delivery, and parroted the oft-invoked public industry position that nicotine follows tar. Alonso PD, United States v. Philip Morris, 6/21/02, 51:6-51:9.

2530. Consistent with the rest of the industry, Liggett continues to deny that it manipulates nicotine. In its Answer to the United States' Complaint filed in this case, Liggett stated: "Liggett admits that it has stated in the past and does now state that it does not manipulate nicotine levels." Answer of Liggett Group Inc. to Plaintiff's Complaint for Damages and Injunctive and Declaratory Relief (R. 180, filed 10/30/2000), at ¶¶ 77, 78-80, 82.

2531. Timothy Jackson, Vice President for Operations at Vector Tobacco, the holding company of Liggett as of September 2000, testified in this action that he was "not aware of . . . any way that nicotine is controlled through cigarette design." Jackson also testified that the delivery of nicotine is "directly relat[ed] to tar delivery." Prior to the time that Jackson became Vice President for Operations, he was the President of Liggett Operations for three years and had worked at Liggett since 1983. Jackson's duties at both Liggett and Vector include overseeing all areas relevant to the manufacture of cigarettes. Jackson also participated substantially in the design and manufacture of the Quest cigarette, which expressly and intentionally contains different levels of nicotine. Jackson PD, United States v. Philip Morris, 3/21/03, 8:16-9:1; 27:12-28:3; 11:15-11:19, 18:23-19:13, 65:20-21; 65:2-65:20; 67:16-67:22; 66:23-68:2.

2532. Even though Philip Morris executives and public relations officers continue to maintain that the importance of nicotine in cigarettes only goes to consumer taste preference and is not used to keep smokers addicted, testimony of former Philip Morris scientists contradicts such public statements. Victor DeNoble performed extensive nicotine-related research while he

was employed at Philip Morris, and he testified that taste was not the reason that Philip Morris performed research on nicotine. He also testified that he never saw a Philip Morris document concerning nicotine research in which the subject of the research was taste. DeNoble WD, 9:23-10:4; see also, TLT0730851-1975 at 0874 (US 77012) (O). William Farone, another Philip Morris scientist, also testified that taste was not the reason that Philip Morris or the other Defendants conducted research on nicotine, and it was not the reason Defendants believed that nicotine was important to smokers. Farone WD, 76:11-77:6, 85:17-23.

2533. Cathy Ellis, formerly Senior Vice President, Worldwide Scientific Affairs for Philip Morris, has admitted that nicotine does not have a good flavor. Ellis PD, Mississippi v. American, 3/20/97,1 58:6-9, 158:15-20, 159:15-160:10; 160:15-161:2, 161:7-17, 161:22-163:19.

(b) Product Goals: Defendants' Motivation for Manipulating Nicotine Delivery in Their Commercial Cigarettes Was to Ensure Delivery of Nicotine at Levels That Would Create and Sustain Addiction, Attract Smokers to Their Brands, and Keep Smokers Purchasing Their Products

(i) Defendants Recognized the Need to Determine "Minimum" and "Optimum" Nicotine Delivery Levels in Order to Provide Sufficient "Impact" and "Satisfaction" to Cigarette Smokers

2534. Through years of research, Cigarette Company Defendants sought to identify what they termed an "optimum" amount of nicotine: one that would meet consumers' demand for lower tar and nicotine products (based on the consumers' perception – deceptively fueled by Defendants – that such cigarettes actually delivered less tar and nicotine and thus would be safer, see US FF § III.D, infra), while still providing enough nicotine to create and sustain addiction. Although different Cigarette Company Defendants sometimes used different terminology – such as "optimal," "threshold," or "minimum" – to refer to the level of nicotine delivery they were researching, the ultimate goal of all of this research was the same, i.e., to assure that their

commercial products – particularly their purportedly low delivery products – were capable delivering enough nicotine to keep smokers hooked and to addict new smokers. Defendants conducted this research with the knowledge that their profits depended on creating and maintaining a base of addicted consumers.

2535. In early research documents, Cigarette Company Defendants' efforts often centered on attempting to identify a particular dose of nicotine that would "satisfy" smokers' need for nicotine and thereby assure continued smoking. As Cigarette Company Defendants' knowledge and understanding of nicotine delivery evolved, they identified and developed product design techniques that would both assure the delivery of the minimum dose of nicotine that Cigarette Company Defendants believed was needed to provide smokers with sufficient "impact" and "satisfaction," and also assure that nicotine delivery was optimized, allowing smokers to easily obtain their required amount of nicotine across a range of doses that the cigarette was capable of delivering.

2536. In relation to cigarette design, the word "impact" is a euphemism used by Defendants to refer to the immediate sensory effect the delivery of nicotine has on a smoker. The sensory response referred to as "impact" occurs through nicotine's stimulation of the afferent nerves in the back of the throat when mainstream cigarette smoke is inhaled, causing a peripheral nerve effect that is recognized by the brain. Benowitz TT, 11/2/04, 4800:21-4801:19; Dixon WD, 11:7-18. Cigarette Company Defendants' internal documents indicate that they were well aware that impact was significant to smokers, and that a particular cigarette's impact was a function of its nicotine delivery. For example, B&W defined impact to mean "the sensory attribute most associated with nicotine" and noted that "[t]he higher the nicotine delivery per puff of a product the higher the Impact felt by the inhaling smoker." 500104403-4424 at 4409

(US47966) (A). Timothy Jackson, Vice President for Operations at Vector Tobacco, testified that the word "impact" in relation to cigarette design relates to the impact of the nicotine in cigarette smoke. Jackson PD, Philip Morris, 3/21/03, 77:18-78:14, 78:3-78:10. RJR documents also connect "impact" to nicotine, stating for example: "Is nicotine addition to boost impact a legal, p.r. [public relations] acceptable path?" 506236904-6907 at 6905 (US 88059) (O).

2537. The term "satisfaction" also has been used by Defendants as a euphemism to describe the pharmacological attributes associated with a cigarette's level of nicotine delivery. The term "satisfaction," as it is found in industry documents, describes the hit of nicotine an individual receives when smoking a cigarette. See Henningfield WD, 87:10-16, 96:17-97:5, 97:13-20; TLT0730001-0850 at 0083 (US 77011) (O). For example, Lorillard has stated that smokers "want some acceptable level of smoking satisfaction; which among other attributes means some acceptable level of nicotine delivery." 87410132-0144 at 0139 (US 88060) (O). Reynolds also discussed "the minimum level of nicotine required for smoker satisfaction." 505243357-3365 at 3365 (US 86944) (O); see also 511703121-3124 (US 51575) (O); 500884922-4941 at 4934 (US 85405) (O); 504423322-3327 at 3322 (US 50614) (O); 536000308-0507 at 0334 (US 85298) (O); 602759-2759 (US 53297) (A). Thus, although Defendants argue that satisfaction is a complex measure of the overall consumer acceptability of their products, see JD FPFF (July 1, 2004), Ch. 5, ¶5, it is evident from their own internal documents that the level of nicotine delivery is considered the primary contributor to "satisfaction."

2538. While Defendants contended at trial that their nicotine-related research was done in response to recommendations and requests from various public health authorities, their own internal scientific documents reveal that the motivation for the research was not concern for

public health, but rather concern for the future of their business if their products did not deliver sufficient nicotine to create and sustain smoking addiction. See generally US FF § III.C.1, supra. Defendants' internal documents further demonstrate that they took actions, based on their knowledge of nicotine's pharmacological properties and of nicotine as **the agent** in cigarettes responsible for continued smoking, to incorporate physical and chemical design techniques into their commercial products that would assure adequate nicotine delivery. Indeed, the Cigarette Company Defendants have taken the course recommended by Philip Morris scientist William Dunn in 1972 to conceive the cigarette "as a dispenser for a unit dose of nicotine" and have engineered their cigarettes to enable smokers to obtain their optimal nicotine dose. 2024273959-3975 at 3962-3963 (US 21461) (US 76198) (O); Henningfield WD, 35:16-36:16, 41:18-42:7; 54:7-15; 66:23-67:12.

(aa) Philip Morris

2539. Philip Morris has been aware of the need to effectively measure and control the amount of nicotine in cigarettes since as early as the 1940s. Philip Morris conducted studies on manipulating nicotine in its Parliament cigarettes in the 1940s. A few years later, in a document entitled, "An Outline of Current and Proposed Quality Control, Development and Research for Benson and Hedges," dated 1954, Philip Morris discussed its program to "ensur[e] the over-all quality and uniformity of the finished Parliament cigarette and thus maintain[] its appeal for discriminating smokers." This program was focused on "nicotine content, tar content, acid-base balance, and content of taste and aroma factors." The memorandum described Philip Morris's efforts to use "informally constituted smoking panels and the results of nicotine analyses performed on the blends . . . to establish a desirable level of nicotine concentration in the blend and hence also in the smoke." 1001761472-1484 at 1472-73 (US 35556) (A).

2540. Philip Morris also was concerned that complaints relating to smoking and health might put pressure on the tobacco industry to lower levels of nicotine in their cigarettes, but that lowering nicotine too much might do away with the smoking market. In 1961, Helmut Wakeham, Philip Morris's Director of Research, wrote: "Even though nicotine is believed essential to cigarette acceptability, a reduction in level may be desirable for medical reasons. . . . How much nicotine reduction will be acceptable to the smoker?" 1000277423-7447 at 7441 (US 20088) (A).

2541. Also in 1961, Wakeham conducted a seminar entitled, "The Big Picture for 1961," in which "Aim 2" was described as: "Define the potential of nicotine control as a cigarette improvement. . . . **Determine optimum levels of nicotine in smoke**. . . . **Perfect processes for controlling nicotine content of filler**." 100277468-1000277482 at 7481 (US 35201) (O) (emphasis added).

2542. From the 1950s and 1960s through the 1980s and 1990s, the most senior levels of executive leadership at Philip Morris considered various mechanisms for controlling the amount of nicotine delivered to smokers by its products, from determining the optimal level of nicotine delivery to the manipulation of nicotine levels through leaf blending and increasing nicotine delivery to cigarette smoke. 1001896774-6776 at 6774 (US 20122) (O); 1003294245-4261 at 4246 (US 20170) (A); 2023186690-6690A at 6690A (US 20379) (O); 511223463-3484 (US 20480) (O); 2031436002-6002 (US 20433) (O); Henningfield WD, 94:6-13, 95:22-96:9; 98:4-99:15.

2543. An October 19, 1977 report entitled, "Smoker Psychology Program Review," postulated the main questions that must be answered in the program: (1) what is the optimum nicotine/tar ratio? (2) given a fixed quantity of nicotine in tobacco, what factors in the cigarette

design determine its availability for delivery to the smoker? and (3) how important is the form of the delivered nicotine? 1000046538-6546 at 6543 (US 26074) (A).

2544. In 1990, Philip Morris researchers explained in an inter-office memorandum that the question of whether there was an optimal amount of nicotine to be delivered to the smoker had been answered by Philip Morris's Electrophysiological Studies Research Group, which explored and measured the brain effects of nicotine. Listed among the various achievements of the group was that it had "shown that there are optimal cigarette nicotine deliveries for producing the most favorable physiological and behavioral responses." 2028813366-3368 at 3366 (US 20430) (A), (US 76179) (O); Henningfield WD, 102:2-10.

(bb) R.J. Reynolds

2545. By 1971, Reynolds also was studying the optimal amount of nicotine to deliver to smokers. 504210018-0018 (US 50577) (O).

2546. In a February 2, 1973 research and planning memorandum on "Some Thoughts about New Brands of Cigarettes for Youth," scientist Claude Teague recommended that "[n]icotine should be delivered at about 1.0-1.3 mg/cigarette, the minimum for confirmed smokers." 502987357-7368 at 7361 (US 21475) (A).

2547. A November 9, 1976 memorandum from W.M. Henley to D.H. Piehl on the subject of "Nicotine Research" demonstrates that Reynolds was actively pursuing research on all aspects of nicotine to better understand how it could be used as a design parameter in its cigarettes. The memorandum reviewed discussions among Reynolds's scientists concerning the physiological action of nicotine in the body and the factors that influence the presence of nicotine in the tobacco leaf and in tobacco smoke. The memorandum also identified issues for further research:

> C.R. Green and D. Lynm raised the questions **concerning the minimum level of nicotine required for smoker satisfaction**.
>
> R.L. Rowland asked if every possible variable had been investigated for its effect upon nicotine delivery to the smoker. It may be generally accepted that the delivery of nicotine is changed by changing the type of tobacco leaf which is used in the cigarette. But, holding constant the tobacco which makes up the cigarette, are we cognizant of all other factors in cigarette manufacture which would change the nicotine delivery, particularly any factors which would allow a decrease in tar delivery without the accompanying proportional decrease in nicotine delivery.

505243357-3365 at 3357, 3359, 3360, 3362 and 3365 (US 86944) (O) (emphasis added).

2548. RJR's focus on delivering "optimal" amounts of nicotine to smokers even while overall amounts of tar and nicotine were being reduced in some of their products was central to research efforts throughout the 1970s. A July 1977 report by A.H. Laurene emphasized Reynolds's concerns regarding its ability to keep smokers hooked on cigarettes with reduced tar levels, stating: "Faced with gravitation of most of our products to the low tar or very low tar category, **the problem of keeping in our products those desirable attributes which keep our smokers smoking becomes a matter both difficult and important**." Laurene described Reynolds's strategies of maintaining "physiological satisfaction" in low tar cigarettes as follows:

> - Develop means to increase the nicotine content in the smoke of our lowered tar products through agricultural methods, selective leaf purchasing, blending and casing techniques, process improvements, and increased transfer efficiency of nicotine from tobacco into smoke.
>
> - Improve method to control pH and free nicotine in smoke.

The significance of controlling the pH and amount of free nicotine in cigarette smoke is explained fully in Section III.C(2)(c)(iv), infra. Laurene reported that "efforts are already underway on each of these approaches to **improve nicotine delivery and impact**." 500884922-4941 at 4933-34 (US 85405) (O) (emphasis added); see also 502314530-4547 at 4538 (US

21917) (O); 502967936-7944 at 7944 (US 76188) (O).

2549. In a memorandum dated January 4, 1978, entitled, "Nicotine and Smoker Satisfaction," D.H. Piehl wrote to Alan Rodgman that an objective of the 1977-1978 research was to "[d]efine the optimum nicotine level in cigarette smoke required to maximize smoker satisfaction. Determine the existence of a minimum or threshold value of nicotine required for satisfaction." 504423322-3327 at 3322 (US 50614) (O) (emphasis in original).

2550. From 1978 to 1984, R. J. Reynolds had a "nicotine optimization" program. 507028876-8876 (US 20771) (O). During this time, potential optimum levels of nicotine were identified and circulated by and among company scientists. In 1978, the "optimum 'nicotine strength'" for Winston filters was identified near smoke pH 6.2-6.3 and at 0.12-0.13 milligrams of nicotine per puff. 504462513-2513 (US 20728) (O). In 1979, the "maximum satisfaction" for Winston King Size was believed to be delivered at 1.0 milligrams of nicotine per cigarette. 503851759-1759 (US 21508) (O). In 1980, R. J. Reynolds reported data from a fuller-flavor low tar consumer satisfaction study, which concluded that there was both an "optimum and minimum nicotine level required to maximize smoking satisfaction. . . . Camel Lights is in the optimum range. Merit 85 is just above the minimum." 500250599-0599 (US 20621) (O).

2551. RJR's efforts to identify an optimal amount of nicotine focused not only on its own products, but also involved evaluating other manufacturers' brands. A September 20, 1979 memorandum from W.J. Casey to R.A. Lloyd discussed the findings of RJR's in-house studies regarding the nicotine content in Philip Morris cigarettes. The studies produced two "striking" conclusions – that Philip Morris brand cigarettes contained significantly less nicotine in the smoke than the RJR brands, and that Philip Morris was able to maintain more constant nicotine levels in their products. 517701734-1735 (US 85407) (O). A 1980 competitive brand analysis

found that Philip Morris's full-flavor brands were delivering close to 1.0 milligram of nicotine per cigarette. This amount approximated the "optimum nicotine level in that ‘tar' range" indicated by RJR's own research studies. 504675253-5282 at 5257 (US 20734) (O).

2552. A March 31, 1989 report prepared by Calvin L. Neumann reviewed the consumer studies conducted by RJR between 1979 and 1984 in which nicotine was a major variable. In the consumer studies reviewed by Neumann, "nicotine, or nicotine and tar, was varied in a systematic controlled manner. . . ." Neumann concluded that "[t]he studies show that as nicotine was lowered from optimum values, key consumer attribute ratings for satisfaction . . . were lowered significantly." Thus, in 1989, RJR continued to be focused on the necessity that its products deliver sufficient nicotine to achieve "satisfaction." 508282165-2191 at 2165 (US 51362) (O).

2553. In a November 26, 1990 document on the subject of "Project XB," one of Reynolds's projects devoted to the study of nicotine manipulation, an employee with the initials GRD identified a series of questions intended to be answered by Project XB. These questions included:

> 1. How much nicotine do we need in a 5± mg product to satisfy normal smokers?
> 2. How much free nicotine of the total do we need to get the proper organoleptic feel?
> 3. What are the limits round the amount of free nicotine before the product is either to harsh or too smooth – ±mg?
> . . .
> 6. How good do we feel that legal group will allow us to sell product we visualize – i.e., take out tar vs. add nicotine?
> 7. Should we look at using tobacco high in nicotine, remove, treat, add back?

511703121-3121 (US 51575) (O). This document demonstrates that, to the extent that Reynolds was motivated to control nicotine in order to affect taste or smoke harshness, it also controlled nicotine for the purpose of delivering the optimum amount to the smoker to achieve

"satisfaction" and keep the smoker hooked. See also 511223463-3484 (US 20840) (A).

(cc) Brown & Williamson and BATCo

2554. BATCo began research on this issue at least as early as the 1950s. 100099115-9117 (US 20112) (A). By the early 1960s, BATCo and B&W scientists were confident that they could design cigarettes to deliver optimum doses of nicotine. A September 16, 1963 letter from Robert Griffith, Director of Research and Development at B&W, to BATCo discussed "optimum levels" for nicotine and correlated the nicotine level in cigarettes with consumer acceptance. The letter recognized that the nicotine levels of B&W cigarettes were not obtained "by accident" and admitted that "we have a research program in progress to obtain . . . any level of nicotine desired." 102630333-0336 at 0334, 0335-0336 (US 23000) (O). This letter significantly predates the recommendations by public health authorities cited by Defendants for the creation of a high nicotine, low tar cigarettes.

2555. Reports, memoranda, and other documents from BATCo throughout the 1970s and 1980s confirm the company's understanding and goal to establish and deliver "the optimal levels of nicotine [in] smokers." 100051935-1948 (US 34587) (A); 660913609-3633 (US 22763) (O); 110069974-9982 at 9975 (US 20268) (A); 400993160-3215 (US 75975*) (A).

2556. At a 1984 Smoking Behavior-Marketing Conference in Montreal attended by representatives of BATCo affiliates from the U.S., the U.K., Australia and Germany, a presentation claimed that individuals who smoked required 12-14 milligrams of nicotine a day, and at least .7 milligrams of nicotine in a cigarette in order for it to provide "satisfaction." 536000308-0507 at 0334 (US 85298) (O); 682637850-7928 (US 88063) (O).

2557. On June 6-8, 1984, BATCo held a comprehensive conference on nicotine. 101234971-5018 (US 21645) (O). Topics at the conference included "Nicotine Dose

Requirements," "Nicotine Dose Estimation," and "Product modification for maximal nicotine effects." 101234971-5018 at 4974 (US 21645) (O); 512106427-6437 at 6428-9 (US 20846) (O). BATCo concluded that if nicotine delivery fell below a certain level (believed at that time to be 0.4 mg nicotine), the cigarette would fail to "satisfy" the smoker. 101234971-5018 at 4978, 4981 (US 21645) (O). BATCo also believed that it was important "to enhance our ability to maximise nicotine effects from a lower delivery base." 101234971-5018 at 4978 at 5013 (US 21645) (O). Finally, BATCo concluded the conference with sessions on product modifications that could be made to produce optimal nicotine effects. 101234971-5018 at 4974-5 (US 21645) (O). The primary objectives of these sessions were to: (a) identify the extent to which nicotine contributes to product satisfaction; (b) understand the "significance of [] different levels of nicotine interaction with the body to smoking behavior and product satisfaction"; and (c) identify a "research programme to meet the criteria for maximising nicotine effects to satisfy consumer needs from a minimum dose of nicotine." 512106427-6437 at 6435 (US 20846) (O).

2558. A document recording the "conclusions" of the conference include reference to the concepts of "satisfaction" and "impact." The conclusions included that "'satisfaction' must be related to nicotine. **Many people believe it a 'whole body response' and involves the action of nicotine in the brain**." They also stated:

> If we are to make better use in product terms of the levels of nicotine in smoke currently available – and even more so if we are forced to market cigarettes with reduced levels of nicotine – then it is important to significantly increase our understanding of impact/satisfaction.

602759-2759 (US 53297) (A) (emphasis added).

(dd) Lorillard

2559. Lorillard pursued research seeking to identify an optimal range of nicotine

delivery throughout the 1970s. As part of its Nicotine Augmentation Project, Lorillard conducted an extensive review of the literature on the "pharmacology of smoke-dose nicotine **with the goal of discovering some indications of threshold dose and optimum doses of nicotine in the average cigarette smoker.**" In a December 10, 1976 report relating to the project, H.S. Tong recommended that, in light of Lorillard's knowledge of smoker compensation,"[i]t would seem desirable to have a low tar cigarette with a nicotine content between the threshold and optimum doses level." Tong also set forth the results of Lorillard's extensive review of scientific literature on the subject of determining the optimum nicotine dose and summarized, "[n]o single parameter appears to offer a reliable handle for measuring optimum satisfaction dose of nicotine at the present time. . . . In a subjective study, test subjects reported that they found cigarettes of 0.8 mg to be acceptable." 00045061-5071 at 5061, 5063, 5068 (US 34210) (A) (emphasis added); Henningfield WD, 94:6-8, 97:6-12; Farone WD, 132:18-133:12.

2560. Like the other manufacturers, Lorillard's search for the bet way to ensure effective and adequate nicotine delivery continued through the years with subtle changes in amount and theory, but always the same goal – determine the amount of nicotine delivery necessary to sustain addiction and make cigarettes that ensure such delivery. A February 13, 1980 internal memorandum from described how Lorillard undertook an internal project to "[d]etermine the minimum level of nicotine that will allow continued smoking." Company scientists hypothesized that there was a nicotine threshold below which "smokers will quit, or return to higher T&N brands." 526321269-1270 at 1269 (US 85323) (O).

(ee) Liggett

2561. An April 30, 1985 memorandum from J.C. Turner to R.L Kersey reporting on

Liggett's various ongoing research and product development projects demonstrates that Liggett was attempting to alter the design of its products for the purpose of delivering a specified amount of nicotine to smokers. The memorandum reported that

LWDOJ9272790-1791 at 2790 (US 86947) (O)

(Confidential).

(ii) Defendants' Efforts to Deliver Optimum Levels of Nicotine Reflected Their Understanding of the Correlation Between Nicotine Delivery and Cigarette Sales

2562. At all times, Cigarette Company Defendants have been aware that a cigarette's ability to deliver adequate levels of nicotine to smokers was critical to its commercial success. See generally US FF § III.C(1), supra. Company documents establish that the Cigarette Company Defendants' intentional manipulation of nicotine reflected their commitment to ensure that smokers could obtain sufficient nicotine doses from their cigarettes in order to become and remain addicted. Through these efforts, Defendants sustained their businesses with continued sales, and more importantly, substantial profits. In addition to the documents discussed directly infra, numerous internal research documents reflecting Cigarette Company Defendants' recognition that their future commercial profits rested on their ability to deliver addictive doses of nicotine are discussed in US FF § III.C.1, supra.

2563. Company documents reveal that the Defendants' most senior executives were not only aware of this focus on nicotine in research and product development, but in fact were central decisionmakers directing, approving, and encouraging such activities.

(aa) Philip Morris

2564. A May 5, 1975 memorandum from John T. Landry, Philip Morris's Executive Vice President of Marketing, to Clifford H. Goldsmith, President, expressed that Landry was "alarm[ed]" that Marlboro's nicotine delivery had "dropped . . . sharply below that of Winston." Landry acknowledged, "**it puts us at a competitive disadvantage**," and recommended "that this problem be thoroughly explored with Manufacturing and R&D and that every attempt be made to return the nicotine delivery to more suitable levels." 1000219888-9888 (US 85409) (O) (emphasis added); see also 1000046538-6546 at 6543 (US 26074) (A).

2565. Even though Philip Morris publicly stated for decades that nicotine is in cigarettes for "taste," an internal Philip Morris document, dated March 18, 1980, more accurately states the utility of nicotine to Defendants, and to Philip Morris in particular. In that document, a memorandum from Jim Charles, Manager of Research and Development to Robert Seligman, then-Vice President of Research and Development, Charles wrote that "**[n]icotine is a powerful pharmacological agent** . . . and may be the most important component of cigarette smoke." With no mention of nicotine being important to taste, Charles argued that further research on nicotine was vital and that it would have a **"direct bearing on our market position in a 10-15 year time frame."** 1003289974-9975 (US 21553) (A) (emphasis added).

(bb) R.J. Reynolds

2566. A July 3, 1973 memorandum from Jerry R. Moore to R.A. Blevins, Jr., reported that a study conducted by Reynolds's Marketing and Development Department found a direct, significant correlation between the amount of "free nicotine" in a brand and the sales level of that brand. 501011401-1401 (US 20668) (O). Blevins summarized the results of the study and his recommendations in a July 12, 1973 memorandum to W.S. Smith, Jr. as follows: "Our analysis

suggests that pH does not correlate as closely with share performance as does free nicotine. Our emphasis should be directed toward free nicotine while pH would provide us with a measure of, or tool, to effect free nicotine." 501011403-1403 (US 20669) (A). The concept of "free nicotine" is explained fully in Section III.C(2)(c)(iv), infra; see also Farone WD, 93:22-98:21.

2567. Also in 1973, Reynolds conducted a "historical review of smoke pH data and sales trends" comparing data for its own cigarettes to that of its competitors. A May 10, 1973 report about the review, authored by John D. Woods and Gloria C. Harilee, indicated that "smoke pH data for competitive brand filter cigarettes measured since 1964 were compiled" for the purpose of attempting "to correlate these data with cigarette sales trends." Woods and Harilee found that:

> A high pH smoke is strong due to a high concentration of unbound, or free, nicotine in the smoke. . . . **Correlation of these values with sales trends were made and the results showed even stronger positive correlations than were found for smoke pH-sales trends studies.**

500606138-6153 at 6138 (US 48334) (O) (emphasis added). Similarly, Reynolds reported internally in 1982 that, shortly after Philip Morris began increasing smoke pH and free nicotine through the introduction of added ammonia in 1965, Philip Morris's sales began growing very rapidly. 500540827-0832 (US 20639) (O).

2568. Defendants contended at trial that the correlation between pH and cigarette sales did not hold up over time. However, these documents are strong evidence that, at the time Reynolds and other Defendants implemented design techniques to affect the pH of their products in the 1960s and 1970s, their intent and motivation was to produce addictive products that would increase their market share and profits, not to create potentially less hazardous cigarettes.

2569. In a February 5, 1979 handwritten memorandum written by RJR scientist C.L. Neumann, Neumann stated that RJR wished to "obtain a fundamental understanding of the role

of nicotine in smoking satisfaction" by examining "whether there is a minimum or threshold level and an optimum smoke nicotine level related to smoking satisfaction" and "the relationship of smoke pH to nicotine perception and satisfaction." Neumann recognized the significance of these issues to increasing Reynolds's sales: "If the optimum smoke nicotine and pH can be determined for each of our products, then **these products can be tailored with respect to these variables to provide maximum satisfaction and acceptance for the consumer, [h]opefully resulting in increased sales**." 504460126-0134 at 0128, 0130, 0133 (US 88065) (O) (emphasis added).

2570. Admitting that there is no "chemical compound more important to a smoker's decision to continue smoking than nicotine," Gary Burger, former RJR Vice President for R&D and, before that, Director of Toxicology, testified that from at least 1983 to 1996, Reynolds researched the threshold level of nicotine to "arrest the decline in the social acceptability of smoking." Burger PD, Arch v. American, 8/22/97, 44:15-72:7, 117:16-20; see also 519192752-2754 (US 80229) (O); 519192755-2756 (US 80230) (O); 519192757-2758 (US 80231) (O).

2571. In 1989, Reynolds examined identified "a particularly disturbing difference" between Winston and Marlboro: "smaller puffs of Marlboro delivered higher levels of nicotine into the bloodstream, and delivered them more quickly than Winston." Reynolds concluded that this difference "could be a major factor in why people stay with a brand . . . even though they don't know why." 507555896-5909 at 5898-5899 (US 20779) (O).

(cc) Brown & Williamson and BATCo

2572. A 1963 letter from B&W's R.B. Griffith, Director of Research and Development, to BATCo's Chemist, John Kirwan, discussed "the question of desirable or optimum levels for

either nicotine or sugar or a balance of the two," and how the level of nicotine and sugars might "be varied to win consumer preference for our brands." Griffith pointed out that B&W's "sales pattern [from 1960 to 1963] has been positively correlated with the nicotine level of the tobacco in our products." Griffith went on to state that "**the nicotine level of B&W cigarettes [studied] was not obtained by accident**." He closed by recognizing the marketing department's role in determining nicotine content in cigarettes, stating, "I think that we can say even now that **we can regulate, fairly precisely, the nicotine and sugar levels to almost any desired level management might require** . . . ." 102630333-0336 at 0333, 0334, 0335, 0336 (US 23000) (O) (emphasis added).

2573. A September 20, 1979 memorandum from the B&W Research Department, authored by Rufus Hugh Honeycutt comparing tar and nicotine delivery information between various commerical cigarettes noted that "[p]erhaps not coincidentally, Philip Morris and R.J. Reynolds have the highest average NTE [nicotine transfer efficiency] and the highest USA sales." 505003431-3438 at 3433 (US 85412) (O). See also 505003675-3688 (US 85413) (O); 510000667-670 (US 51496) (A); 2077864189-4190 (US 45063) (O).

2574. An internal BATCo document date stamped January 28, 1980, emphasized that it was critical to understand the factors which govern the way cigarettes are smoked "[i]f advantage is to be won by marketing low delivery cigarettes." 100431408-1414 at 1411 (US 21796) (O).

2575. On April 7, 1982, BATCo's G.O. Brooks, a research scientist, sent a letter to B&W's William L. Telling regarding a study that concluded that when a cigarette's nicotine level "is so low that the nicotine is below the threshold of pharmacological activity then it is possible that the smoking habit would be rejected by a large number of smokers." 660913609-3633 at 3620 (US 22763) (O). Considering this threshold "satisfaction" level, BATCo senior scientist

S.J. Green later warned that "we should be aware of the long-term dangers of following the crowd into ultra-low nicotine deliveries." Green explained, "Nicotine is an important aspect of 'satisfaction,' and if the nicotine delivery is reduced below a threshold 'satisfaction' level, then surely smokers will question more readily why they are indulging in an expensive habit." 110069974-9982 at 9975 (US 20268) (A); see also 400993160-3215 at 3196 (US 75975*) (A); 100051935-1948 (US 34587) (A). As Dr. Henningfield testified, Green's warning demonstrates that BATCo understood that the trend towards ultra-low nicotine deliveries could mean "that the market would extinguish because people would get to the point that smoking really would be a matter of taste and pleasure and not nicotine receptors in the brain; at that point, people would find it easier to quit." Henningfield WD, 97:21-98:3.

(dd) Lorillard

2576. A November 9, 1976 memorandum from Richard E. Smith, Vice President of Marketing and Development for Lorillard, to Fred Schultz, Vice President of Research and Development, demonstrates that Lorillard internally recommended that an industry-wide effort to offer a product with 50% less nicotine be discontinued despite "considerable consumer trial appeal" because such a cigarette "could not deliver **the smoking satisfaction to sustain consumer purchase**." 01244504-4504 (US 20042) (O) (emphasis added).

2577. In an April 29, 1976 memorandum to J.R. Ave and Alexander Spears, Richard E. Smith, Vice President of Marketing and Development for Lorillard, summarized a meeting on Lorillard's "5 Year Domestic Cigarette Marketing Plan." Smith wrote:

> [i]t was agreed that judgement and recent publicity **give an enriched nicotine product the highest priority of all new brand projects**. This project has been divided into three parts: a.) How to get the nicotine (quantities, prices, throw-away costs, etc.) b.) How to use the nicotine (on both the 5 mg and 2 mg tar products), and c.) What are the corporate implications of nicotine addition.

03364986-4988 at 4987 (US 85408) (O) (emphasis added); see also, 01254896-4898 at 4897 (US 34518) (O), 83250744-0747 at 0746 (US 55650) (O).

2578. One of Lorillard's highest priorities in the late 1970s was its nicotine enrichment program. In a February 9, 1977 memorandum from Harry Minnemeyer, Director of Research, to Fred Schultz, Vice President of Research and Development, Minnemeyer reported on the "Continuation of Nicotine Augmentation Project (CONAP)." Minnemeyer explained the objective of Lorillard's extensive study of the mechanisms by which nicotine delivery could be manipulated was a "highly important business objective." 83251036-1044 at 1037 (US 55688) (O).

2579. In a July 22, 1977 memorandum from Fred Schultz to Alexander Spears, Schultz briefly summarized the progress of Lorillard's efforts to increase the impact of "low tar" cigarettes by adding nicotine directly to reconstituted tobacco leaf and stated: "Consideration of nicotine delivery **necessary to achieve long term use and satisfaction by the consumer** dictate that we should continue to pursue the concept of nicotine enhancement." 00361822-1823 at 1823 (O) (US 20024) (emphasis added). This statement demonstrates, contrary to Lorillard's contentions at trial, that its nicotine research was conducted with the intent to assure "long term use" of its products by smokers, not to respond to public health officials' calls for reduced delivery products.

(c) Product Design: Defendants Researched, Developed and Utilized Various Designs and Methods of Nicotine Manipulation to Ensure That All Commercial Cigarettes Deliver Doses of Nicotine Adequate to Create and Sustain Addiction

2580. Cigarettes sold by Defendants facilitate addiction development and maintenance by enabling rapid and readily controlled nicotine delivery. Henningfield WD, 35:18-19. Nicotine delivery levels are not a matter of random variation; rather, cigarettes are designed to

permit nicotine delivery over a range of doses so that a smoker can obtain his or her optimal dose from virtually any cigarette on the market, regardless of its nicotine delivery as measured by FTC testing. Farone WD, 99:10-12; Henningfield WD, 36:8-16. The design parameters implemented by Cigarette Company Defendants have enabled the most heavily-marketed brands to readily deliver the 1-3 milligrams of nicotine sought by most smokers, and to deliver different amounts of nicotine to different smokers. Henningfield WD, 35:16-36:16, 41:18-42:7; 54:7-15; 66:23-67:12; NCI Monograph 13 at 30-34, DXA0310399-0650 at 0043-0047 (US 58700) (A).

2581. Cigarette Company Defendants' manipulation of nicotine has not been simply an effort to deliver as much nicotine to the smoker as possible because delivery of large amounts of nicotine can make cigarettes harsh and unpalatable. Farone WD, 85:7-16. In addition, an unsmoked cigarette already contains much more nicotine than a smoker will inhale because not all of the nicotine present in tobacco is transferred to mainstream cigarette smoke. Typically, a cigarette that delivers about 1 milligram of nicotine in smoke as measured by FTC testing has "about 14-20 milligrams of nicotine in the unsmoked rod." Farone WD, 86:10-12. Therefore, Defendants' manipulation and control of the nicotine delivery of their cigarettes does not simply refer to "spiking" cigarettes by adding extraneous nicotine. Rather, their manipulation of nicotine relates to design parameters Defendants have implemented to control the dose and form of nicotine delivered to mainstream cigarette smoke. As explained by Dr. Farone, who had extensive personal experience with Philip Morris's cigarette design efforts and objectives as Director of Applied Research from 1977 to 1984, manipulation means "[t]o do something to change the amount of nicotine that comes off a burning cigarette to make it different that what it would be if you just took tobacco, wrapped it up, put it in a rod, lit that up, and let the nicotine go where it may. . . . [N]icotine manipulation deals with making specific changes in that design to

make nicotine go where you want it to go as opposed to where it would go by itself without changing the design." Farone TT, 10/7/04, 2021:6-13.

2582. Cigarette Company Defendants have used a variety of physical and chemical design parameters in order to manipulate the nicotine delivery of their commercial products. Dr. Farone testified, for example, that while he was at Philip Morris, researchers identified fifty-seven different parameters that influence the quality and content of smoke delivery by a burning cigarette. Farone WD, 48:7-22. The physical design parameters include cigarette length, circumference, and density, the filter composition and design, and air dilution or ventilation. Chemical design parameters include the blend selection, cigarette paper composition and porosity, and the choice of additives, including additives such as ammonia and ammonia compounds to influence smoke pH. Farone WD, 85:3-6. Cigarette Company Defendants' knowledge that their products must deliver sufficient nicotine to create and sustain addiction influences their selection and combination of design parameters, and no single design parameter is responsible, on its own, for the level of nicotine delivered by a particular cigarette. Id. 48:2-6, 84:16-85:6; Henningfield WD, 49:8-53:5, 54:7-15, 55:13-56:7, 66:14-67:12.

2583. Defendants' claims that their control of nicotine in their products is strictly a quality control measure is false. See, e.g. 2023011263-1263 (US 20371) (A). Cigarette Company Defendants' manipulation of nicotine starts at the design stage and then it is maintained. As explained by Dr. Farone, Defendants' statements focus only on maintaining the already-manipulated design, but leave out the entire idea of how the level of nicotine delivery was achieved in the first place. Every cigarette on the market has been manipulated to a particular nicotine delivery, and Cigarette Company Defendants use of "quality control" and "quality assurance" simply maintains the manipulated design. Farone WD, 99:10-12.

(i) Background: Defendants Aimed to Develop Commercial Cigarettes That Could Deliver Any Dose of Nicotine Required By a Smoker Regardless of the Cigarettes' Nominal Machine-Measured Nicotine Yield

2584. Defendants began to anticipate in the 1950s and 1960s, as smoking and health was becoming a more prominent subject of public concern, that public interest in less harmful cigarette products could ultimately require reduced levels of tar and nicotine in conventional commercial cigarettes. Harris WD, 139:15-140:10 & Dem. 5. Defendants also recognized that if they addressed smokers' concerns about the health effects of smoking by reducing the levels of tar in their cigarettes, they might also affect a proportional drop in nicotine, and that a drop to nicotine delivery levels that were not sufficient to sustain smokers' addiction could devastate their industry. Defendants therefore set out to design commercial cigarettes that were capable of delivering nicotine across a range of doses that would to keep smokers addicted. Henningfield WD, 54:7-15, 55:13-56:7, 66:23-67:12; Farone WD, 72:10-13, 86:18-89:13.

2585. Defendants have known since the 1960s that because individuals smoke to obtain desired effects of nicotine, smokers of lower nicotine yield cigarettes tend to adjust their smoking behavior to titrate (i.e., control) their intake of nicotine to achieve desired levels. This behavioral adaptation is referred to as smoker "compensation." See generally US FF § III.D(3)(b). By puffing lower yield cigarettes more frequently and/or more intensively, blocking ventilation holes in the cigarette filter, and/or smoking more cigarettes, smokers are able to "compensate" for the lower nicotine deliveries of low tar and low nicotine cigarettes. Id. Defendants used this knowledge in their research of nicotine manipulation and manufacture of cigarettes. Benowitz WD, 55:17-56:2, 56:22-57:14; Burns WD, 36:3-15, 36:20-37:6, 44:4-32; NCI Monograph 13 (US 58700) (A); 1003286580-6581 (US 85415) (O); 1000405641-5689 (US 85416) (O); 002545364544 (US 21747) (O); 775036039-6067 (US 21053) (A); 83250863-0873 (US 55673)

(O). See also US FF § III.D(3)(b).

2586. The primary means by which Cigarette Company Defendants have assured that their low delivery products will sustain smoking addiction is by incorporation into their commercial products of physical design characteristics and ingredients that enable the human smoker to easily obtain his or her reinforcing level of nicotine, regardless of the cigarette's nominal machine-measured yield. Farone WD, 105:10-106:6; Henningfield WD, 66:3-13, 66:23-67:7. Indeed, the Cigarette Company Defendants' internal documents reveal that they designed their cigarettes to increase the flexibility of their tar and nicotine dosing capacity to smokers even as they reduced the tar and nicotine yields as determined by machine tests. Henningfield WD, 48:17-23; 49-8-53:5.

2587. For example, Defendants used physical design features, such as burn accelerants that burn a higher proportion of tobacco in between the puffs of the machine as compared to generally much more rapidly puffing humans, to reduce the tar and nicotine measured by the machine. The FTC test does not account for the fact that cigarettes are engineered to burn at different rates in the testing machine, in part to achieve different tar and nicotine yields on the test. Another feature is the use of ventilation holes that can be easily covered by the smoker's lips or fingers but are never covered by the machine's holders. Defendants' use of these design parameters accentuate the differences between a cigarette's machine measured nicotine yield and its nicotine yield under human smoking conditions. Henningfield WD, 57:11-20, 59:3-15, 61:1-62:6; 64:8-18; see also US FF § III.D(4).

2588. Contrary to their multiple public denials of nicotine manipulation set forth in Section III.C(2)(a), supra, Defendants have spent decades manipulating nicotine in cigarettes through ingredients and design features in order to control the amount and form of nicotine

delivered to the smoker. They have done so for the purpose of creating and sustaining addiction in cigarette smokers. Farone WD, 2:20-3:7, 3:12-22, 59:2-14, 84:16-85:16; Henningfield WD, 49:8-68:4.

(ii) Leaf Blend and Filler: Cigarette Company Defendants Manipulated the Amount and Form of Nicotine Delivery in Their Commercial Products by Controlling the Physical and Chemical Make-Up of the Tobacco Filler

2589. Nicotine delivery can be controlled through variation of the amount and type of tobacco used to manufacture commercial cigarettes, and through adding or taking away particular substances from a tobacco blend before it is used as a filler. Farone WD, 37:8-21; 39:11-16; 89:1-23. The tobacco blend is the main component of a cigarette that contributes to nicotine delivery because the blend determines how much nicotine will be in the unsmoked rod. Farone WD, 86:1-7. Cigarette Company Defendants have used various techniques for adjusting the nicotine content and the chemistry of their filler materials to assure that an amount of nicotine sufficient to create and sustain addiction is released from the blend during smoking. 107472304-2464 (US 20254) (O); Henningfield WD, 65:22-66:8; Farone WD, 49:6-13; 52:15-23.

2590. There are three main varieties of tobacco that have been used in the production of commercial cigarettes in the United States – Bright tobacco, Burley tobacco and Oriental tobacco. Each of these types of tobacco has a different chemical composition and different nicotine concentration that occurs naturally. Farone WD, 42:15-22; NCI Monograph 13, Ch. 5 (US 58700) (A). Because of these variations, Cigarette Company Defendants blend across types of tobacco and also across crop years to compensate for the year-to-year variations in the tobacco crop. Farone WD, 43:9-14.

2591. Bright tobacco is a type of tobacco generally grown in Southern Virginia and across the Southeastern United States. It is also referred to as flue-cured tobacco, which refers to

the process by which the tobacco leaves are dried prior to being used in the cigarette manufacturing process. Flue-cured tobacco is tobacco that is cured by being stored in a hothouse where either hot gases or heat is applied in some manner to the tobacco. Flue-curing has been one of the main methods used to cure tobacco in American-style commercial cigarettes over the years. Farone WD, 44:2-13. Burley is a strain of tobacco that naturally has a higher alkaloid content than Bright tobacco, which means that it naturally has more nicotine than Bright tobacco. Burley tobacco is air-cured, which means that it is hung inside a shed to dry where no sunlight will hit it. Farone WD, 44:14-20, 46:16-20. Oriental tobacco, also referred to as Turkish, is imported is cured through a process called fermentation, meaning that the leaves are packed into moist stacks and fermented. Farone WD, 44:19-20, 47:8-17.

2592. Each of these types of curing – flue curing, air curing, and fermentation – causes different chemical reactions to take place within the tobacco and therefore results in a smoke that has different chemical properties, including different nicotine levels. Farone WD, 47:18-21.

2593. In addition to naturally occurring variations across different strains of tobacco, the nicotine content of tobacco leaves in a single plant can also vary based on the age of the plant and the stalk position of the leaves. Nicotine is synthesized in the root of the plant, and leaves at the bottom of the plant generally are dried out and have lost most of their nicotine to air. As you go up the stalk, the nicotine content of the leaves increases until you reach the top where leaves are still growing and have not yet reached maximum nicotine or alkaloid content. Cigarette Company Defendants are aware of these variations and keep track of tobacco they purchase by its stalk position in the plant. Farone WD, 37:11-18, 43:15-44:1.

2594. Cigarette Company Defendants' commercial cigarettes contain a variety of materials in addition to cut tobacco leaves, including parts of the tobacco plant that have been

altered from their natural state. One such material is reconstituted tobacco, also referred to as blended leaf or reconstituted leaf, which is manufactured by Cigarette Company Defendants out of stems and other small pieces of tobacco that have been removed from the tobacco leaves. These pieces are mixed with binding agents and other chemicals to form a large sheet of tobacco which is then chopped into small pieces and put in cigarette filler. Farone WD, 38:18-39:6. In the process of making reconstituted tobacco, water is applied to the stem material so that water-soluble materials, including nicotine, can be removed from the stem so that it will form a sheet. The nicotine and other water soluble materials are treated with various chemicals and additives and added back to the stem material after it has formed a sheet. Schindler WD, 58:12-59:4.

2595. Another way Cigarette Company Defendants alter the natural state of tobacco is through the use of expanded tobacco. Expanded tobacco is tobacco that has been impregnated with liquid that is eventually evaporated from the tobacco. Farone WD, 39:7-10. This impregnation and evaporation process causes tobacco leaves to shrink when they are dried or cured, after which a chemical such as carbon dioxide or freon is added and causes the tobacco pieces to expand. When this material is heated and expanded, it puffs back up to about the size of that chunk of tobacco as it was originally on the plant. Farone WD, 39:11-16.

2596. Cigarette Company Defendants are aware that the cut width of the filler material can also affect nicotine delivery. As a matter of aerosol chemistry, burning materials that are finer cut creates an aerosol with smaller particle size than materials that are larger. Farone WD, 50:20-51:5. As set forth in Section III.C(2)(c)(iii) infra, particle size affects the rate and location of nicotine absorption. The cut width of the filler also influences how much nicotine from the filter will be delivered to mainstream smoke, thereby affecting the tar to nicotine ratio of the smoke. Farone WD, 91:12-92:1.

2597. Reconstituted tobacco and expanded tobacco and other blend design parameters are selected by Cigarette Company Defendants for use in commercial cigarette products based on the Company's formula for a particular brand. With their knowledge of the stalk position of specific tobacco leaves and of a particular tobacco crop, Cigarette Company Defendants determine what quantities of cut leaf, reconstituted tobacco, and expanded tobacco will, in combination with other physical design features, yield a particular brand's target nicotine delivery. Farone WD, 39:17-40:13.

2598. There is a close relationship between Cigarette Company Defendants' nicotine manipulation through blending and their manipulation through alteration of smoke pH because one manner in which smoke pH can be altered is through increasing the amount of basic material in the tobacco blend or filler. Therefore, many of Cigarette Company Defendants' documents that discuss manipulating the blend and filler also discuss concepts related to pH and free nicotine. Therefore, in order for the evidence of Cigarette Company Defendants' manipulation of leaf blend and filler to be fully understood, it must be considered in conjunction with the evidence set forth in Section III.C(2)(c)(iv) infra regarding smoke pH and free nicotine.

2599. Defendants' public statements that they do not track nicotine during the manufacturing process are misleading. Because they are aware of and keep track of the alkaloid content of the tobacco they purchase, Cigarette Company Defendants are keenly aware of how the combination of different blend components will affect the nicotine delivery of their final products. See Farone WD, 89:16-23; Farone TT, 10/6/04, 1596:16-1597:6. Indeed, some Cigarette Company Defendants – including Philip Morris and BATCo, developed and used sophisticated computer modeling systems to determine exactly what effect each component of the blend would have on nicotine delivery and used those computer modeling systems to design

their blends. Farone WD, 48:7-18, 53:4-9; 105425765-5818 (US 85493) (O).

(aa) Philip Morris

2600. Philip Morris has been manipulating the blend of its tobacco filler to obtain desired levels of nicotine since at least 1954. In a document entitled "An Outline of Current and Proposed Quality Control, Development and Research for Benson and Hedges," circulated in 1954, Philip Morris explained that comparisons of "analytical data for the blend with estimates of nicotine, tar and pH of the smoke should enable us to set up certain limits or norms within which the chemical composition of the blend must be controlled in order to achieve desired smoking quality." The document recommended:

> enlarg[ing] the scope of our present analytical program to secure estimates of nicotine, nornicotine, total volatile bases, ether solubles and ash, not only for the blend but also for all the grades and types of tobaccos which go into the blend. There is no reason why such data cannot be used as a guide to purchasing. Once norms can be established for the composition of grades and types, samples falling outside the range of desirability can automatically be rejected by the buyers. In this way, the adverse effects of fluctuations in the blend originating in wide differences in leaf composition due to cultural and climatic conditions and crop year can be minimized.

1001761472-1484, 1474 (US 35556) (A).

2601. In an outline of a presentation to the Philip Morris Products Committee, dated February 27, 1961, Helmut Wakeham, Philip Morris's Vice President and Director of Research and Development, described under the heading "Data on Experimental Defensive Cigarettes" a "low nicotine" and a "high nicotine" cigarette, with the only difference between the two being the blend of the cigarette. This difference in blends resulted in a .9 mg difference in the amount of nicotine per cigarette. 1000277448-467 at 7458 (US 85479) (O). This document demonstrates that Philip Morris was attempting to develop a high nicotine cigarette well in advance of the

recommendations by public health authorities cited by Defendants as the basis for nicotine research.

2602. By 1960, Philip Morris was studying the effects of adding nicotine maleate to blended leaf tobacco to determine if the nicotine content of cigarettes could be increased. 1001919941-9941 (US 21753) (A).

2603. In an internal research document dated November 18, 1963, and presented to Hugh Cullman, Vice President and Assistant Chief of Operations for Philip Morris USA, Robert Seligman, Manager of Philip Morris's Development Division, described Philip Morris's capabilities of constructing a plant to produce "all tobacco formulated product (TFP)" to replace blended leaf tobacco product. Seligman pointed out that a TFP product would enable " [m]aterials [to] be added to or removed from the formulated product so that predetermined chemical specifications can be met . . . as dictated by the requirements of the marketplace." The research department recommended that Philip Morris "consider this TFP plant as a vital addition to our defensive and offensive armament in the tobacco and health situation which we believe will remain turbulent for many years." Seligman warned, "Our chief competitors either already have the potential to make a tobacco formulated product by a similar process or are building it." 0000334739-4762 at 4742, 4751, 4755, 4759, 4761 (US 85480) (O).

2604. A 1976 Philip Morris Special Report entitled, "Manipulating Smoke Impact in Very Low (Less than 8 mg Tar) Delivery Cigarettes," discussed the company's efforts to develop a new product with low tar and enough nicotine to equal Marlboro in consumers's preference for "strength" and "acceptability." The report detailed Philip Morris's study of relative influences of blend, burley spray, and filter systems to produce "acceptable" impact, finding that a "50% burley blend with a CA [cellulose acetate] filter would be the model of choice." 1000360937-0955 at

0939, 0947 (US 35250) (A); Henningfield WD, 67:13-23.

2605. Altering the composition of the leaf blend was the subject of ongoing study at Philip Morris in 1982. The Biochemical Research Division undertook studies of bright and burley cigarettes with "varying levels of added nicotine to determine the relationship, if any, between nicotine, nicotine pyrolysis products and *in vitro* biological activity." 1002978092-8098 at 8095 (US 85481) (O).

2606. In 1991, Philip Morris studied the differences between Bright tobacco and Burley tobacco, which has a higher alkaloid content and therefore a higher pH level. Researchers specifically raised the question "Can pH affect the chemical nature (gas versus particulate phase form) of nicotine in cigarette smoke?" An October 30, 1991 memorandum by D.C. Watson on the subject "Gas Phase Nicotine" concluded that "[r]elatively large proportions of vapor phase nicotine can, in fact, be swept from Burley using only warm air while Bright tobacco releases very little nicotine but measurable amounts of acetic acid under the same conditions." 2047348210-8218 (US 38596) (A) (emphasis in original). This document is consistent with Dr. Farone's testimony that, as pH rises, a greater proportion of the nicotine is delivered in the vapor phase of the smoke. Farone WD, 94:1-95:3.

2607. Former Philip Morris scientist Ian Uydess stated in a February 29, 1996 declaration that Philip Morris "routinely targeted and adjusted" nicotine levels in its cigarettes, through blend changes and blend design. Udyess stated that this was true of the overall nicotine found in the blends, as well as the "deliverable" nicotine found in the smoke. "Both of these sources . . . were[] considered by Philip Morris' development scientists when formulating a new or modified product." Udyess also explained that "Philip Morris routinely applied this knowledge of selective tobacco blending to achieve desired nicotine . . . levels in the products

that it designed and marketed." 521102262-2286 at 2269, 2271 (US 30497) (O).

2608. On April 14, 1994, William I. Campbell, as CEO of Philip Morris, testified under oath before Congress regarding the tobacco blend used in the production of its Merit Ultima cigarette, which was the lowest tar cigarette in Philip Morris's Merit brand family. Campbell admitted that Philip Morris used a tobacco blend in the production of Ultima that had a higher concentration of nicotine than it used in producing Merit cigarettes. Campbell claimed that the use of a blend with a higher concentration of nicotine was "for taste and flavor" and that its use was "irrelevant in terms of what the smoker gets." TLT0730001-0850 at 0766, 0767, 0768 (US 77011) (O). However, Dr. Farone testified that Cigarette Company Defendants used extra burley in blends for their low FTC-yield products in order to "maintain those cigarettes' ability to provide the 'impact' — nicotine effects – for addicted smokers. Philip Morris did this with its Merit brand." Farone WD, 86:16-19.

(bb) R.J. Reynolds

2609. RJR experimented with adding nicotine to tobacco stem as early as 1956. 501052852-2856 (US 20671) (O).

2610. Reynolds used leaf blending as a method for controlling the nicotine content of its cigarettes prior to the time that consumers began demanding cigarettes that allegedly delivered less tar. Like the other Cigarette Company Defendants, Reynolds was aware that cigarettes with high levels of nicotine were harsh and unpalatable, so it used leaf blending, among other means, to control the amount of nicotine in its products. Dr. Murray Senkus authored Divisional Monthly Research Reports in 1964 and 1965, which discussed the blend changes tested by the company in response to the significant increases in the nicotine contents of burley and flue-cured tobacco crops. "[T]o avoid significant increases in the nicotine content of tobacco and smoke,"

the company tested various blend changes, filter changes, paper changes, denicotinization of additional quantities of burley strips, and a combination of these factors. 502805188-5195 at 5193 (US 50114) (A); 502805205-5212 at 5210 (US 50116) (A).

2611. In 1977, RJR embarked on a search for "new means for control of nicotine, tar to nicotine ratio and satisfaction." 502740087-0087 (US 86978) (A). Reynolds studied the nicotine delivery of individual blend components and the transfer of nicotine from individual blend components. 504423322-3327 at 3323 (US 50614) (O).

2612. As part of its effort to learn how to control the nicotine content of tobacco independently of other components, Reynolds studied agricultural variables that might influence nicotine content in flue-cured and burley tobaccos. Researchers examined: (1) how variables such as climate, fertilizer, and the height of the tobacco plant affect the amount of nicotine in smoke, and (2) efforts directed at developing flue-cured and burley tobacco with higher nicotine content. 508799518-9519 (US 85494) (O).

2613. A September 8, 1980 internal memorandum by scientist Alan Rodgman, reveals that Reynolds was using its knowledge gained from nicotine research in the development of commercial products. The memorandum briefly outlined the types of nicotine technology Reynolds had studied and also compared, over a decade, nicotine levels in Reynolds's Winston cigarettes and Philip Morris's Marlboro cigarettes. Rodgman's analysis of this comparison was that, as a result of Reynolds's research efforts "since mid-1977, we have ‘caught up' to PM insofar as its current use in the Marlboro of nicotine technology is concerned; **our approach has been primarily one of controlling the smoke parameters noted above by blend formulation and denicotinization rather than by addition or transposition of nicotine**." 501522719-2726 at 2720 (US 48913) (O) (emphasis added).

2614. RJR also tracked the year-to-year variations in the nicotine content of various flue-cured and burley tobacco crops in order to "provide background information for nicotine control and grade substitution projects." An October 19, 1982 memorandum authored by E.H. Villegas summarized and analyzed the nicotine content of various crops of tobacco from 1977 to 1981 and concluded: "These graphs and tables provide an easy guide to grade, crop and belt comparison and may provide a new perspective on grade substitution. . . . From a nicotine control point of view, substituting adjacent grades with a given crop year is more logical than substituting a different crop year of the same grade/belt." 510723285-3286 at 3286 (US 88090) (O). This underscores Dr. Farone's testimony that Defendants measure and track nicotine (or "alkaloid") content at the tobacco-buying stage. Farone TT, 10/6/04, 1596:2-1597:12.

2615. In an August 18, 1983 memorandum from G.M. Stewart to J.D. Frederickson, Stewart reported the results of Reynolds's research concerning the modification of tobacco blends, stating: "[T]obaccos with varied levels of ammoniation products, nicotine and expansion can be produced in pilot plant quantities for evaluation as components of new and existing blends. **Such modified tobaccos may provide new ways to control nicotine delivery and modify smoking characteristics**." 504140118-0127 at 0118 (US 85495) (O) (emphasis added).

2616. In 1985, RJR planned to develop "NOW-type cigarettes with increased nicotine." An October 9, 1985 internal memorandum outlined two approaches to the development of such cigarettes, including increasing the nicotine content of a low tar cigarette through blend modifications, i.e., the use of high nicotine tobaccos, and through addition of a "nicotine salt complex . . . to increase the nicotine delivery." 509108038-8040 at 8039, 8040 (US 85496) (O).

2617. An October 17, 1985 internal invention disclosure prepared by Dwo Lynm and Carl Morrison and addressed to Grover Myers of RJR's Legal Department, described a new

proposed method for developing a cigarette that "will meet most of the consumers' needs" by delivering a "high impact of nicotine with low tar delivery." Lynm and Morrison wrote that "the amount of nicotine required for smokers to get an appropriate 'kick' has been calculated to be 10 mg per cigarette in addition to the endogenous nicotine content." Lynm and Morrison proposed adding carbonized flue-cured [CFC] tobacco impregnated with 10 milligrams of nicotine to "the end or in the middle of the hollow tobacco rod in order to deliver more nicotine . . . **This additional nicotine would lower the T/N ratio drastically**." 505624894-4898 at 4894, 4895 (US 85497) (O) (emphasis added).

(cc) Brown & Williamson and BATCo

2618. B&W's most senior executives took a great interest in the company's nicotine manipulation research. This is demonstrated in documents such as a June 5, 1974 memorandum from R.M. Irby, Jr., Manager of New Products Division, Research and Development, to J.B. McCarthy, Executive Vice President, and copied to J.H. Hager, Executive Vice President. The memorandum, written at McCarthy's request, outlined B&W's research and knowledge on "increasing the nicotine content of reconstituted tobacco." The methods for accomplishing this included: adding nicotine to reconstituted tobacco base sheets, replacing current leaf blends with higher nicotine tobacco, cast sheeting tobacco "dust" that is high in nicotine content, manipulating filters, and changing smoke content. Irby discussed studies done to raise the nicotine delivery of Pall Mall and Lucky Strike cigarettes and to raise nicotine delivery in low tar cigarettes. MNAT00533225-3228 (US 85492) (A).

2619. It was known within BATCo that blended cigarettes, which included higher nicotine Burley tobacco in the cigarette, were less acidic and had a "greater proportion of free nicotine present in the smoke . . . which explains why these types of cigarettes tend to have

higher impact than a flue-cured cigarette with the same nicotine delivery." 400132742-2776 at 2769 (US 88084) (O). Dr. Jeffrey Wigand testified that B&W predominantly manipulated the nicotine level in its cigarettes by blending the higher nicotine burley tobacco with the lower nicotine flue-cured tobacco "to ensure a consistent and necessary nicotine level." Wigand WD, 100:22-101:8.

2620. The tobacco companies also spent substantial resources researching the nicotine manipulation strategies of their competitors in order to perfect their own methodologies. For example, in a January 22, 1974 report entitled, "A Chemical Examination of B&W and Competitive Reconstituted Tobacco," B&W researcher R.R. Johnson found that reconstituted tobaccos were in use by B&W, Philip Morris, RJR, American, Lorillard, and Liggett. The report acknowledged, "Most reconstituted tobaccos **gain significantly in nicotine content during cigarette manufacture**," and pointed out that the nicotine transfer for Philip Morris cigarette products was "massive." 650106026-6042 at 6028 (US 86979) (O) (emphasis added).

2621. In 1976, BATCo developed a "Total Product Design" to allow its product designers to use a computer program to create trial product specifications to meet design criteria and minimize cost. The product designer was instructed to input into the program target values for tar and nicotine delivery, along with other specifications, and the program would "calculate the required blend nicotine." This information would then be calculated with further specifications to determine other materials required to produce a cigarette providing the desired nicotine delivery. 105425765-5818 (US 85493) (O).

2622. A 1980 B&W document demonstrates the industry's general knowledge of nicotine levels in different types of tobacco after decades of studying and manipulating nicotine through leaf blending. The document confirms that the greater impact and smoker reaction

occurring with cigarettes made of Burley tobacco, versus tobacco made of flue-cured tobacco, was "as would be expected." 510000667-0670 at 0669 (US 51496) (A).

2623. At the time that Tommy Sandefur was Chairman and CEO of B&W, he testified before the Waxman Subcommittee hearing that in 1984 or 1985, when he "became responsible for [B&W's] domestic business," he directed the Research and Development Department to reverse engineer the Marlboro product. He said that "I wanted to find out how they were doing that because it was important if I was going to compete to improve the quality of my products." He stated that the B&W scientists reported to him that Philip Morris had used ammonia in the reconstituted sheet. Based upon this finding, Sandefur further admitted that B&W incorporated the same technology and applied the same technique of adding ammonia to the reconstituted tobacco in its commercial cigarettes at the time of the hearing. TLT0730851-1975 at 1620 (US 77012) (O).

2624. At an experimental farm in North Carolina during the 1980s, BATCo and B&W developed a tobacco that the companies referred to as "Y-1." The tobacco was genetically engineered to have a nicotine content approximately twice the nicotine content of conventional tobacco. Seeds from the genetically-engineered strain were used to grow artificially high nicotine tobacco in Brazil. This nicotine-enhanced tobacco was blended with other tobaccos in order to alter tar to nicotine ratios in commercial cigarettes sold in the United States. 510003880-3882 (US 20831) (A); Wigand WD, 101:10-102:14.

2625. B&W oversaw the filing of two patents regarding the Y-1 tobacco, patent application #761,312, filed on September 17, 1991, and Brazilian Patent P1 9203690A, filed on September 16, 1992. 682515783-5803 (US 88089) (A); 2072566619-6619 (US 88087) (A).

2626. B&W's U.S. patent application claimed that Y-1 was "a new and genetically stable

variety of tobacco plant" engineered to have a nicotine content "which is significantly higher than any standard commercially grown tobacco variety." 682515783-5803 at 5786 (US 88089) (A).

2627. B&W continued to use Y-1 tobacco products in various B&W cigarettes until as late as January 1994. 682637648-7650 (US 21027) (A); 500004560-4580 (US 20607) (O).

2628. Tommy Sandefur, Chairman and CEO of B&W, admitted before Congress on June 23, 1994, that B&W incorporated the Y-1 leaf into its Viceroy and Richland style cigarettes, using Y-1 "as a blending tool." Sandefur also admitted that the company attempted to use as much as 30% Y-1 in a blend, but that it ultimately reduced this percentage to 10% because consumers rejected that large amount of nicotine in the cigarettes. TLT0730851-1975 at 1619 (US 77012) (O).

2629. Although B&W attempted to downplay the significance of its use of Y-1, see Defs.' Closing Stmt., 6/8/05, 23142:5-8, its use a blending agent is significant. The blend it the most significant contributor of nicotine to an unsmoked cigarette and an important determinant of how much nicotine can be transferred to mainstream cigarette smoke. Farone WD, 86:1-7.

(dd) American

2630. American actively studied blending as a method of increasing the nicotine yield in its low tar cigarettes. Company researchers investigated the effect of increasing the burley tobacco in its Lucky Strike tobacco blend in 1963 as part of its low tar cigarette studies. The objective of the research "was to determine the effect of increasing the Burley Tobacco in a blend on the yield of nicotine." MNAT00316738-6748 at 6738 (US 21226) (A).

2631. American experimented with adding commercial nicotine to its reconstituted tobacco in 1963. In an October 8, 1963 document entitled, "The Effect of the Addition of 1% Nicotine on the Quality of RC Tobacco," American revealed that it bought commercial nicotine

in the form of nicotine citrate, to increase the nicotine content of its reconstituted tobacco. X003371-3376 (US 85482) (O); MNAT00316688-6693 (US 21219) (O); see also MNAT00316683-6684 (US 21670) (O).

2632. According to a June 21, 1963 memorandum concerning tobacco blends for filter cigarettes, American researchers increased the amount of Burley tobacco in a blend to determine the effect the addition of the Burley tobacco had on the "nicotine yield." One of the research findings was that the addition of Burley tobacco "increased the volatile bases, including nicotine, in the smoke. . . ." X003421-3431 at 3421, 3424 (US 34158) (A). In other words, American found that including more Burley in the blend increases the amount of free nicotine in cigarette smoke. See US FF § III.C(2)(c)(iv) infra.

2633. Later, in 1967, American investigated the production of nicotine from tobacco plants (N rustica) with almost double the concentration of nicotine. MNAT00881318-1323 (US 21221) (O); see also, MNAT00316688-6693 (US 21219) (O).

2634. In 1968, American's researchers prepared four lots of Lucky Strike tobacco blend, and directed that twenty-five cartons of cigarettes be made from each lot. All four lots were "made up with a leaf blend to increase the nicotine level of this cigarette." MNAT00316699-6700 at 6699 (US 21616) (O); X003382-3383 (US 34156) (A). The company increased the nicotine content of Lucky Strike Menthol Leaf Blend by .2% and tested the product with smoke panels. X003388-3388 (US 34157) (A). Also in 1968, American studied adding nicotine maleate in the finishing flavor of Pall Mall cigarettes and successfully increased nicotine by .5%. X003365-3366 (US 34155) (A). Another American research memorandum from 1968 reported on the effects of adding reconstituted tobacco to leaf blends containing varying levels of nicotine. At all levels of reconstituted tobacco, a panel of 40 individuals preferred those cigarettes with the

highest nicotine levels, around 2.5% nicotine. X003363-X003364 (US 34154) (A). In early 1969, the company reported the anticipated costs of large scale orders to increase the nicotine content of reconstituted tobacco. MNAT00367431-7431 (US 85483) (O); MNAT00367429-7430 (US 85484) (O). Studies of Pall Mall cigarettes with increased nicotine in the reconstituted tobacco continued throughout 1969. MNAT00367486-7486 (US 85489) (O); MNAT00367423-7424 (US 85486) (O); MNAT00367422-7422 (US 59799) (A); MNAT00367420-7420 (US 85485) (O); MNAT00367418-7418 (US 85487) (O); MNAT00367417-7417 (US 85488) (O).

2635. In 1969, American test-marketed Lucky Strike cigarettes in which nicotine maleate was added to increase nicotine levels. MNAT0533253-3253 (US 21673) (O); MNAT00740105-0105 (US 21674) (O); ATX140008085-8087 (US 21676) (O).

2636. In a May 7, 1969 American memorandum from Timothy Mann to Preston Leake, scientist and eventual Director of Research and Development, regarding the panel studies already completed on the reconstituted tobacco with higher amounts of nicotine, Mann stated, "Taking the proposition of higher nicotine cigarettes in general, I think that this is an area we are going to be most interested in. Because of that, I would recommend to you that we consider testing additional ways of adding nicotine to cigarettes such as, as you suggested, in the form of a salt during the overshot process." MNAT00367425-7425 (US 85490) (O).

2637. The studies of adding nicotine to cigarettes were of great interest to executives at American; however, the company was cautious about openly discussing and reporting the "nicotine" work. On May 14, 1969, John T. Ashworth distributed a memorandum to other researchers, including Leake (eventual Director of R&D at American), that stated, "[i]n the future, our use of nicotine should be referred to as ‘Compound W,' in our experimental work, reports, and memorandums, either for distribution within the Department of for outside

distribution. In the event the nicotine is used in the form of a salt, such as nicotine dimalate, it should be referred to as ‘Compound WM,' if used as citrate salt, refer to it as ‘Compound WS,' etc." MNAT00533224-3224 (US 21220) (O); see also Henningfield WD, 93:9-94:5.

2638. American's extensive study of design techniques that would result in development of a high nicotine cigarette predated the recommendations by public health authorities that Cigarette Company Defendants contended at trial were the reason they such research.

2639. Many top-level executives met with and requested information from the company's scientists on the topic of nicotine research. MNAT00117626-7627 (US 59786) (O). In 1974, American Executive Vice President J.B. McCarthy requested that the R&D department outline the company's "current knowledge regarding increasing the nicotine content of reconstituted tobacco." In a four-page memorandum to McCarthy, dated June 5, 1974, researchers discussed: (1) adding nicotine to reconstituted tobacco; (2) replacing "the lower nicotine-containing leaf components such as Turkish . . . with high nicotine tobacco such as Malawi sun-cured scrap (5% nicotine)"; (3) keeping tobacco stem from being put into reconstituted tobacco "so that the reduction of the nicotine content of the ingoing components is decreased"; and (4) "increasing nicotine transfer to the smoke [by] dilution and/or additives to the filter." MNAT00316695-6698 at 6695, 6696, 6697 (US 21509) (O). McCarthy responded the very next day, endorsing raising nicotine levels as "very beneficial," and directing the researchers to continue their studies, even though some of the studies would be "slow and costly." McCarthy stated that this was "an important project," and encouraged the scientists to call on him directly if need be. MNAT00367409-7409 (US 85491) (O).

2640. Robert Sprinkle, an American scientist who worked extensively on product development and eventually became American's Executive Vice President of Research and

Quality Assurance, testified that American had target nicotine delivery levels for its products and designed its products to achieve those targets. Specifically, Sprinkle testified that American achieved the desired target amount of nicotine by knowing "what the nicotine content of each of the tobacco components is that makes up the cigarette. . . . We keep an inventory of tobacco, 24 months on average, and we know what the nicotine content of each type of tobacco we use by the stalk position by the crop year" and blended to achieve the desired level. Sprinkle PD, Carter v. American (*sub. nom.* Brown & Williamson), 1/19/96, 94:22-96:19, 99:1-15; see also, Sprinkle PD, Small v. Lorillard Tobacco Co., Inc., 10/16/97, 29:13-30:23, 71:11-14. Sprinkle also testified that American measured the nicotine content in tobacco after it was purchased, during the manufacturing process, and in the finished cigarette, and that if the measurement revealed that nicotine content was too low, American would "bury [its] mistakes," i.e., it would "throw it away and start again with a new blend." Sprinkle PD, Small, 10/16/97, 33:8-34:23.

(ee) Lorillard

2641. Lorillard knew in 1971 that the industry's top sellers at the time shared two common traits: high nicotine content and a high nicotine-to-tar ratio. With this knowledge, Lorillard blended different tobaccos in an effort to generate a high nicotine-to-tar ratio blend. By 1973, the company's one-, three-, and five-year research plans included research to modify tobacco in order to control the delivery of nicotine. 00776195-6201 (US 34293) (A); 526321304-1310 (US 85414) (O); Farone WD, 86:20-87:12; Spears PD, Minnesota v. Philip Morris, 9/23/97, 98:5-100:7.

2642. A July 22, 1976 memorandum from J.P. Morgan to H.J. Minnemeyer demonstrates that Lorillard added nicotine to several samples of the blend it used to produce Kent Gold Light cigarettes and periodically monitored the nicotine content of the blend in order

to determine the "shelf life of added nicotine on the Kent Gold Light blend." The memorandum also indicates that Lorillard periodically measured the pH of the samples with added nicotine. 83250849-0851 at 0850 (US 55671) (O).

2643. A November 22, 1976 memorandum from M.S. Ireland to H.J. Minnemeyer reported: "Since the initiation of the nicotine addition project was begun a number of samples have been made which have added impact but with reduced tar levels. . . . Experiments have indicated that free nicotine can be added at almost any place in the manufacturing process, or in the RL [reconstituted leaf] with no appreciable loss and that said nicotine will be delivered into the smoke in the same manner as naturally occurring nicotine. The addition of free nicotine has a direct effect on the pH of the leaf and the smoke." 94937063-7065 at 7063 (US 56780) (O).

2644. In an April 13, 1977 Lorillard memorandum, Minnemeyer reported to Alexander Spears on several approaches to the development of "low tar, enriched nicotine products" and concluded, among other things, that "nicotine can be added to the RL [reconstituted leaf] slurry to give predictable levels of nicotine in the final product. . . . The addition of nicotine to the RL slurry appears to overcome many of the problems associated with earlier work involving the spray application of nicotine solutions." 00044787-4799 at 4787, 4789 (US 34196) (O).

2645. In an April 12, 1977 report investigating the "Enrichment of Reconstituted Leaf Nicotine by Direct Addition of Nicotine Alkaloid to the RL Slurry," Lorillard researchers concluded the "[n]icotine content of the final product can easily be controlled by the addition of predetermined amounts of nicotine alkaloid." 00398474-8484 at 8474 (US 20025) (A), Farone WD, 96:7-19; see also 81090368-0380 (US 85457) (A); 83251170-1192 (US 55726) (O).

2646. On June 30, 1977, R.S. Marmor reported on Lorillard's "Danville Flavor Enriched RL Experiment of May 17, 1977 and Subsequent Research." In this project, Lorillard studied the

potential for using waste from tobacco processing that was high in nicotine, referred to as "black water," as an additive to reconstituted tobacco to increase nicotine delivery. 00118797-8807 (US 34268) (O).

2647. On April 14, 1994, Alexander Spears, then Vice Chairman and Chief Operating Officer of Lorillard, confirmed in testimony before Congress that cigarette makers could adjust the level of nicotine in their products by blending different types of tobacco to create a blend with a higher nicotine concentration. TLT0730001-0850 at 0722 (US 77011) (O).

(ff) Liggett

2648. Liggett's manipulation of nicotine through leaf blending and other manipulations of tobacco filler continues today. Timothy Jackson, Chief Operating Officer of Vector Tobacco, a Liggett Group Inc. subsidiary, wrote in an August 27, 2001 e-mail,

VDOJ25348-5248 (US 64735) (O) (Confidential).

2649.

Jackson PD, Philip Morris, 3/21/03, 54:9-54:13, 57:11-57:15 (Confidential).

2650. Jackson testified

Id., 95:3-98:3, 100:16-100:21 (Confidential).

(iii) Tar to Nicotine Ratio: Defendants Have Used Physical and Chemical Design Parameters to Modify the Tar to Nicotine Ratio of Their Products to Ensure Adequate Nicotine Delivery in All Cigarettes, Including Cigarettes Marketed as "Light," "Ultra Light," and "Low Tar"

2651. As the cigarette market increasingly shifted to products marketed as "low tar/low nicotine" cigarettes, Defendants undertook extensive efforts to manipulate the ratio of nicotine to tar in cigarettes in order to deliver more nicotine than might naturally be delivered by cigarettes with less tar. Their intent was to identify means to prevent nicotine delivery from dropping proportionately with tar in low delivery products. While Defendants' research and nicotine manipulation was used in the many "light," "ultra light," "mild," and "low tar" products brought to market since the 1960s and 1970s, Defendants directed their efforts to all types of cigarettes, including "regular" and "full flavor" brands.

2652. Cigarette Company Defendants sought to appear responsive to public health concerns regarding tar and nicotine without abandoning their fundamental need to provide sufficient nicotine delivery to smokers. Thus, despite claiming publicly that "nicotine follows tar," i.e., that the amount of nicotine delivered by a cigarette follows the amount of tar in a fixed ratio – the companies conducted years of research to develop methods of changing the ratio of tar to nicotine in tobacco smoke. Defendants implemented such methods to provide addiction creating and sustaining amounts of nicotine, while ostensibly lowering levels of "tar" and nicotine. Henningfield WD, 35:16-36:16, 74:9-16.

2653. The tar to nicotine ratio is a numerical expression of the proportion of tar and nicotine in cigarette smoke calculated by dividing the milligrams of measured tar by the milligrams of measured nicotine. When there is a decrease in the amount of tar delivered by a cigarette, the tar to nicotine ratio will stay roughly the same if there is a proportional decrease in

the amount of nicotine delivered. If a decrease in tar delivery is not accompanied by a proportional decrease in nicotine, the tar to nicotine ratio will be lower. Thus, Cigarette Company Defendants' documents that refer to dropping or lowering the tar to nicotine ratio are actually referring to **increasing** the amount of nicotine relative to tar in cigarette smoke. This can be illustrated by a simple mathematical comparison of two cigarettes with equal nicotine deliveries, one of which delivers 16 milligrams of tar and the other which delivers 10 milligrams of tar. If these cigarettes deliver 2 milligrams of nicotine, their tar to nicotine ratios will be 8 and 5 respectively. The 10 milligram cigarette would have higher proportion of nicotine relative to tar in its smoke, but its tar to nicotine ratio is lower than the 16 milligram cigarette. While most of the Defendants' documents refer to a tar to nicotine ratio, some refer to the mathematical inverse – the nicotine to tar ratio. An **increase** in the nicotine to tar ratio represents the same thing as a **decrease** in the tar to nicotine ratio, i.e., an increase in the amount of nicotine in smoke relative to tar.

2654. At trial, Defendants claimed that there is no evidence of that they manipulated the tar to nicotine ratios of their products because analysis of FTC data demonstrates that the tar and nicotine deliveries of their products have dropped proportionately over time. See Defs.' Closing Stmt., 6/8/05, 23141:1-6. Contrary to Defendants' contention, there is in fact such evidence in the record. See, e.g., Farone WD, 87:1-88:14 (unchallenged testimony describing Philip Morris's manipulation of tar to nicotine ratios in Merit brand). In any event, extensive evidence set forth herein, and more prominently in Section III.D, infra, proves that Defendants incorporated design parameters into their cigarettes that would accentuate the discrepancy between FTC nicotine deliveries and human smoking nicotine deliveries. The evidence demonstrates that Defendants manipulated the tar to nicotine ratios of their commercial products through means that they knew

would not be reflected in FTC testing; therefore, evidence that FTC nicotine deliveries have dropped proportionately with tar over time warrants limited evidentiary weight in assessing whether Cigarette Company Defendants actually manipulated the ratio of tar to nicotine in their products. Additionally, the testimony of Dr. Kessler demonstrates that the FDA's analysis of FTC nicotine yields resulted in the opposite conclusion, i.e., that nicotine levels did decrease less than tar levels over time according to their FTC yields. See Kessler TT, 9/23/04, 563:6-21; see also Kessler TT, 9/23/04, 547:4-14; Kessler WD, 1:10-17; 2:3-8; 20:16-22:6.

(aa) Filter Design

2655. There is evidence in the record that Defendants were aware of, and developed, filters that could limit or prevent smoker compensation. See, e.g., Farone WD, 124:4-125:7, 133:13-134:1. However, Cigarette Company Defendants instead researched, designed, and incorporated filters into their products that allow smokers to determine the amount of nicotine that comes out of the cigarette and into the lungs. Henningfield WD, 43:15-20. As researchers inside the industry explored potentially effective filters for tars, they well understood that if nicotine delivery was affected it could reduce the addictive properties of their product. Thus, Cigarette Company Defendants designed and manufactured filters that do not eliminate nicotine transfer into the body, but rather facilitate its addictive effects by assisting in quick delivery of sufficient dose of nicotine to the lungs. Id., 43:15-44:13.

2656. In the 1950s, when filters were put on more and more cigarettes, many in the public health community believed that filters trapped some of the suspected toxins that otherwise were ingested by smokers. However, the effectiveness of a filter with respect to any particular substance depends on: what the filter is designed to screen, the design of the filter, and the size of the particles that attempt to pass through it. Henningfield WD, 43:15-44:13.

2657. The design factors which influence the effectiveness of a filter include: its physical design, the density of the filter packing, the length of the filter, the porosity of the filter wrapper, ventilation holes and channels, and various potential ingredients. By varying these factors, Cigarette Company Defendants can manipulate a cigarette's nicotine yield as well as features affecting the palatability and absorption of nicotine. For example, the nicotine concentration of the puffs and the ratio of free base nicotine to bound nicotine can be influenced by the design of the filter. Henningfield WD, 43:23-44:8; Farone WD, 49:14-50:11.

2658. Tobacco manufacturers also use filters to control the particle size entering the body. The density, length, and ventilation of the filter can alter the ability of the smoke particles to coagulate and form particles in the brief transit from the tobacco column of the cigarette to the mouth of the smoker. If the particles are too big, they cannot efficiently get into smokers' lungs; if they are too small, they may not be transferred across membranes before exhalation. Physiologically, particles that are too large cannot efficiently get into the deep alveoli of the lung regardless of how hard the smoker sucks or smokes a cigarette. The importance of particles getting deep into the lungs is that, as with most addictive drugs in general, the faster the particles are delivered to the brain, the stronger their effect. Cigarette Company Defendants knew that the fastest way to get the drug to the brain is through the lung. Henningfield WD, 44:14-45:22; see also Farone WD, 50:7-8; 58:20-59:14.

(bb) Ventilation and Air Dilution

2659. Ventilation holes are small perforations in cigarette paper that dilute mainstream cigarette smoke with air during inhalation. Henningfield WD, 46:11-22; Farone WD, 42:11-14. Ventilation holes are created by perforation that can be done with lasers, mechanically, or electrostatically. Henningfield WD, 46:4-7.

2660. By diluting mainstream cigarette smoke with air, ventilation holes ostensibly reduce the concentration of tar and nicotine in the smoke and result in a decrease in the tar and nicotine ratings generated by FTC testing. Henningfield WD, 46:11-22. However, ventilation holes are generally placed on the cigarette filter at a distance beyond which they would by covered by the orifice of the FTC smoking machine, and therefore the reductions in FTC measurements caused by filter ventilation do not necessarily translate to reductions in nicotine delivery under human smoking conditions, where ventilation holes are frequently blocked by smokers' lips or fingers. Henningfield WD, 47:7-10. Cigarette Company Defendants have long been aware that the use of ventilation holes accentuates the differences in tar and nicotine yields observed under standard FTC smoking conditions and human smoking conditions. Henningfield WD, 61:1-62:6.

2661. Ventilation holes also change the chemistry of smoke by adding air to the smoke. Since the air enters closer to the filter end, it also slows down the smoke behind it, giving that smoke more time to undergo further chemical changes. Farone WD, 57:6-9. It was understood by the industry that one way ventilation changes smoke chemistry is by increasing the pH of smoke. See, e.g. 00044525-4528 (JE-34191) (A). Another change to the chemistry of smoke caused by air dilution is an increase in the nicotine concentration of mainstream cigarette smoke, and Cigarette Company Defendants are aware of this. Farone WD, 88:17-89:13, discussing 1001883866-3870 (US 35572) (A); Henningfield WD, 46:19-20.

2662. Defendants admit that the filter ventilation techniques used in their commercial products are less efficient at filtering nicotine than filtering tar and other components of cigarette smoke, i.e., the filters do not reduce the amount of nicotine in proportion to their reduction of other smoke components. American has stated:

> The American Tobacco Company pioneered the commercialization of filter ventilation to afford the smoking public alternatives for lower ‘tar' and nicotine delivery cigarettes. . . . Although filter ventilation reduces the delivery of all mainstream smoke components, all components are not reduced in the same proportion. An inherent consequence with filter air dilution is removal efficiency that is slightly greater for ‘tar' than nicotine. Increasing the degree of filter air dilution increases the magnitude of this relationship.

VXB3580006-0004 at 0019 (US 65263) (O). Thus, the use of such filter ventilation techniques results in an increase in the nicotine-to-tar ratio of mainstream cigarette smoke inhaled by a smoker. See Henningfield WD, 76:5-10, 76:23-77:7; 00044525-4528 (JE-34191) (A); 00044537-4544 (US 34194) (A).

(cc) Paper Porosity and Composition

2663. The Cigarette Company Defendants also have used paper porosity and composition to affect delivery of nicotine to smokers. The paper used for cigars and hand-rolled cigarettes does not burn well and evenly, and it often self-extinguishes. Cigarette paper used on manufactured cigarettes is different. It is treated with both chemicals that can affect nicotine delivery and burn accelerant chemicals that make the cigarettes burn hotter and faster. The result is that less nicotine is delivered to FTC smoking machines than under human smoking conditions because the FTC machine puffs less frequently than do most people. Henningfield WD, 63:19-64:4, 64:8-18. Some of the chemical additives that affect nicotine delivery in commercial cigarettes are buffering compounds, including alkaline compounds, which make the paper white and keep the ashes a relatively attractive light grey color, and burn accelerants, such as sodium and potassium citrate. Henningfield WD, 64:5-18.

2664. The porosity of cigarette paper refers to the relative amount of air that can permeate or pass through the paper. Air fuels the burning and smoldering tobacco. Henningfield

WD, 62:23-63:3. The cigarette paper used by Cigarette Company Defendants to manufacture their commercial products is of controlled porosity. Controlling porosity is another means of controlling the composition and amount of smoke that is collected by smoking machines by altering the mix of gases, temperature of the burning tobacco, and the speed at which the cigarette is burned. Henningfield WD, 62:22-63:18.

2665. Another feature of cigarette paper that can affect nicotine delivery to human smokers is the filter overwrap. The filter overwrap is a layer of tough, glued paper that attaches the filter to the tobacco rod and is composed of materials that resist decomposition when held in the lips. Farone WD, 42:10-11; Henningfield WD, 64:22-65:3. The filter overwrap typically extends beyond the filter from a range of a few millimeters to nearly one centimeter. Henningfield WD, 65:1-3. The parameters of FTC testing dictate that the machine stops smoking at a point that is 3 millimeters beyond the filter overwrap, which means that the smoking machine does not burn all of the tobacco in a cigarette. Id., 65:4-10.

2666. Human smokers, of course, can and often do smoke cigarettes all the way to the filter overwrap, providing smokers the equivalent of a few extra puffs of tar and nicotine. These extra puffs are significant because they are more tar and nicotine laden than earlier puffs of tobacco that are farther from the filter. This is true because, with each successive puff on a cigarette, the remaining tobacco and the filter collect tar and nicotine which can, in turn, be released by continued puffing and because the filter loses efficiency with each successive puff. Thus, a few extra puffs beyond those measured in FTC testing can mean disproportionately large increases in tar and nicotine exposure because the smoke from these extra puffs is highly concentrated with tar and nicotine. Henningfield WD, 65:11-21.

2667. During the cross examination of Dr. Henningfield, Defendants attempted to

establish that smokers do not smoke the tobacco under the overwrap. See, e.g., Henningfield TT, 11/20/04, 7300:23-7301:25. In fact, Dr. Henningfield had already stated during his live direct examination that "there is wide variability" among smokers as to how long a butt they leave, and "most smokers don't smoke most" of the tobacco under the overwrap. Henningfield TT, 11/22/04, 6797:2-22. However, Dr. Henningfield's testimony established the important point that studies show that smokers who have to work for cigarettes or have the number of cigarettes restricted do smoke beyond the overwrap, and that the concentration of tar and nicotine increases for each successive puff on a cigarette. Id., 6796:8-6797:22; see also Henningfield WD, 64:19-65:21. Thus, the overwrap is yet another design feature by which Defendants ensure a particular FTC tar and nicotine yield, while giving smokers another mechanism to receive actual doses that substantially exceed those FTC ratings.

(dd) Cigarette Company Defendants' Internal Research Documents Reveal That They Researched These Various Design Parameters and Implemented Them into Their Commercial Products for the Purpose of Assuring Delivery of Levels of Nicotine Sufficient to Create and Sustain Addiction

(aaa) Philip Morris

2668. As early as 1954, Philip Morris was already testing other companies' cigarettes to "ensure fuller evaluation of relative filter efficiency and of the composition of the smoke and the tobacco blends." 1001761472-1484 at 1476 (US 35556) (A).

2669. By the late 1950s, Philip Morris was studying the impact of particle size on nicotine and tar delivery. P.E. Resnick, Supervisor of the Physical Section of the Research and Development Department, exchanged correspondence with General Electric in early 1959 regarding a small particle detector. PM3000136166 (US 61554) (O); PM3000136167-6173A (US 61553) (O).

2670. Philip Morris understood more than forty years ago that a high nicotine-to-tar ratio was important in formulating a successful cigarette strategy. A February 9, 1960 memorandum from L.L. Long, Research and Development Engineer, to A.B. Clarke, Research and Development Scientist, and copied to Robert Seligman, who became Vice President of Research and Development, discussed Philip Morris's ongoing efforts to manipulate the amount of nicotine received by a smoker through concentration of nicotine in tobacco smoke while maintaining lower levels of tar. Long wrote:

> One of the objectives of the 1960 cigarette project is the control of TPM ["total particulate matter," or tar] at a low level while maintaining the nicotine level in the smoke at its current level of about 1 mg/cigt. Several years ago some work was conducted along these lines. Nicotine Maleate was added to a low nicotine filler with a resulting increase in nicotine in the smoke. It would be most helpful if you could conduct some investigation in this area along with your work on nicotine control through extraction.

1001919958-9958 (US 85460) (O). This issue received further attention throughout 1960. 1001919941-9941 (US 21753) (A).

2671. Philip Morris also knew no later than 1961 how to remove nicotine entirely from cigarettes, demonstrating Philip Morris's ability both to manipulate and control the level of nicotine in its cigarettes. In March 1961, Helmut Wakeham, then Philip Morris's Vice President and Director of Research and Development, reminded Philip Morris President Hugh Cullman that, "we have available in Research and Development two processes for reducing nicotine in smoke. . . ." 2021657722-7722 (US 20352) (A); Farone WD 73:21-74:3, 90:23-91:11.

2672. In 1962, Cullman instructed Wakeham, to evaluate Reynolds's processing methods because Cullman had determined that Reynolds's cigarettes were "significantly lower in T.P.M. [tar] for a given nicotine level than all other cigarettes tested, including those of Philip Morris." Cullman had also concluded that Reynolds's method of controlling T.P.M. did not

involve "any of the variables generally tested," was likely not "accomplished through leaf selection," but rather was most likely "the result of a method of tobacco processing, or the use of certain additives, not yet generally known to the rest of the industry." Thus, in light of his conclusion that a high nicotine-to-tar ratio would be important to the company's future, and that Reynolds might obtain a competitive advantage in this area, Cullman instructed Wakeham to research the issue further. 1000235191-5193 at 5191 (US 20082) (O). Philip Morris scientists conducted the research requested by Mr. Cullman and concluded, among other things, that to match the "high nicotine to T.P.M. ratio" found in RJR's brands, "[i]t would be possible to control the necessary variables through blending." 2022241584-1587 at 1584 (US 36850) (O); see also US FF § III.C(2)(c)(ii), supra.

2673. On March 26, 1964, Philip Morris scientists provided an outline of their work on a "1965 Cigarette" that would have lower tar amounts but that would still contain at least 7 milligrams of nicotine per cigarette. The scientists focused on the question, "Can we transfer nicotine from filter to smoke?" The same outline set forth goals for a "1966 Cigarette" that would provide "optimum nicotine in relation to flavor and impact." 1001901299-1310 at 1301, 1309 (US 35573) (A).

2674. The Philip Morris Research and Development Department wrote, in a document titled, "Project 0706: Flavor and Aroma of Tobacco and its By-products," that one of the accomplishments of this project in 1964 was to find that "[a]dded nicotine seems beneficial to the smoke flavor enhancement of hi-fi cigarettes. . . . Better efficiency in nicotine delivery results from filler than filter additives." 1000849809-9811 at 9810 (US 35476) (A); Farone WD, 101:7-102:1.

2675. Notes taken by a Philip Morris employee referring to questions for "low tar"

product design demonstrate Philip Morris's desire to produce a lower tar cigarette with adequate "nicotine to keep a man hooked?" 2078099704-705 at 9704 (US 85420) (A).

2676. A March 24, 1969 Philip Morris memorandum demonstrates that the company had considered several different filters, air dilution, and improved internal filtration, and had determined the effects that these methods would have on the tar and nicotine levels read using the FTC method. The memorandum states that "[t]here does appear to be a definite increase in nicotine concentration as the percentage dilution increases," demonstrating that Philip Morris could increase the nicotine-to-tar ratio by increasing the amount of air dilution from ventilation. 1001883866-3870 at 3867 (US 35572) (A); Farone WD, 88:17-89:13.

2677. Philip Morris's Cathy Ellis has admitted that, during the 1970s, Philip Morris looked into increasing the nicotine delivery in its cigarettes while at the same time decreasing tar levels. Ellis testified that one method of achieving the higher nicotine delivery level was through selective tobacco blending. Ellis PD, Mississippi, 3/20/97, 92:21-93:18.

2678. Philip Morris often used human smokers to provide results for different tests it ran regarding nicotine delivery, sometimes sending samples to identified smokers in the public and oftentimes using its own employees as subjects, asking them to take part in smoking studies and then analyzing the results in order to inform not only its research but also the production and marketing of its product. 2025986931-6935 (US 37314) (A); 1000408760-8809 (US 35272) (O).

2679. Philip Morris conducted multiple consumer research studies to determine the acceptability of various tar-to-nicotine ratios. Studies conducted in the early- and mid-1970s tested smokers' reactions to "low tar, high nicotine" cigarettes. These studies provided evidence that consumers preferred nicotine-to-tar ratios that were higher than those that occur naturally in tobacco. 1000351570-1595 (US 85423) (O); 1003288950-8967 (US 20166) (A); 1003288934-

8949 (US 20165) (A); 2024545758-5773 (US 20402) (O); 1000048633-8654 (US 20075) (O); 1000350159-0186 (US 35241) (A).

2680. In a January 18, 1971 memorandum from psychologist Thomas Schori, to L.L. Long, Research and Development Engineer, Schori described a human smoking survey in which Philip Morris would mail to 600 Marlboro smokers ten experimental packs of four cigarettes each, with each pack having varying tar and nicotine levels, between .33 mg to 1.3 mg of nicotine per cigarette. The memorandum plainly stated, "Nicotine will be added as needed." 1003285444-5445 at 5444 (US 35692) (O).

2681. In 1971, Philip Morris asked some of its own employees to participate in a smoking study in order to "find out how the nicotine and tar levels of cigarettes affected their acceptability and consumption." One of the conclusions of the study was that the number of cigarettes the employees smoked per day was directly correlated to the nicotine levels, but not to the tar levels. 1003285443-5443 (US 85421) (O).

2682. In November 1971, Philip Morris issued a special report on "Tar, Nicotine and Smoking Behavior," written by Schori and approved by William Dunn, Associate Principal Scientist. The report, which involved analyses of the results of tests involving human smokers, concluded that "tar deliveries of the currently best selling cigarettes might be reduced somewhat, leaving nicotine as it is, without any significant overall decrease in the cigarettes' acceptability." The study also found that test subjects received similar amounts of tar and nicotine each day, regardless of the levels available in the cigarettes they were smoking, thus proving that compensation existed. 1000350158-0188 at 0161 (US 20176) (A); Henningfield WD, 94:6-13; Farone WD, 110:6-9, 110:15-111:4.

2683. Philip Morris continued such research into 1972. On September 8, 1971,

company R&D scientists, including Dunn, wrote to Paul Eichorn, then Manager of Technical Planning and Information Development, stating their intent to "concentrate upon the nicotine/tar ratio as a factor in determining cigarette acceptability." The goal was to determine the "optimum" nicotine/tar ratio levels. The plans for 1972 included a focus on nicotine delivery between .3 and 1.2 mg of nicotine per cigarette "with a **systematic manipulation of the nicotine/tar ratio at incremental nicotine levels within this range**." 1003289951-9954 at 9951 (US 85422) (A) (emphasis added); see also, 1000351570-1595 (US 85423) (O); 1003288521-8545 (US 35683) (O) (US 35719) (O).

2684. Correspondence between the Marketing Department and the Research Center at Philip Morris in 1972 reflects the company's desire to increase its share of the menthol cigarette market, then dominated by B&W's Kool cigarettes, by manipulating the nicotine-to-tar ratio and overall nicotine levels in Philip Morris's own menthol cigarettes, such as Alpine. 2022244795-4801 (US 85424) (O).

2685. In a July 8, 1974 letter from Philip Morris's Helmut Wakeham to Max Hausermann of Philip Morris Europe, Wakeham acknowledged receipt of a Research Progress Report from Hausermann and responded to studies highlighted in the report that had found discrepancies between the way that humans smoke cigarettes compared to the FTC smoking machine's workings. Wakeham agreed that Philip Morris had found evidence of the same phenomenon. He advised Hausermann not to publicly share this information:

> There is concern that if in the light of new findings, we are too strong in denunciation of the present test as being unrealistic, then some advocates might claim the advertised numbers are false and misleading. . . .
> I am not suggesting we defer the research or neglect to apply it to our product problems.
>
> We should by all means use it to the best of our advantage. On the

> other hand, I would propose deferring publication or presentations to committees or conferences, particularly those attended by our competitors, for obvious reasons.
>
> Let us pursue the research and hold back on the publicity until we can agree on some pro-industry approach to the problem.

1004863921-9975 at 3921 (US 35921) (O); 1000356550-6576 (US 85425) (O); 0000258064-8064 (US 85426) (O).

2686. A study concluded in 1975, and distributed widely throughout the Philip Morris Research Center, confirmed that the "optimum nicotine to tar (N/T) ratio for a 10 mg tar cigarette is somewhat higher than that occurring in smoke from the natural state of tobacco. . . ." As a result, as detailed in the Special Report entitled, "Low Delivery Cigarettes and Increased Nicotine/Tar Ratios, A Replication," the researchers added nicotine to cigarettes in the form of nicotine citrate. The document urged development of:

> [a] low delivery cigarette that will both look and taste like a regular filter cigarette and thus will appeal to current regular filter smokers. . . . If a low delivery cigarette with impact and flavor were developed, it may cause the segment of current regular filter smokers who are concerned about their health but demand a flavorful cigarette to voluntarily switch to the low delivery cigarettes. This may seem at first to be a senseless venture since it might result in Marlboro smokers switching to this low delivery cigarette. However, we must recognize the possibility that if we do not develop such a cigarette, it may be developed by another tobacco company.

1003288950-8967 at 8951, 8954, 8952 (US 20166) (A); 2076738596-8619 (US 43894) (A).

2687. An additional study, entitled, "Low Delivery Cigarettes and Increased Nicotine/Tar Ratios, III," was conducted in 1976 and continued to find that many smokers preferred a cigarette with a higher nicotine/tar ratio, accomplished through the addition of nicotine citrate to the cigarette. 1003288934-8949 at 8943 (US 20165) (A). Studies involving nicotine citrate continued into 1977. 1003285418-5418 (US 85427) (A); 2081925847-5856 at

5851 (US 88784) (A).

2688. It is clear that the research during the 1970s focused on how to retain nicotine delivery even if tar levels would be reduced. It is also clear that Philip Morris was studying nicotine primarily because of its pharmacological effects, not because of "taste." Farone WD, 85:7-23; DeNoble WD, 9:23-10:4.

2689. Philip Morris found it important to be at the forefront of nicotine study in order to understand its pharmacological and chemical characteristics and capabilities. In a February 3, 1978 memorandum to Tom Osdene, then-Director of Research, research center scientists summarized a proposal to involve Philip Morris more heavily in biological studies of nicotine. The scientists wrote, "[o]ur present area of expertise is our knowledge of nicotine structure, chemistry and the ability to prepare nicotine analogues almost at will. . . . If our nicotine program is to be at the forefront of nicotine research and to have an influence on the course of events with respect to the tobacco industry, we must be willing to upgrade our testing program." The scientists proposed pharmacological and psychopharmacological research, as well as collaboration with outside experts, all of which were ultimately undertaken by Philip Morris. 1000128656-8659 at 8657 (US 34423) (A); Henningfield WD, 99:2-15; 1000366976-6995 (US 35253) (O); 0000128660-8661 (US 85404) (A).

2690. A December 6, 1978 memorandum from William Dunn to Thomas Osdene, with the subject heading "Plans and Objectives 1979," indicated that Philip Morris had previously researched "the optimal nicotine-to-tar ratio:"

> To what extent does the presence of detectably more or detectably less nicotine in smoke affect the acceptability of low-delivery cigarettes. This question is related to the **optimal nicotine-to-tar ratio, a problem we have addressed before** at higher delivery levels.

2022150943-0951 at 0947 (US 85254) (A). This memorandum also demonstrates that Philip Morris took measures to increase the nicotine-to-tar ratio of its lower delivery products, identifying the nicotine delivery, the FTC tar delivery, and the nicotine-to-tar ratio for many of its products, including "lights." 2022150943-0951 at 0947 (US 85254) (A). Dr. Jerry Whidby, Philip Morris scientist from 1972 to 1998 and presently a paid consultant for Philip Morris, who held the title of Senior Fellow – the highest non-management scientific position at Philip Morris – acknowledged during his trial testimony in this case that nicotine deliveries identified in this memorandum "show[] almost uniformly that the brands with the lower FTC tar deliveries actually have higher nicotine-to-tar ratios." Whidby TT, 2/22/05, 14015:8-14016:14.

2691. Although Philip Morris has claimed in public statements that its efforts were focused on lowering tar levels, and that nicotine levels automatically dropped by equal proportion, Philip Morris's emphasis on nicotine, including how to control nicotine level independently of tar levels, is clear from the abundance of research and discussion that went into this topic. One part of this focus on nicotine, as outlined in a March 21, 1978 memorandum from scientists J.I. Seeman, Carolyn Levy, and E.B. Sanders to Thomas Osdene was Philip Morris's "Nicotine Program." The program was described in the memorandum as "aimed at elucidating the basic mechanisms of action of nicotine with a major goal of understanding and controlling the physiological effects of 'smoke.'" 1000128638-8644 at 8638 (US 86949) (A); Levy WD, 5:5-6:31; see also 2031436002-6002 (US 20433) (O).

2692. An April 17, 1980 Philip Morris USA memorandum from P.A. Eichorn to R.B. Seligman with subject-heading "Reynolds' Proposal to Lower Nicotine in the New Flue-Cured Varieties" indicates Philip Morris's control over the nicotine levels of its cigarettes. In response to a proposal by RJR that the companies lower the nicotine content of their cigarettes, Mr.

Eichorn of Philip Morris wrote: "From our viewpoint, I don't think lowering of standards to be desirable. **To do so would put us in a position of minimal control of nicotine levels which we are able to adjust as needed with present technology**." 1000779209-9209 (US 90178) (A); Whidby TT, 2/22/05, 14019:2-14021:1, 14021:22-14022:5.

2693. By 1982, Philip Morris had the ability to manufacture experimental cigarettes containing very low amounts of nicotine. Consumer acceptance of these cigarettes was very low. Philip Morris concluded that consumers would not accept over a long period of time cigarettes with a minimum amount of nicotine. Nicotine-free cigarettes therefore were determined to be "most unacceptable." Nevertheless, Philip Morris revived the idea of a nicotine-free cigarette in the late 1980s. After a period of test marketing, the cigarette was withdrawn from the market. 2000515580-5580 (US 20297) (O).

2694. A Philip Morris document titled "Tentative Agenda Richmond Meeting – August 2, 1983 Product With Most Desirable Smoke Characteristics Future Product Trends," set out a plan to develop a cigarette that reduced delivery "under actual smoking cond[itions]" by increasing nicotine delivery relative to tar: "[C]an show. . . how to balance nicotine level **to achieve a real low delivery cigt. under actual smoking cond** . . .Make a series of cigts. w/low tar & varying nic." 1003177954-7957 at 7957 (US 35661) (A); Whidby WD, 64:1-18.

2695. Beginning in 1989, Philip Morris briefly sold denicotinized cigarettes in test markets under the Next (Nicotine Extraction), Merit De-Nic, and Benson & Hedges De-Nic brands. 2021391458-2071 at 1539 (US 36741) (A); TLT0730001-0850 at 0407 (US 77011) (O). The company used a "supercritical fluid extraction" process to manufacture cigarettes that "had virtually no nicotine, but about 14 mg. of tar by the FTC method." Farone WD, 91:8-11. This confirms Philip Morris's ability to manipulate nicotine, to the point of removing virtually all

nicotine, in the delivery from a cigarette.

2696. Philip Morris scientist Frank Gullotta conducted research for the company in the early 1980s, including human smoking studies, that involved holding tar levels constant and varying nicotine levels, in order to discover human smoking reaction to increased levels of nicotine delivery. This research informed his search for the optimal nicotine delivery level. 2025986350-6401 at 6393 (US 87080) (A); 2023105617-5623 (US 85464) (O).

2697. In a November 8, 1990 memorandum, Philip Morris scientists Frank Gullotta, Cynthia Hayes, and Bobby R. Martin wrote to Cathy Ellis, then Manager of the Biochemical Research Division and later Senior Vice President, Worldwide Scientific Affairs for Philip Morris, regarding "past, present and future" contributions of "Electrophysiological Studies to P.M. USA." The scientists listed first among their accomplishments, "Experiments conducted in our laboratory led us to the idea of how to produce an acceptable low tar cigarette. **It was our work which led to the development of cigarettes with altered tar/nicotine ratios.** The tobacco blend which we advocated . . . is now being used in Project Bold and may soon find its way to the marketplace." Another accomplishment was research showing that **"there are optimal cigarette nicotine deliveries for producing the most favorable physiological and behavioral responses,"** and that "**all forms of nicotine are not behaviorally or physiologically equal**." 2028813366-3368 at 3366, 3367-3368 (US 20430) (A) (emphasis added); Henningfield WD, 102:2-10.

2698. Philip Morris continued into the 1990s to study various nicotine delivery levels while holding tar levels constant. In some of these studies, Philip Morris also examined the interactions between menthol, nicotine, and tar levels in cigarettes, determining how menthol levels in cigarettes with different levels of nicotine affected smoker impact. These studies

included human smoker studies. 2028813366-3368 (US 20430) (A).

2699. At trial, Dr. Jerry Whidby denied that nicotine is one of the parameters Philip Morris uses to design its cigarettes Whidby WD, 2:3-7; 4:18-5:3; 16:4-7. However, Dr. Whidby admitted that, "[f]rom the 1970s until today, Philip Morris has . . . used computer models that predict tar and nicotine delivery according to the FTC Method based upon the design of the cigarette that you put into the program." Id., 16:13-16. Dr. Farone testified that these computer models were used by Philip Morris to adjust, among other things, the nicotine delivery of commercial cigarettes to the target level desired by Philip Morris. Farone WD, 47:7-18, 53:4-9.

2700. Dr. Whidby also testified at trial that Philip Morris's Merit Ultima cigarette has a higher nicotine-to-tar ratio than full flavor cigarettes, and that this cannot be explained solely by "filtration efficiency." He further admitted that Philip Morris's Merit Ultima cigarettes uses a "higher nicotine blend" of tobacco. Whidby TT, 2/22/05, 14056:19-25; 14110:24-14111:14.

(bbb) R.J. Reynolds

2701. No later than 1972, RJR recognized an urgent need, in order to have a competitive advantage in the marketplace, to develop a lower tar cigarette that would deliver a high level of nicotine. In a May 19, 1972 internal memorandum to Claude Teague from Frank G. Colby, Manager of Scientific Information, Colby recounted a conversation he had with an employee of Imperial Tobacco Company while preparing for an industry-wide conference: "He explained in some detail how desirable it would be to have a high nicotine tar ratio cigarette, but said that unfortunately he did not have any idea how to realize this technologically. Naturally, I did not mention in any way our interest in this subject." Colby also reported his suspicion that Philip Morris already was developing a high nicotine cigarette. Colby concluded: "I feel these two incidents prove that the high nicotine tar ratio cigarette is a concept which is ‘very much in the

air.' We should definitely make an effort to be first." 500790798-0798 (US 20651) (O); see also 500901543-1545 (US 85428) (O).

2702. In a March 28, 1972 paper from Claude Teague to E.A. Vassallo and Murray Senkus, who became Vice President of Research and Development, Teague noted that he believed Reynolds had identified the minimum nicotine delivery required to make a cigarette "acceptable" to a smoker as 1.3 milligrams. Teague's paper, entitled "A Gap In Present Cigarette Product Lines And An Opportunity To Market A New Type Of Product," advocated that Reynolds take advantage of the so-called gap in product lines by developing a cigarette that would deliver 1.3 milligrams of nicotine while delivering less tar than any current product: "[A]t the desired nicotine delivery, calculated to be 1.3 mg., the smoker will chose [sic] the cigarette offering the lowest T/N Ratio, if other qualities are satisfactory. With current brands at or even near the desired nicotine level, the smoker is offered no brand with a T/N Ratio below 13. Indeed, of all 121 brands tested by the FTC, the only one with a T/N Ratio less than 13 is Carlton, and it delivers only 0.4 mg. of nicotine." 500790776-0784 at 0776 (US 29473) (O) (emphasis in original).

2703. An undated RJR document setting forth the objectives and strategies of its Tobacco Development Department reveals that Reynolds's early strategies for developing reduced tar products focused primarily on how to maintain adequate nicotine delivery if tar levels dropped. The document identified the "need for increased smoker satisfaction" as a key issue, and Reynolds's strategies for maintaining and improving smoker satisfaction included "proceed[ing] with tar reduction programs maintaining maximum nicotine deliveries in the smoke" and "study[ing] all means to maximize nicotine content of tobaccos and delivery to the cigarette smoke . . . [including] agricultural practices, leaf purchase program, blending,

processing, nicotine transfer efficiency, casing levels, added nicotine, selective filtration, effect of wrapping materials." 504658762-8769 (US 85429) (O).

2704. In recommending development of a new "youth-appeal brand," Frank G. Colby, Manager of Scientific Information, wrote in a December 4, 1973 memorandum to R.A. Blevins, Jr., about the importance of assuring that the new product delivered sufficient nicotine:

> In my judgment, for public relations reasons it would be impossible to go back all the way to the 1955 type cigarettes. As far as tar and nicotine in the smoke are concerned, I believe it should be possible to achieve the desired effect by going to a tar level of today's Pall Mall (non-filter type) of about 29 mg of tar and 1.8 mg nicotine. Still, with an old-style filter, any desired additional nicotine 'kick' could be easily obtained through pH regulation.

501166152-6153 at 6152 (US 23051) (A) (emphasis in original); Henningfield WD, 75:22-76:1, 78:1, 79:16-20.

2705. On June 5, 1974, a meeting occurred between individuals from RJR's research department and RJR's advertising agency, Tatham-Laird & Kudner, Inc., "to review a selected group of technical developments in the cigarette category . . . [and] to determine whether any of the technical developments to date could, at this time, be utilized in the development of new brands for marketing." The memorandum memorializing this meeting demonstrates that one of the technical developments discussed was a low tar/high nicotine cigarette: "Until this development, tar and nicotine went either up or down in a cigarette simultaneously; **the technical development here has enabled RJR to deal with these two elements separately and therefore each can be controlled at virtually any given level desired.**" 501186367-6369 (US 20673) (O) (emphasis added).

2706. In May 1976, Reynolds's Research Department prepared a document entitled "Planning Assumptions and Forecast for the Period 1977-1986+ for R.J. Reynolds Tobacco

Company." The document demonstrates Reynolds's recognition of the significance of the need for research concerning the minimum level of nicotine that must be delivered to a smoker in order to keep a smoker addicted to cigarettes. Envisioning cigarettes delivering less than 0.8 milligrams of nicotine, RJR acknowledged that:

> **[I]t is essential that we are fully aware that, at these nicotine levels, smoking cessation will be very much facilitated. Some 'farmed out' or in house research on determining the minimum nicotine level (at the highest 'acceptable' pH) for providing 'satisfaction' should be considered.**

500884613-4638 at 4619-4620 (US 85430) (O) (emphasis added); see also, 504707350-7372 at 7365 (US 86950) (O); 504424968-4976 (US 86951) (A).

2707. RJR analyzed Cambridge filter pads - the pads used to collect tar and nicotine during the FTC smoking test - and found it "disturbing" that the filter pads removed a large amount of smoke nicotine. This, and other findings on nicotine, fueled Reynolds's interest in discovering means for control of nicotine and nicotine satisfaction with RJR cigarettes. 505024234-4244 at 4235 (US 86952) (A); Green WD, 64:6-9.

2708. According to an August 19, 1976 report entitled "New Product/Merchandising Directions A Three Year Action Plan," R.J. Reynolds's "**top priority [was] to develop and market low 'tar' brands that: [m]aximize the physiological satisfaction per puff – the single most important need of smokers.**" Reynolds was not content to allow tar reductions to effect a proportionate reduction in nicotine: "It would be more desirable from our standpoint, i.e. providing satisfaction to the smoker and maintaining his allegiance to smoking if we could reduce 'tar' to whatever target we choose without a proportionate drop in nicotine." The report also outlined Reynolds's "approaches to decreased T/N ratio," including the development and commercialization of high nicotine tobacco, the development of "means to supplement nicotine"

in tobacco, and the development of "means to increase nicotine transfer in smoke." 500672011-2172 at 2054, 2111-2112 (US 20645) (A) (emphasis in original).

2709. An August 23, 1976 document titled "MBO Performance Report," outlined the objectives and activities of "Project 1250," a research project carried out by RJR's Chemical Research Division for the purpose of "search[ing] for fundamental information which will lead to new techniques and methods of altering and controlling nicotine/ 'tar' ratio, which will define important factors related to optimum nicotine level and smoker satisfaction." The report demonstrates that, through Project 1250, Reynolds was fully committed to developing its knowledge regarding the various ways to control nicotine content and delivery in low tar cigarettes. For example, the report defined Reynolds's objectives for 1977 as including: (1) "Identify factors influencing nicotine delivery efficiency, and determine means to increase nicotine to 'tar' ratio"; (2) "Determine minimum 'tar'-nicotine levels for smoker satisfaction through panel testing and study effect of varying nicotine levels on low 'tar' blends"; (3) "Evaluate existing competitive brand data and crop analyses to determine factors related to nicotine and 'tar' delivery"; (4) "Evaluate various experimental and foreign tobaccos to determine the effect of these materials on 'tar' and nicotine delivery"; and (5) "Continue casing studies, particularly the effect of sugar on nicotine delivery." 511526479-6481 at 6479 (US 85431) (O); see also 502966364-6374 at 6364-6367 (US 85432) (O).

2710. In a January 5, 1977 memorandum on the subject of "Nicotine-Related Research," D.H. Piehl, Manager of Reynolds's Chemical Research Division, informed a large group of RJR employees that "[i]n 1977 we will be increasingly concerned with discovering new means for control of nicotine, tar to nicotine ratio and satisfaction in our products." 502740087-0087 (US 85433) (O).

2711. On May 19, 1977, W.M. Henley sent a memorandum to Piehl concerning Reynolds's "Project 1250: Methods of Controlling Tar, Nicotine and Satisfaction." Henley outlined the research activities that were already underway in support of Project 1250's objective – to "identify factors influencing nicotine delivery efficiency and determine means to manipulate nicotine/tar ratio to provide a more satisfying smoke." The memorandum demonstrates that Reynolds was actively researching a variety of means to increase nicotine delivery to smokers of low tar cigarettes to assure that smokers would achieve "satisfaction," i.e., that smokers would ingest sufficient nicotine to keep them addicted to low tar cigarettes. 504476706-6706 (US 85434) (O).

2712. In a January 4, 1978 memorandum, entitled "Nicotine and Smoker Satisfaction," D.H. Piehl wrote to Alan Rodgman, RJR scientist, that an objective of the 1977-1978 research was to "[d]etermine the means to alter and control ‘tar'/nicotine ratio and increase nicotine transfer efficiency" with the objective of maximizing smoker satisfaction. 504423322-3327 (US 50614) (O) (emphasis in original).

2713. The progress made by RJR in researching and developing means to increase nicotine delivery to smokers of low tar cigarettes is evidenced in Piehl's 1979 work plan. The work plan, which set forth the objectives and the results achieved by the Chemical Research Division, indicated that Reynolds had identified the "optimum and minimum nicotine deliveries that maximize satisfaction" for full flavor cigarettes; established the "optimum T/N for . . . low ‘tar' cigarettes in house"; and demonstrated through research that "nicotine can be substantially relocated from one blend component to another, without affecting smoke delivery in blended cigarette." 502972546-2579 at 2547-2550 (US 85436) (O).

2714. A 1981 strategic analysis evaluating RJR's changes to the delivery levels if its

brands demonstrates that RJR altered the tar to nicotine ratio of its products. The analysis stated that in 1980, "on Vantage Filter 85, tar was decreased . . . but the nicotine level remained constant. 501754849-4866 (US 20685) (O).

2715. A document setting forth the mission and goals of Reynolds's "Tobacco Development Department" for 1980, 1981, and 1982 demonstrates that Reynolds intended by the early 1980s to modify the tar-to-nicotine ratios of all of its commercial products. For example, the document indicates that as part of Reynolds's "action plan" it intended to "[d]etermine means to optimize tobacco density and puff count on light brands" by 1981, and, "[i]n cooperation with Research, establish appropriate T/N ratio, absolute nicotine and strength index for each brand" by 1982. 500545614-5644 at 5627 (US 86953) (O).

2716. In the early 1980s, with knowledge that FTC testing did not accurately measure the amount of nicotine inhaled by a smoker, Reynolds developed a human mimic smoking machine, or "HMSM," in order to obtain a more accurate picture of how much nicotine and other materials in cigarette smoke, on a puff-by-puff basis, a human smoker would inhale from smoking its products. In a February 26, 1981 memorandum from Alan Rodgman to Roy E. Morse, Rodgman reported that "[r]efinements to control calculations for the human-mimic smoking machine resulted in satisfactory performance in duplicating the shapes and volumes of a variety of human puffs. Minor problems with auxiliary equipment are being corrected." 500952530-2532 at 2530 (US 88067) (O). In a similar March 12, 1981 memorandum, Rodgman stated that "[t]esting of the human-mimic smoking machine has shown that good replication of most puff shapes can be made." 500952551-2551 (US 88068) (O). Reynolds used the human mimic smoking machine in its product development research throughout the 1980s and 1990s to replicate observed human smoking patterns, thereby enabling "the determination of the effect of

individual human smoking behaviors on yields of mainstream smoke components" for any cigarette tested with the machine. 508187782-7803 at 7785 (US 88069) (O). For example, an April 4, 1992 research report authored by John H. Robinson, Sandra W. Ingram, Riley A. Davis, Mitchell F. Stiles, and David W. Griffith concerning Reynolds's Project XGT stated: "The mainstream smoke yield data presented in Table V [of the report] offer the opportunity to compare smoke yields under both human smoking conditions versus yields obtained via the FTC machine smoking method." 508187782-7803 at 7789 (US 88069) (O). The comparison revealed that two of the prototype cigarettes Reynolds was studying – "XGT 'E'" and "XGT 'F'" – and an 85 millimeter Marlboro Light had FTC nicotine yields of 0.72, 0.78, and 0.78 respectively; those same cigarettes smoked under human smoking conditions, as measured by the human mimic smoking machine, had nicotine yields of 1.05, 1.09, and 1.19 respectively. 508187782-7803 at 7790 (US 88069) (O). The report noted this difference, stating "[a]ll 3 cigarettes yielded approximately equal amounts of nicotine when smoked by humans, and these yields ranged from 132% (XGT 'E') to 152% (ML [Marlboro Light]) of the FTC nicotine yields." 508187782-7803 7792 (US 88069) (O); see also 508389543-9607 at 9586-9588 (US 88070) (O).

2717. A January 10, 1983 internal memorandum to W.M. Henley from C.L. Neumann, and Thomas A. Perfetti summarized Reynolds's research activities "directed toward the development of information relating consumer perceptions to cigarette parameters." The memorandum indicates that Reynolds had conducted several consumer studies in which nicotine and/or smoke pH were controlled variables and that Reynolds reached conclusions about optimum nicotine deliveries and tar-to-nicotine ratios based on the studies. USX3621341-1345 at 1341,1343-44 (US 77401) (O).

2718. An internal RJR memorandum dated February 18, 1984, from Charles Green,

Prinicipal Scientist, discloses that RJR continued to research means of "optimizing" nicotine delivery through modification of cigarette filters. The memorandum stated that the purpose of one experiment was to manipulate particular variables of filter design, including length and chemical composition, in order "to find maximum nicotine delivery." The memorandum indicated that the results of the experiment "show that nicotine and glycerine deliveries can be greatly altered by the manipulation of variable[s]" in filter design, and that RJR was in the process of designing additional experiments to "optimize" nicotine delivery. 505006266-6276 at 6274, 6275, 6276 (US 85499) (A); see also 506339873-9880 (US 85500) (O).

2719. In 1987, RJR conducted studies to create a product that would deliver the taste and satisfaction of a 7-9 milligram tar product with only 1-2 milligrams of tar. Researchers maintained consumer satisfaction (i.e., addicition) through the use of "nicotine salts" technology, facilitating more effective nicotine delivery. 506686631-6634 (US 50938) (O).

2720. In 1989, Reynolds formed its "Intra-Company Nicotine Review Committee (INRC)," an "interacting group comprised of representatives from Research and Development, Marketing and Marketing Research whose goal . . . [was to] develop a strategic plan that provides resources which will satisfy consumer wants and company needs related to nicotine." 507063957-3960 at 3957 (US86955) (A). A document setting forth the INRC's priorities demonstrates that Reynolds was determined to employ nicotine as a key design element of its cigarettes. Under the heading "Nicotine Strategic Plan," the document stated that "[b]y building our knowledge base with respect to nicotine, as a **key design parameter**, R&D can place the company in a more responsive position to act on identified consumer wants and product ideas to maximize volume and share growth." 507904528-4535 at 4530 (US 86956*) (A). The INRC recommended that, in order to maintain its "technical leadership," Reynolds must "[m]eet

existing and emerging consumer wants via new products or enhancements to current products that employ nicotine as a key design parameter." 507904528-4535 at 4530 (US 86956) (A).

2721. In the late 1980s, RJR began experimentation with preparing tobaccos using the "REST" [Reestablishment of Solubles in Tobacco] process. A December 11, 1989 internal memorandum from Rhenda H. Steele to Barry S. Fagg explained the purpose of REST processing as follows: "Using this process, **all variables [in tobacco] are held constant except nicotine, the concentration of which can be controlled.**" 509887264-7264 (US 85437) (O) (emphasis added). A May 3, 1991 report entitled "REST Program Review" explained Reynolds's goal for use of REST processing to manipulate nicotine in its products:

> To develop a viable process for the total control of nicotine in product, in conjunction with the 'REST' process without affecting smoke performance other than attributes connected to nicotine. Basic development and process specifications are to be completed by the end of 1991. . . . We are basically in the nicotine business. **It is in the best long term interest for RJR to be able to control and effectively utilize every pound of nicotine we purchase**. Effective control of nicotine in our products should equate to a significant product performance and cost advantage.

509479574-9587 at 9582, 9854 (US 20829) (A); Henningfield WD, 102:2-4, 102:11-12.

2722. REST processing was a vital part of Reynolds's "Nicotine Control Program" begun at least by 1990. The Nicotine Control Program included at least three distinct studies of methods for the manipulation of nicotine delivery:

> -Project "LN," the objective of which was to "[o]ptimize products with extremely low smoke nicotine yields" using, among other things, REST technology;
>
> -Project "GTX," the objective of which was to "[d]evelop basic information on how the design variables of nicotine, 'tar' yield and draft interact physicochemically;"
>
> -Project "Nicotine RSM," the objective of which was to "[e]xplore effects (independently and interactively) of nicotine, 'tar', and draft

on smoker perceptions, behavior and acceptance" using, among other things, REST technology.

508112783-2807 at 2788, 2790, 2792, 2794 (US 85438) (O). An August 22, 1990 report on REST technology stated that Reynolds had "**achieved on a development scale a practical process for selectively adjusting the nicotine content in a tobacco extract and, therefore, in the tobacco blend after REST processing**" and that Reynolds intended to use REST technology to "**[i]ndependently control nicotine delivery, from very low to elevated levels**." 509479574-9587 at 9576, 9577 (US 20829) (A) (emphasis added); see also 509479799-9799 (US 86958) (O); 508099588-9588 (US 86959) (O); 507051133-1136 (US 86960) (O); 512331601-1601 (US 86961*) (O).

2723. A document prepared for an August 6, 1990 meeting regarding the Nicotine Control Project's "Nicotine RSM Study" explained the benefit of REST processing: "A new process (REST) makes possible for the first time independent manipulation of three key product development variables (nicotine, 'tar', draft)." The document demonstrates that Reynolds designed consumer studies for testing products developed with REST processing for the purpose of developing "a comprehensive understanding of how to independently control nicotine, 'tar', and draft levels in RJR FFLT [full flavor low tar] and FF [full flavor] product lines to optimize smoker satisfaction. . . ." 507523433-3477 at 3441 (US 85439) (O). Reynolds's Biobehavioral Research Division also saw significant benefits of the use of REST technology in the Nicotine Control Program, as expressed in an April 9, 1990 memorandum from J.H. Reynolds to Mari-Jo Dryden: "**For the first time 'tar' and nicotine can be independently varied without excessive changes in blend. This has been a 'dream goal' of developers and researchers for years**." 510961941-1941 (US 85440) (O) (emphasis added); see also 509347328-7336 (US 85441) (O); 507973629-7348 (US 86962) (O).

2724. In another consumer study relating to REST-processed tobacco, Reynolds endeavored "to assess the pharmacological component of smoking satisfaction by attempting to experimentally control the level of nicotine absorbed by smokers under normal smoking conditions." In a memorandum describing the experiment, Walter S. Pritchard and John H. Robinson explained that "[t]he nicotine yields of the experimental cigarettes will be controlled using the R.E.S.T. (Re-Establishment of Soluble Tobacco) process, with target nicotine yields of 0.06, 0.2, 0.4, and 0.8 mg. The target 'tar' yield of the experimental cigarettes will be 10 mg." 525246100-6103 at 6100 (US 85442) (O).

2725. An RJR document entitled "Nicotine Strategic Plan September 26, 1990" apparently reflects a presentation given by Reynolds scientists, including A. Wallace Hayes, Mari-Jo Dryden, John Robinson, Tom Perfetti and Pat Lippiello, concerning several of their ongoing nicotine research projects. Regarding the "Nicotine RSM Study," the document described nicotine as a "critical variable[] for product development" and noted that "**independent manipulation of nicotine will result in a better understanding than ever before of satisfaction**." The document identified as one of the "Overall Study Implications" that the Nicotine RSM study would "result in definition of optimal combination of tar, nicotine, and draft to maximize acceptance among one or more smoker groups/mindsets." In addition, the document confirmed that the goals of Reynolds's Projects XGT and GTS were to"explore alternate methods/sources for enhancing nicotine yields of low 'tar' products." The document also identified as a "key issue" the "[o]ptimization of nicotine's sensory properties in smoking products." 514106716-6809 at 6737, 6781, 6803 (US 51775) (A) (emphasis added); see also 514940099-0120 (US 51894) (O).

2726. A November 15, 1990 facsimile from Emily Etzel to Donna Wilson hypothesized

about the "several reasons why Philip Morris would find it strategically advantageous to master nicotine manipulation." Etzel wrote that:

> Nicotine manipulation involves the changing of nicotine levels in their products other than by buying tobacco with high or low nicotine levels. The extraction of nicotine for such products as NEXT and Merit De-Nic results in an [sic] surplus of nicotine. This nicotine can be added to other products. . . . **PM has successfully raised the nicotine levels on all their products (across the line) by using high nicotine tobaccos. Thus, they already have a better T/N ratio than their competitors**. Adding nicotine could further improve that ratio.

509348227-8229 at 8228 (US 88072) (O).

2727. A June 27, 1991 RJR document entitled "Nicotine Delivery Expert System" outlines mechanisms by which the "[a]vailable nicotine in [the] tobacco rod" can be modified, including by Reynolds's G-7, G-13 (discussed below) and REST processing procedures. 510962740-2741 at 2740 (US 88073) (O).

2728. In a detailed April 1, 1992 report, Barry S. Fagg detailed RJR's continued investigation and progress of using REST technology in product development. Fagg described the rationale and strategy of the continued investigation:

> Previous development of the REST processing techniques has indicated that tobacco material can be disassembled into essentially water insoluble and water soluble portions, followed by controlled reassembly. . . . When coupled with the technology for denicotinization of aqueous tobacco extracts, **the expanded process provides the power to produce a variety of 'engineered' tobacco laminas in which the nicotine level is manipulated while other 'non-nicotine' compounds are effected [sic] to a minimum degree.**

Fagg concluded that "[t]he overall process has demonstrated the ability to start with lamina cut filler and produce processed tobacco cut filler in which the nicotine level within the tobacco can be controlled," and that "**[c]ontrolled nicotine materials allow novel manipulations of tar to**

nicotine ratios which significantly alter smoking sensations. Product opportunities are apparent and consumer testing has been included in the Winston and Vantage brand families." 508380001-0027 at 0008, 0014-0015 (US 85443) (O) (emphasis added).

2729. On April 27 and 28, 1992, Reynolds held an "XB Integration Meeting," the purpose of which was to "pull together internal and external information that is germane to our sensory research efforts on XB." In an April 23, 1992 memorandum, J.C. Walker invited Mary Stow, Mike Dube, Tom Perfetti, and Watson Dufour to attend the meeting and encouraged them to invite employees to the meeting with whom they worked. 517597880-7880 (US 88074) (O). The meeting was videotaped. 522531991-1993 at 1992 (US 88076) (O). A document produced from RJR files roughly summarized the topics discussed over an eight-hour period on the "XB Integration Meeting Video Tapes." That document described one area discussed as "'[w]e can take a cigarette unsmokeable because nicotine is so high and make it smooth with acid.'" Id. at 1991. Other issues discussed during the XB Integration Meeting included "add nicotine to cigarette," "load blend with high nicotine tobacco to get satisfaction," and "by adding nicotine, you can change tons of sensory attributes." Id. at 1992. The participants in the meeting apparently believed that they could discuss the addition of nicotine to low tar cigarettes freely since they expected the videotapes would be destroyed: "these tapes will be destroyed, we have to be careful with these." Id.; see also 508364418-4419 at 4422 (US 88077) (O); 517597869-7871 (US 88078) (O).

2730. RJR continued its research into changing the nicotine-to-tar ratio throughout the 1990s. The company concentrated on research that would allow it to create an ultra low tar product that provided nicotine delivery similar to full-flavor products. 509308455-8459 (US 20827) (O).

2731. An April 6, 1998 memorandum among RJR's employees "the locations where nicotine is currently measured on a regular basis in the domestic tobacco company." A chart appended to the document as "Attachment B" indicates that Reynolds **regularly measured nicotine levels at twenty different stages of the tobacco manufacturing process**. 523196492-6499 at 6492, 6493-6495 (US 88062) (O).

(ccc) Brown & Williamson and BATCo

2732. Contrary to Cigarette Company Defendants' argument that they do not manipulate the nicotine content of their cigarettes because nicotine always follows tar, Hugh Honeycutt, B&W's Director of Research Services and Analytical Research testified that B&W "absolutely" had the ability to manipulate the tar to nicotine ratio of its products. Honeycutt PD, United States v. Philip Morris, 4/23/02, 160:15-19. Also, Jeffrey Wigand, Vice President of Research & Development at B&W from 1989-1993, testified that B&W manipulated nicotine levels to produce a cigarette that would consistently deliver the amount of nicotine to keep smokers addicted through techniques such as tobacco blending, cigarette design, and the use of additives. Wigand WD, 99:22-100:15.

2733. As noted by former FDA Commissioner, David Kessler, in his testimony in this case, BATCo conducted "considerable research to enhance nicotine deliveries, including the use of chemical manipulation of tobacco." Kessler WD, 34:14-22. A March 17, 1967 study by BATCo described a study in which the "delivery of 'extractable nicotine' was manipulated, to cover a convenient range" by chemical additives in the filters. 750039365-9385 at 9367 (US 88091) (A). See infra US FF § III.C(2)(c)(iv) (defining "extractable nicotine").

2734. BATCo has been aware of the importance of ventilation holes to the delivery of nicotine since the 1960s. 110083832-3838 at 3833 (US 34964) (O); see also 400132742-2776

(US 88084) (O). As Dr. Wigand testified, B&W also was aware that smokers routinely blocked ventilation holes, thus resulting in higher nicotine exposure of the smoker than was registered by the FTC testing method. Wigand WD, 107:11-15. Using this knowledge, B&W manipulated nicotine levels in their cigarettes by placing ventilation holes in the filter of the cigarette, where smokers would block them, and this allowed more air to be mixed with the smoke measured by the FTC smoking machine. Id., 107:4-10.

2735. M. Lance Reynolds, former B&W Director of Product Development and Director of Research, testified that from the beginning of his career at B&W in 1968 onwards, B&W and BAT Group companies had "projects to try and increase nicotine delivery with respect to tar, for many years." Reynolds PD, United States v. Philip Morris, 9/12/02, 301:1-301:23.

2736. BATCo was working to manipulate and change the tar-to-nicotine ratio in its cigarettes as early as the 1950s and 1960s through Project Ariel. Some of the research on Project Ariel was performed externally at Battelle Memorial Institute. In a February 8, 1966 report entitled, "Nicotine Administration: Ariel Smoking Devices," issued by D.G. Felton of BATCo's Research and Development Department, and distributed to D.S.F. Hobson, Esq., BATCo Production Director, S. J. Green, also of the Research and Development Department, and Sir Charles Ellis, a summary of the project revealed that the construction enabled controlled amounts of smoke from the tobacco outer to be mixed with the nicotine aerosol from the inner tube, resulting in the ability to create smoke of any tar/nicotine ratio. 301099888-9902 (US 21547) (A). Although internal BATCo reports concluded that the product was marketable, executives at the highest levels of control within BATCo, including BATCo board member (and future Chair) D.R. Clarke, discouraged development and sale of the Project Ariel cigarette, apparently out of concern that Ariel represented an implicit admission as to the harmfulness of conventional

cigarettes. The project foundered and, shortly thereafter, was de-funded. 100335808-5816 (US 20173) (O); 301121935-1936 (US 20581) (A); 301121911-1917 (US 22023) (A); 201035126-5126 (US 20304) (O); 110415482-5485 (US 20275) (O); 301121057-1086 (US 20578) (O); 110080519-0519 (US 21546) (O); 107623976-3976 (US 20259) (O); Farone WD, 178:15-179:4.

2737. BATCo also worked in the 1960s to manipulate nicotine and change tar-to-nicotine ratios in the research projects called HIPPO I (completed in January 1962) and HIPPO II (completed in May 1963), which investigated the actions of nicotine as it related to the cigarette habit and examined the potential beneficial physical and psychological effects of nicotine. 105620620-0683 (US 20247) (A); Farone WD, 84:6-15; 105620569-0605 (US 20246) (A); 301083862-3865 (US 20577) (A); Henningfield WD, 89:11-90:8. The practical benefits of being able to provide seemingly smaller amounts of nicotine while still providing an addiction-creating and sustaining dose became clear to BATCo in the early 1960s as the Surgeon General's first report on smoking and health neared publication. Prior to the publication of the 1964 Surgeon General's Report, B&W General Counsel Addison Yeaman evaluated the findings of HIPPO I and II, and became aware of the impact the Surgeon General's Report could have upon potential litigation. After discussing the conclusions of the two reports about nicotine's potential benefits, Yeaman concluded: "Moreover, nicotine is addictive. We are, then, in the business of selling nicotine, an addictive drug effective in the release of stress mechanisms." Yeaman suggested the best reaction to the Surgeon General's Report was to provide a filter capable of removing certain constituents of smoke considered suspect by public health officials, while still "delivering full flavor - and incidentally - a nice jolt of nicotine." 2046754905-4909 at 4908-4909 (US 20477) (O).

2738. At the same time, BATCo was conducting tests on carbon filters, examining how

they affected nicotine and smoke pH. 682638573-8629 (JE-25453) (O).

2739. BATCo, like the other cigarette manufacturers in the 1970s and 1980s, undertook research to manipulate or maintain nicotine delivery for cigarettes with reduced FTC tar levels. This research was based on the corporate understanding that nicotine, unlike tar, was the essential part of the cigarette to smokers. For example, the basis for studies carried out in 1973 to assess the use of additives to reduce tar while at the same time increasing nicotine delivery to smokers was stated as follows: "The increased importance being placed on the lowering of TPM [total particulate matter] and **the controlling of nicotine delivery** has made it necessary to investigate the different methods available for producing these changes in smoke." The 1973 study also utilized "ADDITIVES FOR NICOTINE CONTROL," including nicotine tartrate, sodium bicarbonate, and diammonium hydrogen phosphate to increase the "extractable nicotine" in the smoke. The researchers found that certain combinations of additives successfully reduced tar while "maintain[ing] the impact and physiological strength levels" of nicotine. 402390265-0282 at 0268, 0280 (US 86963) (O) (emphasis added).

2740. In 1980, researchers employed by the tobacco companies, such as B&W's scientists Tilford Riehl, D.V. Cantrell, and C.M. DiPietro, studied the effect of cigarette wrapping paper on nicotine delivery and found evidence that some papers enhanced nicotine delivery to smokers of low tar cigarettes. These studies were conducted on Cigarette Company Defendants' commercial cigarette products. 510000661-0662 (US 85501) (O); see also 400132742-2776 (US 88084) (O).

2741. A September 20, 1979 memorandum entitled "Tar/Nicotine Ratios and Nicotine Transfer Efficiencies of B&W and Competition Brands" demonstrates that B&W and other Cigarette Company Defendants had successfully increased the ratio of nicotine to tar in the

cigarette smoke of their commercial products. The memorandum indicates that the average tar to nicotine ratio for B&W brands and competition brands had declined, and that the tar to nicotine ratio for "Low Tar" and "Ultra Low Tar" products was lower than for "Full Flavor" products. 505003431-3438 (US 85412) (O).

2742. At a 1984 Smoking Behavior-Marketing Conference, Tilford Riehl, B&W's Vice President for Research and Development, gave a presentation on Project Aries, a new filter design intended to lower FTC tar counts. After comparing puff counts for individuals smoking Aries cigarettes and commercial cigarettes, Riehl pointed out that the "smoke chemistry" of the Aries cigarette provided "nicotine enrichment in latter puffs." 536000308-0507 at 0366 (US 85298) (O); see also, 82637850-7982 at 7932 (US 88063) (O).

2743. BATCo held a Nicotine Conference in England, from June 6-8, 1984. The agenda for the conference demonstrates that BATCo, its subsidiaries and affiliates, were well aware of the addictive nature of nicotine as well as deeply involved in nicotine manipulation in order to maintain that addiction and build their business. Session titles include: "A smokers [sic] requirement for nicotine. A smoking behavior and market place view"; "Product elasticity, nicotine and perception of product strength"; and "Product modification for maximal nicotine effects." Two out of the three "primary objectives" were listed as:

> Review the research to establish the relationship between tar and nicotine (ratios and absolute levels) as controlling factors of smoking behavior and their role in product assessment and acceptance.

and

> **Identify to what extent the nicotine dose on a puff-by-puff, per cigarette, or on a daily basis can be used to indicate a smokers [sic] requirement for nicotine or infer product acceptance**.

512106427-6437 at 6428-29, 6430 (US 20846) (emphasis added).

2744. Nicotine to tar ratios were also a central issue at the Smoking Behavior-Marketing

Conference, held July 9-12, 1984. A presentation was given in which further study of nicotine was encouraged, particularly with the goal of **"enhanc[ing] the properties of nicotine in reduced delivery products**." B129103030501 at 0326 (US 85449) (A); 521016789-6864 (US 85450) (O) (emphasis added).

2745. A document entitled, "R&D Views on Potential Marketing Opportunities, marked, "Not for Circulation" and dated September 12, 1984 emphasizes the significant role nicotine delivery played in BATCo's research and marketing activities. The document refers to compensation and lists as a "high priority" development of "alternative designs (that do not invite obvious criticism) which will allow the smoker to obtain significant enhanced deliveries should he so wish." The author recommends that this action be taken "irrespective of the ethics involved." Also listed under "high priority" is an item described as "nicotine deliveries," in which it is admitted that:

> Nicotine is the key pharmacological component of cigarette smoke. . . . An area of importance is to distinguish whether smokers smoke for (a) transient peak effects or (b) threshold base-line levels throughout the day. **Another area of importance is the exploitation of physical and chemical means to increase nicotine transfer, ie to increase the effective utilisation of nicotine.**

109869437-9440 at 9437-9438 (US 21707) (A) (emphasis added).

2746. BATCo's focus on enhancing the transfer of nicotine to the consumer was reiterated in a January 1985 internal document titled "Tobacco Research in BAT Industries." That memorandum indicated that "[m]ore resources will be provided for research into means of enhancing nicotine transfer to smoke and experimental combustion research, including cigarette paper effects." 109070972-0979 at 0976 (US 34858) (O).

2747. In March 1985, BATCo scientist C.I. Ayres circulated a report regarding research

being conducted to determine how to "make smaller amounts of nicotine work harder." 102440178-0179 at 0178 (US 21729) (O).

2748. In a September 26, 1986 "Note for E.A.A. Bruell" from A.L. Heard, Group Research Director, entitled "Tobacco Strategy Group: Position Paper," Heard described BATCo's contacts with Advance Tobacco Products Inc. to obtain access to the FAVOR plug, a filter containing nicotine and flavors that "may enable nicotine to be regulated quite independently of tar and other compounds." 109879044-9045 at 9044 (US 34921) (O).

2749. In 1986-1987, BATCo undertook studies that revealed that nicotine delivery could be increased through filter modifications, with one study finding up to a 30% increase in nicotine per puff and a 19% increase in the tar to nicotine ratio. 400260652-0674 (US 76183) (O).

2750. BATCo realized that its approach to nicotine control required alternatives to simply adding nicotine during the manufacturing process, and made pursuit of additional techniques a top priority. In 1987, BATCo held a "Fundamental Research Review" in Southampton with scientists from the research and development department. It identified as one of its top three priorities for research in the United States, "Nicotine Control," in order to "optimise nicotine in current and future products." It explained the need for this research as "past experience with fortified products has shown poor taste – why?" 400260496-0514 at 0499 (US 85451) (O).

2751. At the same time, BATCo's scientists continued to research modifying nicotine to tar ratios. In a May 14, 1987 document developed by the Southampton Research and Development Centre, with contributions from BAT Group participants, including B&W's R.R. Johnson, and distributed to the research and development departments throughout the BAT Group, the authors highlighted the success that the Barclay brand had enjoyed and cited as a

reason for its success its nicotine to tar ratio, "using both high blend nicotine and high ventilation levels, to give an NTR [nicotine/tar ratio] some three times that of a full flavour product. . . ." The document pointed out that "[t]echnologically, design of a high NTR product anywhere in the 1-10 mg tar range is possible immediately." The question for further research was how "NTR should vary with tar delivery to give ‘acceptable' smoking characteristics at any given delivery level." 570346066-6151 at 6068 (US 53187) (A).

2752. In "Chemosensory Research," by BATCo scientist Richard Baker, dated February 28, 1990, Baker argued for continued research on tar/nicotine ratios, maintaining that both components of smoke were necessary – at the appropriate levels – to produce a successfully marketable cigarette. However, he made clear that nicotine is of greatest importance and that tar's role is to make nicotine inhalation palatable:

> The **ultimate product of the tobacco industry is nicotine** and research should continue to be directed at the development of low tar/medium nicotine cigarette smoke. **Nicotine alone in smoke is not practical, nor are extreme tar/nicotine ratios, since nicotine is too irritating – other substances are required for sensoric reasons**.

400854060-4066 at 4060 (US 67851) (O) (emphasis added). Baker also wrote that since the 1960s, B&W conducted such nicotine delivery research as part of a coordinated BAT Group research strategy, with "work done by a variety of groups in Southampton, Louisville and elsewhere." 400854060-4066 at 4060 (US 67851) (O).

2753. BATCo's Operating Group Five Year Plan 1991-1995, dated January 15, 1991, stated that "[b]asic research will continue into products delivering adequate levels of nicotine . . .[,] controlled release of nicotine . . . and enhancement of the transfer of nicotine . . . ." BATCo used this knowledge to develop ultra low tar products that delivered the nicotine at a level equal to regular cigarettes:

> Ultra Low Delivery Products - High priority will be given to the development of more satisfying products in the low and ultra low delivery ranges (1-9 mg). New concepts developed through Projects FELT and GREENDOT will be applied to a range of products in the next 2-3 years, especially at low delivery levels . . . Project FELT which is to be test-marketed as B&H SM in Belgium in the second quarter of 1991, has demonstrated BAT's ability to design a 9 mg flue-cured product that has the impact, satisfaction and mechanics of a 14 mg commercial product (B&H SF). The principles applied to FELT will now be used to develop a 7 mg USB style product to match a 12 mg US commerical product.

201752783-2899 at 2837, 2838 (US 85452) (O).

2754. BATCo and B&W's research on manipulating the nicotine-to-tar ratio continued into the 1990s. Various methods of nicotine manipulation are discussed in the companies' joint 1991 Fundamental Research Programme Review. The goal of the fundamental research programme was to produce "products which are superior to competition (particularly Philip Morris)." Projects identified to meet the goal of improving the smoke quality of the company's products included identifying and overcoming the "existing barriers to sensory acceptability" of low tar/high nicotine products. Another project, Greendot, was aimed at creating low tar-to-nicotine ratio products for which the company could achieve both "Marketing and Regulatory support." 401090280-0294 (US 47539) (O).

2755. The efforts of BATCo and B&W to modify the nicotine-to-tar ratio also centered around the use of a genetically-engineered, increased nicotine content tobacco known as Y-1. See Wigand WD, 101:10-102:14; US FF § III.C(2)(c)(ii), supra.

2756. On March 8, 1994, BATCo published a "Review of Information on Sensory Effects of Changing Tar/Nicotine Ratio of Smoke," designed to summarize the company's knowledge on the "sensory effects of changing tar/nicotine ratios of smoke." The summary was devised to help "point the way" toward "manipulat[ing] and modify[ing] the impact and irritation

sensations and the balance between them." The summary pointed out the following main conclusions:

> (1) impact increases when nicotine delivery is increased and tar remains constant;
> (2) impact increases when nicotine delivery is held constant and tar is reduced;
> (3) a decrease in the tar/nicotine ratio increases smoke pH, which increases impact; and
> (4) nicotine is the source of impact.

Contrary to BATCo's assertions that it did not engage in nicotine manipulation, this report clearly demonstrates that BATCo's research in this area was aimed at gaining an "understanding of how impact and irritation can be tailored to meet product requirements by optimisation of nicotine delivery." 575102998-3015 at 3002-3003, 3010 (US 53213) (O).

(ddd) American

2757. In late 1967 and early 1968, American conducted a series of tests to determine nicotine content in puffs of cigarette smoke achieved through the addition and manipulation of a carbon filter to its Tareyton cigarettes. The results of the studies clearly reveal that American was aware that nicotine and tar levels could be manipulated individually. X003580-3586 (US 34161) (A).

2758. By the 1960s, American was undertaking numerous studies designed to affect the tar to nicotine ratio naturally found in cigarettes. These methods included adding nicotine to reconstituted tobacco, increasing the amount of Burley tobacco – which is naturally higher in nicotine content than other tobaccos – in a blend to determine its effect on the "nicotine yield," and producing tobacco plants, such as N rustica, that had almost double the concentration of nicotine as other tobacco plants used by American. MNAT00316688-6693 (US 21219) (O); X003421-3431 at 3421, 3424 (US 34158) (A); MNAT00881318-1323 (US 21221) (O); see also X002999-3038 (US 88082) (O).

2759. In 1969, American researchers, working with researchers from Philip Morris, RJR, and Liggett, conducted experiments "to determine if [genetically different tobacco] varieties differ in their ratio of nicotine to FTC 'tar.'" MNAT00533294-3295 at 3295 (US 21665) (O).

2760. An April 29, 1974 memorandum from R.M. Irby, Jr., Manager of New Products Division for Research and Development, to Virginius Byran Lougee, III, executive, and E.C. Cogbill, scientist, entitled "Compound W"– American's code word for nicotine – describes the company's successful efforts to increase the nicotine content of its cigarette tobacco, thereby increasing the nicotine-to-tar ratio of its cigarettes:

> Regular PALL MALL Red blend analyzing 1.95% nicotine . . . was treated with Compound W to increase nicotine in the blend by 19% . . . To make absolutely sure that the complete evaluation has been carried out at the desired nicotine level, the TC-22 blend will be modified with regular PALL MALL blend to yield an exact increase of 19% above the standard 1.87% nicotine blend. This is currently under way. . . LUCKY 100's blend was treated with Compound W to yield 2.58% nicotine; a 21% increase above the standard control of 2.13%.

It was also found that "Compound W" added to tobacco has little effect on the overall taste of the cigarette. Impact is increased slightly." ATX050142123-2128 at 2123-2124 (US 21602) (O); Sprinkle PD, Carter, 1/19/96, 99:16-17; Henningfield WD, 93:9-94:5.

2761. Robert Sprinkle testified that American had a target burn rate and a target puff count that it sought to achieve in its cigarettes, and that it achieved these targets in part through controlling paper porosity. He also testified that American selected paper porosity in order to assure a target nicotine delivery to smokers. Sprinkle PD, Small, 10/16/97, 67:22-68:25.

2762. In a 1977 document, American's researchers suggested "methods for increasing the [nicotine to tar] ratio" ["NTR"]: (1) "addition of nicotine to the tobacco"; (2) "addition of ammonia salts . . . to tobacco, which on smoking would free the ammonia and thereby cause an

increase in nicotine transfer to the smoke"; (3) increasing "the porosity of cigarette paper"; (4) "adding a nicotine salt . . . to cigarette paper"; (5) "making cigarette filter tips basic [to] enhance the nicotine transfer in the smoke and [to] increase the NTR's. . . . Adding nicotine salts to the cigarette filter is also a means to increase the NTR"; and (6) "adding salts that enhance the combustion of the tobacco" to offset the "reduction in the nicotine content" caused by reducing tar. MNAT00533268-3286 at 3270-3272 (US 22175) (O).

(eee) Lorillard

2763. A draft presentation located in a 1969 file of Alexander Spears demonstrates the early extent of Lorillard's understanding of the factors affecting nicotine delivery and mechanisms that might be used to alter the ratio of nicotine to tar in cigarette smoke. In the draft presentation describing Lorillard's research efforts, Spears wrote:

> The research activities on the physiological element are concerned with nicotine. The quantity of nicotine required for the stimulus is mediated to the nicotine content of the cigarette by several factors: (1) absorption rate into the bloodstream, once the nicotine has deposited on the respiratory tract; (2) fraction of inhaled nicotine which is deposited in [the] respiratory tract (pH dependence); (3) concentration of nicotine in the smoke and (4) transfer rate of nicotine from the tobacco to the mainstream smoke.

Spears further stated that "it would be useful to have a wider range of control over nicotine than now exists, through the selection of tobacco and the physical construction of the smoking article. **Within one year, it is expected that tobacco modifications can be made to optimize absorption of smoke nicotine.**" 87667736-7740 at 7737 (US 56302*) (O) (emphasis added). In an undated paper entitled "Factors Affecting Smoke Delivery of Nicotine and Carbon Monoxide," Spears identified several factors that affect the nicotine yield of a cigarette and stated: "**Through [a] combination of these variables, plant genetics and commercial processes, . . . it is possible to manipulate the yield of nicotine from about .1 mg to 4 mg per**

cigarette." 00044998-5021 at 5001-5002 (US 34208) (O) (emphasis added).

2764. By 1971, Lorillard was analyzing the nicotine content and nicotine-to-tar ratio of several brands of cigarettes in connection with sales data for each brand. In a February 8, 1971 memorandum to top scientist Alexander Spears and C.L. Tucker, Jr., Director of Product Development and Marketing Research, S.T. Jones wrote that "[i]t has become apparent from the available data that the top sellers, e.g. Winston, Salem, Marlboro, and Kool are all fairly high in smoke nicotine. . . . The one other parameter common to the top sellers is the ratio of smoke nicotine to 'tar'." Jones concluded that "[t]he ratio of nicotine to tar can be controlled by blending high nicotine and tar grades with low ones resulting in a net gain of nicotine delivery over tar level." 00776195-6201 at 6195, 6196 (US 34293) (A).

2765. Lorillard's efforts to modify the nicotine-to-tar ratio of its cigarettes included a long-term program beginning in the mid-1970s to enrich its low tar cigarettes with nicotine. The "nicotine-enriched" low tar cigarette was a top priority at Lorillard in 1976. 526321374-1376 (US 85453) (O); 00781406-1417 (US 20029) (A); Farone WD, 96:7-19; Spears PD, Minnesota, 9/23/97, 156:2-159:14.

2766. By 1976, Lorillard had embarked upon a comprehensive study of product design mechanisms for manipulating the nicotine content and delivery of its products with the goal of developing a "cigarette delivering lower tar while at the same time delivering a level of nicotine higher than could be obtained normally. [sic] by conventional cigarette construction." A May 4, 1976 memorandum to F.J. Schultz, Vice President of Research and Development, from Harry Minnemeyer, Director of Research, details the scope of Lorillard's extensive research plan, dubbed the "Nicotine Augmentation Project (NAP)." In the memorandum, Minnemeyer described proposed research into numerous mechanisms for manipulating nicotine, including,

inter alia, adding "nicotine from an outside source to that naturally present in cigarette tobaccos"; chemical treatment of tobacco with ammonia to create more free nicotine in the smoke, which "would have a much greater physiological effect than nicotine salts"; air dilution of cigarette smoke; decreasing the acidity of smoke; and development of filters that selectively allow the passage of nicotine while reducing tar. 00050444-00050450, passim, (US 47721) (A); Farone WD, 96:7-19; see also 00044529-4533 (US 34192) (A); 00050440-0443 (US 47720) (A).

2767. At trial, Lorillard contended at trial that its interest in nicotine augmentation was entirely due to ideas for potentially less hazardous cigarettes discussed at a meeting of NCI's Tobacco Working Group in May 1976, pointing only to a single reference among its literal volumes of internal research documents referring to "[r]ecommendations of health oriented agencies." See Henningfield TT, 11/30/04, 7360:11-7361:14. In fact, trial testimony and other evidence show that Lorillard and other Cigarette Company Defendants were researching the manipulation of nicotine, including altering pH, well before that recommendation was raised by the Tobacco Working Group in 1976. Henningfield TT, 12/1/04, 7518:17-7527:14. Moreover, Lorillard's internal research documents belie their contention, indicating that their intent and motivation in engaging in nicotine augmentation research was to assure "nicotine delivery necessary to achieve long term use and satisfaction by the consumer." 00361822-1823 at 1823 (O) (US 20024)

2768. By 1976, Lorillard was evaluating methods it believed might be used by other Defendants, including Philip Morris and RJR, to externally apply nicotine to tobacco in order to "raise the impact" of low tar cigarettes "while maintaining a low ‘tar' profile." In a March 9, 1976 memorandum from J.R. Reid to Minnemeyer, Reid reported on the methods believed to be used by other Defendants and recognized that the research was important because of "[r]ecent

public demand for low tar smoking materials." 00120379-0388 at 0379, 0380, 0384 (US 85455) (O).

2769. In a March 2, 1976 memorandum to Alexander Spears regarding the "R&D Sedgefield Meeting," Lorillard's Schultz summarized the various research topics discussed at the meeting, which took place on February 3, 1976. Regarding the topic of "Enhancement of Nicotine or Nicotine Effects," Schultz stated that "[t]he modification of products to allow delivery of more of the available nicotine in the free form was discussed as a viable possibility." With regard to the topic "Very Low Tar Cigarettes," Schultz summarized that "[i]t was considered that cigarettes with tar deliveries of 2 mg or less are likely to become important but that reasonable levels of nicotine (0.5 mg or more) and relatively high flavor levels would be necessary to make such a product a leader in the field." 01111982-1985 at 1984-1985 (US 34311) (A); Farone WD, 96:7-19.

2770. In 1976, Lorillard also investigated spraying free nicotine or nicotine tartrate onto cigarette tobaccos using various solvents to increase the nicotine-to-tar ratio in the cigarette smoke. The resulting taste impact would be similar to that of naturally occurring nicotine in regular production cigarettes. 00781406-1417 (US 20029) (A).

2771. In a June 8, 1976 report on a portion of Lorillard's Nicotine Augmentation Project entitled "Application of Free Nicotine to Cigarette Tobacco and the Delivery of that Nicotine in the Cigarette Smoke," T.M. Larson and J.P. Morgan explained the purpose of the research: "Nicotine was applied as free nicotine and nicotine tartrate to different tobaccos for the purpose of increasing the nicotine to tar ratio in cigarette smoke." One conclusion of the study was that "only a small addition of free nicotine was needed to provide the impact of a higher nicotine cigarette." 00398312-8322 at 8312 (US 85456) (A); Farone WD, 96:7-19.

2772. In a June 16, 1976 memorandum to Alexander Spears, H.J. Minnemeyer gave another progress report on Lorillard's "Nicotine Augmentation Project." Minnemeyer wrote that "[a]bout a dozen approaches have been recognized as a possible solution to the problem of delivering more nicotine in the smoke of low tar cigarettes." Minnemeyer stated that "[o]ne approach involved the procurement and addition of nicotine to tobacco to supplement that already present, while [another] attempts to optimize the delivery of nicotine already present in cigarette tobaccos. . . ." Minnemeyer also reported that small amounts of nicotine could be added to a blend without affecting the tar-to-nicotine ratios reported by FTC testing:

> Participants in this work now feel that a satisfactory low tar smoking article might be achieved by the addition of much less nicotine than was previously thought necessary. By spaying the blend with a small amount of nicotine it might be possible to get the impact of a higher T&N cigarette. This might be achieved without actually changing the T&N figures one would get from untreated tobacco.

00044525-4528 at 4525, 4526 (US 34191) (A).

2773. Also in connection with its Nicotine Augmentation Project, Lorillard concluded as early as January 31, 1977, that nicotine could be successfully added to reconstituted tobacco leaf by spraying, that nicotine added in this manner was in fact delivered to the smoker in a normal manner, and that "the added nicotine improved the overall quality of the RL [reconstituted leaf] smoke somewhat." 81090368-0380 at 0369, 0372 (US 85457) (A); Farone WD, 96:7-19. In an April 12, 1977 report concerning "Enrichment of Reconstituted Leaf Nicotine Content By Direct Addition of Nicotine Alkaloid to the RL Slurry," Morgan and Larson concluded that the "[n]icotine content of the final product can easily be controlled by the addition of predetermined amounts of nicotine alkaloid." 00398474-8484 at 8474 (US 20025) (A); 01254872-4876 (US 20043) (A); Farone WD, 96:7-19. In a June 30, 1977 memorandum, H.S. Tong recommended

further study of the "enrichment" of reconstituted tobacco leaf through the addition of pure nicotine or nicotine salts, stating: "I think it is an important and worthwhile project because it gives us precise control over nicotine contents in all our products." 00045059-5059 (US 34209) (A); Farone WD, 96:7-96:19.

2774. A July 27, 1976 memorandum from Senior Chemist M. A. Skladanowski to Mary Sue Ireland described methods studied by Lorillard to "increase nicotine to tar ratios in the mainstream smoke of cigarettes." The memorandum notes that: "The use of air dilution to augment cellulose acetate filters has increased as the demand for low tar and nicotine cigarettes has increased. . . . The renewed interest in air dilution as a filter mechanism is due to the fact that these filters produce relatively high nicotine in the mainstream smoke." 00044989-00044993 at 4989 (US 34207) (A). Later that year, Skladanowski reported in a November 4, 1976 memorandum the results of another internal research project concerning the effect of air dilution filtration on nicotine delivery and determined that among "[t]he advantages of a total air dilution cigarette are . . . higher nicotine to tar ratios . . . [and] [g]reater smoke pH." 00044975-4984 at 4975 (US 34205) (A). In an April 4, 1977 memorandum, Skladanowski again reported the results of a study of air dilution filtration, finding that:

> [a]ir dilution alone, without a cellulose acetate filter increased the nicotine to tar ratio in the smoke and the number of puffs per cigarette. . . . By simply removing the cellulose acetate filter and adding air vents, a True 85 cigarette with 11.6 mg tar and 0.6 mg nicotine was modified to deliver 13 mg tar and 1 mg nicotine. The nicotine to tar ratio in the smoke of modified cigarette . . . was 52% greater than in the control.

00044955-4970 at 4959 (US 85459) (A); Farone WD, 96:7-19.

2775. A 1977 Lorillard research proposal offered as part of the Nicotine Enrichment Project detailed plans for two new Lorillard products: (a) a cigarette of 2 milligrams of tar having

the taste level of a Kent Golden Light; and (b) a cigarette of 8 milligrams of tar having the taste of a Marlboro. The proposal included detailed plans to engineer the cigarettes to offer pre-determined amounts of nicotine. 01417830-7840 (US 20048) (O).

2776. By 1977, Lorillard was investigating possible nicotine sources because it believed that one promising method for developing a low tar cigarette with a high nicotine to tar ratio was the addition of nicotine or nicotine salt directly to a low tar, low nicotine tobacco blend. A February 7, 1977 report by J.R. Reid entitled "Investigation into the Extraction of Nicotine from Tobacco" demonstrates that Lorillard's study of methods to remove nicotine from tobacco was part of this effort:

> Lorillard currently desires to introduce a low 'tar', moderate nicotine cigarette as a marketable sales brand. One means of accomplishing this goal is by the addition of nicotine . . . onto a low tar, low nicotine blend of tobaccos. . . . Our primary objective was to study the economically feasible sources of nicotine and its isolation and recovery as the pure alkaloid or as a nicotine salt.

00778281-8321 at 8285 (US 34296) (A); see also 00118828-8832 (US 34269) (A); 00044800-4803 (US 34197) (A); Farone WD, 96:7-19.

2777. A February 14, 1978 confidential report prepared by Harry Minnemeyer and P.D. Schickedantz reviewed the progress of Lorillard's Nicotine Augmentation Project. The report reveals that Lorillard had initiated a "major new project . . . in order to create the technology necessary to market a cigarette with a nicotine to tar ratio higher than is normally found in commercial cigarettes." The report reviewed the various technological mechanisms studied by Lorillard as a means of increasing nicotine delivery to the smoker in "ultra low- and low-tar" cigarettes, including: studies of Lorillard's manufacturing process for the purpose of determining whether nicotine could be extracted from the waste of normal tobacco processing; studies of the effect on nicotine delivery and impact of spraying tobacco with nicotine tartrate and free

nicotine; studies of increasing the ratio of free nicotine to total nicotine by raising smoke pH; and studies of increasing the nicotine to tar ratio of "low tar" cigarettes through filter design and treatment of the filter with additives. 00782192-2223 at 2196-2199 (US 54377) (A); Farone WD, 96:7-19.

2778. In 1982, Lorillard experimented with adding bases to tobacco to enhance migration of nicotine to mainstream smoke and alter nicotine-to-tar ratios. 00053989-4018 (US 34217) (A); 00053989-4018 (US 47723) (A); Henningfield WD, 75:22-76:1, 77:15-18; Farone WD, 96:7-19.

2779. Lorillard extensively studied the effect of the treating filters with various chemical additives on the nicotine-to-tar ratios in mainstream smoke. For example, an April 8, 1982 memorandum concerning the "Results of Preliminary Experiments to Increase Nicotine to Tar Ratios in Mainstream Smoke by Augmenting Nicotine Elution from the Filter" concluded that increasing the amount of nicotine in a filter, modification of particle size in the smoke aerosol, and modification of the polarity of a filter were all possible mechanisms by which more nicotine could be "eluted," i.e., extracted by means of a solvent, from a filter and thus by which the nicotine to tar ratio could be increased. 00054361-4368 at 4361, 4367 (US 34220) (A).

2780. A July 25, 1984 memorandum reported on Lorillard's "Evaluation of Potassium Acetate as a Cellulose Filter Additive." The report concluded: "Addition of potassium acetate cause significant increases in nicotine delivery (28%, 45%) and nicotine/CPM [corrected particulate matter] levels (19%, 36%) relative to the control." 83897124-7127 at 7125 (US 55935) (O); see also 88169525-9528 (US 56437) (O).

2781. An August 3, 1984 memorandum from M.A. Sudholt to M.S. Ireland acknowledged that "[o]ne object of the nicotine project has been to increase the level of nicotine

relative to tar in cigarette smoke. Increased ratios of nicotine to [tar] as high as 66% were obtained with diethylaminoethyl cellulose ion exchanger purchased from Whatman." 83897139-7142 at 7140 (US 55938) (A); see also 81070726-0727 (US 88772) (A); Farone WD, 96:7-19.

2782. A February 6, 1985 memorandum described the "ultimate goal" of Lorillard's ongoing study of filter design as "increas[ing] the amount of nicotine which 'migrates' to the filter from the tobacco while cigarettes are stored, prior to consumption. It is hoped that shifting more nicotine to the filter than is currently shifted with cellulose acetate filters will increase the smoke impact." The report concedes: the "major objective" of Lorillard's study of nicotine was "to increase the physiological impact and/or nicotine to tar ratio in ultra low tar cigarettes." 80551040-1042 at 1040 (US 55381) (A).

2783. Alexander Spears, Lorillard's CEO, admitted in testimony that Lorillard conducted a large-scale effort in the 1970s and 1980s to augment or enrich the nicotine in its cigarettes, in part through adding alkali compounds directly to the filters of its cigarettes. Spears PD, Minnesota, 9/23/97, 156:2-159:14; 80642659-2661 (US 21996) (O).

(fff) Liggett

2784. Liggett also had projects to alter the ratio of nicotine to tar. In 1970, Liggett changed the tobacco blends of at least six brands, which resulted in an increased ratio of nicotine to tar in those brands. LG2013892-3893 (US 21189) (O).

2785. In 1977, Liggett's new product concepts included producing a "low tar cigarette with increased nicotine impact." Methods for designing this proposed cigarette included adding nicotine to the tobacco blend, or increasing the smoke pH through the use of additives. LWDOJ9165472-5472 (US 22169) (O).

2786. In 1978, Liggett researched creating "Cigarettes with Elevated Nicotine." As part

of this research, Liggett created test cigarettes using the additive nicotine malate to alter the nicotine-to-tar ratio. LG234157-4157 (US 21425) (O).

2787. In a May 25, 1994 letter responding to a request for information from Congress concerning any research studies Liggett had conducted concerning the relationship between nicotine and taste, Liggett stated that

This statement demonstrates that Liggett did not consider nicotine a significant contributor to a cigarette's taste. LDOJ9511212-1230 at 1216, 1218 (US 86933) (O) (Confidential).

2788. In a November 9, 2001 e-mail to Vector and Liggett management and employees, Timothy Jackson, the Vice President for Operations at Vector Tobacco, stated with regard to the Omni and Quest cigarette brands,

VDOJ 25299-5299 (US 75450) (O) (Confidential). In another e-mail dated August 27, 2001, Jackson informed Liggett and Vector management that the Omni was being modified in order to Jackson further informed management that alternatives were being considered VDOJ 25348-5348 (US 64735) (O) (Confidential).

2789. In an August 23, 2001 e-mail discussing product design on six new cigarettes, Jackson noted that demonstrating an intent that Liggett's new products achieve a specified, pre-determined level of nicotine delivery. VDOJ 25347-5347 (US 64736) (O) (Confidential).

2790. A memorandum dated July 25, 2001, regarding the launch of Omni Gold, a

Vector Tobacco product, details cigarette design changes in the filters, paper, and various flavorings. This memorandum also acknowledges the concept of compensation and notes that a particular choice of paper

A Liggett scientist has acknowledged that choice of filters, paper, and additives, can affect nicotine delivery. VDOJ 25339-5341 at 5339, 5340 (US 64737) (O) (Confidential); Dietz PD, United States v. Philip Morris, 7/1/02, 95:3-118:8.

2791. Liggett acknowledges that one aspect of a cigarette is that it is a system for the delivery of nicotine to the smoker, which is confirmed by Liggett's view that denicotinized products have not been successful. Dietz PD, Minnesota v. Philip Morris, 9/29/97, 66:14-68:7.

(iv) Smoke pH and Ammonia: Alteration of Chemical Form of Nicotine Delivered in Mainstream Cigarette Smoke for the Purpose of Improving Nicotine Transfer Efficiency and Increasing the Speed with Which Nicotine is Absorbed by Smokers

2792. The Cigarette Company Defendants have used chemical additives to alter the form of nicotine delivered to the smoker and enhance the speed of absorption. One main area of research that Defendants pursued and implemented with the intent of manipulating nicotine was the use of techniques to alter the pH of smoke.

2793. The acidity or alkalinity of a substance is commonly expressed as a measure of pH. The pH scale is open ended, but most substances have pH measurements ranging from zero to fourteen on the scale, with a pH below seven representing an acidic substance, and a pH measurement above seven representing an alkaline, or basic, substance. Farone WD, 8:20-9:3. The pH scale is a logarithmic scale, meaning that as pH rises, the alkaline (or basic) nature of a substance increases exponentially by a magnitude of 10 between each unit of measurement on the scale. For example, a substance with a pH measurement of 6 is ten times more basic than a

substance with a pH measurement of 5, while a substance with a pH measure of 7 is 100 times more basic than one with a pH measurement of 5. See Henningfield WD, 68:16-69:1.

2794. The pH of tobacco smoke is significant because it affects the chemical form of nicotine delivered in mainstream smoke, which in turn affects the rate and amount of nicotine delivery and the speed of absorption of nicotine over certain biological membranes. Henningfield WD, 69:2-9. Nicotine in cigarette smoke is found primarily in two different chemical states: either the protonated "bound" form or the unprotonated "free" form. As cigarette smoke becomes more basic – that is, as the smoke pH rises – more of the nicotine delivered is in its "free" chemical form. At a given pH, there is a given ratio of free to protonated nicotine. As more nicotine is delivered in the free, unprotonated form, a greater proportion of the nicotine is also delivered in the gas phase of smoke. Farone WD, 93:22-94:7.

2795. Molecule for molecule, the pH of the tobacco and/or cigarette smoke is an important determinant of how much nicotine gets into the bloodstream of a person exposed to nicotine through cigarette smoking. Creating more free nicotine by increasing the pH level of cigarette smoke increases "the amount of nicotine that can be readily released from the tobacco rod of a cigarette and, in turn, readily absorbed into the body of the cigarette smoker." Henningfield WD, 68:16-69:12, 69:19-70:2; Wigand WD, 118:14-20. Some of the Cigarette Company Defendants' internal research documents refer to the measurement of the amount of nicotine transferred from the original unsmoked tobacco rod to the cigarette smoke (where it is available for inhalation) as "nicotine transfer efficiency" or "NTE." Farone WD, 101:19-22; Henningfield WD, 72:22-73:14; 103281081-1112 (US 34706) (A); 599003691-3695 (US 22077) (A); 103281081-1112 at 1082, 1099 (US 20234) (A).

2796. Free nicotine also is more volatile and more physiologically active than bound

nicotine. Farone TT, 10/6/04, 1609:21-1610:6; Farone WD, 95:8-12; 00776238-6250 (US 21477) (O). It, therefore, is more rapidly transferable across the biological membranes of the mouth and oral mucosa than bound nicotine. Henningfield WD, 69:2-9; Henningfield TT, 12/01/04, 7517:24-7518:8; Farone TT, 10/6/04, 1610:10-20; Farone TT, 10/7/04, 2015:8-11. In addition, because free nicotine is volatile and more physiologically active than bound nicotine, the presence of more free nicotine in cigarette smoke also increases nicotine's effect on the central nervous system, because it transports across cells more rapidly. Farone WD, 76:11-77:1; Farone TT, 10/7/04, 2015:1-8, Farone TT, 10/12/04, 2126:10-12.

2797. Through research on nicotine's effects on the brain, Defendants were aware that there are greater physiological effects, and therefore "impact," with cigarettes that have a greater percentage of the nicotine in the free form. Farone WD, 76:18-19; 96:7-97:14; Farone TT, 10/12/04, 2126:8-2127:8. Two cigarettes with identical nominal machine-measured nicotine yields may have different impacts. 506236904-6907 at 6905 (US 88059) (O); 1000048537-8552 at 8539 (US 35106) (A). This difference in impact is due not to the amount of nicotine but to the form of nicotine and its availability to be absorbed in the mouth and oral mucosa of a smoker. Henningfield WD, 68:2-9; Dixon WD, 13:17-20. The addictive nature of cigarette smoking has a sensory component, and a cigarette's impact is significant to that sensory component. Henningfield WD, 81:22-23. Defendants' internal research documents have long recognized the significance of impact to addiction. For example, a BATCo document discussing the significance of the speed of nicotine delivery stated: "Within 10 seconds of starting to smoke, nicotine is available in the brain. Before this, impact is available **giving an instantaneous catch or hit, signifying to the user that the cigarette is 'active.'"** 400993160-3331 at 3320 (US 75975*) (emphasis added) (A); see also, 500378383- 8386 at 8385 (US 85467) (A).

2798. Extensive evidence in the record shows that Defendants were well aware of the particular chemical characteristics and effects of free nicotine and undertook extensive efforts to exploit these features. Internal research at Philip Morris confirmed that cigarette smoke that is more basic increases nicotine's effects on the central nervous system, and that the "rate of entry [of nicotine into the bloodstream] is pH dependent." 2025986551-6553 at 6552 (US 37312) (A); 2025986931-6935 at 6934 (US 37314) (A); 2056128345-8379 (US 20496) (A). As one Reynolds document explained: "In essence, a cigarette is a system for delivery of nicotine to the smoker in attractive, useful form. . . . As the smoke pH increases above about 6.0, an increasing proportion of the total smoke nicotine occurs in 'free' form, which is volatile, **rapidly absorbed by the smoker**, and believed to be instantly perceived as nicotine 'kick'." 511223463-3484 at 3466 (US 20840) (A) (emphasis added).

2799. Increasing the pH by a small percentage can double, triple, or quadruple the amount of free nicotine available for inhalation in cigarette smoke. Therefore, by increasing the pH on a small scale (e.g., from 0% unprotonated to 2% or 4%), a significant increase in free nicotine results. Henningfield WD, 68:16-69:1, 86:5-14.

2800. There are several means by which the pH level of cigarette smoke can be altered. The blend of tobacco used to make the cigarette is important to pH because, for example, Burley tobacco is naturally higher in alkaloids and nitrates than other tobaccos, and therefore, yields a higher smoke pH. Farone WD, 94:8-12.

2801. Another significant means of altering pH is through the use in the manufacturing process of additives, such as ammonia or ammonia-based compounds, or other compounds that create ammonia when burned. Farone WD, 94:8-12; Henningfield WD, 69:13-18; Rodgman PD, United States v. Philip Morris, 6/26/02, 155:15-156:6, 157:7-13. Ammonia compounds are basic

substances that raise the pH level and thus convert bound nicotine to free nicotine. Farone WD, 94:11-12, 16-18. The pH of cigarette smoke can be altered through the addition of ammonia compounds directly to the filler material as well as through the use of ammonia compounds in the process of making reconstituted tobacco. Henningfield WD, 69:13-18. In addition to the fact that ammonia compounds alter the ratio of free to bound nicotine in cigarette smoke, the way ammonia actually works is also important. When ammonia is released during combustion, it sweeps along the remaining tobacco in the rod, which has been moistened by water of combustion, replacing nicotine and causing the nicotine to be released in gas phase from the tobacco. Farone WD, 94:18-21. Research as early as 1975 showed that, through controlling pH, "up to 14% of the nicotine can be delivered in the gas phase of smoke." Farone WD, 100:4-15; VXB3282256-2278 at 2275 (US 61368) (A). Finally, because they are not as bitter as nicotine, ammonia compounds also alter the impact of smoke and nicotine by smoothing the smoke. Farone WD, 94:15-16.

2802. As discussed above, this transformation of cigarette smoke caused by ammonia compounds facilitates consumer use of cigarettes for pharmacological purposes by: (1) increasing the amount of nicotine that is transferred from the tobacco to the smoke; (2) increasing the absorption of nicotine in the mouth and oral mucosa; and (3) increasing the speed of delivery of nicotine to the bloodstream and possibly to the brain. 511223463-3484 (US 20840) (A); Henningfield WD, 69:2-18, 74:21-75:13; 85:12-86:14; "Nicotine in Cigarettes and Smokeless Tobacco Products Is a Drug and These Products Are Nicotine Delivery Devices Under the Federal Food, Drug, and Cosmetic Act: Jurisdictional Determination," 61 Fed. Reg. 44619 (August 1996) (jurisdictional determination annex) at 44974-44975 (US 61237) (A). The speed with which a drug is delivered to the body influences its addictive potential, and the speed of

delivery can be influenced by factors such as: where the drug is targeted, the pH, and the concentration of the drug in aerosol. Henningfield WD, 32:6-12, 33:20-21.

2803. In addition to raising the pH level, ammonia treatment leads to lower nicotine levels being reported through FTC testing than the nicotine level actually received by a smoker. This is true because ammonia treatment causes more nicotine to be released from the tobacco as gas phase nicotine, and FTC testing devices do not measure gas phase nicotine. Farone WD, 98:9-16. Thus, separate and apart from the discrepancies in nicotine yield between FTC testing and human smoking that are attributable to Defendants' cigarettes designs that facilitate smoker compensation, cigarettes with more gas phase nicotine regularly deliver more nicotine to smokers than their FTC ratings suggest. Farone WD, 98:14-16.

2804. The Cigarette Company Defendants' internal research documents reveal that, at least until the time they were publicly accused of using ammonia technology and other methods to alter the pH of cigarette smoke, Cigarette Company Defendants steadfastly embraced these basic scientific principles concerning pH, and that they incorporated the use of ammonia technology in their commercial products with the intent to alter the pH of cigarette smoke and thereby affect nicotine delivery and absorption in smokers. Although in recent years Defendants have set out to disprove the science upon which they relied for decades, following public accusations against the tobacco industry in 1994 and the publication of the results of the FDA's investigation of the industry in 1996 (see Section III.C(2)(a), supra), the weight of the evidence in this case demonstrates that Cigarette Company Defendants' post-hoc efforts to minimize the significance of their use of ammonia technology in commercial products is unpersuasive, and that the testimony of Defendants' witnesses on these points is not credible.

2805. First, the internal research documents of the Cigarette Company Defendants,

identified specifically in the findings set forth Defendant-by-Defendant below, demonstrate that: (1) the Cigarette Company Defendants have been aware at least since the 1960s of the ability to alter the amount and form of nicotine delivered to smokers by using cigarette design techniques intended to raise the pH of cigarette smoke; (2) the Cigarette Company Defendants incorporated design techniques – including, but not limited to, the use of ammonia technology and alterations to the tobacco blend – to raise the pH of the smoke in their commercial products with the purpose and intent of creating cigarettes that would deliver a greater amount of free nicotine and allow for faster absorption of nicotine than cigarettes with lower smoke pH; (3) Cigarette Company Defendants took these actions in order to assure that their purportedly low-delivery products could deliver doses of nicotine sufficient to create and sustain addiction in cigarette smokers, Farone WD, 75:1-6, 93:12-15, 94:4-98:8; (4) the extensive research conducted by the Cigarette Company Defendants' on the methods and effects of altering the pH of cigarette smoke demonstrates their internal acceptance of the scientific principles concerning alteration of smoke pH relied upon by the United States' experts on this subject.

2806. Second, Defendants have argued that the pH of cigarette smoke has not, on average, increased over the years. However, before the Cigarette Company Defendants started using ammonia technology in their products, the pH for cigarette smoke was much lower. Farone TT, 10/7/05, 1995:24-1996:16, 2010:19-22. Indeed, the pH of cigarette smoke has risen steadily since the late 1960s, such that it has recently been tested at one full pH unit higher (i.e., a ten-fold increase) than the level it was in the 1960s. Farone TT, 10/7/04, 1995:6-23, 2010:18-2011:2; DXA1200008-0012 (US 88093) (A); Farone WD 98:2-8, 100:16-101:6.

2807. Third, although Defendants argue that there is virtually no free nicotine at the pH levels generally found in commercial cigarettes, the evidence demonstrates that a small upward

increase in smoke pH can cause significant chemical and biological effects by substantially increasing amount of free nicotine delivered to the smoker and cause. Henningfield WD, 68:23-69:1, 69:21-23; 500606138-6153 (US 48334) at 6140 (O) (showing that an increase in pH from 6.0 to 6.5 more than triples the amount of free nicotine available in cigarette smoke). There also is substantial documentary evidence, detailed below, that Cigarette Company Defendants' scientists found these "small" increases in pH and free nicotine delivery to be extremely significant to their ability to deliver an "optimum" dose of nicotine, i.e., one that was capable of creating and sustaining addiction in cigarette smokers.

2808. The manner in which the measurement of smoke pH is derived has a significant impact on its accuracy. Cigarette Company Defendants have been aware that the methods historically used to measure smoke pH have resulted in measurements that are "biased approximation[s]" of the actual smoke pH, but are believed to be sufficient to "give a practical scale for comparative studies." 00044921-4938 at 4921, 4923-27 (US 34203) (A); see also Dixon WD, 56:11-21. While these historical methods have been relied upon by researchers inside and outside the tobacco industry, it is known that measuring the pH of smoke is difficult as a technical matter because it typically involves the use of aqueous solutions or other methods that may affect the pH measurement. 00044921-4938 at 4921, 4923-27 (US 34203) (A).

2809. Indeed, a recent, peer-reviewed scientific study authored by James Pankow, and relied upon by the United States' experts, used a method for calculating smoke pH that is a "significant advancement" in determining accurate measures of smoke pH. Benowitz TT, 11/2/04, 4782:23-25; DXA1200008-0012 (US 88093) (A). The technique actually measures the proportion of free to bound nicotine found in cigarette smoke, and then "back-calculates" the measurement of the pH of the smoke. As explained by Dr. Benowitz, the Pankow method "looks

at how much nicotine . . . is bound verus unbound in a given smoke . . . [and uses] that calculation to figure out what the pH must have been" in order to yield the particular proportion of free to bound nicotine. Benowitz TT, 11/2/04, 4821:19-4822:5. Pankow measured "the pH of the smoke particle by looking at its effect on partition of [smoke] constituents. . . . So [the method has] great promise as giving us a better indicator of pH than we've had in the past." Id., 4822:2-5.

2810. The results of the Pankow study indicate that the traditional methods that have been used to measure smoke pH have underestimated pH, and that the pH of smoke in typical commercial cigarettes is higher than what earlier studies suggested. Farone WD, 101:1-6. Specifically, the Pankow study reported a pH of 7.08 for the first puff of a commercial Marlboro cigarette, a pH of 6.78 for the first puff of a commercial Winston cigarette, and a pH of 6.91 for the first puff of a commercial Virginia Slims cigarette. DXA1200008-0012 at 0010 (US 88093) (A); Benowitz TT, 11/2/04, 4823:12-4824:11. Based on these results, the Pankow study found that "significant amounts of the nicotine in smoke PM [particulate matter] from some cigarettes can be in the free base form." DXA1200008-0012 at 0010 (US 88093) (A). Dr. Farone concluded that this research demonstrates that previous statements concerning the typical amount of free nicotine present in tobacco smoke have "understate[d] the actual amount [of free nicotine] in cigarette smoke." Farone WD, 101:3-6. Thus, as the United States' experts testified in reliance upon Pankow's work, Defendants have been effective at increasing the amount of free nicotine in the smoke in their commercial products.

2811. Defendants cite the 1979 Surgeon General's Report to support their claim that there is virtually no "free" nicotine in mainstream cigarette smoke; however, as Dr. Farone explained, there are various methods that have been used to measure pH and free nicotine, and

each method can render different results. The test described in the Surgeon General's Report only measured nicotine collected on the collection pad of the measuring device; it did not measure gas phase nicotine. Farone TT, 10/7/04, 2003:15-2004:13, 2005:14-25; DXA1200008-0012 (US 88093) (A).

2812. Regardless of what measurement technique has been used, however, cigarette products that are purportedly low delivery historically have been measured to have pH levels that are higher than higher tar cigarette brands, indicating that Defendants manipulated the pH level of lower delivery products in order to assure delivery of a dose of nicotine sufficient to create and sustain addiction. As Dr. Farone explained, the "exact number [of measured pH] is not as important as the differences between [the pH measurements of regular versus lower delivery cigarettes] because it's showing you whether you have more or less" free nicotine in the smoke of low delivery products. Farone TT, 10/7/04, 2010:9-11.

2813. Fourth, Defendants have asserted that increased presence of free nicotine in cigarette smoke does not affect the rate at which nicotine is absorbed in the body, and that increased free nicotine therefore does not increase the central nervous system [CNS] effects caused by the delivery of nicotine to the brain through cigarette smoking. However, Defendants' arguments are contradicted by basic, fundamental principles of chemistry and of the existing science evaluating the effect delivering drugs in their free chemical form.

2814. The basic principles of chemistry and of the operation of drug delivery systems were established by Drs. Farone and Henningfield. Dr. Farone was accepted by the Court as an expert in four proffered areas: (1) chemistry and biochemistry of alkaloids and addictive drugs; (2) the chemistry of physics of cigarette smoke; (3) cigarette design and technology; and (4) the chemistry and biochemistry of toxic substances and their interactions with living systems. See

Farone TT, 10/12/04, 2185-2191. Dr. Farone's degrees (B.S., Master's and Ph.D.) are all in Chemistry or Physical Chemistry. Dr. Farone testified that he is specifically trained, both through formal education and experience, in the study of colloidal systems (i.e., chemical aerosols and smoke). See Farone WD, 6:1-8.

2815. Dr. Henningfield was accepted by the Court as an expert in all the areas for which he was proffered by the United States: psychopharmacology, including in the areas of health and medical issues related to the development of treatment for medical disorders, including tobacco dependence and other drug addictions, and including in the design and effect of drug delivery systems for addictive drugs. Henningfield TT, 11/22/04, 6786:12-19; Henningfield TT, 12/1/04, 7594:7-8. Dr. Henningfield has a Ph.D. in the field of Experimental Psychology with an emphasis on psychopharmacology, or "behavioral pharmacology," which is the study of drugs that affect the brain and thereby affect mood and behavior, including the interaction between drugs and addictive behavior. Henningfield WD, 2:6-21. Additionally, Dr. Henningfield has extensive experience in the design and evaluation of drug delivery systems, including drugs that are administered by inhalation, and specifically in evaluating the addictive potential of such drugs. Henningfield WD, 29:7-30:9, 33:7-14.

2816. It is a basic principle of chemistry that free nicotine transports across biological membranes more quickly than bound nicotine. Dr. Farone explained that, chemically, materials that are soluble in lipids transport through the chemical structure of cells more rapidly than materials that are less soluble, because cells have a lipid layer through which substances must pass. Bound nicotine is not very soluble in that environment, "[w]hereas free base chemicals, especially of the nicotine type, are more soluble . . . [and pass through cell] membranes much more quickly." Farone TT, 10/6/04, 1610:10-20. "We know chemically, fundamentally, that free

nicotine transports across a cell much more rapidly" than bound nicotine. Farone TT, 10/7/04, 2015:8-11.

2817. It is scientifically accepted that the free base forms of other drugs of abuse, such as free base cocaine, are more reinforcing than their non-free base counterparts because they reach the brain more quickly. Farone TT, 10/7/04, 2012:20-22, 2015:1-2017:5; Henningfield WD, 34:14-17, 85:23-86:4, 86:9-11. Dr. Farone explained that the effects of pH on changing the chemical form of alkaloids like cocaine have been discussed in scientific literature for decades. Farone WD, 94:22-93:3. He also explained the chemical principles of freebasing, which include the fact that drugs in their freebase form are absorbed more quickly, and therefore reach the brain more quickly than other drugs. Farone TT, 10/7/04, 2012-2017. Similarly, Dr. Henningfield explained that alteration of pH is a well established, scientifically effective means of dose control for certain substances, in particular substances in which variation of pH within physiologically tolerable parameters affects the fraction of drug transferred across membranes of the mouth and throat. Henningfield WD, 75:9-12. Techniques to alter pH so as to change the proportion of free and bound molecules of a substance are understood and employed by pharmaceutical companies to control the bioavailability of many drugs, including nicotine in nicotine-delivering medications. Id., 75:7-9.

2818. There is no counter-evidence demonstrating that free nicotine behaves differently than the free base forms of other alkaloids. In fact, studies conducted internally at Philip Morris confirm that free nicotine acts similarly to other free base alkaloids. The studies comparing the central nervous system effects of cigarettes treated with an acid and cigarettes treated with a base confirms that those treated with a base – i.e., those with higher smoke pH values – caused comparatively greater central nervous system effects. 2025986551-6553 at 6552 (US 37312)

(A); 2025986931-6935 at 6934 (US 37314) (A); 2056128345-8379 (US 20496) (A); Farone WD, 76:11-21, 97:7-12.

2819. Defendants contended at trial that ammonia and ammonia forming compounds, such as DAP and urea, do not increase the amount of nicotine going into the bloodstream or the speed at which nicotine enters the blood. In support of this contention, Dr. Michael Dixon, a BATCo scientist, testified concerning a study that he coauthored in 2003 which measured, among other things, nicotine blood levels during smoking. Dixon TT, 3/9/05, 15032:8-15033:18; (JD-031612) (A). However, Dr. Dixon's conclusion is not compelling evidence based on the record before the Court. His study measured the amount and speed of nicotine uptake into **venous blood**, which is not the path by which nicotine is delivered to the brain. After inhalation, nicotine is rapidly absorbed in the lung where it enters the bloodstream and quickly moves into the heart. From the heart, nicotine travels through the **arterial blood** to the brain and other organs. Benowitz WD, 16:4-10. Significantly, Dr. Dixon's study acknowledges that "further study" measuring arterial blood levels "would be required" in order to address this issue. See p.6-7 (JD-031612) (A). Yet, Dr. Dixon failed to inform the Court of this call for further study.

2820. Defendants argue that increasing the proportion of free to bound nicotine could actually decrease nicotine's addictive potential, because free nicotine is absorbed in the mouth rather than the lung, where it travels more slowly to the brain. Defs.' Opening Stmt, 9/22/04, 317:10-20; Dixon WD, 61:16-17, 63:23-64:15. Again, this argument conflicts with basic rules of chemistry. Each droplet of smoke aerosol has a certain ratio of free to bound nicotine. For those droplets that stay in the mouth and throat, the free nicotine is absorbed in that location. However, the droplets that reach the lungs do not lose their free nicotine as they travel there, and once delivered to the lung, basic principles of chemistry dictate that free nicotine should be

absorbed faster than bound nicotine. Farone TT, 10/6/04, 1611:6-15. Defendants conducted extensive product research and development based on precisely this premise.

2821. The argument that increasing the proportion of free nicotine would make cigarette smoking less addictive was advanced by Dr. Dixon, who is not a chemist. Dr. Dixon was offered, and accepted by the Court, as an expert in "smoking behavior." Dixon TT, 14917:5-10. Dixon has a B.Sc. in human biology and a Ph.D. in respiratory physiology. Although he was permitted to discuss areas of chemistry and cigarette design, he is not formally trained in either of these areas, nor does he hold himself out as a chemist. Being an expert in human physiology (anatomy) and "smoking behavior" does not necessarily mean that Dixon is an expert in the chemical makeup of colloidal systems (i.e., aerosols and smoke), as is Dr. Farone.

2822. Although Defendants' expert, Peter Rowell, criticized the testimony of Dr. Henningfield, Dr. Rowell's criticisms are based on a misapprehension of Henningfield's testimony. Specifically, Rowell's criticisms are based on the notion that Dr. Henningfield testified that increasing the proportion of free nicotine in cigarette smoke results in more total nicotine being absorbed in the lung. See Rowell WD, 48:7-14. However, Dr. Henningfield did not testify that **more** nicotine is absorbed in the lung at a higher pH; in fact, the United States' experts who testified about nicotine and pH agreed that all nicotine that reaches the lung is eventually absorbed there regardless of the smoke pH. Rather, Dr. Henningfield testified, based on principles of chemistry and his own experience in designing drug delivery systems, that pH is an important determinant of how many molecules of nicotine ultimately reach the blood stream (rather than being exhaled or swallowed into the gastrointestinal tract) and of how much time it takes those molecules to be absorbed in the lung and reach the bloodstream. Henningfield WD, 86:5-14. Significantly, Dr. Farone testified at trial, consistent with Dr. Henningfield, that free

nicotine affects the speed at which nicotine is absorbed in the lung and ultimately delivered to the brain. Farone TT, 10/7/04, 2014:20-2016:4.

2823. Finally, Defendants argue that they began researching ammonia technology in response to the public health authorities' suggestions in the 1970s that one way to create a potentially less hazardous cigarette might be to increase the pH of cigarette smoke to liberate more free nicotine, create a harsher smoke, and thereby discourage inhalation by cigarette smokers. See, e.g., Rowell WD, 47:12-48:2, 49:10-13. Based on the voluminous internal research documents of Cigarette Company Defendants described below, it is clearly evident that this argument lacks any credibility because: (1) the documents indicate that pH and ammonia technology research by the Cigarette Company Defendants was well underway prior the 1970s, and that some Defendants had already incorporated ammonia technology into their commercial products prior to the 1976 recommendation of the NCI Tobacco Working Group, see 1003728988-9020 at 9014-9015 (JD001934) (O); (2) the motivations for researching ammonia technology and other methods of altering smoke pH described in the documents do not reference the recommendations of public health authorities, but rather reference the Cigarette Company Defendants' worry that they might not be able to keep smokers hooked on their products unless they developed means to alter nicotine delivery in lower delivery products; and (3) contrary to the testimony of Dr. Rowell, the documents do not discuss, as a product goal, increasing pH for the purpose of discouraging inhalation by smokers.

2824. Furthermore, Defendants have conducted and continue to conduct studies on ammonia that are misleading, because they do not consider other materials within the cigarette, such as urea, that decompose to make ammonia upon burning. Farone WD, 180:20-181:19; see also Henningfield WD, 85:16-22. For example, Philip Morris scientist, Cathy Ellis, presented a

paper to CORESTA in 1999, which concluded that ammonia in a commercial Marlboro Lights cigarette did not increase smoke pH and FTC nicotine yield. VXB3267959-7980 at 7979 (US 61312) (A). As Dr. Farone noted, the test cigarettes in this study were not explained fully to determine what compounds were used. The paper also ignored other important effects of ammonia compounds, specifically, the percentage of free nicotine in the smoke. Farone WD, 181:8-19.

2825. Ammonia compounds are among the top additives by volume in the industry. 566408585-8587 (US 21999) (O). A B&W document concluded: "R.J. Reynolds alone has ammonia emissions of 900,000 lbs./year in North Carolina . . . . [T]he U.S. industry uses about ten million pounds of ammonia compounds a year," and industry ammonia usage "**corresponds to about 10 mg. of ammonia compounds per cigarette produced**." 508104011-4164 at 4017 (US 20807) (A) (emphasis added).

2826. By 1993, all the Cigarette Company Defendants used some form of ammonia technology in some cigarette products. For example, an April 12, 1994 list of "Ingredients Added to Tobacco in the Manufacture of Cigarettes" by the six largest U.S. manufacturers states that the companies added ammonia and other ammonium compounds to their cigarettes during the manufacturing process. 508104011-4164 (US 20807) (A); 681001134-1139 (US 21016) (O); LG2018563-8563 (US 21190) (O); 606000841-0889 at 0842 (US 53325) (O).

(aa) Philip Morris

2827. With the understanding that nicotine levels in cigarette smoke were essential to a smoker's experience, and armed with the knowledge of nicotine's addictiveness, Philip Morris undertook to manipulate the pH of tobacco to enhance the psychoactive effects of nicotine on the brain. 500606138-6153 (US 48334) (O); 509314122-4154 (US 51456) (O).

2828. Philip Morris appears to have been the first tobacco manufacturer to use the ammonia process in the United States, beginning in 1964 or 1965, on the heels of the 1964 Surgeon General's Report. At the time, Philip Morris ranked far behind RJR in domestic cigarette sales. Internal Reynolds research speculated that Philip Morris introduced ammonia into certain cigarettes as early as 1965. Shortly after the introduction of ammonia processes into their products, Philip Morris's sales began to grow rapidly. 500990999-1004 (US 20666) (O); 500540827-0832 (US 20639) (O).

2829. A March 31, 1966 "Progress Report" on "Nicotine and Smoke pH" to R.N. Thomson, Philip Morris's Director of Development, indicated that nicotine delivery "varies with filler (smoke) pH – the higher the pH the higher the nicotine delivery and vice versa." The report concluded that "**nicotine delivery can be controlled via filler or smoke pH adjustment**." 2051205600-5605 at 5600 (US 85461) (O).

2830. According to a 1970 inter-office memorandum from Jim Charles, Associate Professional who would later become Vice President of Research and Development, to Thomson, the company had developed a method for determining the pH of whole smoke on a puff-by-puff basis and was analyzing per-puff pH content for Marlboro, its competitor, Winston, and other cigarettes and tobacco blends. 2028812066-2067 at 2066 (US 20429) (O).

2831. By 1974, Philip Morris was conducting multiple tests to manipulate levels of free nicotine in smoke through pH levels, so as to affect smoke impact. One of the tests varied the amounts of nicotine salts added to the tobacco and another manipulated the tobacco blend and the carbohydrate concentration in the smoke, with the effects of both tests leading to higher pH levels. In an October 1974 report, Philip Morris psychologist T.R. Schori concluded, "The amount of free nicotine in the smoke depends upon . . . total nicotine[] and pH of the smoke."

Schori also noted that machine measured nicotine yields could be misleading because, depending on pH, a smoker could obtain different levels of free nicotine from two cigarettes with identical machine-measured yields, or similarly could obtain the same amount of free nicotine from two cigarettes with different machine-measured yields. 2047113252-3267 at 3264-66 (US 85462) (O).

2832. Schori also wrote, in an October 22, 1979 document entitled, "Free Nicotine: Its Implication of Smoke Impact," that "we should be able to increase smoke impact by increasing the total free nicotine potential (i.e. by using high nicotine blends and/or nicotine additives) in the smoke." Schori identified burley blend tobacco and ammonia as two methods of increasing pH in tobacco smoke. 542001986-1996 at 1993 (US 53135) (A).

2833. In the same paper, Schori again explained the misleading nature of machine-measured nicotine yields with respect to free nicotine:

> The way in which nicotine is typically reported can be misleading. This is due to the manner in which nicotine determinations are made. For instance, cigarettes X and Y may both be reported to deliver (based upon the standard smoking machine test) 2 mg. nicotine/cigt. However, a given smoker may actually inhale much more free nicotine from cigarette X than from cigarette Y. Likewise, cigarette W may deliver 1 mg. nicotine/cigt. while cigarette Z delivers 2 mg. nicotine/cigt. Yet a given smoker may inhale equal amounts of free nicotine from cigarettes W and Z. This paradox results from the fact that in making the nicotine delivery determinations strong bases are employed to free or release the nicotine from its bonds with other elements. . . . Thus, the amount of free nicotine available to the smoker is determined by the degree of alkalinity (or pH) of the smoke as well as his own degree of alkalinity.

542001986-1996 at 1989 (US 53135) (A).

2834. Philip Morris's testing of the effect of ammonia on nicotine delivery continued throughout the 1970s. As summarized in a November 8, 1971 Special Report of the Research

Center, entitled "Effects of Ammonia - Odor and Smoke," and distributed to, among others, F.E. Resnick, then Director of the Research Center and later Chairman and CEO of Philip Morris USA, scientists measured the differences in the impacts of nicotine levels in Marlboro cigarettes versus competitor brands. The study concluded that, for competitor brands containing less ammonia than Marlboro, addition of ammonia increased the "desirability" of the brands. 1000349937-9947 (US 85463) (O).

2835. A June 18, 1975 Special Report entitled the "Manipulation of Nicotine Delivery by Addition of Acids to Filler," prepared by Joseph J. Cipriano and distributed widely through the Research Center, demonstrates Philip Morris's knowledge of the significance of free nicotine in mainstream cigarette smoke and its unwillingness to implement design parameters that would reduce the amount of free nicotine in its products. The Report discussed manipulation of nicotine in the smoke through the use of acid, and found that although the acid increased nicotine delivery to mainstream smoke, it also lowered pH and therefore delivered the additional nicotine in the protonated form. Because this approach reduced the pH and therefore the amount of free nicotine in mainstream smoke, Cipriano recommended against its use, stating that "the increased nicotine delivery at a lower pH seems to lower rather than increase response." 1000051227-1240 at 1235 (US 85502) (O); Farone WD, 95:13-96:6.

2836. Philip Morris's nicotine-enhancing techniques have been studied by other tobacco companies, including B&W. In 1984, R.R. Johnson authored a report entitled, "The Unique Differences of Philip Morris Cigarette Brands," that was sent to numerous B&W executives, including Chief Executive Officer I.W. Hughes, in which Johnson stated: "Ammonia treatments appear to be the most important aspect of PM's blend uniqueness. It is definitely used in making one of the two types of reconstituted tobacco and one of the two types of puffed tobacco in these

blends. Results from a Marlboro matching project at R.J.R. provide strong evidence that they also treat their lamina with ammonia." Johnson went on to state that B&W's research department had reason to believe that Philip Morris began to develop some of their techniques from the early 1960s, and had spent the time since then optimizing their methods. 570322550-2583 at 2552, 2568 (US 53186) (A); 103281081-1112 at 1082, 1098 (US 20234) (A).

2837. At the same time, Philip Morris engaged in research regarding its competitors' methods of nicotine manipulation. Cathy Ellis has testified that Philip Morris extensively studied the ingredients and make-up of Winston cigarettes, particularly to discover tar and nicotine levels. Ellis PD, Mississippi, 3/20/97, 131:1-132-3.

2838. On August 26, 1986, Philip Morris applied for a patent on a "process for modifying the smoke flavor characteristics of tobacco." 2026526349-6353 at 6349 (US 86964) (A). The patent request related to Philip Morris using ammonia in order to increase the nicotine delivery of Bright tobacco. Philip Morris acknowledged, "Ammonia treatment of tobacco has been employed in the past, principally as a means to displace and effect release of nicotine." 2026526349-6353, at 6350 (US 86964) (A); 2026377889-7896 (US 37347) (O); 2024761243-1250 (US 86965) (O).

2839. On August 2, 1989, scientists Gullotta, Hayes and Martin reported to H.L. Spielberg on a Philip Morris study comparing the effect on the central nervous system ("CNS") of cigarettes made from filler that had been oversprayed with nicotine as an acid (i.e., "the citrate") and as a base. "Cigarettes made from filler oversprayed with nicotine as the citrate . . . produce CNS effects which are approximately half the magnitude of those obtained with the [filler oversprayed with nicotine as a base]." 2025986931-6935 at 6934 (US 37314) (A). Thus, this report indicates that the magnitude of CNS effects was twice as big when the nicotine in the

cigarettes was applied as base than when it was applied as an acid. Farone WD, 76:11-19. It also confirms that Philip Morris's primary interest in studying nicotine was to learn about its effects on the brain. Id., 76:20-77:1.

2840. By 1990, Philip Morris's research efforts included producing low delivery cigarettes with more nicotine impact. Philip Morris theorized that manipulation of smoke pH would result in more free nicotine that would then, based on its previous findings, be perceived as having a greater nicotine impact. The finding of one study, explained in a December 14, 1990 memorandum from scientists Gulotta, Hayes, and Martin to R.D. Kinser, was "that one could produce a low nicotine delivery cigarette with a higher proportion of free to protonated nicotine. Such a cigarette would be analytically similar to other cigarettes at comparable nicotine deliveries, but would be judged to have much more impact." 2023107993-7999 at 7993 (US 85465) (O); 2022262774-2775 at 2774 (US 36876) (O); 2023105617-5617 (US 85464) (O).

2841. Others in the industry closely studied, and duplicated, Philip Morris's use of ammonia. Minutes of an Ammonia Technology Conference, sponsored by B&W on May 18-19, 1989, and attended by representatives of Defendants, concluded that ammonia technology "is the key to competing in smoke quality with PM worldwide." It was noted that all U.S. manufacturers except Liggett were using some form of ammonia technology on their commercial projects at the time of the conference. 508104012-4164 at 4016 (US 53249*) (A).

2842. In an October 26, 1992, report authored by B&W's Research and Development Department entitled "PM's Global Strategy: Marlboro Product Technology," B&W points to Philip Morris's "[a]mmonia technology [as] critical to the Marlboro character, taste and delivery," in part because of the smoke pH increase it produced and the "free nicotine/nicotine transfer" that occurred through its usage. 570399133-9370 at 9183 (US 88083) (A); 304569591-9595 (US

46615*) (O).

2843. To evaluate FDA Commissioner David Kessler's statements about smoke pH during the Waxman Hearings before Congress in 1994, Philip Morris compiled research on smoke pH reported in the scientific literature, as well as its own internal documents. This research confirms that higher smoke pH leads to quicker delivery of nicotine into the bloodstream. 2056128345-8379 (US 20496) (A).

2844. William Farone, former Director of Applied Research for Philip Morris, testified that Philip Morris used ammonia and ammonia compounds in its manufacturing process with the intent of altering the form of nicotine delivered and rate of absorption of nicotine delivered by its products. Farone testified that it was widely discussed and understood at Philip Morris that the company considered its blended leaf, or BL, to be a secret to Marlboro's success, because of the ammonia added to the BL. Farone WD, 95:4-7. He further testified that Philip Morris was fully aware of the chemical properties of free nicotine, that nicotine delivered in the gas phase could not be detected in standardized FTC testing, and that Philip Morris used this knowledge to exploit the properties of nicotine in its commercial products. Id., 97:9-21.

(bb) R.J. Reynolds

2845. RJR conducted multiple studies regarding the impact of smoke pH on nicotine delivery. For example, a December 16, 1971 report authored by D.P. Johnson demonstrates that Reynolds studied very early on a method "to increase the free nicotine content of the VANTAGE smoke by adding selected salts to the VANTAGE blend." Although Johnson recommended that the costs of adding the salts outweighed the benefits, Reynolds continued its study of various methods for delivering more nicotine to the mainstream cigarette smoke of its products. 504414205-4211 at 4205 (US 50608) (A); Henningfield WD, 78:2-16.

2846. In 1973, RJR conducted an extensive study of the design of Philip Morris's Marlboro cigarettes in an attempt to discover the reason for its competitor's sharp increase in sales. In a 1973 memorandum entitled "Implications and Activities Arising from Correlation of Smoke pH with Nicotine Impact, Other Smoke Qualities, and Cigarette Sales," Claude Teague, Reynolds's Director of Research and Development, reported that the pH of Marlboro was consistently and significantly higher than Reynolds's brands and, accordingly, Marlboro contained more free nicotine and "would be expected to show more instantaneous nicotine 'kick' than our brands." The amount of free nicotine in Marlboro was found to be almost three times that found in the smoke of Reynolds's Winston brand. Reynolds also concluded that other popular brands – for example, B&W's Kool – also had an increased smoke pH and increased amounts of "free nicotine." Significantly, the smoke pH as measured by Reynolds in 1973 of Marlboro and Kool was found to typically range from 6.8-7.3 and 6.4-6.6 respectively, significantly above the pH of "about six" that Cigarette Company Defendants claimed during trial. Reynolds concluded that the high smoke pH attained by Philip Morris and B&W was "deliberate and controlled." 511223463-3484 at 3465-3466 (US 20840) (A); see also 500990999-1004 (US 20666) (O).

2847. In the same 1973 memorandum, Teague outlined the various methods the industry had already identified to alter the pH of cigarette smoke:

> Methods which may be used to increase smoke pH and/or nicotine "kick" include: (1) increasing the amount of (strong) burley in the blend, (2) reduction of casing sugar used on the burley and/or blend, (3) use of alkaline additives, usually ammonia compounds, to the blend, (4) addition of nicotine to the blend, (5) removal of acids from the blend, (6) special filter systems to remove acids from or add alkaline materials to the smoke, and (7) use of high air dilution filter systems. **Methods 1-3, in combination, represent the Philip Morris approach, and are under active investigation**.

511223463-3484 at 3468 (US 20840) (A) (emphasis added).

2848. Teague further reported on the significance of smoke pH to the amount of free nicotine in Marlboro cigarettes: "As a result of its higher smoke pH, the current Marlboro, despite a two-thirds reduction in smoke ‘tar' and nicotine over the years, calculates to have essentially the same amount of ‘free' nicotine in its smoke as did the early WINSTON." Teague also reported on other benefits of altering the pH of cigarette smoke:

> In addition to enhancing nicotine ‘kick', increasing the pH (increasing alkalinity) of smoke above about 6.0 causes other changes, particularly when the increase in smoke pH is achieved by adding ammonia to the blend. As smoke pH increases, in general stemmy taste, mouth irritation, flue-cured flavor and Turkish flavor are diminished. . . . It should be noted, however, that if the smoke pH goes much above 7 at normal total smoke nicotine levels . . ., the amount of ‘free' nicotine becomes high, and this may cause harshness to the throat.

511223463-3484 at 3466 (US 20840) (A).

2849. Another 1973 RJR study illustrated the discrepancies between FTC tar and nicotine data and actual cigarette strength. This study found that the smoke pH for the Marlboro and Kool cigarettes had been steadily increasing since 1964, while the pH for Reynolds's products had remained almost constant. At the same time, the FTC tar and nicotine levels for Marlboro and Kool had decreased. The study also showed that the Marlboro and Kool brands had higher levels of ammonia than the other cigarettes studied. The researchers concluded that controlling smoke pH would be extremely important to the successful performance of Reynolds's cigarettes. Significantly, the comparisons made in this study were of Cigarette Company Defendants' commercial products. 500606138-6153 at 6138, 6140,6144, 6145 (US 48334) (O).

2850. Reynolds soon developed its cigarette design in the same direction as Philip Morris. In a December 4, 1973 memorandum to R. Blevins, Director of Marketing and Planning

for Reynolds, from Frank Colby, RJR scientist, titled "Cigarette Concept to Assure R.J.R. a Larger Segment of the Youth Market," Colby stated that, in developing a low tar cigarette to appeal to the youth market, "any desired additional nicotine 'kick' could be easily obtained through pH regulation." 501166152-6153 at 6152 (US 23051) (A). By 1974, Reynolds had "**introduced ammoniated sheet filler in the Camel filter cigarette** . . . . Better market performance was indicated in the subsequent years." 509018864-8865A at 8864 (US 20820) (A) (emphasis added).

2851. An undated RJR document discussing the technology of ammoniation reveals that Reynolds "introduced ammoniated sheet material in the Camel filter product in 1974. . . . Low 'tar' products at R.J. Reynolds were designed with ammoniated sheet material beginning in 1974. . . . Ammoniated sheet was introduced into the Winston KS product in 1979." The document described two of the characteristics of products that incorporate ammoniation technology as "cleaner taste with more free nicotine" and "stronger physiological impact with less harshness." 509018864-8865A at 8864, 8865 (US 20820) (A); see also 510983376-3380 (US 20833) (O). This document demonstrates that the tobacco companies actually used ammonia to change the characteristics of their marketed brands, and understood both the chemistry and that one of the positive attributes was more free nicotine and greater physiological impact. Henningfield WD, 79:13-15.

2852. RJR continued to study the relationship between the amount of free nicotine in a cigarette, the smoke pH of a cigarette, and its market performance throughout the 1970s. A January 15, 1975 paper by John D. Woods and Sue H. Sheets, of RJR's Chemical Research Division, analyzed these relationships, concluding: "With only a few exceptions, brands with high smoke pH performed better than those with low smoke pH. Correlations were also

observed between calculated free nicotine and sales trends and total sugar in the blend and sales trends." 500615944-5960 at 5944 (US 21786) (O).

2853. In a talk delivered to RJR's management on June 25, 1974, and to Reynolds's international management on August 4, 1976, Murray Senkus described Reynolds's knowledge of how the pH of smoke affected the delivery of nicotine in lower tar cigarettes. Senkus observed that, at that time, cigarettes lower in tar and nicotine had a taste difference, discernable to the smoker, that interfered with smoking "satisfaction." Senkus stated this problem could be remedied by raising the pH of the smoke so that it would deliver more nicotine: "So, simply by raising pH, say from 6.0 to 6.5 you raise the level of nicotine that is transferred to the taste buds and body fluid in the mouth to the same level as with the higher tar cigarette." In the same talk, Senkus recommended development of a low tar product with a specific nicotine to tar ratio and stated that "[it] is worth noting that our competitors are fully aware of the significance of pH with respect to smoking satisfaction and taste. Moreover, they are fully aware of the advisability of maintaining a low tar value and also maintaining the nicotine as high as possible." 50152 5355-5366 at 5359, 5363-64 (US 29531) (O).

2854. Senkus's comments focused on the sensory, peripheral nervous system effects of higher levels of free nicotine. As Drs. Henningfield and Benowitz readily acknowledged at trial, sensory effects of nicotine in the mouth and throat also can contribute to its addictiveness. Henningfield WD, 81;22-23; Benowitz TT, 11/2/04, 4800:16-4802:5.

2855. Senkus's talk also demonstrates the falsity of Defendants' claim that "nicotine follows tar." Senkus stated that Reynolds's competitors were "fully aware of the advisability of maintaining a low tar value and also maintaining the nicotine as high as possible." As an example, Senkus pointed to a commercial Lorillard product, the True cigarette: "the old True has

11 mg. tar [and] .6 mg. nicotine – the new True is 5 mg. tar [and] .5 mg. nicotine. So although the tar was reduced 6 mg. . . . nicotine was dropped only .1 . . . The tar to nicotine ratio was dropped from 18.3 to 10." Thus, Senkus identified that Lorillard had achieved a roughly 55 percent reduction in tar delivery accompanied by only a 16 percent decrease in nicotine delivery – a decrease that obviously was not proportional as Cigarette Company Defendants claim. 50152 5355-5366 at 5364 (US 29531) (O).

2856. By 1976, RJR was aware that the inhalation of cigarette smoke was the most effective method of administering nicotine to smokers. Thus, the company emphasized research to determine the "minimum level of nicotine required for smoker satisfaction," and the particular chemical form of nicotine, i.e., whether "nicotine in smoke was ‘free' or ‘bound' or some mixture of these two forms." 504424968-4976 (US 86968) (A).

2857. A September 21, 1976 memorandum from John L. McKenzie to A.P. Ritchly confirms Reynolds's belief that altering the pH of cigarette smoke affected nicotine delivery to the smoker. In the memorandum, McKenzie stated that "[t]he pH also relates to the immediacy of the nicotine impact. **As the pH increases, the nicotine changes its chemical form so that it is more rapidly absorbed by the body and more quickly gives a ‘kick' to the smoker.**" The document also identified the typical range of cigarette smoke pH was from 5.5 to 7.0. 500378383- 8386 at 8385 (US 85467) (A) (emphasis added); Henningfield WD, 75:22-76:1, 78:17, 79:21-80:2.

2858. An October 12, 1979 report written by Calvin L. Neumann and M.D. Wallace regarding "Nicotine Satisfaction, Consumer Test 2740," reveals that Reynolds conducted research regarding the minimum and optimum nicotine delivery required to "maximize[] consumer acceptance," and concluded that "[c]igarette strength is nicotine and pH dependent,

increased with both increasing nicotine and increasing pH." The report was addressed to D.H. Piehl, Manager of Reynolds's Chemical Research Division, and its contents were presented to Reynolds's Research and Development management. 5009069450-9466 at 9450, 9452-53 (US 85468) (O).

2859. In a September 8, 1980 internal memorandum, scientist Alan Rodgman stated that Reynolds had "'caught up' to PM insofar as its current use in the Marlboro of nicotine technology is concerned." Rodgman's memorandum indicates that, in 1980, the pH of Reynolds's Winston measured 6.4, the same level as its measurement of Marlboro's pH that year. 501522719-2726 at 2720 (US 48913) (O). A pH of 6.4 is four times greater than the pH of "about 6" testified to by David Townsend, Reynolds's former Executive Vice President for Research and Development. Townsend WD, 173:21-174:4. If Dr. Townsend interprets "about 6" to allow for a fluctuation of four-tenths above and below 6.0, it allows for variation of almost an entire unit of pH, which would have a substantial impact on the amount of free nicotine delivered in the cigarette smoke.

2860. An August 9, 1982 draft paper sent to G.R. DiMarco from E. Bernasek and C.W. Nystrom set forth Reynolds's "position papers describing our rationale for using the following additives in RJRT tobacco flavor formulations: ammonia, sclareol, sclareolide, glucose tetraisovalerate." On the topic of ammonia, the document stated that one use of ammonia in Reynolds's processing operations was the "[a]mmoniation of reconstituted tobacco." The paper revealed that "[a]mmonia in smoke is one of the major pH controlling components" and that "[s]tudies of the effect of ammonia on smoke composition showed . . . an increase in physiological satisfaction with increasing ammonia content." 504438506-8512 at 8506, 8509 (US 21386) (O).

2861. These and other Reynolds's internal research documents clearly demonstrate Reynolds's motivation for incorporating ammonia technology into its commercial products, namely, to design products that would deliver nicotine to smokers in a form that would be more rapidly absorbed than cigarettes without ammonia technology. These documents directly contradict and undermine testimony of David Townsend, who told this Court that the only reasons for Reynolds's incorporation of ammonia technology into its commercial products were for taste and to increase the "tensile strength" of reconstituted tobacco sheet. Townsend WD, 169:22-170:5. While some of Reynold's documents may also discuss the effect of ammonia technology on the taste or flavor of cigarette smoke, it cannot credibly be disputed that Reynolds's primary intention in incorporating ammonia technology into its commercial products has been to affect nicotine delivery to the smoker.

2862. A January 10, 1990 research report authored by W.M. Coleman, III, documents a portion of RJR's research relating to the manipulation of nicotine "through the regulation of the pH of the dense fluid process stream." The purpose of the experiment described in the memorandum was to "refine" information gained from an earlier study in order to "optimize the ability to control the nicotine to the desired levels." The memorandum concluded:

> Evidence has been presented which confirms a novel process for the control and manipulation of the level of nicotine in tobacco and tobacco extracts. The process makes use of the chemistry of tobacco by extracting the available nicotine through a **minor but subtle adjustment of the pH**. . . . The full range of nicotine control can be realized. The process possesses many variables, among them being 1) pressure, 2) temperature, 3) NH_3 concentration, 4) flow rate, 5) flow volume, etc. With this number of degrees of freedom it is possible to dictate the level of nicotine in the extract as well as the tobacco.

508381102-1112 at 1102, 1103, 1105 (US 85469) (O) (emphasis added).

2863. Even in products RJR has developed to be potentially "reduced harm" products, it

has experimented with ways to boost pH to increase their nicotine delivery. Scientist Gary Burger, who worked on Eclipse from its inception, concedes that, in 1993, Reynolds looked at adding L-arginine to Eclipse to see if it increased pH and, in turn, nicotine yield. Burger PD, Arch, 8/22/97, 189-192; 519193178-3184 (US 80235) (O).

2864. RJR continued to conduct studies comparing the nicotine content of its cigarettes to the content of nicotine in cigarettes manufactured by other Defendants in the 1990s. For example, an October 1, 1991 memorandum authored by Kenneth A. Beard reported on the results of studies conducted to determine the amount of "volatile nicotine," i.e., free nicotine, in RJR's Winston and Winston Light as compared to Philip Morris's Marlboro and Marlboro Light. The study compared the brands in terms of the amounts of "volatile nicotine," total nicotine, and volatile nicotine as a percentage of total nicotine. 508257695-7696 (US 86983) (O).

2865. RJR's research on smoke pH and nicotine transfer efficiency continued even as the congressional tobacco hearings were being held in 1994, and Reynolds was publicly denying any effort to manipulate the nicotine content or delivery of its products. A 1994 Research Summary sent to in-house attorney Charles Blixt from RJR researchers discussed efforts to "determine the effects of the addition of K2CO3 [potassium carbonate] (a base) to tobacco on smoke nicotine transfer." 511872061-2087 at 2061 (US 20844) (O).

2866. RJR continues to incorporate into a wide variety of its commercial products tobacco blends and reconstituted tobaccos that have been treated with ammonia or to which extracts treated with ammonia were applied. Schindler WD, 56:9-51:18; 508062474-2493 (US 51299) (A); 512337856-7859 (US 51628) (O). In particular, Reynolds refers to its reconstituted tobacco internally as G-7, and Reynolds has developed numerous formulations of G-7 that are designed for particular blends and brands and brand styles. The formulations are identified

internally using specific numbers, such as G7-1, G7-2, G7-3, etc. Schindler WD, 56:17-22. Internal Reynolds's documents reveal that G7 is a large blend component in many of its commercial products, that numerous formulations of G7 are ammoniated, and that the ammoniated formulations of G7 are used in Reynolds's full flavor, light, and ultra light commercial products. 508062474-2493 (US 51299) (A); 512337856-7859 (US 51628) (O); Schindler WD, 56:9-51:18; Rodgman PD, United States v. Philip Morris, 6/26/02, 169:1-21.

2867. An RJR document apparently written on or around February 11, 1998 confirms that Reynolds used ammonium hydroxide to adjust the pH level of its reconstituted sheet tobacco. The document stated that

A typewritten notation on the document indicates that this information was

521484265-4265 (US 86969) (O) (Confidential).

2868. A January 22, 1999 "PAC NOTIFICATION," on the subject of "Change in Concentration Level of Ammonium Hydroxide Solution, Currently Used in Production of Four (4) G7 Products," reveals Reynolds's continued use of ammonia compounds and continued manipulation of the pH of its products. The document states that "RJR currently uses a 29% Ammonium Hydroxide solution on the production of four (4) G7 products. . . ." The document recommends that, in order to "avoid costs/complexity associated with regulatory compliance" of provisions of the Clean Air Act that would apply to facilities using ammonia solutions with a concentration of ammonia greater than 20%, Reynolds "[b]egin usage of an Ammonium Hydroxide solution at 19% concentration level versus current 29%." The document also states

that "[t]ransition to the 19% solution will be transparent from a finished product standpoint, **given that the G7 process controls pH on-line to target**." 521484535-4536 at 4536 (US 86971) (O) (emphasis added).

2869. Recent research documents confirm Reynolds's continued study of mechanisms for efficient transfer of nicotine from tobacco to smoke. RJR Scientist Thomas Perfetti reported the results of his study of peak nicotine release temperatures in a paper entitled "The Themochemical Properties of Nicotine Salts." RJC9543057-3073 (US 86985) (O). Perfetti also prepared a paper with B.M. Gordon and W.M. Coleman, III, in 2000 or later, reporting on the results of Reynolds's study of the transfer efficiency of different types of nicotine into mainstream smoke. RJC9540310-0330 (US 86986) (O). Perfetti shared the results of his work with Philip Morris Chemist Jeffrey Seeman. In a June 12, 2000 e-mail exchange, Perfetti described the results of his studies concerning the "thermal stability and peak nicotine release temperatures" for different types of nicotine salts. RJC9540339-0341 at 0339 (US 86984) (O).

(cc) Brown & Williamson and BATCo

2870. In a document entitled, "The Significance of pH in Tobacco and Tobacco Smoke," D.E. Creighton, BATCo employee, wrote that "**free base nicotine is the most chemically and physiologically active form because it is most rapidly absorbed**." 500104403-4424 at 4408 (US 47966) (A) (emphasis added); see also 400132742-2776 (US 88084) (O).

2871. On March 11, 1964, BATCo published a report on the "Release During Smoking of Nicotine Added as Various ‘Salts' to Extracted Tobacco Cigarettes," concluding, "**the transfer of nicotine, and thus the delivery per cigarette, is dependent upon the extent to which the nicotine is present as ‘free base' (which in turn is controlled by pH). . . . [I]t appears possible to control nicotine transfer and this has some implications in the production of**

cigarettes giving a smoke of a low tar to nicotine ratio." The report described the free base nicotine as having a transfer three times greater than that of nicotine citrate, a salt. 400722326-2343 at 2327 (US 21577) (O) (emphasis added).

2872. In 1964, a BATCo researcher recognized the effect that adding potassium carbonate– a base – to tobacco could have on pH and, as a result, on the nicotine "kick" a smoker receives: "There seems no doubt that the 'kick' of a cigarette is due to the concentration of nicotine in the blood-stream which . . . is a product of the quantity of nicotine in the smoke and the speed of transfer of that nicotine from the smoke to the blood-stream." The researcher concluded that "**it is almost certain that the free nicotine base is absorbed faster into the blood stream.** Thus [the] effect of this potassium carbonate treatment, **even though it does reduce the total quantity of nicotine in the smoke, may be to enhance the effect of what is left until it is equal or may be greater in psychological effect than the original smoke**." 100059066-9067 at 9067 (US 20102) (O) (emphasis added).

2873. BATCo incorporated manipulation of nicotine delivery through smoke into its work on Project Ariel. The company revealed that its main objective was "to achieve the physiological response of normal cigarettes." Scientists working on the project began to theorize as early as 1964 that this effect may be a function of either "nicotine being present as a free base or at least partly in vapour form." 100175681-5687 at 5682-5683 (US 20116) (O).

2874. Internal BATCo documents revealed the company's focus throughout the 1960s on manipulating nicotine delivery through changing smoke pH. BATCo even developed a process of extracting nicotine from an aqueous solution of smoke by using organic solvents, such as chloroform in order to measure the "extractable nicotine" of smoke. Dixon WD, 55:13-16; 83916527-6596 at 6530 (US 55968) (A). The amount of "extractable nicotine" provided

researchers with an indication of the amount of free nicotine in smoke. Dixon WD, 56:6-10.

2875. A draft letter written in 1964 on that subject set forth BATCo's theory that "the rate of absorption or transfer of nicotine base to the blood stream is more rapid than [nicotine] salt." Based on this and related findings, the author of the draft letter concluded that "since the process of absorption of nicotine from smoke is via the saliva to the blood stream, I would think that there must be at least quantitative differences in the physiological response when the ratio of nicotine base to salt in the smoke is increased." 105521746-1748 at 1746-1747 (US 20240) (O).

2876. A document produced by B&W reveals that, in 1964, BATCo data reported that nicotine transfer from the tobacco to the smoke was directly related to the relative degree to which the nicotine in the tobacco was in the "free" form.

> The results show that the transfer of nicotine, and thus the delivery per cigarette, is dependent upon the extent to which the nicotine is present as ‘free base' (which in turn is controlled by pH), e.g. **as base the transfer is three times greater than that of the salt, nicotine citrate**.

689201723-1770 at 1758, 1760 (US 31049) (O) (emphasis added).

2877. In 1965, a BATCo research report found in B&W's research library and entitled, "The Effect of Additives on Smoke Chemistry: Action of Gaseous Ammonium Flue-Cured Tobacco," noted the main effect of "treatment of flue-cured tobacco with ammonia" would be a 30% increase in delivery of nicotine. 570538281-8295 at 8283 (US 20941) (O). According to a November 1, 1995 document produced by B&W, this belief was corroborated during a subsequent Technical Development Meeting in September 1965. 689201723-1770 at 1761, 1734, 1735 (US 31049) (O).

2878. BATCo's Southampton Research and Development Establishment conducted extensive research on extraction in the 1960's. The Southampton center, under the leadership of

Ivor Hughes, supplied over 150 reports a year to BATCo. Minutes taken by R.J. Johnson regarding a meeting of scientists at Southampton, on June 30, 1967, reveal that, at that time, BATCo was heavily involved in nicotine manipulation research, including: Project Ariel; studies on extractable nicotine; smoke pH; and alkaline filter additives that selectively increased nicotine delivery. 500012143-2159 (US 85471) (O).

2879. A September 30, 1966 document, titled "Further Work on Extractable Nicotine," demonstrates that B&W was well aware at that time of the importance of smoke to an individual's receipt of nicotine from a cigarette. The document, issued by I.W. Hughes and distributed widely, including to Sir Charles Ellis, R.B. Griffith and the Research and Development Library, confirms a finding in an earlier report that "the reaction of a smoker to the strength of the smoke from a cigarette could be correlated to the amount of ‘extractable' nicotine in the smoke, rather than to the total nicotine content." The report also notes that "**it would appear that the increased smoker response is associated with nicotine reaching the brain more quickly**." 83916527-6596 at 6530 (US 55968) (A) (emphasis added).

2880. B&W has concentrated its efforts on extractable nicotine ever since. B&W's corporate designee on cigarette design and addiction, M. Lance Reynolds, who was also B&W's former Director of Research and Director of Product Development, testified that B&W and BATCo worked on the hypothesis that smoke pH and extractable nicotine were important to affect sensation. Reynolds PD, Minnesota v. Philip Morris, 9/30/97, 89:8-90:18, 93:16-19.

2881. A B&W document entitled, "Use of Ammonia/Ammonium Compounds/Urea," stated that "reasons for use" of ammonia included, "[r]ais[ing] the pH of smoke and increas[ing] impact through increased levels of free form, vapour phase nicotine," and "[i]ncreas[ing] the efficiency of transfer of nicotine from tobacco to smoke." 303636914-6922 at 6914 (US 46608)

(A).

2882. M. Lance Reynolds, a chemist who worked for B&W from 1968 to 1991, eventually rising to Director of Product Development and then Director of Research, testified that, during his entire tenure with B&W he had a working hypothesis that, as a 1979 Philip Morris document acknowledged, smoke impact is not determined by "the amount of nicotine in the smoke per se but rather it is the amount of free nicotine in the smoke." Reynolds PD, Minnesota, 6/4/97, 103:3-12; 542001985-1986 (US 86973) (O).

2883. In a July 30, 1969 file note entitled "Added Ammonium Salts in Marlboro and Philip Morris Cigarettes," B&W research scientist C.J. Rosene reported that in a comparison of cigarettes manufactured by Philip Morris (including Marlboro) against Viceroy, "the [Philip Morris] tobaccos showed higher ammonia values than are normally encountered in U.S. blends." Dr. Rosene inferred that the higher ammonia values were due to ammonium salts, and speculated that "these compounds may contribute to physiological impact if free ammonia [sic] is released into the smoke." Accordingly, Dr. Rosene wrote, "[w]e recommend that the effect of ammonium salts on B&W brands be studied." 100025331-5331 (US 34585) (O). Through designated testimony, M. Lance Reynolds acknowledged that this was B&W's "earliest indication" that "ammonia chemistry was involved in Philip Morris cigarettes." Reynolds PD, Minnesota, 6/4/97, 217:12-15.

2884. A later file note, dated September 8, 1969, and entitled "Added Ammonium Salts in Marlboro and Philip Morris Cigarettes," reported that, as B&W continued researching Philip Morris's cigarettes, it found that they not only had higher ammonia values than B&W's own cigarettes, but higher phosphate levels as well. Based upon Philip Morris's patents for processes employing diammonium monohydrogen orthophosphate (DAP) as a reagent, B&W hypothesized

that Philip Morris was using DAP in its reconstituted tobacco. 100025332-5334 at 5332 (US 86974) (O).

2885. The Cigarette Company Defendants were aware of other chemicals that could affect the pH, and nicotine level, in smoke. In 1970, B&W researcher, R.P. Newton, wrote about the effects of urea on pH and nicotine. At this time, tobacco treated with urea and a urea enzyme system was reported to have achieved increases in extractable nicotine levels as great as 80%; and the tobacco's pH was reported to be elevated to as high as 7.5. 650360443-0458, at 0445 (US 20949) (O).

2886. Armed with the knowledge that certain compounds, like urea, can convert to ammonia during combustion, B&W sought to find ways to modify current ingredients to produce ammonia. A primary method of nicotine manipulation used at B&W was the use of ammonia based additives or additives that converted to ammonia when burned, "which trigger the chemical transformation necessary to convert bound nicotine to free nicotine." Wigand WD, 107:19-108:6. An undated B&W presentation reported that the company was assessing emerging technology, including using "natural fermentation . . . [as a] means of converting nitrate to ammonia." 570353434-3770 at 3741 (JE 53243) (A).

2887. In a January 4, 1980 document, a B&W scientist spoke about the varying levels of nicotine delivery through the use of smoke pH and free nicotine:

> [t]hese relationships are not unknown to those persons developing new products in the tobacco industry. We have seen many changes in these relationships at B&W, e.g., through filter technology, use of chemicals, as well as conversion products formed from using tobaccos treated with microorganisms, to yield smoke with both increases and decreases in the free nicotine levels.

510000667-0670 at 0669 (US 51496) (A).

2888. In a January 4, 1980 file note recounting an "Observation of Free Nicotine

Changes in Tobacco Smoke," C.F. Gregory wrote: "It appears that we have sufficient expertise available to 'build' a lowered mg tar cigarette which will deliver as much 'free nicotine' as a Marlboro, Winston or Kent without increasing the total nicotine delivery above that of a 'Light' product." 510000667-0670 at 0669 (US 51496) (A) (emphasis added).

2889. A January 20, 1981 B&W Research Department file note reported on the pH and extractable nicotine content of several commercial cigarette brands studied by B&W. B&W found that "[w]ithout exception, there is an inverse relationship between pH and tar delivery." Thus, this research indicates, consistent with Dr. Farone's conclusions, that commercial cigarettes designed to deliver less tar showed higher pH values when tested. This study measured the pH of the total particulate matter of the commercial cigarettes studied, and found the pH measures for the low delivery cigarettes tested ranged from 6.76 to 7.23, more than one full pH unit higher than the intermediate delivery pH's of 5.68 and 6.40. Not surprisingly, the percentage of extractable nicotine in the cigarettes with higher TPM pH values was significantly higher for the low delivery cigarettes. 620676643-6651 at 6643, 6647 (US 53345) (A).

2890. In the same 1981 "File Note," the researchers recognized that, consistent with Dr. Farone's conclusions, traditional FTC testing methods do not detect nicotine in the gas (or vapor) phase. The researchers noted that "at 34 degrees C[elsius], nicotine has sufficient vapor pressure to be stripped from the filter during smoking and thus contribute to the vapor phase nicotine content of smoke even though it may not be apparent by routine analytical measurements." 620676643-6651 at 6644 (US 53345) (A).

2891. Minutes of a September 1984 Joint Research and Development/Marketing Session held during an R&D Conference in Marlow, U.K., reveal that discussions took place regarding the various ways in which BATCo was able to increase the level of nicotine transferred in smoke.

According to the meeting minutes, "[a] direct method of enhancing nicotine in tobacco smoke is through additions of nicotine oxide or nicotine salts." 109872430-2447 at 2439 (US 23340) (A).

2892. In a November 12, 1984 progress report on "Project SHIP," scientists from B&W, BAT Germany and Group Research and Development Center ("GR & DC") met to discuss the status of the development of "major product change." The research and development of this new product centered around nicotine, and included a study of the best form in which to present the smoker with nicotine in order for the nicotine to be most "active." Many of the studies involved comparisons to what was known by BATCo of Marlboro's processing. 100543649-3659 (US 34670) (O); 510001467-1478 (US 88085) (O).

2893. Recognizing the importance of nicotine in smoking, notes of a BATCo research conference in Rio de Janeiro, held from August 22-26, 1983, state that "[t]here is an urgent need to prepare a status review on all major aspects of the pharmacological influences of nicotine in the smoking process." Areas of nicotine research included: (1) factors affecting the transfer of nicotine from leaf to smoke aerosol; and (2) factors influencing the rate of transfer of nicotine from particulate matter to the vapor phase. 102231077-1102 at 1092, 1091 (US 34685) (O).

2894. Like RJR, B&W had long analyzed and evaluated Philip Morris's use of ammonia and other methods to affect nicotine transfer. B&W reverse engineered Philip Morris's Marlboro to learn what it could do to develop their own commercially successful products. Appleton TT, 3/24/05, 16883:25-16884:4. B&W's internal research shows that the focus of this work was on the alkalinity of Marlboro. In 1984, a B&W researcher drafted a report on "The Unique Differences of Philip Morris Cigarette Brands" describing the way that Philip Morris achieved "lower blend alkaloids than competition brands [i.e., less total nicotine in the unsmoked rod], yet deliver[ed] the same smoke nicotine." The researcher noted that "[a]mmonia treatments appear

to be the most important aspect of Philip Morris's blend uniqueness," resulting in "a mild and natural tasting smoke . . . favorable to nicotine transfer." 103281081-1112 at 1082, 1112 (US 20234) (A).

2895. Smoke pH, and its connection to a cigarette's impact, continued to capture the attention of B&W executives and scientists throughout the 1980s. At a "Nicotine Conference," held in Southampton from June 6-8, 1984, participants concluded:

> If we are to make better use in product terms of the levels of nicotine in smoke currently available – and even more so if we are forced to market cigarettes with reduced levels of nicotine – then it is important to significantly increase our understanding of impact/satisfaction. There is an urgent need for experimental cigarettes in which the levels of nicotine in smoke (and smoke pH) are carefully controlled.

602759-2759 (US 53297) (A); see also 401020175-0181 (US 47529) (O).

2896. Under cover memorandum dated May 2, 1980, BATCo's W.B. Fordyce circulated a report written by company scientist Terry Mitchell to BATCo directors. 110088143-8143 (US 34965) (O). In his report, Mitchell discusses three means of intentionally increasing the nicotine content of cigarettes, including the use of specialized high nicotine tobaccos (such as N. rustica), direct addition of nicotine/nicotine extracts, and the chemical "augmentation of smoke nicotine." Mitchell noted that smoke nicotine could be augmented by improving the nicotine transfer to smoke and by increasing the alkalinity/pH of smoke. 110088144-8155 (US 34966) (O).

2897. In a January 4, 1980, B&W Process Department "file note," entitled "Observation of Free Nicotine Changes in Tobacco Smoke," C.F. Gregory discussed pH and nicotine delivery in Philip Morris's Merit and Marlboro brands. Gregory's data revealed that, although Marlboro's total nicotine content was almost double that of Merit, the two delivered equal amounts of "free" nicotine. 654005805-5807 (US 85446) (A).

2898. Gregory commented that "[i]n theory, a person smoking these [Merit and Marlboro] cigarettes would not find an appreciable difference in physiological satisfaction from either based on the amount of free nicotine delivered." He then gave other examples where cigarette manufacturers could maintain "free" nicotine despite reducing machine-measured nicotine yield. Gregory suggested this information could be used to gain B&W a competitive advantage in marketing "Light" cigarettes:

> Is there not some way open now to use the knowledge we have gained in this area of tobacco and smoke research to give B&W a competitive advantage over its competition? **It appears that we have sufficient expertise available to "build" a lowered mg tar cigarette which will deliver as much "free nicotine" as a Marlboro, Winston, or Kent without increasing the total nicotine delivery above that of a "Light" product.**

65005805-5807 at 5806 (US 85446) (A) (emphasis added).

2899. B&W scientist Tilford Riehl, who later became Vice President of Research and Development, received Gregory's "file note" and commented on an alternative to Gregory's proposal to increase "free" nicotine to boost "physiological satisfaction." Riehl's suggestion, while accepting Gregory's data and concept, proposed maximizing the effects of nicotine on smokers in a different way. Riehl wrote in the margin:

> Several of us have proposed an alternative (almost opposite) approach – design a low tar cig with high <u>total</u> nicotine / low to moderate <u>% free</u> nic. Theory: provide cig with "appropriate" level of sensory satisfaction/higher than usual "pharmacological" satisfaction.

510000667-0670 (US 51496) (A) (emphasis in original).

2900. In reviewing Gregory and Riehl's statements, a November 1, 1995 Shook, Hardy & Bacon commentary included the following observation from counsel: "This [Riehl's] marginalia comment, of course, raises an issue of the motivations of the company in designing

cigarettes to provide pharmacological satisfaction to smokers." 689201723-1770 at 1754 (US 31049) (O).

2901. In 1984, B&W studied the effects of varying the smoke pH of Kool cigarettes. The results of B&W's study were that increasing the smoke pH of Kool KS would increase consumer acceptance of the cigarette. 510004186-4190 (US 20832) (O).

2902. Also in 1984, B&W researchers reported on "The Unique Difference of Philip Morris Cigarette Brands." The report concluded that Marlboro and other Philip Morris brands "clearly contain very high ammonia levels" and that Philip Morris brands "get more of their nicotine delivered in mainstream smoke than brands of other domestic manufacturers." B&W's research of Philip Morris brands also concluded that the process used by Philip Morris to create its reconstituted sheet creates a "reconstituted tobacco [that] efficiently scavenges nicotine from other blend components." The B&W researchers also concluded that Philip Morris had been able to accomplish increases in nicotine transfer efficiency without substantial increases in smoke pH. 103281081-1112 at 1099-1100, 1104 (US 20234) (A).

2903. A 1984 B&W summary of tests on smoke pH concluded that increasing the smoke pH of certain brands could aid consumer acceptance of those brands. 510004186-4190 (US 20832) (O). In his trial testimony, Dr. Wigand confirmed that B&W used ammoniated reconstituted tobacco to guarantee a level of nicotine to create and sustain addiction. Wigand WD, 104:10-107:3. The two forms of reconstituted tobacco utilized by B&W, "band cast" and "paper," included the addition of chemical additives, such as diammonium hydrogen phosphate (DAP) and ammonia based compounds. Id., 104:13-106:12. According to Dr. Wigand, the use of these additives is critical to the product design, because they change the overall pH of the cigarette smoke, which increases the free nicotine available to the smoker. Id., 106:13-21.

2904. A BATCo report entitled "Group R&D Programme Group Projects" detailed several BATCo Group research efforts and revealed that BATCo was keenly aware that individuals smoked to experience the effects of nicotine. This awareness fueled research aimed at enhancing BATCo's ability to control the doses of nicotine delivered by the cigarette to the smoker. The report disclosed that, among other things, BATCo Group companies sought to determine nicotine-carrying capacity of aerosols in cigarette smoke and the effect of nicotine enhancement on human smoking behavior. In addition, BATCo sought to create alternative products with appropriate nicotine dosing in the event that other companies' alternative products became "a significant threat to [BATCo's] business." The results from one such project found that the "impact" of the cigarette was a function of the aerosol pH, for which "optimal" levels were possible, thus viewing nicotine transfer efficiency as a way of increasing the impact of the cigarette on the smoker. 107472128-2302 at 2142, 2146, 2203-2204 (US 85472) (O). Accordingly, BATCo sought to "evolve ways and means of ensuring that smaller amounts of nicotine continue to give the satisfactory ‘reward' to the smoker." 103498901-8902 at 8901 (US 21384) (O).

2905. Ammonia technology has long been perceived by B&W as key to the competitiveness of B&W's cigarette products worldwide. Wigand WD, 111:10-112:15. Contrary to B&W's assertions, the benefit of ammonia is not simply as a flavor compound to improve taste; ammonia technology improves nicotine transfer. Id., 112:3-10; 570353434-3770 (US 53243) (A). Minutes of a B&W Ammonia Technology Conference held on May 18-19, 1989, show that Dr. Baran Chakraborty presented his research on ammonia technology and listed the main effect as:

- Enhanced natural flavor/body via. formation of volatile nitrogen flavorants.
- **Improved nicotine transfer**.

- Reduced irritation via. scavenging irritants and buffering.
- Superior paper recon (sensory/physical) by urea addition.

508104012-4164 at 4017 (US 53249*) (A) (emphasis added). The report of this conference also noted that "[a]ll U.S. manufacturers except Liggett use some form of AT [Ammonia Technology] on some cigarette products." 508104012-4164 at 4016 (US 53249*) (A).

2906. B&W adopted B&W's efforts to understand ammonia technology included: analyzing the product design of the leading cigarette brands, reverse engineering Marlboro, and holding two ammonia conferences in 1989 and 1990, which were attended by representatives of all BAT Cigarette Affiliated Companies. Wigand WD, 108:4-112:15; 508104012-4164 (US 53249*) (A); 570353434-3770 (US 53243) (A). Ultimately, these efforts culminated in the preparation of the 1991 handbook, "Root Technology: A Handbook for Leaf Blenders and Product Developers," which was created by B&W and other BAT Group company scientists to provide ammonia technology information "for the product developer who is looking for ways to incorporate [ammonia] technology . . . in a cigarette design." 621800840-0899 at 0843 (US 86908) (A); Wigand WD, 112:17-115:11.

2907. The Handbook provided a history of the use of ammonia by the tobacco industry. It referred to ammonia technology as "a relatively new technology at B&W and within the BAT Group of companies," and went on to list five types of ammonia technology "currently used in production" by BAT Group companies. 621800840-0899 at 0844, 0855 (US 86908) (A); see also 599003691-3695 (US 22077) (A).

2908. The Handbook also examined the methods employed by Defendants Philip Morris, RJR, Lorillard and American to use ammonia technology, stating that B&W and Philip Morris used ammonia technology in almost all of their brands, and that it was heavily used by the other companies as well. A particular type of ammonia technology, involving reconstituted sheet

and called "RCB" by B&W, was referred to by the scientists as "the soul of Marlboro." The objective in B&W's "CPCL [a band-cast reconstituted tobacco] development was to match PM's RCB in all important characteristics except for nitrate removal." The scientists observed, "[t]his objective has been met." 621800840-0899 at 0853-0854, 0849, 0851 (US 86908) (A).

2909. Further, the Handbook succinctly explained the various ways in which ammonia technology could be used during cigarette manufacturing. It described reconstituted tobacco not only as "an ammonia source" itself, but found that it "incorporat[es] sugar-ammonia reactions. As a low alkaloid blend component, it also absorbs nicotine from higher alkaloid-containing components." Reconstituted tobacco served as "a positive blend contributor rather than merely a filler." It described various methods undertaken by B&W and the other cigarette manufacturers, including the addition of diammonium phosphate ("DAP") and urea into "recon," and the use of several casings. 621800840-0899 at 0855-0861 (US 86908) (A).

2910. The scientists who wrote the Handbook found "two consistent trends apparent in the U.S. market. First, recon is the preferred means for applying [ammonia technology]. Second, everyone is working hard to match PM smoking quality." 621800840-0899 at 0853 (US 86908) (A).

2911. The purposes for which the Cigarette Company Defendants used ammonia technology appear in the Handbook. For one, "[the ammonia in cigarette smoke] can liberate free nicotine from the blend, which is associated with increases in impact and ‘satisfaction' reported by smokers." As the Handbook explained:

> Ammonia, when added to a tobacco blend, reacts with the indigenous nicotine salts and liberates free nicotine. As a result of such change, the ratio of extractable nicotine to bound nicotine in the smoke may be altered in favor of extractable nicotine. **As we know, extractable nicotine contributes to impact in cigarette smoke and this is how ammonia can act as an impact booster**.

In discussing diammonium phosphate ("DAP") as an additive, the Handbook states that "[s]ince DAP can only provide ammonia, it can act only as an ameliorant, an impact booster, **and satisfaction promoter**." 621800840-0899 at 0845 (US 86908) (A) (emphasis added); Wigand WD, 106:5-21.

2912. The Handbook also described how B&W used ammonia technology to increase nicotine transfer efficiency. 621800840-0899 at 0872 (US 86908) (A). Through the trial testimony of Michael Dixon, Senior Scientific Advisor to BATCo, and Scott Appleton, former Director of Scientific and Regulatory Affairs for B&W, the Cigarette Company Defendants attempted to discredit the Handbook and the notion that ammonia technology increases nicotine transfer efficiency. Dr. Dixon asserted that B&W researchers misinterpreted data in reaching their conclusion that there was an increase in nicotine transfer as a result of using ammonia-treated reconstituted tobacco. The basis for this assertion was that the nicotine transfer efficiency reported for the ammonia and non-ammonia cigarettes were identical. Dixon WD, 58:8-12. However, as Dr. Farone established, traditional smoking machine test methods do not detect nicotine delivered in the gas phase; therefore, one would not necessarily expect that a comparison of tar-to-nicotine ratios, as measured by standard machine testing, would fully reflect the amount of nicotine that would be delivered under human smoking conditions. Farone WD, 98:9-16; Dixon TT, 3/9/05, 15018:2-20. The table in the Handbook to which Dixon refers indisputably notes, however, that as the percentage of ammonia-treated tobacco increased in the blend, the efficiency of the cigarettes ability to transfer nicotine to smoke increased. 621800840-0899 at 0872 (US 86908) (A).

2913. Dr. Dixon claims that BATCo pointed out the mistake to B&W researchers "very shortly after the manual was circulated." Dixon WD, 59:22-23. Yet, he could not recall giving

this same testimony about the misinterpreted data in any prior cases. Dixon TT, 3/9/05, 15012:1-15013:12. It was also never mentioned in his expert report in this case. Id., 15013:13-15. Further, Dixon did not point to any contemporaneous documents showing that the "error" was in fact called to the attention of B&W. Importantly, there has never been any formal instruction by B&W to its scientists or leaf blenders to disregard the Handbook's conclusion that increased use of ammonia-treated reconstituted tobacco leads to greater nicotine transfer efficiency. Appleton TT, 3/24/05, 16894:12-18.

2914. Scott Appleton also testified that the Handbook was essentially "folklore" based on theories that were not rigorously tested. However, Dr. Wigand, who participated in the preparation of the Handbook, testified that the Handbook was written following extensive study of the use of ammonia technology in its competitor's cigarettes through Project Globe and Project Adverb. Wigand WD, 108:14-109:9. Following these studies but before the Handbook was written, B&W held two conferences on ammonia technology in 1989 and 1990 during which the impact of ammonia technology on nicotine transfer efficiency was extensively examined. Wigand WD, 111:10-112:15; 508104012-4164 (US 53249*) (A) 570353434-3770, at 3741 (JE-53243) (A). Additionally, Dr. Wigand testified that technologies described in the Handbook served as the basis for B&W's attempt to reverse engineer a Marlboro cigarette throughout 1991 and 1992, contrary to Dr. Dixon's testimony that the error was corrected "shortly after" circulation of the Handbook. Wigand WD, 115:13-117:14; Dixon WD, 59:22-23. Unlike Dr. Wigand, whose educational background is in biochemistry and who worked directly on the Handbook and the product development issues surrounding it, Appleton first studied ammonia and its relationship to pH and nicotine delivery in 1994 in assisting with B&W's response to FDA investigation. Appleton TT, 3/24/05, 16893:10-16894:11.

2915. By 1991, BATCo apparently decided that it was unwise to use the word, "ammonia" when referring to its ammonia technology. In a March 1, 1991 document by A.L. Heard to employees in the research department, including Wigand, Heard informed the employees that the "Tobacco Strategy Review Team has identified a need to add greater confidentiality to our use of ammonia technology throughout the BAT Group. They have asked that for commercial confidentiality, we substitute a code word in place of the expression 'ammonia technology.'" The memorandum further stated that existing code words for ammonia-related processes such as "ammonia treatment of stems or lamina" would continue to carry code names already in existence. The new code word for ammonia technology was to be transmitted via separate cover. 400182372-2372 (US 47487) (A).

2916. Nicotine transfer delivery has been regularly studied and monitored by B&W (and its affiliates), even throughout the 1990s, and is usually expressed as a percentage of the tobacco nicotine that is released into the cigarette smoke. This percentage is referred to as "nicotine transfer efficiency." Internal company documents reflect that nicotine transfer efficiency was of interest to B&W/BATCo at least since the 1960s and that this parameter was routinely measured. 689201723-1770 at 1758, 1760 (US 31049) (O).

2917. A 1995 document produced by B&W revealed, "[r]aising the pH of the [nicotine] to a more alkaline level will increase the percentage of nicotine that is in the un-ionized ("free") form. . . . Since ammonia is an alkaloid (base), if added to tobacco in sufficient quantity, it would be expected to increase the prevailing pH of both the tobacco and the cigarette smoke." 689201723-1770 at 1761, 1734, 1735 (US 31049) (O).

2918. M. Lance Reynolds, B&W's former Director of Research and Director of Product Development, has testified that "nicotine-transfer efficiency is one of the most basic parts of

cigarette design." Reynolds PD, Minnesota, 9/30/97, 112:15-16.

2919. As of 1997, B&W had never disclosed to its customers that it used ammonia technology in its cigarettes to enhance the delivery of nicotine, and had never provided them with nicotine-transfer information. Moreover, as of 2002, B&W had not made public its research on the effect of pH on nicotine impact. Reynolds PD, Minnesota,6/4/97, 112:19-112:23; Reynolds PD, Philip Morris, 9/12/02, 346:2-346:19, 347:8-347:20, 348:7-348:14.

(dd) American

2920. American investigated the effects of using nicotine in a free base form. A June 30, 1980 American memorandum from N.L. Bodenhamer to Eugene Glock on "Increasing Nicotine Transfer in Smoke" stated: "There has been an interest in increasing the amount of nicotine that is transferred from the tobacco to the mainstream smoke while leaving the ‘tar' level unchanged. Since most nicotine in tobacco is a non-volatile salt, it was thought that a greater transfer would take place if the tobacco was made basic causing the nicotine to volatilize when the cigarette is smoked." To test this hypothesis, researchers conducted an experiment in which they added 2% or 5% potassium carbonate to American's Tareyton tobacco blend. Taste tests "suggested that more nicotine had transferred to the smoke, with the 5% being more harsh than the 2%." ATC2570157-0157 (US 66272) (A). This document also supports Dr. Henningfield's testimony that, while the quantity of an added base may be small on an absolute scale, even small differences contribute to noticeable differences for the smoker. Henningfield WD, 68:23-69:1, 69:21-70:16.

2921. In a follow-up memorandum between the same American employees a month later, it was reported that using nicotine in a free base form could "volatilize and thereby increase the amount of nicotine in the smoke. Some further work planned in this area is the addition of

sodium carbonate, treatment of stems with alkali base, and treatment of CARLTON blend to possibly increase smoke taste since cigarettes treated thus far have been much stronger than the control." X003498-3506 at 3497 (US 86972) (O).

2922. Many of American's research and product development efforts aimed at increasing the pH of cigarette smoke involved manipulating the content of its leaf blend and filler. Those efforts are described in Section III.C(2)(c)(ii).

(ee) Lorillard

2923. Lorillard also was studying ways to alter the pH of its cigarette products. In 1973, Lorillard sought to improve the smoking quality of its reconstituted tobacco. Lorillard believed its research at that time demonstrated that the amount of free nicotine contained in mainstream smoke increased with higher pH, and that higher pH increased impact. Lorillard also studied how the Marlboro reconstituted leaf achieved a higher pH while maintaining a good flavor. Using different additives, types of leaf, and added nicotine, Lorillard tested numerous ways to increase the smoke pH in its reconstituted leaf. 00044833-4841 (US 47324) (O); see also 87644269-4277 (US 56273*) (O).

2924. A November 2, 1973 memorandum, entitled "Research 1–3–5 Year Projection of Major Projects," outlines Lorillard's research goals for "Tobacco Modification," among other things. The memorandum revealed that Lorillard had undertaken a research program designed "to explore the possibilities of modifying various physical and chemical properties of tobacco by means of chemical treatments or additives." One of the areas of interest in this regard was the "control of nicotine delivery." The memorandum noted that the ability to control nicotine and other parameters "will permit the design of low tar products with acceptable burning rates having specified nicotine deliveries." 83250679-0693 at 0683 (US 55641) (A).

2925. Several Lorillard studies reiterate the connection between smoke pH and nicotine delivery. For one, a May 4, 1976 memorandum concerning the "Nicotine Augmentation Project" noted, "It is known that the higher the pH of the smoke is (i.e. the more basic), the more nicotine exists in the free form. Free nicotine has a greater physiological effect . . . ." 00050444-0450 at 0448 (US 47721) (A). A July 12, 1976 Lorillard study by Leighton Chen provided an extensive review of "input variables affecting the pH of smoke" and the "effect of pH on smoke delivery." Chen reported, among other things, that "[t]he market leaders appear to have the higher pH's, and hence the higher concentration of free base nicotine. If the desired goal is defined to be increased nicotine yield in the delivered smoke . . . increase the pH, which increases the 'apparent' nicotine content without changing the absolute amount." 00044921-4938 at 4922, 4933-4934 (US 34203) (A). See also 00778258-8265 (US 34295*) (O); 00121921-1942 (US 85476) (O); 00778109-8113 (US 22930) (O); 83250763-0765 (US 55655) (O).

2926. In an April 13, 1977 memorandum to Harry Minnemeyer entitled "Gas Phase Ammoniation of Tobacco," P.D. Schickedantz recognized that the addition of bases such as ammonia to tobacco might result in "a greater efficiency of nicotine delivery or in an increased smoke pH. An increased smoke pH would liberate nicotine free base from its salts to give a greater chest impact." Schickedantz also reported on several techniques to more accurately estimate the amount and form of ammonia that could be added without resulting in "the undesirable taste previously associated with ammoniated tobacco." 00778451-8457 at 8451, 8456 (US 34299) (A).

2927. Lorillard also studied filtration and pH systems in 1976 as other potential methods to enhance nicotine delivery. Lorillard found that free nicotine could be added to tobacco at practically any point in the manufacturing process using solvents such as water, alcohol, freon, or

top flavor. 00778476-8490 (US 34300) (O); 00778109-8121 (US 22930) (O).

2928. A 1977 update on the "Nicotine Enrichment Project" informed Lorillard management that the most promising method of enriching nicotine was to add nicotine alkaloid to tobacco. 526321428-1440 at 1428 (US 85478) (O).

2929. Lorillard conducted research on ammonia and smoke pH well into the 1990s. In 1995, the company investigated the ability of diammonium phosphate to increase the level of nicotine delivery and smoke pH. See 96522458-2467 at 2461 (US 21973) (O). A September 18, 1996 memorandum titled, "Summary of the Effects of Ammonium Carbonate, Ammonium Bicarbonate, Urea and Diammonium Phosphate on Smoke pH, Smoke Data and Leaf Chemistry" concluded: "A positive trend was observed between increasing levels of urea and increases in the percent transfer of nicotine from the leaf to the smoke on a per cigarette basis." Although this trend was not observed with the addition of other additives, the researchers found that smoke pH increased with the addition of ammonium carbonate and ammonium bicarbonate, and that the addition of diammonium phosphate led to increased puffs, thereby increasing the nicotine delivery. 83502523-2535 at 2525, 2531 (US 55858) (A). In a related memorandum examining the addition of urea, ammonium carbonate, and ammonium bicarbonate, the researchers concluded that "[f]or all three additives, as the amount of the additive applied to the tobacco was increased, the smoke pH increased. Increased smoke pH results in increased calculated levels of unprotonated, or free, nicotine." 93848806-8818 at 8809 (US 56687) (O). See also 96522506-2542 (US 21822) (O).

2930. Lorillard conducted in-house research that was relevant to the FDA's examination of whether and how the tobacco industry was manipulating the nicotine yield of its cigarettes with additives. In 1996, Lorillard researchers issued a report, which confirmed that cigarette

additives, such as urea, diammonium phosphate (DAP), ammonium carbonate and ammonium bicarbonate, increased the smoke pH and "the nicotine transfer from leaf to smoke." 88029439-9460 at 9439, 9449 (US 22048) (O). Lorillard relies on an earlier 1994 study to show that DAP does not increase nicotine yields; however the later 1996 study clearly shows that increases in DAP resulted in increased nicotine transfer. Compare 89766136-6195 (JD-020304) (O) with 88029439-9460 at 9439, 9449 (US 22048) (O). Another document upon which Lorillard relies to refute this finding does not identify the blend tested, nor does it examine varying levels of DAP as in the prior studies. See 95308900-8906 (JD-020165) (O).

2931. As late as October 2000, Lorillard continued to use additives to affect smoke pH and produce ammonia. An October 3, 2000 Lorillard memorandum disclosed the concerns of Lorillard's then-CEO, Alexander Spears, concerning the use of ammonium carbonate to change pH balance: "[Spears] had a big concern about using ammonium carbonate to change the pH. His point was that much of the pH changes reported have shown that when the ammonia is generated is just as, if not more, important than the amount. He would like us to use urea instead, since it will allow ammonia to be generated at a more even rate and at higher temperatures than with the use of ammonium carbonate." 97014099-4099 (US 21853) (O) (emphasis in original).

(ff) Liggett

2932. Liggett also aggressively pursued designing a cigarette with increased smoke pH. A 1971 progress report on project TE-5001 reported that "[i]ncreasing the pH of a medium in which nicotine is delivered increases the physiological effect of the nicotine by increasing the ratio of free base to acid salt form, the free base form being more readily transported across physiological membranes." The importance of this finding was explained: "[w]e are pursuing

this project with the eventual goal of lowering the total nicotine present in smoke while increasing the physiological effect of the nicotine which is present, so that no physiological effect is lost on nicotine reduction." LG0262125-2126 at 2126 (US 59994) (O).

2933. By early 1972, Liggett had achieved its goal of increasing the smoke pH. Another report on project TE-5001 was issued heralding the success of the pH studies: "The original purpose of this development was to increase the smoke pH through the addition of a basic material to the tobacco in order to achieve a higher physiologic effect from the nicotine in the smoke. This has been accomplished." Liggett's researchers found related results from the study encouraging, reporting "the above-observed facts would seem to present intriguing possibilities in the development of new products, particularly in the development of low yield cigarettes where it is desirable to obtain a higher physiologic effect from a cigarette yielding relatively small amounts of nicotine." The report set forth various ways Liggett would improve "taste" for commercialization of the product. LG0262506-2508 at 2506-2507 (US 36263) (A).

2934. Liggett continued its work on the TE-5001 throughout the 1970s. During this time, company scientists developed a sound base of knowledge in the area and advised management of the perceived benefits of increasing smoke pH, writing: "[a] low smoke solids, low nicotine cigarette with an increased smoke pH would then have relatively more free nicotine in its smoke. Consequently, a higher nicotine impact would result producing a more satisfying smoke." This January 22, 1974 report, and others, discuss methods, including filters, blends, and additives, by which the smoke pH could be altered. It was reported that "all the increased smoke pH cigarettes generally exhibited an increased physiological impact." LG0262127-2129 at 2127, 2128, 2129 (US 21185) (O).

2935. In a January 29, 1974 report concerning the progress made by Liggett in 1973 on

Project TE 5001, J.R. Newsome explained: "The purpose of this project is to develop a method for increasing the smoke pH of a cigarette. A low smoke solids, low nicotine cigarettes [sic] with an increased smoke pH would then have relatively more free nicotine in its smoke, and consequently, a higher nicotine impact." Newsome also stated that "[f]uture plans on this project will consist of screening a number of basic materials on both the cigarette filter and blend in an attempt to find which additive is most effective in producing a smokeable increased smoke pH cigarette." The report confirms that Liggett continued studying various methods of manipulating cigarette smoke to increase smoke pH, including the use of filters, additives, and different tobacco blends. LG 0262130-2131 at 2130, 2131 (US 21596) (A).

2936. Liggett continued its work on Project TE-5001 through at least 1978. Through this work and other research, by 1976, the company was aware of various methods of altering pH. Among the methods that Liggett believed could alter pH were: changing the tobacco blend, adding additives to the tobacco or adding additives to the filter. LG0262155-2155 (US 21428) (O); LG0262149-2151 (US 21186) (A); LG0262152-2153 (US 21187) (O); LG0262509-2512 (US 36264) (O).

2937. Liggett was incorporating ammonia technology into some of its products no later than 1993, as demonstrated in a memorandum to Dennis Dietz, Liggett's Manager of Scientific Issues, who testified in this case. LG2018563-8563 (US 21190) (O).

2938. Liggett was aware decades ago of the basic science surrounding pH and the freebase form of nicotine. Dietz PD, Minnesota v. Philip Morris, 9/29/97, 22:15-24:1, 25:23-27:5. Since 1971, Liggett has hypothesized that the effect of increasing the pH of nicotine, and hence increasing the ratio of freebase nicotine to salt form, increases the physiological effect of the nicotine. Id., 28:1-32:3.

2939. Liggett pursued research into the manipulation of the pH of nicotine because it sought to lower the total nicotine present in smoke while increasing the physiological effect of the nicotine that remained. Id., 33:25-34:19.

2940. Liggett's research confirmed the research conducted by BATCo and RJR. Dietz testified that BATCo found that treatment of tobacco with potassium carbonate reduced the total quantity of nicotine in the smoke while enhancing the physiological effect. Id., 57:12-59:17. Similarly, Reynolds found that pH in smoke can affect the physiological impact, and that ammonia is one of the major pH controlling components. Id., 59:19-61:3.

2941. As internal research and Dietz's testimony show, Liggett was aware that adding calcium hydroxide to tobacco makes the tobacco more basic, thus raising the pH and increasing the amount of freebase nicotine relative to the salt form of nicotine. Liggett added calcium hydroxide to the L&M blend. LG0262506-2508 (US 36263) (A); Dietz PD, Minnesota, 9/29/97, 35:17-41:11.

2942. Liggett also experimented with increasing the smoke pH by making the filter more basic and thereby increasing the physiological impact of the nicotine. Dietz PD, Minnesota, 9/29/97, 41:12-43:24; LG0262127-2129 at 2128 (US 21185) (O).

2943. In 1976, Liggett continued its research into the modification of smoke pH, and noted that a smoke pH of 6 resulted in the nicotine in smoke as salt form, while a pH of 11 resulted in nicotine as almost entirely freebase form. The most dramatic shift from salt form to freebase form occurred between pH 6 and pH 9. Dietz PD, Minnesota, 9/29/97, 44:21-50:4.

2944. Between 1993 and 1996, Liggett added diammonium phosphate to its cigarettes. Id., 61:7-19. As seen through research conducted by other Cigarette Company Defendants noted earlier in this Section, DAP has been shown to increase nicotine transfer.

2945. Timothy Jackson, the Vice President for Operations at Vector Tobacco, a Liggett subsidiary, wrote in a July 30, 2001 e-mail discussing Vector Tobacco cigarette testing that a third party had

VDOJ 25337-5337 (US 64738)(O) (Confidential).

(v) Other Research Efforts and Additives Used by Cigarette Company Defendants to Manipulate Nicotine

2946. Cigarette smoke contains chemicals that can act synergistically to produce effects that might be even more reinforcing to addiction than those of nicotine alone. For example, studies by Philip Morris have indicated that levels of acetaldehyde (a chemical involved in alcohol dependence) in smoke can be manipulated through additives so as to produce a mixture of acetaldehyde and nicotine that would be more addictive than either drug alone. DeNoble WD, 31:5-32:15; 1000413881-3964 (US 20100) (A); 1003060443-0503 (US 87091) (A). At trial, Victor DeNoble, a scientist who ran Philip Morris's Behavioral Pharmacology lab from 1980-1984, testified as a fact witness about acetaldehyde research that he personally conducted. Dr. DeNoble's testimony on acetaldehyde was corroborated by the unchallenged testimony of Dr. Paul Mele, another scientist in Dr. DeNoble's lab, and was not rebutted on cross examination or by any other witness called by Philip Morris.

2947. Philip Morris studied the compound acetaldehyde beginning as early as 1980, because it had been shown to have positive reinforcing effects, i.e., that it enhanced a smoker's desire to continue to ingest nicotine. DeNoble WD, 29:16-33:5; 1002973586-3615 at 3598 (US 35633) (A)1000390648-8764 (US 35259) (O). In 1982, Dr. DeNoble reported that, in preliminary studies, acetaldehyde readily penetrated the blood-brain barrier. 1003198459-8461 (US 20156) (A). DeNoble's studies on acetaldehyde revealed a "synergistic effect" with nicotine. In other words, "the combination of nicotine with low doses of acetaldehyde caused more

powerful results than either one of the drugs acting alone." DeNoble WD, 31:11-12; Mele WD, 18:18-19:1; 2048376436-6437 (US 85503) (O). In 1983, Philip Morris determined that acetaldehyde could enhance the positive reinforcing effect of nicotine, and the company set as a goal finding the ratio of acetaldehyde to nicotine that would have "optimal reinforcing effects." 1000413881-3964 at 3883-3884, 3908 (US 20100) (A). Philip Morris scientists even charted the effect of the presence of acetaldehyde in cigarettes upon sales. 2022261214-1225 (US 20364) (O).

2948. On January 30, 1981, Thomas Osdene, then Director of Research and later Vice President of Science and Technology, received a letter from Philip Morris consultant Leo Abood, informing Osdene of research showing that acetaldehyde was self-administered by rats and that it could reinforce smoking behavior. Abood postulated that acetaldehyde may "enhance" the behavioral effects of nicotine and suggested that further studies be done to see how acetaldehyde interacts with nicotine. 2058212035-2036 (US 64776) (O).

2949. In 1982, DeNoble presented his acetaldehyde research to Philip Morris corporate officers in meetings in Richmond and at Philip Morris headquarters in New York. Subsequent to his presentations, Philip Morris executives expressed interest in finding the ratio of the acetaldehyde-nicotine combination that would be optimally reinforcing. DeNoble also testified that Philip Morris considered the acetaldehyde work "very sensitive and that [the company] did not want it to be misinterpreted if it got out." As a result, Philip Morris explored ways to move DeNoble's research out of the company labs in Richmond. DeNoble WD, 11:8-10, 32:18-33:1, 33:18-35:4, 36:14-18.

2950. It is clear that Philip Morris recognized "[t]here was a practical aspect of the super-additive quality of the reinforcing effects of nicotine and acetaldehyde." According to Paul

Mele, a Scientist in DeNoble's lab, their supervisor in the Biochemical Research Division, Jim Charles, "discussed with us the importance of finding the optimum ratio of nicotine and acetaldehyde that was reinforcing in the self-administration test." Mele WD, 19:14-19:16.

2951. Similarly, former B&W Director of Research Jeffrey Wigand explained that acetaldehyde is an impact booster and that B&W knowingly used additives, such as sugars, that would produce acetaldehyde when burned. Wigand WD, 119:7-22; Wigand TT, 1/31/05, 11580:1-4.

2952. BATCo researchers were aware as early as 1968 of the importance of nicotine and of the potential value of a product that combined nicotine with some other chemical to increase the pharmacological effects of nicotine. Minutes written by S.J. Green from a BATCo conference held in Hilton Head, South Carolina, on September 24-30, 1968, included the following conclusion:

> In view of its pre-eminent importance, the pharmacology of nicotine should continue to be kept under review and attention paid to the possible discovery of other substances possessing the desired features of brain stimulation and stress-relief without direct effects on the circulatory system. **The possibility that nicotine and other substances together may exert effects larger than either separately (synergism) should be studied** and if necessary the attention of Marketing Departments should be drawn to these possibilities.

682633150-3156 (US 54206) (A) (emphasis added).

2953. Internal documents show that Cigarette Company Defendants researched various additives with the intent to facilitate the nicotine delivery. In 1969, American test-marketed Lucky Strike cigarettes to which it had added nicotine malate to increase the nicotine levels of the cigarettes. "Evidence of Nicotine Manipulation by the American Tobacco Company," Staff Report prepared by the Majority Staff Subcommittee on Health and the Environment of the

House Committee on Energy and Commerce, December 20, 1994, at 2 (US 76044) (O).

2954. In a February 8, 1960 memorandum, L.L. Long wrote to A.B. Clarke, with copies to Seligman and G.E. Shaffer, Jr., discussing Philip Morris's ongoing efforts to manipulate the amount of nicotine received by a smoker through concentration on the make-up of tobacco smoke. Long wrote:

> [o]ne of the objectives of the 1960 cigarette project is the control of TPM at a low level **while maintaining the nicotine level in the smoke** at its current level of about 1 mg/cigt. Several years ago some work was conducted along these lines. Nicotine Maleate was added to a low nicotine filler with a resulting increase in nicotine in the smoke. It would be most helpful if you could conduct some investigation in this area along with your work on nicotine control through extraction.

1001919958-9958 (US 85460) (O) (emphasis added).

2955. By 1978, Lorillard was studying means by which nicotine migration – the redistribution of nicotine within a cigarette from the tobacco to the outer periphery for the purpose of increasing the amount of nicotine in mainstream smoke – could be maximized. In a February 23, 1978 memorandum to Harry Minnemeyer, M.S. Ireland set forth the "steps which are planned in the nicotine migration project," including maximizing migration through the addition of acids or other compounds and determining the maximum amount of nicotine that can be migrated. 82514702-4703 (US 55517) (O).

2956. By 1980, Lorillard was aware that "nicotine could be manipulated within a cigarette to a specific area. The objective of such a redistribution within the cigarette would be to increase the delivery of nicotine to the mainstream smoke." Thus, researchers proposed to study possible cigarette additives that would facilitate the migration of nicotine from other parts of the cigarette to the cigarette paper, recognizing that "the major portion of the mainstream smoke is generated from the outer periphery of the cigarette." 83896877-6879 at 6878 (US

55922) (O). A 1980 report likewise stated that "[i]t has been demonstrated that the impregnation of cigarette paper with acid can cause migration of nicotine to the periphery. This in turn elevates delivery of nicotine in mainstream smoke." 00114987-4996 at 4987 (US 34264) (O). Lorillard conducted further studies on migration and confirmed these results. 00114962-4975 at 4962 (US 34263) (O); see also 00041734-1735 (US 34189) (A); 000115023-5025 (US 34265) (A); 83896952-6954 (US 55925) (O).

2957. A February 25, 1982 Lorillard research paper entitled "A Progress Report on Nicotine Migration and Manipulation," concluded that "[a]ddition of bases to tobacco was found to substantially enhance migration of nicotine to acid impregnated media." 00053989-4018 at 3989 (US 34217) (A); Henningfield WD, 75:22-76:1, 77:15-18. A March 2, 1982 report summarizing internal Lorillard research noted that various cigarette constructions, including "[n]ew filter additives, cigarette papers and means of migrating nicotine to cigarette paper were evaluated" with the objective of increasing the tar/nicotine ratio. 00041682-1696 at 1682 (US 34188) (A); see also 00041734-1735 (US 34189) (A); 00397548-7553 (US 34289) (A).

2958. A December 6, 1983 Lorillard memorandum by J.M. Johnson described the purpose of another study of filter additives as "to increase smoke pH and therefore increase free nicotine in smoke by adding an aryl alkyl amine to the filter." The results of the study revealed "increased smoke pH and a six-fold increase in free nicotine." 87632595-2598 (US 56265*) (A); Henningfield WD, 75:22-76:1, 77:8-14.

2959. One of RJR's significant research objectives outlined in an August 27, 1979 report by Alan Rodgman entitled "Research Department Program 1980" was to identify the advantages and disadvantages "of various treatments such as nicotine relocation, heat treatment, denicotinization, casing or use of other additives to control nicotine delivery to mainstream

smoke." 502490232-0246 at 0242 (US 85406) (O).

2960. An April 30, 1984 draft "TGA [thermal gravimetric analysis] Monthly Report" from Calvin L. Neumann to M.D. Shannon reports on the progress of Reynolds's "Nicotine Delivery Experiments." The draft report demonstrates that RJR continued extensively to study cigarette design mechanisms that would result in efficient and effective delivery of nicotine to the smoker. For instance, the report presents the following conclusions, inter alia, from RJR's nicotine delivery experiments:

> -Nicotine transfer is a function of nicotine level and form. Nicotine transfers most efficiently as the free base, and least efficiently as the salt with added acid present.
> -When nicotine is present as a free base, transfer begins at about the same puff as aerosol generation begins (puff #2) and lasts for only 4-6 puffs. When nicotine is present as a citrate salt with excess acid, nicotine delivery is delayed for 1-2 puffs, but lasts until ca [approximately] puff 11. Without excess acid nicotine delivery from the citrate salt is intermediate between these cases.

505008446-8460 at 8447 (US 85504) (O); see also 506517246-7300 (US 85505) (O).

2961. On February 19,1988, RJR employee Ken Shu sent an inter-office memorandum to Brian Lawrence regarding using levulinic acid derivatives and nicotine levulinate salts to reduce "throat harshness" in high nicotine tobacco products. Shu recommended use of high nicotine tobacco extracts to make nicotine levulinate salt "so it may be legally considered a natural process." 506448793-8794 at 8793 (US 20758) (O); see also 514894567-4676 at 4579 (US 20862) (A).

2962. In an April 22, 1988 internal invention disclosure prepared by Barry Fagg and addressed to August J. Borschke of RJR's Legal Department, Fagg described a method for incorporating levulinic acid into tobacco materials, noting that the "addition of levulinic acid to tobacco materials has proven in the past to effect desirable smoking characteristics to a tobacco

product incorporating the material; i.e. reduced harshness, **modified nicotine delivery**, etc." 508675959-5961 at 5960 (US 85506) (O) (emphasis added).

2963. RJR's study of the use of levulinic acid as an additive indicates that Reynolds believed that levulinic acid or other organic acids could be used to remove and/or mask the harshness associated with cigarettes having a high concentration of nicotine. An undated Reynolds document described an invention where "[c]igarettes having high nicotine content tobacco cut filler are rendered smooth smoking and palatable by incorporating an organic acid additive therein." The document described the incorporation of "one or more salts provided from nicotine and an organic acid" into a cigarette. The effect of adding an organic acid salt to a high nicotine concentration tobacco was also described: "Typically, the FTC 'tar' to FTC nicotine ratios of a cigarette having a nicotine/organic acid salt incorporated therein can be lowered by up to about 80 percent of that ratio of a similar cigarette not having the salt additive incorporated therein." 507873543-3593 at 3543, 3558, 3565 (US 86982) (O); see also 522531991-1993 at 1991 (US 88076) (O).

2964. In handwritten notes dated December 1, 1988 from an internal meeting on the topic of levulinic acid, the positive attributes of adding levulinic acid to cigarettes were described as "permitts [sic] increased product nicotine levels without increasing smoke harshness" and "permitts [sic] reduction of 'tar' to nicotine ratio." 507862863-2870 at 2867 (US 85507) (O).

2965. Reynolds was denicotinizing burley tobacco by 1981 – further proof that Defendants have substantial control over the nicotine levels in their cigarettes and that such levels are the result of deliberate choices. 501754849-4866 (US 20685) (O).

2966. Defendants have also researched other sophisticated methods of manipulating the addictive potential of cigarettes. In 1977, BATCo scientists discussed the drug etorphine, noting

that it "is 10,000 times as effective an analgesic as morphine and has addictive characteristics," noting that "[p]erhaps a regular dose of 0.2 ug/day would generate an addictive craving for the source. If so, 6 ug in, say, 30 cigarettes would provide such a dose . . . . Do you think the possibility that competitors might use such a route to create brand allegiance for low delivery cigarettes ought to be discussed at the Research Managers Conference?" 107467542-7542 (US 20250) (O).

2967. Even to this day, the cigarette industry is unwilling to fully disclose information regarding tobacco ingredients and additives on a brand-specific basis. Some companies recently have begun to provide limited information on their website, but those websites contain various disclaimers and means of preventing regulatory agencies and public health scientists from knowing the full array of ingredients that are used to control tar and nicotine levels in particular brands. These ingredients include what are sometimes referred to as "processing aids" and "flavorings," components that typically are not included in the publicly available "ingredient disclosures." The decision as to how such categorizations and exclusions are made is done by the manufacturer and not by a disinterested regulatory agency. Furthermore, ingredients and design features in the paper and filter also help meter dosing, but also are not fully disclosed. Henningfield WD, 86:22-87:9; 321205145-5146 (US 86980) (O); 321205312-5312 (US 86981) (O).

2968. By providing incomplete ingredient disclosures on a brand-by-brand basis and a long list of approximately 600 **potential** ingredients, the cigarette companies assure that their disclosures have only a very limited usefulness to research scientists outside the industry who study nicotine pharmacology. Even based on these limited disclosures, however, it is clear the Cigarette Company Defendants use other chemical additives to facilitate the delivery of nicotine.

Henningfield WD, 86:22-87:9.

(d) Conclusions

2969. The above-described conduct of all of the manufacturing Defendants in researching, developing, and implementing techniques to manipulate the amount and form of nicotine delivered by their cigarettes proves the falsity of Defendants' public statements that they do not manipulate nicotine. It is also additional supportive evidence that confirms Defendants' internal recognition – from the 1950s forward – that nicotine is the most important component of cigarette smoke because it is the one primarily responsible for keeping people smoking. Indeed, the evidence in the record shows that Defendants' nicotine manipulation efforts have stemmed directly – and explicitly – from their understanding that their extraordinary profits depend upon their ability to design cigarettes in a way to ensure that smokers can use the cigarette to get enough nicotine to create or sustain their addiction.

2970. The Court finds the evidence establishes that Defendants have had an extraordinary focus on nicotine's pharmacological effects, and have dedicated an extraordinary level of resources, both human and financial, to nicotine-oriented research and product development.

2971. The Court further finds that the evidence establishes that Defendants incorporated physical and chemical design parameters into their commercial products with the intent of assuring that those products delivered sufficient nicotine to create and sustain addiction in cigarette smokers.

2972. The Court also finds that the length of time for which, and the vigor with which, Defendants have pursued their campaign of obfuscation, misrepresentation, and concealment of their predominant focus on nicotine, constitute powerful evidence that the profitability of this

misconduct was high and that maintaining a uniform, fraudulent public position as to their manipulation of nicotine was critically important to Defendants' scheme to defraud.

D. Defendants' Fraud Regarding Filtered and "Low Tar/Nicotine" Cigarettes

(1) Introduction and Overview

2973. As demonstrated above, Defendants have conspired over the over the last five decades to keep Americans from quitting smoking by maintaining a core "continuing controversy" public relations position denying that any negative health impacts from smoking had been proven. See US FF § III.A(1), supra. The evidence below demonstrates that, as part of their scheme to dissuade potential quitters from giving up smoking, Defendants also introduced filtered and low tar cigarette brands that they internally referred to as "health reassurance" brands. Indeed, Defendants' internal documents show that Defendants engaged in massive, sustained, and highly sophisticated marketing and promotional campaigns intended to portray their health reassurance brands as less harmful than regular cigarettes, and thus an acceptable alternative to quitting, while at the same time carefully avoiding any admission that any negative health impacts from smoking had been proven.

2974. The evidence shows that, over multiple decades, Defendants used a combination of techniques to market and promote their health reassurance brands. In the early 1950s, Defendants explicitly marketed and promoted the first health reassurance brands as less harmful due to an added filter which purportedly protected smokers from the harmful tar in cigarette smoke. In subsequent years, Defendants' marketing of their health reassurance brands featured claims of low "tar" and nicotine delivery accompanied by statements that smoking these brands would reduce a smoker's exposure to the "controversial" elements of cigarette smoke (i.e., tar). Since in the 1970s, Defendants also have used so-called brand descriptors such as "light" and "ultralight" to communicate health reassurance and suggest to consumers that low tar cigarettes are an acceptable alternative to quitting. The evidence further demonstrates that, in addition to

written statements and brand descriptors, Defendants have used marketing imagery such as lighter color cigarette packaging and white tipping paper to communicate to smokers that Defendants' health reassurance brands were low in tar and therefore less harmful. See US FF §§ III.D(1)-(3), infra (Defendants' deceptive marketing of low tar cigarettes).

2975. The evidence shows that, even as they engaged in a campaign to market and promote filtered and low tar cigarettes as less harmful than regular cigarettes, Defendants either lacked evidence to substantiate their claims or knew them to be false. Indeed, internal industry documents evidence Defendants' awareness by the late 1960s/early 1970s that, because low tar cigarettes do not actually deliver the low advertised levels of tar and nicotine to human smokers, they are unlikely to provide any health benefit to smokers compared to regular, full flavor cigarettes. See US FF § III.D(4)(a), infra (health effects of low tar cigarettes).

2976. As Defendants have long been aware, nicotine delivered by cigarettes is addictive (see US FF § III.C(1), supra (addiction)). Defendants' internal documents demonstrate their awareness that, in order to obtain an amount of nicotine sufficient to satisfy their addiction, smokers of low tar cigarettes modify their smoking behavior, or "compensate," for the reduced nicotine yields by taking more frequent puffs, inhaling smoke more deeply, holding smoke in their lungs longer, covering cigarette ventilation holes with fingers or lips, and/or smoking more cigarettes. See US FF § III.D(4)(b), infra (smoker compensation). As a result of this nicotine-driven smoker behavior, smokers of light cigarettes concurrently boost their intake of tar, thus negating what Defendants have long promoted as a primary health-related benefit of light cigarettes: lower tar intake.

2977. The evidence shows that Defendants withheld and suppressed their extensive knowledge and understanding of smoker compensation from public dissemination, and instead

used this knowledge to design their low tar cigarettes to register low tar and nicotine yields on the standardized testing machine operated by the Federal Trade Commission ("FTC"), while enabling smokers to compensate and obtain much higher deliveries of nicotine (and with it, tar), deliveries high enough to create and sustain addiction. Defendants' internal documents referred to this design feature as "elasticity" of delivery. The evidence shows that Defendants designed low tar cigarettes with elasticity of delivery because Defendants knew that if smokers were not able to get a sufficient amount of nicotine from them to sustain their addiction, they would be more likely to quit smoking. See US FF § III.D(4)(c), infra (Defendants' deceptive design of low tar cigarettes).

2978. The evidence shows that Defendants' deceptive conduct with respect to health reassurance cigarettes continues to this day. Despite their internal knowledge that "light" and low tar cigarettes offer no health benefit as compared to regular cigarettes, Defendants continue to market and promote light and low tar cigarettes as less harmful, capitalizing on smokers' mistaken belief that low tar cigarettes are in fact less harmful. Additionally, despite their extensive knowledge of smoker compensation, Defendants continue to disseminate inaccurate and/or incomplete statements downplaying its existence and prevalence. Defendants' concealment of smoker compensation – which is driven by nicotine addiction – is consistent with the fact that the Cigarette Company Defendants (with the exception of Liggett) refuse to publicly acknowledge that nicotine is addictive.

2979. As detailed below, the evidence shows that Defendants' conduct relating to low tar cigarettes was intended to further the aims of the Enterprise and Defendants' scheme to defraud by providing smokers with a false sense of reassurance and thereby weakening their resolve to quit smoking, and by drawing ex-smokers back into the market.

(2) Defendants Introduced Health Reassurance Cigarettes to Discourage Smokers from Quitting

2980. As expert economist Dr. Jeffrey Harris testified, "[a]n extensive body of literature by economic researchers supports the conclusion that American consumers have consistently reduced their use of cigarettes in response to publicity about the adverse health effects of smoking." Dr. Harris testified that cigarette consumption in the United States declined in the early 1950s, around the time when reports appeared in the popular press concerning scientific studies on smoking and lung cancer, particularly the 1953 report from Sloan-Kettering Institute that cigarette tars caused cancers in laboratory animals, and declined again immediately following the 1964 Surgeon General's Report. Harris WD, 71:3-18; 62:4-64:12.

2981. Dr. Harris's expert trial testimony is entitled to significant weight. Dr. Harris, who was accepted by the Court as an expert in economics, is highly credentialed and well-qualified to give testimony in this case. He is both a primary-care physician at Massachusetts General Hospital and a tenured Professor of Economics at the Massachusetts Institute of Technology ("MIT"), where he has been a faculty member for over 25 years. Dr. Harris holds an M.D. degree from the University of Pennsylvania and a Ph.D. in Economics from the University of Pennsylvania. Dr. Harris has spent a career both as an economist working on tobacco related issues, and as a practicing physician treating patients addicted to nicotine. He has authored numerous peer-reviewed articles and book chapters concerning his research on "the effects of price on cigarette smoking, the economic structure of the cigarette industry, the profits of cigarette manufacturers, trends in smoking rates throughout the twentieth century, and the impact of anti-smoking campaigns." Dr. Harris's publications include a chapter in the 1979 Surgeon General's Report explaining "trends in cigarette consumption, smoking rates, changes in the type of cigarettes smoked, and the responses of consumers to information about the risks of smoking,"

and a "review of trends in smoking in the United States throughout the twentieth century, entitled 'Patterns of Cigarette Smoking'" for the 1980 Surgeon General's Report. Dr. Harris has been a consulting scientific editor, invited contributor, or senior reviewer to Surgeon General's Reports on smoking and health in 1980-1983, 1986, 1988, 1989, and 1996. Dr. Harris testified that through his work on the Surgeon General's Reports, he 'acquired specific expertise in both the economics of the cigarette industry' by working with "raw data on government surveys of smoking practices,' studying 'detailed trends in cigarette consumption, smoking rates, and product mix, including the relationship between these trends and publicity about the adverse effects of smoking.' Dr. Harris has served as a consultant to numerous public health and governmental bodies on matters involving smoking and health as well as the economics of the tobacco industry. Harris WD, 1:22-3:16; 4:1-14:2; Harris TT, 2497:20-2499:2.

2982. Dr. Harris's expert conclusions that during the past five decades, Defendants engaged in a sustained cooperative arrangement in which they jointly denied that smoking caused disease, jointly refrained from making explicit comparative health claims about each others' products, jointly withheld potential risk-reducing alternatives from the marketplace, and colluded via direct communication and explicit agreement among themselves, are based on sound economic principles and are supported by the overwhelming weight of the evidence. In formulating his expert opinions, Dr. Harris reviewed tens of thousands of pages of internal documents originating from the Defendant cigarette manufacturers as well as the deposition testimony of expert and fact witnesses in this case. Dr. Harris's unique economic perspective of the tobacco industry's conduct was not countered or rebutted by any expert witness called by Defendants. Defendants did not call a single expert to offer contrary opinions to Dr. Harris's economic conclusions, which were based upon a comprehensive review of fifty years of tobacco

industry materials and employee testimony. Harris WD, 22:22-23:14; 26:9-27:11; 24:21-25:4.

2983. The effect of the health scare on Defendants' sales is captured in a November 1964 marketing plan prepared by Grey Advertising for Lorillard entitled "Old Gold Spin Filters 1965 Marketing Plan," which noted that "[t]otal dealer purchases of cigarettes for the first eight months of 1964 totaled 220.2 billion units, 3.7% below year ago sales . . . Bi-monthly sales registered their lowest 1964 volume in January-February, **reflecting the full effects of the Surgeon General's Report**." Marketing expert Dr. Robert Dolan testified that this document "shows both that Lorillard was concerned about the total volume of cigarettes sold and that they saw the negative health messages in the 1964 Report of the Surgeon General as responsible for driving sales down." 84443158-3221 at 3163 (US 67524) (A) (emphasis added); Dolan WD, 130:14-131:3.

2984. Dr. Dolan's expert trial testimony is entitled to significant weight. Dr. Dolan, who was accepted by the Court as an expert in marketing, is Dean of the Stephen M. Ross School of Business at the University of Michigan, one of the nation's premier business schools. Prior to his current position, Dr. Dolan taught for 21 years at the Harvard University Graduate School of Business Administration, in the marketing area, holding the position of Marketing Area Chairman from 1986-1994. Dr. Dolan has authored or co-authored a number of textbooks on marketing management, including five case study handbooks designated as "best seller" by Harvard Business School Publishing. Dr. Dolan also has authored or co-authored 24 articles, nearly half of which were written for an academic audience and published in peer-reviewed journals, and has served as a member of the Editorial Review Board of the Journal of Marketing and Marketing Science. Dr. Dolan has been hired to teach marketing management to the executives of some of America's largest companies, including Allied Signal, Bethlehem Steel,

Chase Manhattan, Citicorp, the Ethicon Division of Johnson & Johnson, Ford Motor Company, General Electric, IBM, 3M, Merrill Lynch, and Xerox. Dr. Dolan testified that "[w]orking with many of the leading firms in the country . . . has enabled me to see how marketing really works – how it gets done within large corporations. I know the processes a large, multinational company is going to use to market. And, I know the type of marketing planning documents a firm like Philip Morris or the other tobacco companies is going to have, and how it developed them." Dolan WD, 2:11-19:9; Dolan TT, 12/1/04, 7660:4-9.

2985. Dr. Dolan testified that "[t]he tobacco companies perceived a significant threat from the potential quitting phenomenon." He explained that "[c]igarette smoking is kind of an unusual practice in that **most of the people who do it want to quit. Defendants knew this and wanted to decrease this urge to quit**." Dr. Dolan testified that if anywhere near the number of smokers who wanted to quit actually did quit, "[i]t would have been a great threat to the companies' financial performance," and that, as a result Defendants "did research to assess how many people acted on their desires to quit and how successful they were with those attempts." Dolan WD, 106:8-13; 67:1-7; 101:14-103:5; 104:18-22; Dolan TT, 12/1/04, 7660:12-7661:23 (emphasis added).

2986. Dr. Dolan testified that Defendants knew that the main reason people wanted to quit was due to health concerns, and that many smokers felt guilty about the fact that they continued to smoke. Dr. Dolan further testified that "two very specific activities directed at deterring quitting were: (1) the fostering of a "continuing controversy" denying that any negative health impacts had been proven (see US FF § III.A(1), supra) and (2) the introduction of low tar and nicotine brands as "health reassurance brands." Dr. Dolan explained that Defendants "introduced a number of brands and brand extensions lower in tar and nicotine and positioned

them as ‘health reassurance' brands to meet health concerns of smokers." Dr. Dolan testified that Defendants' own internal research showed that "smoking low tar and nicotine helped a smoker to reduce guilt about smoking and thus made a smoker less likely to quit. Smoking a ‘health reassurance' product with its low tar was a ‘compromise' to justify not quitting." Dolan WD, 106:14-107:2; 118:4-8; 118:23-119:21; 126:8-16; accord Burns WD, 69:3-14 (testifying that beginning in the 1950s, Defendants "introduced and marketed filtered cigarettes and 'low tar and nicotine' cigarettes as an effort to prevent smokers from quitting based on growing health concerns among smokers").

2987. The evidence shows that Defendants' introduction of filtered and low tar cigarettes had a tremendous affect on cigarette consumption in the United States. Dr. Burns testified that Defendants' actions reversed the decline in smoking that had occurred when smoking was linked to lung cancer, and resulted in per capita cigarette consumption rising "to new heights." Dr. Burns further testified:

> Based on my training, experience and review of changes in cigarette smoking based on the actions of the tobacco companies, it is clear that the misconduct of the tobacco industry in [many areas, including] deceptively marketing filtered and ‘lower yield' cigarettes as safer cigarettes has led to **substantially higher rates of cigarette consumption than would have occurred absent these actions**. This excess consumption has resulted in substantial excess rates of disease, a result of which would not have occurred absent these actions by the tobacco industry.

Burns WD, 69:3-14; 71:13-20 (emphasis added).

2988. Dr. Harris testified that "[d]uring 1955 to 1963, even though the scientific evidence pointing to cigarette smoking as a cause of disease continued to mount, cigarette consumption rebounded and rose further, as smokers switched in large numbers to filter cigarettes." Dr. Harris further testified:

> In response to the 'health scare' of the early 1950's . . . the market share of filter cigarettes rose rapidly in the United States, from 3 percent of the market in 1953 to 49 percent of total cigarette output in 1959. After the Federal Trade Commission began reporting tar and nicotine ratings in 1967, the market share of low-tar cigarettes - that is, cigarettes with a tar rating of 15mg or less - rose rapidly, from 2 percent in 1967 to 56 percent in 1981.

Harris WD, 102:18-103:14, 139:15-140:2; accord Dolan WD, 128:23-129:8 (testifying that Defendants' "marketing activities did have a positive impact on the overall size of the cigarette market," i.e., the number of cigarettes sold in a year").

2989. This was recognized by Defendants in their own documents. For instance, an October 1979 "History and Key Trends in the U.S. Cigarette Market" compiled by E.T. Parrack, B&W Vice President of Brand Management, noted that filter cigarette sales rose whenever smoking declined due to anti-smoking publicity:

> In 1953 and 1954, the market reacted to the impact of anti-smoking publicity in two ways: . . . Total consumption of cigarettes declined . . . filtered cigarettes share rose . . . . Surgeon General's report in 1964. Cigarette consumption again declined . . . and again filters entered another cycle of growth . . . in 1969 . . . TV campaigns against cigarettes . . . total consumption declined again . . . surge in filter growth followed the consumption drop.

670624932-5364 at 5323 (US 53869) (A).

2990. This document also noted that Defendants' heavy and sustained advertising of filtered and low tar cigarettes as less harmful was responsible for their success:

> [F]iltered products took off, rocketing from 3% of the market in 1950 to 53% in 1960. **The most important reason for this growth would have to be growing health concern** . . . . Hi-Fi was catapulted into existence . . . 1957 . . . . There was no doubt as to the underlying interest at the time in protection from the dangers of cigarettes . . . . [Between 1957 and 1960] the consumer was bombarded with messages regarding high filtration . . . . **The success of hi-fi brands is due in part to the large sums being spent to advertise them**.

670624932-5364 at 4935, 5036, 5277, 5279, 5342 (US 53869) (A) (emphasis added); Smith WD, 52:17-53:11.

2991. United States expert Dr. Dean Krugman concluded, from his review of Defendants' marketing plans and other internal marketing documents, that 4 to 9% of smokers switch brands every year. Defendants' internal documents also show that the "[d]irection of switching" is "generally in [the] direction of lower tar," with "75% of switchers switch[ing] to a lower tar category." Krugman WD, 152:13-25; 2500002189-2207 at 2204 (US 21460) (A); see also 2041787758-7815 at 7763, 7765 (US 38236) (A); 2044977085-7147 at 7124, 7126 (US 38383) (A).

2992. The evidence shows that even though low tar smokers may have a greater desire to quit, the misperception of increased safety associated with low tar cigarettes persuades them to avoid quitting. Research shows that low tar cigarette smokers have made a greater number of quit attempts than smokers of full flavor cigarettes, or were more likely to have considered quitting, (Weinstein WD, 56:21-57:8 (citing Giovino, et al., 1996)); however there is no data that indicates that switching to low tar cigarettes actually increases the likelihood of successfully quitting, (Weinstein WD, 57:9-17 (citing Giovino, et al., 1996)).

2993. Dr. Burns testified that "reassuring the public that smoking filtered or 'low tar' cigarettes was safe, or at least safer," benefits Defendants, because "[i]t keeps at least some smokers smoking; **many smokers who were concerned about the risks of smoking responded by switching to low tar cigarettes instead of quitting**." Moreover, Dr. Burns testified that, while "[m]any smokers switch to lower yield cigarettes as part of an effort to quit," the evidence indicates "that they are not more likely to quit." Burns WD, 46:21-47:9; 47:10-14 (emphasis added).

2994. Dr. Burns testified that "[t]here is profound harm" for people who smoke low tar cigarettes. As Dr. Burns explained:

> The vast majority of people who smoke are addicted. They're interested in quitting but are unable to do so. . . . To provide smokers an alternative that says you don't have to quit, you can use this other type of cigarette, to intercept them on the way to quitting smoking is a profound harm because they continue to smoke longer than they might have otherwise. **Some of those people who switched might have . . . been successful in quitting**, and when they did that, they would have in actuality reduced their disease risks. And those individuals have been profoundly harmed.

Burns WD, 1:10-15; 12:10-11; 61:14-62:4; Burns TT, 2/15/05, 13311:9-15 (emphasis added).

2995. The 2004 Report of the Surgeon General noted Defendants' apparent success in keeping smokers from quitting by their widespread marketing of low tar cigarettes as less harmful, noting that "[r]esearch has demonstrated that with the expectation of reducing risk, many smokers switched to low machine-measured tar/nicotine cigarettes, and may thus have been deterred from quitting"). TLT0930001-0949 at 0911 (US 88621) (A); DXA0310399-0650 at 0418 (NCI Monograph 13) (US 58700) (A) (referring to Chapters 6 & 7 of Monograph 13 and noting that "substantial numbers of smokers" switched to cigarettes with lower machine-measured tar yields "in an effort to reduce their disease risks," and that "[t]he switch to low machine-measured-yield cigarettes with the illusion of risk reduction was, therefore, substituted for a real risk reduction that would have occurred had the smoker quit smoking altogether").

2996. As demonstrated below, Defendants conducted extensive research on quitting to help them identify and understand potential quitters (i.e., smokers who were "concerned" and "uncomfortable" with the fact that they smoke) so that they could design marketing that would dissuade them from quitting. Defendants' internal documents show that they were confident that, if they could convince potential quitters that low tar cigarettes were a healthier choice and an

acceptable alternative to quitting, they could keep their sales from declining. As further demonstrated below, Defendants' internal documents show that smokers interested in quitting smoking were switching to low tar cigarettes under the mistaken belief that doing so would either help them quit or be better for their health. See US FF §§ III.D(3)(a), (b), infra (Defendants' deceptive marketing of low tar cigarettes).

(a) Tobacco Institute

2997. A May 1978 Tobacco Institute document entitled "A Study of Public Attitudes Toward Cigarette Smoking and the Tobacco Industry in 1978 Volume I" prepared for the Tobacco Institute by The Roper Organization stated that "**low tar cigarette smokers . . . are potential cigarette quitters** . . . . And more of them than the average have tried to quit smoking. Since low tar smokers are an expanding share of the market, **their greater desire to quit smoking poses a special problem for the cigarette industry**." 501565967-6019 at 6008 (US 21866) (A) (emphasis added).

(b) Philip Morris

2998. Philip Morris conducted research on former smokers to assist it in marketing purportedly less harmful cigarettes to draw them back into the market and to dissuade potential quitters from actually quitting. Carolyn Levy, who worked as a research scientist for Philip Morris in its Behavioral Research Group from 1975-1980 and as the Assistant Director and Director of Consumer Research from 1986-1991, testified that when she was in the Consumer Research Department, she "performed research on quitting on behalf of Philip Morris," and that when she was in the Behavioral Research Department in the late 1970s, "[q]uitting was also a subject of interest and research to Philip Morris." A report entitled "Exit-Brand Cigarettes: A Study of Ex-Smokers," written by F.J. Ryan and approved by Dr. William Dunn, dated March

1978 and distributed to certain Philip Morris employees, including Levy, stated: "**If the industry's introduction of acceptable low-nicotine products <u>does</u> make it easier for dedicated smokers to quit, then the wisdom of the introduction is open to debate**." The report further stated that "experience in dealing with 'quitters' suggests that most people who quit smoking will resume after a while. Hunt and Matarazzo show data suggesting that 50% of quitters resume smoking within 3 months and 70% resume within a year." Levy testified that she was "aware when [she was] studying quitters that most quitters resume smoking." Levy WD, 26:1-5, 26:20-28:10; 1000368057-8081 at 8060, 8066 (US 20098*) (A) (emphasis added - bold text).

2999. Levy further testified that Philip Morris was "studying the factors that influence quitting," including whether "people quit because of health concerns," so that Philip Morris could "design products or line extensions of existing brands that addressed those factors." Levy testified that "[t]o the extent we determined that people quit because of health concerns, that would be very important in reaffirming Philip Morris' commitment to develop cigarettes with lower harm or risk." Asked if the purpose was "[s]o that people would keep smoking Philip Morris cigarettes rather than quitting," Levy testified: "Yes, if Philip Morris could design new products to address those concerns." Levy WD, 31:9-22.

3000. Accordingly, in a September 28, 1987 inter-office memorandum written by Levy and sent to David Dangoor, Executive Vice President at Philip Morris, entitled "Critical Consumer Research Issues," Levy outlined what she called "the most important consumer-related questions which should be addressed in 1998." Levy testified that this document contained "information about some of the types of research that Philip Morris planned to conduct in the upcoming year." Among the questions Levy posed in the memorandum were: "Can we

determine the relative importance of various factors which influence quitting?"; "**What are the factors which influence brand choice of smokers reentering the market? Can we capitalize on these?**"; and "**Which new product options will . . . appeal to former smokers?**" 2080009516-9522 at 9517, 9520 (US 88155) (A) (emphasis added - bold type); Levy WD, 28:20-30:8, 31:5-22.

3001. Pursuant to her 1997 memorandum, Levy testified that "Philip Morris conducted a 'major study' on quitting in 1988," which Levy described in a September 26, 1988 memorandum she sent to John Zoler, then Director of Market Research entitled "Critical Issues - 1988 Progress Report," which Levy described at trial as a "major accomplishment for the consumer research department in 1988." Under the heading "Smoker Dynamics," Levy wrote in the 1988 memorandum: "Conducted a major study on quitting showing: demographics of quitters, quitting by brand, reasons for quitting, methods used to quit, substitutes used for cigarettes." Levy testified that there were 506 people surveyed in the Philip Morris study, and that "[t]he research results indicated that the number one reason for people quitting smoking was health concerns." Levy WD, 32:2-33:8; 2080009523-9529 at 9524 (US 88156) (A).

3002. Levy testified that "[q]uitting continued to be a critical consumer research issue for Philip Morris in 1989 as well." To that end, in a September 26, 1988 memorandum entitled "Critical Consumer Research Issues," to Dangoor, Levy outlined "the issues we anticipate addressing in 1989." Under the first topic, "Marketplace Tracking," Levy wrote: "Can we understand the importance of group dynamics in brand selection, brand switching, quitting? How can group dynamics be influenced by marketing efforts?" At trial, Levy testified that "Philip Morris wanted to understand whether the factors that influence quitting were changing." Under the heading "New Products," Levy posed the question "**What new product concepts will**

alleviate smokers' guilt and reduce their desire to quit?" Levy further testified that "at the same time that this research was being conducted, Philip Morris continued to make public statements that it only marketed to adults who already smoked." 2080009511-9515 at 9511 (US 20535) (A) (emphasis added); Levy WD, 33:12-34:9, 34:23-35:2.

3003. An overwhelming amount of additional consumer research conducted by or on behalf of Philip Morris, shows the company's intent to dissuade smokers from quitting by marketing low tar cigarettes as an acceptable alternative to quitting. For instance, an August 14, 1978 consumer research report prepared for Philip Morris by Wells, Rich, Greene, Inc. regarding Benson & Hedges stated: "Those who are currently smoking 'Lights' do so because '. . . they are better for you. . .' than full flavor cigarettes. Although some experience that they actually smoke more Lights, **they perceive that they are cutting down and it is an alternative to quitting – which most cannot accomplish**." 1004888470-8484 at 8480 (US 85009) (A) (emphasis added).

3004. A January 1979 study prepared for Philip Morris stated:

> [W]ith respect to ultra low tar brands there appear to be particular additional motivations for smoking this type of cigarette . . . [h]ealth problem forcing a change to a safer cigarette (as an alternative to not being able to quit) . . . [p]eer and family pressure to smoke a safer cigarette (as an alternative to not being able to stop smoking) . . . . Characteristics of ultra low tar smokers were: people who want to quit . . . . **In point of fact, smoking an ultra low tar cigarette seems to relieve some of the guilt of smoking and provide an excuse not to quit**. All of these smokers expressed an awareness of a health hazard from smoking, but felt that they had alleviated some of this hazard by smoking an ultra low tar brand. They described these cigarettes as 'safer'. . . . **With these justifications, there may be less of a compulsion to quit smoking** . . . .

2040066740-6766 at 6747, 6751-52, 6754, 6755 (US 20435) (O) (emphasis added).

3005. A March 1979 report prepared for Philip Morris entitled, "A Study of Smokers' Habits and Attitudes With Special Emphasis on Low Tar and Menthol Cigarettes," stated:

> **The percentage of adults who smoke has stabilized for the first time since 1965 – at 34%. This could well be due to the greater perceived safety of low tar cigarettes and their resultant neutralization of the health threat** . . . The number of cigarettes smoked per day per smoker continues to climb, in part at least because **low tar cigarettes seem to cause people to increase the number of cigarettes they smoke**.

2049455309-5318 at 5313 (US 22218) (A) (emphasis added); Bonhomme WD, 25:15-26:1, 46:19-47:7.

3006. A February 7, 1984 Philip Morris memorandum to Leo Meyer from Myron Johnston included a chart that showed that 60.4% of white males had "made a serious attempt to quit." 2001255595-5615 at 5597 (US 36470) (A).

3007. A June 20, 1988 memorandum on Philip Morris USA letterhead from consumer researcher Jan Jones to Dr. Ed Gee, entitled "Statement of Position on the Social Pressures Construct," discussed Philip Morris's goal of introducing a "socially acceptable cigarette" that "could capture the trend-setters who might find such a product preferred over current cigarettes, **be a welcomed alternative to quitting**, and might attract new smokers who would not otherwise choose to become product users." The memorandum further stated:

> With the recent attrition rate of smokers, attaining 'new' smokers is no longer synonymous with capturing young smokers. **We already have Marlboro as the brand of choice for young smokers entering the market. We do not have a product that meets the needs of the growing population of ex-smokers. Many of these ex-smokers will resume smoking, and the product that they choose could cause a swing in market share**. These quitters (and those who are soon to become quitters) are dissatisfied with certain aspects of a product that previously met their needs . . . . These consumers have not yet as a group found a satisfactory replacement for their previous product – **a textbook example of a market opportunity**.

2050801835-1853 at 1845 (US 38763) (A) (emphasis added); Bonhomme TT, 2/10/05, 12936:6-12939:7.

3008. In a July 20, 1988 memorandum entitled "Quitting," Andrew Schwartz, a Philip Morris Manager, wrote: "About one quarter of adults who smoked in the past year report having tried to quit (27%) . . . among those . . . about one-third report having successfully quit." 2043898156-8166 at 8156 (US 69923) (A).

3009. In deciding how to package Marlboro Extra Lights, a Philip Morris marketing research report, dated February 12, 1991, described the smoker profile of a Marlboro Extra Lights smoker as close to that of a traditional low tar smoker. That profile included both smokers who were attempting to cut down and smokers who were attempting to quit. 2041497481-7503 at 7485 (US 22145) (A).

3010. A March 1993 Philip Morris document entitled "Quitting Dynamics" showed statistics from "Smoker Tracking" that indicated that more Low Tar smokers did not try to quit (53.5%) compared to Full Flavor smokers (43.5%). 2062362453-2474 at 2473 (US 39555) (A).

3011. In a July 1993 Philip Morris presentation entitled "Merit Franchise" prepared by Norma Suter Drew, Brand Manager and Marketing Director for Merit cigarettes from 1992-1994, Drew reported that the "Intended Audience" of Merit advertising was "self-conscious low tar smokers who want to cut down on tar and nicotine but who won't sacrifice taste completely." 2070661683-1727 at 1714 (US 40337) (A); accord 2041453659-3754 at 3678 (US 23906) (A) ("Merit's consumers are self-described ‘Uncomfortable Smokers' who tell us they are self-conscious about the fact that they smoke"); 2063690017-0018 (US 85002) (O); LeVan PD, United States v. Philip Morris, 6/25/02, 178:13-181:2.

3012. Philip Morris's 1993-1997 Research and Development Strategic Plan stated: "Historically, in the US market, there have been only two causes of major, technically related, share-change influences – cost (per puff) and perceived health concerns." For 1955-1965, in the

category of "Perceived health," the "Specific Influence" listed was "Filters, menthol." For 1975-1985, in the category of "Perceived health," the "Specific Influence" listed was "Low tar." 2021323192-3347 at 3247 (US 85099) (O).

3013. In November 1994, Philip Morris commissioned a study from the research firm Guiles & Associates entitled "B & H Qualitative Research Exploring Out-Switching," to "understand more about how Benson & Hedges smokers exit the franchise." One of the conclusions reported in the study was: "For many smokers, the ultimate ramification of all the anti-smoking rhetoric has been their heightened commitment to quit (or at least reduce) their smoking. For these, the greatest evidence of this commitment has been in shifting tar levels (even to different brands, as necessary). . . . **For many, lowering tar levels is the next best thing to quitting**." 2072622442-2451 at 2444, 2445, 2449 (US 41562) (A) (emphasis added); see also 2063688212-8284 at 8226 (US 39823) (A) (Jan. 18, 1994 document prepared for Philip Morris USA indicating that Merit is perceived as a "quitters brand"); Bonhomme WD, 41:4-44:5.

3014. Philip Morris's 1994-1998 Plan Overview stated: "If ultra low tar segment growth accelerates, we will launch Marlboro Ultra Lights **to prevent Marlboro from losing smokers**. Marlboro Ultra Lights will reinforce Marlboro's appeal among tar 'conscious' Lights smokers and **improve Marlboro's ability to retain smokers as they age**." 2071032180-2206 at 2188 (US 21964) (O) (emphasis added); Bible PD, United States v. Philip Morris, 8/22/02, 163:8-165:2.

3015. An internal July 1995 draft presentation entitled "Marlboro Women," bearing the handwritten notation "Approved as Revised, VMM [Virginia Murphy, a Philip Morris attorney] 8/9/95," includes a section entitled "The Marlboro Lights Female." The presentation stated that "[p]opularity and low tar are why they initially smoke the brand." The presentation further noted that for female Marlboro Lights smokers, 27% of 18-24 year olds, 29% of 25-29 year olds, and

34% of 30-39 year olds were "Under Pressure To Not Smoke," and that 21%, 16%, and 30% of each age group, respectively, "Intends to Quit." 2071373667-3751 at 3709, 3750 (US 27272) (A).

3016. In a March 26, 1996 cover memorandum, Shari Teitelbaum, a consumer researcher for Philip Morris, delivered to Jodi Sansone, then Brand Manager for Merit cigarettes, a consumer research report commissioned by Philip Morris to "gain an understanding of consumers perceptions of the lowest category, as well as the motivations and wants of smokers of Carlton, Now, and Merit Ultima, and potential down-switchers to this category." Under the heading "The Decision to Enter the Lowest Category," the attached consumer research report found:

> At some point in their smoking histories, these smokers decided or became more receptive to the idea of a lighter or lower brand than the one they were currently smoking. Some cited perceived health concerns. **Others had been 'bugged' by family members at home to cut down, or stop smoking**.

2045628312-8328 at 8320, 8326 (US 22217) (A) (emphasis added).

3017. In August 1996, Natalie Ellis, Senior Manager at Philip Morris, and Urvashi Kohli disseminated a June 1996 consumer research study entitled "Marlboro Ultra Lights: A History" to a distribution list of Philip Morris employees, including Norma Suter Drew, then Director of New Products for Marlboro, gauging consumer reactions to the contemplated launch of Marlboro Ultra Lights. The study found that Marlboro Red smokers see Marlboro Ultra Lights as "**a brand for quitters and people who are trying to cut down**." 2071535027-5090 at 5090 (US 22020) (A) (emphasis added).

3018. A Philip Morris document bearing the heading

2071178333-8340 at 8335 (US 40396) (Confidential) (A).

3019. In a Leo Burnett October 4, 1999 letter to certain Philip Morris employees, entitled "Schedule for Merit Competitive Lights and Ultra Lights Study," Beth Hooper of Leo Burnett discussed an upcoming Philip Morris study being conducted to "[e]xplore adult smoker attitudes toward the Lights/Ultra Lights category" and to "[b]etter understand the impact of Marlboro Ultra Lights on the category overall." Under the heading "Background," Hooper noted:

> The dynamics of the Lights/Ultra Lights category have changed significantly over the past several years, particularly with the entry of Marlboro Ultra Lights. **In the past, Lights and Ultra Lights were stops on the way to leaving the tobacco category. However, today, we are seeing that both segments are the destination of choice for many adult smokers**.

2080929561-9562 at 9561 (US 27786) (O) (emphasis added).

3020. Jeanne Bonhomme, Director of Consumer Insights for Philip Morris, testified that Philip Morris was aware that some "consumers who wanted to quit were switching to several of its light cigarette brands instead of quitting." Bonhomme WD, 45:17-19.

3021. Bonhomme further testified that "I have been involved in research where smokers have said ‘I know I should quit smoking, but I can't' or ‘I tried and I have not been able to' or ‘I am not ready yet to do it, so I am going to switch to a low tar' because they thought that it would be less hazardous for them to smoke a low tar brand." Bonhomme WD, 40:17-22.

(c) R.J. Reynolds

3022. A 1969 RJR Survey of Cigarette Smoking Behavior and Attitudes recognized that "[a]s a group filter cigarette smokers were more conscious of a possible relationship between smoking and health," and recognized the "**willingness of an increasing number of smokers to**

compromise – to smoke what they considered to be a less harmful cigarette rather than give up smoking entirely." 650340129-0193 at 0180, 0183 (US 20948) (A) (emphasis added).

3023. RJR's advertisements for Vantage cigarettes employed signed testimonials by smokers who claimed to have considered the risks of smoking and decided not to quit smoking, but rather to switch to Vantage. The Vantage advertisements included the following:

1971: "You don't cop out. Why should your cigarette? Vantage doesn't cop out. It's the only full-flavor cigarette with low 'tar' and nicotine." (US 3545) (A).

1974: "**Instead of telling us not to smoke, maybe they should tell us what to smoke**. For years, a lot of people have been telling the smoking public not to smoke cigarettes, especially cigarettes with high 'tar' and nicotine. But the simple fact is that how more Americans are smoking than ever before. Evidently many people like to smoke and will keep on . . . no matter what anyone says or how many times they say it. Since the cigarette critics are concerned about high 'tar' and nicotine, we would like to offer a constructive proposal. **Perhaps instead of telling us not to smoke cigarettes, they can tell us what to smoke. For instance, perhaps they ought to recommend that the American public smoke Vantage cigarettes**." (US 4403) (A) (emphasis added); Schindler WD, 79:9-23.

1976: "**To smoke or not to smoke. That is the question**. With all the slings and arrows that have been aimed at smoking, you may well be wondering why you smoke at all." (US 5198) (A) (emphasis added); Schindler WD, 78:18-79:8.

1975: "Out of the last 6 years of smoking, I've only enjoyed the last 5 months. I started to pay attention to all the fuss about smoking about 6 years ago. That's when the uproar about 'tar' and nicotine started to get in the way of my pleasure. For me, it made the real difference between just liking smoking and really enjoying it. **I thought of quitting, but I really didn't want to. So I decided to switch to a low 'tar' and nicotine cigarette**." (US 4954) (A) (emphasis added); Schindler WD, 79:24-80:9.

1976: "How many times have you decided to give up smoking? **If you're like a lot of smokers these days, it probably isn't smoking that you want to give up.** It's some of that 'tar' and nicotine that you've been hearing about." (US 4998) (A) (emphasis added); Biglan WD, 377:12-379:22.

3024. A 1974 RJR document entitled "Winston National Introduction Project WG,"

prepared in contemplation of the introduction of Winston Lights, theorized that "[e]ntry of a new Winston brand in a category in which the Brand does not have representation creates a new opportunity for gaining additional Winston volume, thereby establishing a potential for increasing market share as well as total volume." 500496713-6740 at 6716 (US 22122) (O).

3025. A 1975 Marketing Plan Presentation by RJR boldly stated that: "The fastest growing category is low 'tar'/nicotine cigarettes. We have almost a third of that category and we want more." 501421310-1335 at 1326 (US 23052) (A).

3026. A June 1975 RJR marketing plan stated that the introduction of a Salem high filtration line extension was, in part, to "**[p]rotect the current Salem franchise from quitting and switching losses**." The introduction was to "**[t]erminate the trend toward reduced consumption** currently in evidence among the Salem Brand franchise." RJR recognized that Salem King smokers were reducing their daily cigarette consumption "at least partly due to concerns about the alleged health hazards of smoking." 502313230-3308 at 3235, 3240 (US 22151) (A) (emphasis added).

3027. In discussing RJR's Limit, a then-new low tar cigarette, a 1976 memorandum made clear that the marketing and promotion of the product was to convey a healthy image based on its claim of being the lowest tar product on the market. The memorandum noted that "LIMIT will satisfy the needs of smokers who wish for the ultimate in low 'tar' assurance – **providing the strongest health reassurances available in cigarettes today**." Under the heading "Target Audience," the memorandum stated:

> The extreme worriers. **That large group of smokers on the fringe of quitting who are on the verge of that final step: quitting smoking all together. This enormous group of smokers of various ages who have unsuccessfully tried to quit**. Our target group will also include smokers whose concern with the health implications of smoking surpass their needs for full flavor in

a cigarette.

502784092-4100 at 4097 (US 22153) (A) (emphasis added); Schindler WD, 77:11-78:11.

3028. An August 19, 1976 RJR document entitled "New Product/Merchandising Directions" indicated that "'Numbers' Products," i.e., those with low FTC tar and nicotine numbers, serve to "assuage" smokers' worries about the harmfulness of smoking. It stated that the "'worrier' segment of the market (17% of smokers are so classified) . . . seek products with tangible/visible features to assuage their 'concern' about smoking. 'Numbers' products have a growing appeal to these smokers. Products in the 1-6 mg. 'tar' range will continue to build successful long-term franchises (e.g., Carlton's growth rate, NOW's immediate acceptance)." 500672011-2172 at 2069 (US 20645) (A).

3029. A document circa 1977 labeled "RJR/SECRET," entitled "Mission Statement For Behavioral Aspects of Smoking," stated:

> It is imperative that we fully understand smoker satisfaction, particularly for those smoking low-tar cigarettes. **In the wrong hands this information could be used to decrease or modify the basic motivations for smoking or perhaps be used to develop other means to fulfill needs currently met by smoking. In either case reduced cigarette consumption would result.** If RJR had at least one trained behavioral scientist, it is possible that our own understanding could be increased to the point that opportunities would emerge. It might allow us to anticipate more effectively action by anti-smoking or governmental bodies and perhaps help us to develop means to **off-set potential losses in cigarette consumption**.

500892080-2083 at 2082 (US 85028) (O) (emphasis added).

3030. A July 9, 1980 RJR memorandum from Kay Duffy to Uziel Frydman entitled "Teenage Smokers (14-17) and New Adult Smokers and Quitters" revealed RJR's concern for losing business to quitters as people switched to low tar cigarettes. The memorandum included an analysis intended to "**identify trends among new smokers and quitters, and to estimate**

their impact on company and key brands' share." The memorandum analyzed the percentage of quitters by the following cigarette categories: full flavor, low tar, fuller flavor low tar, and ultra low tar, and found that in Fall 1979 ultra low tar smokers had the lowest percentage of quitters with 6.2%, compared to 33% of full flavor smokers. Under the heading "Key Findings," the memorandum stated:

> There is no indication as of yet that the ultra low tar category is walking smokers out of the market: relative to their share, ultra low tar smokers are no more likely to quit smoking than are fuller flavor low tar smokers or full flavor smokers . . . **New smokers and quitters by category will continue to be tracked in the future in order to gain a better understanding of the effect ultra low tar category has on new smokers and quitters**.

The memorandum also analyzed the effect that quitters had on market share for RJR (Winston and Salem), Philip Morris (Marlboro), American, B&W (Kool), Lorillard (Newport), and Liggett, and found as follows for the Fall 1979: RJR lost .16 share points, which was "due to both a decrease in new smokers and an increase in quitters"; Philip Morris gained .30 share points, which was "primarily due to a surge of new smokers to Marlboro"; Lorillard lost .20 share points, which was "due to both a decrease in new smokers and an increase in quitters"; while American, B&W, and Liggett were "relatively stable in terms of their gains/losses from new smokers and quitters." 518015005-5017 at 5013-5017 (US 80222) (A); 501254289-4301 at 4297-4301 (US 20674) (A); Orlowsky WD, 86:8-87:1; Schindler WD, 80:16-82:4.

3031. RJR understood that smokers' guilt was a key concern in their attempts to quit. For instance, an August 5, 1980 RJR memorandum marked "RJR SECRET" from M. D. Shannon to Dr. W. M. Henly and Dr. R. A. Lloyd (all three were RJR researchers), titled "Project HR," stated:

> ULT [‘Ultra Low Tar'] smokers. . . . Very health conscious – These smokers are well aware of the smoking and health controversy and

> have switched to ULT products in an effort to decrease ‘tar' intake. Many of these smokers are victims of pressure from peers and loved ones to quit or reduce smoking. Therefore, they smoke ULT brands to ‘get people off their backs' . . . . **Feelings of guilt about smoking are very strong . . . . Many would like to quit smoking but cannot. This tends to fuel their low self-esteem . . . . These smokers do not feel good about themselves.'** [S]everal concepts were developed to appeal to these smokers: 1. To convince the HR target that the new brand represents a payoff or reward for his forced decision to sacrifice by going down in ‘tar' level . . . . 2. To convince the HR target that the new brand is a reflection of his rational, sensible decision to switch to a low ‘tar' . . . . Again **an attempt is made to make him feel better about smoking . . . . Advertisements were developed . . . to address these concepts and present them in a manner that would be positively received by the target audience**.

Dr. Dolan explained the significance of this document, testifying that it "shows that R.J. Reynolds understood that smokers had strong guilt feelings and low tar brands were a way of trying to deal with this guilt, while they were not able to quit smoking." 500251567-1570 at 1567-1569 (US 21563) (A) (emphasis added); Dolan WD, 122:1-11; see also Orlowsky WD, 86:4-7.

3032. An August 1981 report prepared for RJR by The Beaumont Organization advised that ultra low tar brands, such as Now, Carlton, Cambridge and Barclay, can cause smokers who seek to eliminate the "danger" of smoking to keep smoking, because these smokers believe the ultra low tar brands "reduce the alleged health risks" of smoking "to an acceptable – minimal – level":

> Some smokers have been strongly alarmed by the extensive publicity concerning alleged health hazards of smoking, to the extent that they seek not merely to moderate their smoking but to eliminate entirely the ‘danger' that it may present. Such a smoker has two options. Firstly, he may simply cease smoking altogether. However, in some cases, the smoker does not wish totally to elimate [sic] the benefits of smoking. His second option is to seek a cigarette which he perceives to reduce the alleged health risks to an acceptable – minimal – level. Within this second option, the

> smoker essentially seeks a brand that will protect him from the dangers that are alleged to attend smoking. He is often prepared to sacrifice most of the benefits he previously derived from smoking to achieve this. Such a brand provides the consoling sense that the smoker has eliminated the risks of smoking by 'quitting', while continuing to engage in ritualized behaviors associated with cigarettes. An increasing number of brands addressed this benefit, including Now, Carlton, Cambridge and, perhaps, Barclay.

503972013-2063 at 2038 (US 66448) (A); Orlowsky WD, 86:4-7.

3033. A 1983 NOW Brand Image report prepared for RJR recognized that "[a] major motivation in brand switching has been concern over health. . . . Most people chastise themselves for continuing with what they refer to as a 'bad habit.' They are aware of mounting pressures and criticism from non-smoking groups. They speculate about planning to quit, but they are not sure if they will be able to do so. . . . **The typical solution to this dilemma is the two pronged approach of trying to cut down and/or moving to a lower tar brand**." The report further stated:

> Respondents were asked what the words 'low' and 'lowest' in the ads meant to them. At the literal level they say this means that the two brands are very low or lowest in the amount of tar and nicotine they contain. **They interpret this to mean that the two brands are 'safer' and pose less of a health hazard**. Consequently, they reason, this would make the brands more appealing to younger people who are very health conscious or to older, long-time smokers who are concerned about the long-range effects of tobacco.

506671319-1418 at 1326, 1379 (US 22160) (A) (emphasis added); Orlowsky WD, 85:8-19.

3034. A May 11, 1983 RJR R&D Project Outline by J.H. Reynolds entitled "Smoke Component Dose," discussed the need to understand human smoking behavior to accurately determine the amount of smoke/tobacco components delivered to individual smokers, and stated that RJR's Commercial Goal (RJRT Key Issue 5) was: "Arrest the declining social acceptability of smoking." 506047899-7900 at 7899 (US 85054) (O); 519192755-2756 at 2755 (US 80230)

(O).

3035. A June 21, 1990 RJR report entitled "U.S. Cigarette Market in the 1990s" stated "[t]he number of smokers attempting to quit also increased in the 1980s" and included a chart detailing the percentage of "smokers who tried to quit in past year" which showed that 13% tried to quit in 1978 and 32% tried to quit in 1986. 507798137-8230 at 8144 (US 20789) (A).

3036. A November 3, 1998 e-mail from Mario Possamai to Randy Tompson, then Director of Issues and Information Management for RJR, discussed the results of an October 20, 1998 Gallup Survey regarding quitting behaviors and motivations. The survey found that "the number of smokers who are very interested in quitting has increased dramatically in the last five years," specifically noting that 36% of all current smokers are "very interested" in quitting. Health concerns were cited as the primary reason smokers want to quit, with 43% of smokers reporting that they were more concerned about health than they were five years earlier. Although 77% of smokers had tried to quit an average number of seven times each, more than half (54%) of smokers reported resuming smoking within one month. Over half of all smokers (53%) smoked light, low-tar or ultra-light cigarettes. According to the survey, "many of these smokers believe that they will get some health benefit from smoking non-regular cigarettes, including: ‘to be healthier/improve health' (11 percent), ‘reduce exposure to toxins/tar' (10 percent), and ‘reduce exposure to nicotine' (9 percent)." 700173214-3217 at 3214, 3215, 3216-3217 (US 22121) (A).

(d) Brown & Williamson

3037. A January 19, 1978 memorandum from Dr. E.F. Litzinger to E.T. Parrack, with copies to Dr. R.A. Sanford and M.L. Reynolds, entitled "Social Smoking Studies," stated:

> We search for answers to the questions ‘Why do people smoke?' and ‘Why do people stop smoking?' to provide us with direction in

> developing new products. Perhaps answers to another question 'How do people stop smoking?' could lend insight into the creation of new products. **Having answers to this latter question we might then design products to 'intercept' people who are trying to give up smoking**.

650510607-0607 (US 87138) (A) (emphasis added); Smith WD, 63:10-64:7.

3038. A February 7, 1979 letter from Stephen D. Schwartz of Grey Advertising Inc., stated that ultra low tar smokers of brands like B&W's Carlton and RJR's Now, have "consciously decided to sacrifice taste for low tar," and that these smokers "**want a way to quit smoking**." 774138538-8545 at 8539 (US 54613) (A) (emphasis added).

3039. A "confidential" March 5, 1980 report prepared for B&W by Hawkins, McCain & Blumenthal discussed marketing strategies for a proposed new B&W brand pursuant to its "Project Omega." The report stated: "The objective of all advertising and promotion will be to convince low 'tar' smokers that this new brand is the only one that combines the two most important qualities a contemporary cigarette should have – a satisfying taste and the lowest 'tar.'" The report further stated, under the heading "Conclusions":

> 2) Low tar and ultra low tar smokers share personal 'concern.' The difference between them lies in the depth of the concern. . . 3) **Most of these smokers would quit if they could**. The pressure to quit is omnipresent from all sources. . . 5) **To reach these smokers we must acknowledge their concerns**. 6) **This acknowledgment must make them more comfortable (at ease) about smoking the Omega cigarette**.

The report further stated: "These executions are built on an expanded **strategy which includes an understanding of the target audience and the need to create a maximum ease or comfort level that addresses the concept of 'cognitive dissonance**.'" 660026713-6718 at 6714, 6717-6718 (US 85030) (A) (emphasis added); Smith WD, 64:19-65:14.

3040. A May 7, 1982 report prepared by a consultant for Imperial Tobacco Ltd. (the

Canadian sister company of B&W) revealed that many smokers, young and old, view light cigarette brands as vehicles for quitting for health reasons, but that they are unsuccessful, leaving smokers frustrated and smoking more. The report stated that youth believed the "truly light brands" were "false safety brands for the older worried smoker who cannot quit . . . . Of course, they knew this because some . . . had tried to go very low for exactly the same reasons as smokers two or three times their age do so. All they found was increased consumption and frustration." Statements from young smokers included: "I think all the stuff coming out the past couple of years about how bad smoking is for you made a lot of people go down to a light cigarette to sort of ease their own conscience." 566627751-7824 at 7817-7818 (US 20938) (A).

3041. A 1984 B&W internal marketing research document entitled "Why People Smoke, Brand Imagery and New Product Opportunities" made clear that B&W was aware that its Barclay cigarette (which B&W marketed as an ultra-low tar cigarette) appealed mainly to those who otherwise would quit smoking. The document stated that both smokers of B&W's Barclay cigarettes and smokers of other brands "perceive BARCLAY to be for one who wishes not to smoke." 670132512-2597 at 2566 (US 20964) (A).

3042. A 1986 B&W document stated: "**Quitters may be discouraged from quitting, or a least kept in the market longer**. . . . A less irritating cigarette is one route (indeed, the practice of switching to lower tar cigarettes and sometimes menthol in the quitting process tacitly recognizes this). The safe cigarette would have wide appeal." 566628004-8083 at 8015 (US 20940) (O) (emphasis added).

3043. A December 16, 1999 "Presentation of Findings" for "STAR Tobacco Focus Groups" prepared for B&W by "Rabid Research" identified "4 segments of light/ultra smokers (segmented based on motivation for smoking light/ultra variant)." One of the four segments was

identified as "those who switched to lights/ultras because they were attempting to quit." It also noted that some consumers "started smoking lights after making an attempt to quit." In addition, this document shows that Defendants intended that their claims of reduced harm regarding low tar cigarettes lessen the social pressure on smokers to quit: "The benefits of switching to this new cigarette are not just health related[.] **Would reduce the pressure on them from friends and family members to quit[.] Would allow them to feel better about themselves[.] At least I'm smoking a cigarette that isn't as bad for me[.] Maybe people wouldn't be as worried about me smoking around them cause it's a better cigarette**." 190200047-0116 at 0061, 0071, 0106 (US 22162) (A) (emphasis added); Ivey WD, 59:1-10.

3044. A July 27, 2000 document prepared for B&W by Kay Harwood Marketing Analysts, Inc., entitled "Topline Report of Findings for Carlton Advertising Research," reported that smokers view Carlton cigarettes as a less harmful alternative to quitting smoking:

> As participants described their transition from heavier to lighter (i.e., higher tar to lower tar) cigarettes, they frequently used phrases like 'working my way down' and being 'that much closer to quitting.' **Ultra light cigarettes were frequently associated with trying to quit smoking**. . . . [M]any participants intimated that ultra lights already represent a sacrifice (i.e., less taste for a cigarette lower in tar and nicotine).

A "summary of the most common perceptions/images associated with" Carlton and Merit Ultra Light included descriptions of Carlton as for "[s]omeone trying to quit/cut back/smoke lighter" and descriptions of Merit Ultra Light as a "[c]igarette used to quit smoking/almost ready to quit/cutting back." Among the Report's "Key Findings" were the statements from the focus groups describing their perceptions of several Carlton campaigns. The statements included:

> Trying to quit/cut down . . . . to change/cut down. . . . **If you can't stop smoking, smoke Carlton – it's better for you if you can't quit**. . . . Cut down on smoking – better for you. . . . Diet restrictions/quitting/cutting back. . . . The least you could do. . . if

> you have to smoke. . . smoke the less harmful cigarette. . . . If you've got to smoke, smoke this one. . . . Cut down on your smoking. . . . Directed to someone who wants to cut down is better for you if you cannot quit. – Quit smoking, or smoke less nicotine cigarettes. . . . **Don't feel bad if you can't stop smoking; if you smoke Carltons, you have accomplished something**. . . . Use these in case of emergency nicotine fit while quitting. . . . Smoke when trying to quit – emergency cigarette. – Switch to Carlton when quitting.

250255336-5347 at 5339, 5343-47 (US 22031) (A) (emphasis added). These statements were repeated in an August 8, 2000 document prepared for B&W by Kay Harwood, Marketing Analysts, Inc., entitled "Carlton Advertising Research: Report of Key Findings." 250255060-5075 (US 22170) (A); Ivey WD, 60:13-62:22; Smith WD, 62:9-63:6.

(e) BATCo

3045. A circa 1976 BATCo document from S.J. Green to P.L. Short and P. Sheehy revealed that the true aim of BATCo's cigarette marketing was to increase the number of smokers: "**We should aim to maintain or increase the smoking habit**." 110076428-6432 at 6428 (US 34957) (A) (emphasis added).

3046. A March 29, 1976 BATCo report entitled "The Product in the Early 1980s," that "considers the main threats to the smoking habit [and] the probable constraints on the type of product in the future," showed BATCo's concern that making cigarettes that could not deliver enough nicotine to sustain addiction might facilitate quitting:

> Taking a long-term view, **there is a danger in the current trend of lower and lower cigarette deliveries – i.e. the smoker will be weaned away from the habit**. . . . Nicotine is an important aspect of satisfaction and if the nicotine delivery is reduced below a threshold satisfaction level, then surely smokers will question more readily why they are indulging in an expensive habit.

At trial, Dr. Henningfield explained that "[t]his document expresses concern that the trend toward cigarettes with lower FTC tar and nicotine ratings could mean that the market would

extinguish because people would get to the point that smoking really would be a matter of taste and pleasure and not nicotine receptors in the brain; at that point, people would find it easier to quit." 110069974-9982 at 9974-9975 (US 20268) (A); Henningfield WD, 97:13-98:3.

3047. A February 15, 1978 memorandum entitled "An Outline for Research in the Psychology Group" presented "a brief description of the research area believed to be the most appropriate to the psychology group." The memorandum stated that the psychology group "should be interested in those aspects of the individual which predispose him to change his behaviour: to quit smoking, modify his consumption, alter his brand choice." The memorandum recommended that the group conduct "careful research" into quitting and switching behavior and stated that "[w]e believe that this new emphasis will have greater relevance and utility in defining the market and is a necessary co-ordinate" with BATCo's study of smoker dependence and brand preference. 105399785-9791 at 9786 (US 85031) (O).

3048. A March 22, 1979 internal BATCo document written by Terry Hanby, who researched "Smoking & Health reassurance" for BATCo, concluded that the sale of low tar cigarettes as "health reassurance" products would stem the decline in cigarette sales:

> It is quite clear that the emergence of Hi-Fi products has been welcomed by much of the smoking community and their use is emerging as an important health reassurance mechanism for many smokers . . . . [T]he growth of Hi-Fi brands will increasingly ensure that up-market smokers will turn to them as a health reassurance mechanism . . . . **[W]e feel that in the markets of 'developed nations' the incidence of smoking may continue to decline but that the various reassurance mechanisms listed above will ensure that this decline will eventually plateau at a level not too far removed from current incidence levels**.

109883112-3117 at 3115, 3117 (US 20264) (A); 105657908-7909 (US 20248) (A).

3049. A BATCo memorandum dated April 4, 1979 entitled "Year 2000" contained predictions for the future of the tobacco industry:

> Low tar products will eventually and substantially define the tobacco business. **This will serve as an important mechanism for reassuring smokers** . . . . **Quitting rates will also not increase as existing smokers become increasingly reassured by the growth of Low Tar brands** . . . . the ready availability of Low Tar brands will supply high reassurance.

109883101-3103 at 3101, 3102 (US 21518) (A) (emphasis added). Dr. Dolan explained the significance of this document, testifying that "[i]t shows that the false reassurance about health became a fundamental driver of the cigarette market. This creation of a misperception – its 'important mechanism for reassuring smokers' – was so important that BATCO saw the deceptively marketed low tar products as the products which 'substantially define the tobacco business.'" Dolan WD, 121:15-23.

3050. An April 23, 1979 BATCo Research Report found that "most smokers wish to quit smoking." Dr. Dolan explained that this document shows "the vast magnitude of potential business loss due to quitting." 105562110-2189 at 2114 (US 21516) (A); Dolan WD, 103:6-10.

3051. An April 28, 1981 memorandum by Dr. Martin Oldman, entitled "Low Delivery Cigarettes and Quitting" and delivered to Dr. L.C.F. Blackman, Director of Millbank, stated:

> **With the emergence of lower delivery cigarettes there was understandable concern that the provision of cigarettes containing less nicotine and yielding less taste would facilitate an individual's quitting the smoking habit**. It was feared that, by using such products, the smoker could more easily wean himself from smoking by progressively moving from one product to another of lower delivery. Eventually, it was posited, he would be smoking cigarettes of such low 'satisfaction' that he would question the utility, and the cost, of his continued smoking.

The memorandum further stated:

> The role of low delivery cigarettes in a health-conscious market, and for the health concerned individual, can probably be best explained in terms of a simple balance model. This would suggest

> that **the individual smoker seeks to reduce the tension arising from the perceived incompatibility between his health concern and continuing to smoke by making various psychological and behavioural adjustments. For some the tension will only be sufficiently reduced by quitting. For others, an adequate discharge will be achieved by reducing the number of cigarettes smoked and, for yet others, a switch to lower delivery cigarettes is the appropriate modification**. In all cases, the model would suggest, the individual makes only that change in his smoking behaviour which is sufficient to offset to a tolerable level the tension arising from the perceived conflict between smoking and his health concern.

105399687-9689 at 9688, 9689 (US 85032) (A) (emphasis added).

3052. An April 1983 document entitled "Brown & Williamson Report to BATUS Board of Directors on Smoking and Health" indicated that "[t]hirty-three percent of smokers would 'very much like to quit.'" Dr. Dolan explained that this document "gives an indication of the strength of the desire to quit. The tobacco companies knew that one third of smokers had a very strong desire to quit." 512106944-6964 at 6959 (US 51618) (A); Dolan WD, 103:11-16.

3053. Notes of a July 12, 1983 meeting of BATCo's newly established "Sidestream Working Party" recognized that the company was aware that individual smokers view switching to low tar brands as an alternative to quitting. It stated: "Smokers who are concerned about the smoking and health aspect but who have not given up, have done all they can (by moving to lower tar brands) to avoid the pressure to quit." The notes continue, recognizing that "[m]arket research undertaken in the US and the UK indicates that smokers would welcome a reduction in the visible smoke they are creating as it would ease the social pressures being increasingly placed upon them and provide a degree of solace, in that they themselves can do no more – short of quitting – having already moved down the tar scale." 109881462-1467 at 1462, 1463 (US 26230) (O).

3054. A circa 1984 BATCo "R&D/Marketing Conference" report stated: "**It is useful to**

consider lights more as a third alternative to quitting and cutting down – a branded hybrid of smokers' unsuccessful attempts to modify their habit on their own." This document also stated that lights "offered one solution to the smokers dilemma" regarding the adverse health effects of smoking. 100501581-1657 at 1593 (US 20187) (O) (emphasis added – bold type).

3055. A February 28, 1985 internal memorandum by W.D.E. Irwin, a scientist at BATCo's Group Research & Development Centre, to Dr. R. Binns, Manager, BATCo's Group Research & Development Centre, titled "New Initiatives – Less Contentious Products" acknowledged that lower deliveries likely resulted in increased sales:

> In many markets, stagnation or contraction in total market size is due primarily to the health issue. **If that issue were removed or substantially reduced in importance then total market size would either increase dramatically or, at worst, contract more slowly**. . . . [T]he strategy . . . has been to reduce all smoke components whilst trying to minimize effects on product acceptability . . . this approach has probably led to a less rapid contraction in some markets than would have been the case if deliveries had not been reduced.

103020940-0943 at 0940-0941 (US 34704) (A) (emphasis added).

3056. An internal document from Imperial Tobacco Ltd., the Canadian sister company of B&W, subsidiary of BATCo, revealed that the company viewed the promotion of light cigarettes as the "**ability to reassure smokers, to keep them in the franchise for as long as possible**." 689466032-6789 at 6351 (US 31053) (O) (emphasis added).

3057. A BATCo document bearing the heading "Barclay Business Review 1996" reported that ultralight cigarettes are particularly attractive to people who may start smoking again after quitting. The document stated that, due to its packaging, the Barclay cigarette (in the Netherlands) was "not clearly perceived as an ultra light and consequently lost attractiveness particularly amongst **re-starters who look for an ultra light offer**." This appeared under the

heading "The core positioning of the brand needs to be clarified in the minds of the consumer." 700767443-7457 at 7446 (US 22123) (A) (emphasis added – bold type); Ivey WD, 79:5-22.

3058. A "Qualitative Research Report on Light Cigarette Brand Perceptions" dated January-February 1997, and also contained in BAT Russia's 1999 Brand Plan, stated:

760008596-8803 at 8681, 8683-8685 (US 54588) (Confidential) (A) (emphasis added).

3059. A January 2001 BATCo file entitled

325238922-8994 at 8992-8993 (US 22079) (Confidential) (O) (emphasis added).

3060. A January 15, 2001 BATCo document written by Steven Coburn entitled "Project Balcony," that referenced California marketing studies related to proposed advertising campaigns, acknowledged that low tar cigarettes are smoked by people who want to quit: "3rd

board highlights low nic/tar aspect – quitters cig." 325239014-9022 at 9015 (US 22082) (O). A document with the same author, title and date that also referenced California smokers stated "less tar less nic – less harmful . . . . 2nd board implies **a cigarette to be used as a substitute for quitting**." 325239014-9027 at 9017 (US 22082) (O) (emphasis added). A January 24, 2001 BATCo document with the same author and title that referenced Tokyo, Japan marketing studies related to proposed campaigns, stated: "[L]ights are supposed to be healthier. . . . What is the difference between lights and full flavour? . . . . Some had tried lights as a step down to quitting." 325239001-9013 at 9008-9009 (US 22081) (O).

(f) American Tobacco

3061. A November 11, 1976 report prepared by Fay Ennis Creative Research Services for F. William Free & Company, an advertising agency used by American Tobacco, summarized focus group sessions relating to low tar cigarettes. The report stated: "**By changing to a lower tar cigarette, [the panelists] felt less guilty about continuing to smoke** and eventually hoped to stop smoking completely." The report stated that "[s]ome of the panelists actually tried smoking brands of low tar in a downward progression of milligrams in order to quit smoking entirely." ATC037310-7324 at 7318, 7320 (US 87890) (O) (emphasis added).

3062. A May 25, 1977 report entitled "Tareyton Lights Field Trip Report," prepared for American by SSC&B Advertising, reported results of focus group research conducted on Tareyton Lights in order to "insure success of this very important product entry." The report stated:

> In general, **most people who smoke would like to quit**. Primary reasons for smoking low tars are: It is a means of cutting down on the amount of tar ingested. **It is a first step in quitting**; people step down in stages to a lower tar cigarette until finally they are smoking the lowest tar. Even among those who enjoy smoking low tars help alleviate their concern.

ATC0136995-7017 at 7005, 7006 (US 87906) (O) (emphasis added).

3063. A January 20, 1987 "Lucky Strike Brand Review" noted that "**[d]ecreasing category consumption has required innovative approaches to gain consumer awareness, trial repeat and cigarette purchase . . . Importantly, the style featured in the advertising is Lucky Lights, the mildest product within the franchise**. This product portrayal is important to signify the change in Lucky from the strong taste of Lucky Straights to the lower tar cigarettes of today." ATC274 5221-5267 at 5228 (US 87907) (O) (emphasis added).

3064. A November 12, 1990 memorandum from C.J. Brown, Product Manager, to R.E. Smith, Vice President-Brand Management, recommended "next steps toward halting TAREYTON's volume decline, while bringing vitality to an important franchise." The memorandum concluded that: "TAREYTON's position in the Low Tar and Ultra Low Tar Category has never been fully exploited." ATC1095215-5217 at 5216 (US 87908) (O).

(g) Lorillard

3065. A November 1964 Lorillard plan entitled "Old Gold Spin Filters 1965 Marketing Plan" noted that "[o]nly about one-half of smokers say they really enjoy smoking." Dr. Dolan explained that this document "shows that cigarette companies faced an unusual challenge. About one-half of the users of their product did not really enjoy using it. It's obvious that if the situation developed such that you don't enjoy something and you have to pay to do it, you will consider giving it up. The cigarette companies did not want this to happen." 84443158-3221 at 3190 (US 67524) (A); Dolan WD, 102:1-16.

3066. As Dr. Dolan testified, Lorillard's True advertisements from the mid-1970s specifically offered True as an acceptable alternative to quitting smoking:

1975: "Considering all I'd heard, I decided to either quit or smoke True. I smoke True." (US 4853) (A); (US 4939)(A); (US 5000) (A) (1976 advertisement

in Sports Illustrated magazine noting same); Biglan WD, 233:20-235:22.

1975: "With all the talk about smoking I decided I'd either quit or smoke True. I smoke True." (US 87206) (A).

1975: "With all I've read about smoking and things I decided to: 1. Play as hard as I work. 2. Cut out the heavy lunches. 3. And either quit smoking or smoke True. I smoke True. The low tar, low nicotine cigarette. Think about it." 03496228-6630 at 6268 (US 20057) (O).

1975: "I thought about all I'd read and said to myself, either quit or smoke True. I smoke True." (US 10447) (A); 03061394-1394 (US 21700) (A).

1975: "I'd heard enough to make me decide one of two things: quit or smoke True. I smoke True." (US 87462) (A); 01408237-8237 (US 21808) (A); 03496228-6630 at 6269 (US 20057) (O).

Dolan WD, 125:1-5.

3067. Lorillard's internal marketing documents demonstrate that Lorillard commissioned extensive consumer research to make sure that its intended message – that True was an acceptable alternative to quitting – was getting through to consumers. For instance, an August 4, 1975 presentation given to Lorillard by a marketing research consultant entitled "Cigarette Advertising 1974-1975," showed that several of the respondents concluded that Lorillard's "Quit or smoke True" advertisements communicated that True cigarettes are "LESS HARMFUL/BETTER FOR YOU." 03496228-6630 at 6277, 6280 (US 20057) (O).

3068. As a 1981 FTC Report on cigarette advertising noted, Lorillard's True advertisements "incorrectly impl[y] that when the alternatives of quitting smoking or smoking a low ‘tar' cigarette are weighed, the low ‘tar' cigarette is the healthier option." FTC, 1981 Report at 2-12 to 2-13 (JD-004744) (A).

3069. A December 1976 report prepared for Lorillard by the Nowland Organization, Inc. "to develop market information useful to Lorillard in strengthening its position in the SHF [super high filtration]/low T&N [tar & nicotine] cigarette market" and entitled "SHF Cigarette

Marketplace Opportunities Search and Situation Analysis Volume I" revealed that low tar cigarettes were alleviating the concerns of health-conscious smokers, thereby dissuading them from quitting. The document stated: "As would be expected, **the advantages of low tar and nicotine cigarettes are seen as health related**." The document further stated:

> **On the more positive side, many SHF [super-high filtration] smokers note that the existence of low tar and nicotine cigarettes, and their switch to such cigarettes, has alleviated some of their health concerns** . . . . A number of SHF smokers note that they turned to this 'compromise' smoke because, while they felt they should quit smoking (a few on doctors' advice), they were unwilling or unable to do so...yet. They see smoking low tar and nicotine cigarettes both as a way to cut back on the intake of harmful substances without cutting back on the number of cigarettes habitually smoked; and (in some cases) . . . so that they will be able to quit more easily at some future time. The fact that many SHF smokers (women especially) now find themselves smoking more than when they smoked regular cigarettes works to defeat their purpose in switching, and is a source of considerable annoyance to them.

Under the heading "Reasons for Prior Brand Switching The Switch to SHF," the document stated:

> As discussed, **most SHF smokers deliberately chose to switch to low tar and nicotine cigarettes because of health concerns – to get less tar and nicotine**, for a milder/gentler smoke, and/or to relieve specific smoking-related symptoms. Often, the actual switch was precipitated by . . . .
>
> - experiencing or becoming more aware of, or more concerned about personal ill-effects from smoking (e.g., cough, throat irritation, difficulty breathing)
>
> . . .
>
> - a failed attempt to quit, or a (perceived) **inability to quit, coupled with the heightened perception that one 'should' quit**
>
> The main advantages which they feel they experienced in this switch are . . . they have less (or no) smoking irritation . . . they like knowing they are getting less tar and nicotine.

84053616-3706 at 3618, 3628, 3632, 3637, 3678-3679 (US 55997) (A) (emphasis added);

Orlowsky WD, 67:6-10.

3070. Volume II of this Report contained the following "Key Highlights":

> **Health concerns are the usual reason for switching to a low T&N brand. Such cigarettes are 'better for you' – milder and less irritating** (now) as well as less likely to cause serious problems (later). . . . To many SHF smokers, **a low T&N cigarette represents a compromise smoke between a more satisfying smoke and not smoking at all**.

The report also stated: "Those who smoke low tar and nicotine cigarettes generally do so because they believe such cigarettes are 'better for you' . . . there is less tar and nicotine to do long-term damage . . . **reduces smoking anxiety, guilt**." 84053709-3744 at 3712-3713, 3716-3719 (US 21073) (A) (emphasis added); Orlowsky WD, 67:6-10.

3071. Dr. Dolan testified that US 21073 "says quite a lot about low tar and nicotine cigarettes and the impression created by Defendants' marketing of them." Dr. Dolan explained that:

> First is the simple point that Lorillard's research on consumers established that those who smoke low tar brands do so because they believe these cigarettes are 'better for you.' This is an incorrect belief. The companies knew it was a false belief but sought to build on the misperception rather than correct it. Second, **the research showed that smoking low tar and nicotine helped a smoker to reduce guilt about smoking and thus made a smoker less likely to quit. Smoking a 'health reassurance' product with its low tar was a 'compromise' to justify not quitting. This document shows the deep impact on consumers and why these products were important in deterring quitting**.

Dolan WD, 118:23-119:21 (emphasis added).

3072. A February 13, 1980 "secret" memorandum on Lorillard letterhead from Richard E. Smith to J.R. Ave, Lorillard Senior Vice President of Marketing, J.G. Flinn, and Dr. A.W. Spears shows that the company's desire to keep smokers from quitting guided Lorillard's marketing efforts:

> Information on reduced tar, ULT [indicating ultra low tar] and Carlton 85 smoking, **as well as quitting, will give generally valuable perspectives to Lorillard marketing**. Next Steps – There is a good deal of information available on the general physiology and psychology of smoking, **especially with regard to quitting motivation**. It was agreed that the general literature and existing Lorillard marketing research will be reviewed; within the focus of our task force goal.

01394380-4381 at 4381 (US 21543) (O); 95539778-9779 at 9779 (US 22808) (O) (emphasis added).

(h) Liggett

3073. In a December 2, 1968 letter from Max Samfield, Senior Assistant Director of the Liggett Research Department, to Copeland Robinson, New Products Manager at Liggett, Samfield discussed the importance of releasing Dorset brand cigarettes, citing: "The obvious void in the 4-6 mgm range for a low tar cigarette with acceptable taste. I firmly believe that those who switch to Marvels, Carltons, or Life cigarettes are in the last stages of quitting smoking. **The Dorset, however, is a low tar cigarette one can 'live' with**." LWDOJ8006760-6760 (US 87909) (O) (emphasis added).

(3) To Reassure Consumers, Defendants Falsely Marketed and Promoted Low Tar Cigarettes As Less Harmful than Regular Cigarettes

3074. The evidence immediately above shows that Defendants introduced health reassurance cigarette brands as part of a scheme to dissuade health-conscious smokers from quitting smoking. The evidence detailed in the following section demonstrates that Defendants effected their scheme to dissuade health-concerned smokers from quitting by engaging in massive, sustained, and highly sophisticated marketing and promotional campaigns intended to portray their health reassurance brands as less harmful than regular cigarettes. Defendants' internal marketing documents show that Defendants conducted tremendous amounts of consumer

research over the last five decades to ensure that their marketing campaigns were effectively communicating their deceitful health reassurance message.

3075. The evidence shows Defendants' initially sought to communicate health reassurance by adding filters to cigarettes. Medical historian Dr. Brandt testified that "the industry sponsored massive advertising campaigns for filtered cigarettes which implied to consumers that they were protected from possible harms." Brandt WD, 131:5-132:8; DXA0310399-0650 at 0612 (US 58700) (A).

3076. As marketing expert Dr. Dolan testified, "[a]dvertisements in the late 1940s and early 1950s were relatively explicit in their health claims." Expert economist Dr. Harris testified that:

> Prior to the formation of the TIRC in December1953, the advertisements of cigarette manufacturers frequently contained claims that their own brands were milder, were less irritating, contained fewer toxic substances, offered some form of protection, or were otherwise safer than other companies' competing brands. While this pattern of advertising had been prevalent for a number of years, it intensified in the early 1950's, at least through early 1954.

Drs. Dolan and Harris identified as examples of explicit health claims Lorillard's advertisements for Kent with its Micronite Filter, American Tobacco's advertisements for Carlton, Liggett & Myers' advertisements for Chesterfield and L&M, Philip Morris's advertisements for Parliament, and B&W's advertisements for Viceroy. Dolan WD, 123:21-125:5; Harris WD, 68:12-70:20.

3077. Defendants' plan with respect to filtered cigarettes was highly successful. As a 1967 FTC report noted, "the belief that filter cigarettes are less hazardous appears to be widespread. It may be assumed therefore that to people holding this belief, the word ‘filter' itself connotes ‘less hazard.' And through the addition of suitable adjectives to the word ‘filter', this impression can be enhanced. Thus, in current advertising there are ‘recessed filters' (Benson &

Hedges and Parliaments), ‘white filters' (Yorks), ‘menthol filters' (Springs)." 92382035-2095 at 2058-2059 (US 57179) (A).

3078. As Dr. Brandt testified, "filtered cigarettes, and their advertising and promotion, constituted a critical aspect of industry strategy in the wake of categorical scientific evidence demonstrating the harms of smoking." Dr. Brand explained that:

> At the same time that the tobacco industry continued to insist that there was no credible scientific evidence of the harmfulness of smoking, they nonetheless undertook major campaigns to develop and market filter cigarettes. The industry understood that in the face of the mounting scientific knowledge of the harmfulness of smoking, smokers needed various forms of support. This support or affirmation might come in the notion that there was a controversy about whether of not smoking was dangerous; or it might come in the notion that filters effectively eliminated those dangers. **The industry walked a fine line in its aggressive marketing and promotion of filter cigarettes through the 1950s and 1960s. On the one hand, it sought scrupulously to avoid any public acknowledgement that its product was now, or had ever been, unsafe, a claim it would maintain into the 1990s. On the other, it sought to reassure smokers whose legitimate concerns had been raised by the emerging scientific data**. As a result, the industry sought to indicate that any harmful elements in tobacco smoke could be easily removed through the technical innovation of filters.

Brandt WD, 138:19-139:12; 132:9-133:14 (emphasis added).

3079. As expert economist Dr. Harris testified, Defendants realized that "[b]y reminding consumers about the health risks of smoking, [Defendants'] advertisements may very well have induced smokers to quit or cut down on the number of cigarettes smoked." Therefore, for the good of the industry, the chief executive officers of the leading tobacco manufacturers at that time, including American Tobacco, RJR, Philip Morris, and B&W, agreed to cease making explicit health claims for competitive advantage. Harris WD, 70:21-79:11; 2048375960-5964 at 5060, 5962 (US 85819) (A); DXA0310399-0650 at 0612 (US 58700) (A).

3080. In his testimony before the Court, Dr. Harris cited to several documents as illustrations of Defendants' agreement not to compete using explicit health claims, including an RJR document entitled "Forwarding Memorandum: To Members of the Planning Committee," that stated:

> **Develop some understanding with companies that, on this problem, none is going to seek a competitive advantage by inferring to its public that its product is less risky than others**. (No claims that special filters or toasting, or expert selection of tobacco, or extra length in the butt, or anything else, makes a given brand less likely to cause you-know-what. No 'Play-Safe-with-Luckies' idea - or with Camels or with anything else.)

MTP0023539-3547 at 3546-3547 (US 21408) (A); Harris WD, 76:12-79:11.

3081. Defendants' agreement not to make express health claims is made clear by a 1987 meeting with the Food & Drug Administration attended by RJR attorney Peter Hutt, regarding RJR's Premier cigarette. In a letter by Hutt recounting the meeting, he wrote:

> Near the end of the discussion, Assistant Secretary Lee Miller asked me several questions about the relationship of the new cigarette to potential health claims. I again responded that **Reynolds did not agree that the current cigarette is unsafe and would not contend that the new cigarette is safer or safe**.

506147781-7783 at 7782 (US 93089) (A) (emphasis added); see also HHS0880359-0364 at 0361 (US 85828) (A) (minutes of meeting: "Mr. Hutt stated that RJR had no intention at this time to promote or label its new 'smokeless' cigarette as safer than conventional cigarettes. He commented that such a claim would be an indictment of the tobacco industry and its long standing position that conventional cigarettes are not unsafe").

3082. Dr. Harris testified that economists have considered alternative explanations for Defendants' discontinuation of explicit health claims, including "the hypothesis that cigarette manufacturers did not reach an explicit agreement, but were instead complying with Federal

Trade Commission guidelines concerning false and deceptive advertising," but concluded that "collusion was the cause of the cessation of advertising, and not the FTC [advertising] Guidelines." Indeed, Defendants' expert witness regarding FTC regulation, Dr. James Langenfeld, failed to provide the Court with a single example in which Defendants stated that their course of conduct was constrained by the concerns of FTC enforcement actions, or the 1955 FTC Guidelines. Dr. Langenfeld admitted he was in no position to opine on Defendants' intent to defraud because he had not conducted any review of Defendants' internal documents. By contrast, Dr. Harris reviewed thousands of Defendants' internal documents in reaching his conclusions that Defendants acted collusively. Dr. Harris characterized the involvement of the FTC in advertising and marketing issues concerning smoking and health as "toothless" and concluded that the actual influence of the FTC is minimal. Dr. Harris's testimony was confirmed by the testimony of FTC Staff Economist Dr. Joseph Mulholland, who has been at the FTC for some 35 years, who testified that the FTC "has never focused, nor at any given time have more than a handful of staff focused, on cigarette-related issues." Harris WD, 81:11-83:6; Harris TT, 10/14/04, 2547:24-2548:19; Langenfeld TT, 3/10/05, 15171:7-15173:1, 15175:7-20; Mulholland Written Direct at 5:16-18.

3083. The FTC's 1967 report to Congress revealed that Defendants were using the word "mild" in advertising as a euphemism for "cloaking the dangers of increased cigarette smoking . . . . Carlton filters have ‘Good mild taste . . . created for those who are interested in the amount of tar and nicotine in the smoke of their cigarette . . . . Montclair (menthol filter) cigarettes are made especially for smokers who seek exceptional mildness . . . . You get Pall Mall's famous extra length of fine tobaccos . . . and a filter tip. Result? A new longer length, a full 100 millimeters long and a new milder taste . . . . (Chesterfield kings) made to taste even milder

through longer length." 92382035-2095 at 2058-2059 (US 57179) (A).

3084. The FTC explained further in its 1968 report how Defendants' use of the phrase "mild taste" in advertising is just another way to communicate "less harmful":

> Advertising in 1966 featured the phrase ‘mild taste' to describe the satisfactions obtained from smoking and also as a **euphemism to cloak the dangers of cigarette smoking. The euphemistic effect derives from the possibility that the public assumes ‘mild' tasting cigarettes to be less strong, i.e. lower in tar and nicotine than many cigarettes, and hence less hazardous**.

TIMN288040-8122 at 8055-8056 (JD-043418) (A).

3085. The evidence, as detailed below, shows that from the 1960s to the present, Defendants' marketing of their health reassurance brands has featured claims of lowered tar and nicotine accompanied by written statements that implied a health benefit as a result of the lowered tar levels, as well as marketing imagery to communicate to smokers that Defendants' health reassurance brands were "lighter" and lower in tar, such as lighter color cigarette packaging and white tipping paper. Dr. Dolan testified that "[t]ar levels were trumpeted in advertising and both new brands and line extensions such as Lights and Ultra-Lights were introduced. Virtually every major brand undertook line extensions and by 1980 over 50% of cigarettes sold were ‘low-tar' (by industry definition ‘low-tar' was less than 15 milligrams tar on the FTC Method)." As examples, Dr. Dolan cited Philip Morris's introduction of the purportedly low tar Merit brand cigarettes in 1976 as well as RJR's introduction of low tar Vantage brand cigarettes in 1971 and Now brand cigarettes. Defendants' internal documents reveal that Defendants, with their marketing of health reassurance brands, carefully targeted smokers concerned with the ill health effects of smoking. Dolan WD, 123:21-124:7.

3086. The evidence shows that over the last five decades, Defendants have not only introduced numerous stand-alone cigarette brands that purport to be low in tar (e.g., Merit,

Vantage, and Carlton brand cigarettes), but also have introduced what they refer to as low tar "brand extensions" of existing full flavor cigarette brands (e.g., Marlboro Lights and Ultra Lights as extensions of the full flavor Marlboro brand). Defendants have used so-called brand descriptors such as "light," "medium," "mild," and "ultralight" to market their brand extensions as low in tar. Defendants acknowledge that, today, every major manufacturer continues to manufacture and sell low tar brands and brand extensions in both the 'light' and ‘ultra light' categories. Ivey WD, 54:6-17; Bonhomme WD, 8:13-9:18.

3087. Denise Keane, Philip Morris General Counsel, testified that the FTC does not formally classify cigarettes according to tar or nicotine yield, but that "[i]ndustry practice has long been to apply the ‘light' descriptor to cigarettes with 7 to 14 milligrams of tar, and the ‘ultra light' descriptor to cigarettes with fewer than 7 milligrams of tar." As Dr. Mulholland testified, brand descriptors "have been developed **by cigarette manufacturers** through their advertising." Keane WD, 56:14-23; Mulholland WD, 26:4-27:9 (emphasis added); accord Henningfield WD, 56:8-11 (testifying that the FTC has no "control over which cigarettes Defendants advertise as 'light' or 'ultra light'").

3088. Dr. Farone testified that the terms "Light" and "Low Tar," as they are used by Defendants, are "meaningless" and "arbitrary", because:

> [T]here are lights of certain brands with higher tar levels than regulars of other brands from the same company, and there are also lights and regulars of the same brand that have the same FTC tar rating. So therefore the term ‘light' is not related to tar or taste. For example, according to the most recent FTC report of tar and nicotine yields, Philip Morris sells versions of Virginia Slims and Virginia Slims Lights that both deliver 15 mg of tar by the FTC method.

Farone WD, 116:3-14; 525311179-1223 at 1185, 1207-1208, 1222 (US 52977) (A).

3089. A 1971 FTC report noted that "[r]elieving anxieties about the risks to health posed

by cigarette smoking" was among Defendants' three main advertising themes and that "[c]laims of low tar and nicotine content present yet another appeal to relieve concern about the dangers to health associated with cigarette smoking." In 1975 and 1976 reports, the FTC reported that this theme, used separately or with themes regarding taste or desirable personality characteristics, "continued to predominate in 1975," and "continued to dominate in 1976, with little variation in format and copy except in the greatly increased promotional emphasis given to the lower and lowered 'tar' varieties." 680043553-3595 at 3564, 3567 (US 87922) (A);1005121108-1119 at 1114 (US 87921) (A); FTC, 1976 Report at 4-5 (JD-003563) (A).

3090. As a 1981 FTC Report on cigarette advertising noted, many of Defendants' advertising campaigns had, over the course of the preceding four decades, "impl[ied] that smoking a particular brand solves the health problem or at least minimizes the risk." The report noted that Philip Morris's Parliament and American Tobacco's (subsequently B&W's) Tareyton cigarettes "imply that their special filters minimize the risks of smoking." The report also cited the advertisements for RJR's Vantage, B&W's Viceroy, and Lorillard's True cigarettes as examples of advertising campaigns implying that the brands marketed are either not harmful or less harmful. FTC, 1981 Report at 2-12 to 2-13 (JD-004744) (A).

3091. Similarly, a prominent report prepared by the Institute of Medicine in 2001 cited the advertisements of Defendants Philip Morris, RJR, B&W, American Tobacco, Lorillard, and Liggett as examples of advertisements that relate health benefits to particular low tar cigarette brands. Institute of Medicine, Clearing the Smoke: The Science Base for Tobacco Harm Reduction, National Academy of Sciences (K. Stratton, et al., eds., National Academy Press 2001) (US 20919) (A); 99053048-3558 at 3124-27 (US 57494) (A).

3092. Dr. Harris testified that Defendants' shift from competing on explicit health claims

to competing on machine-measured tar and nicotine yields did not signal the end of their collusive arrangement. Dr. Harris testified that " Defendant manufacturers continued to collude not to make damaging health claims about each other while, at the same time, they could still compete on tar numbers. With competition ‘on the numbers' carved out of the collusive agreement, collusion and competition could prevail at the same time." Harris WD, 98:12-99:4.

3093. The FTC noted in a 1976 report that "[t]he lower and lowered ‘tar' and nicotine cigarettes have in the last year been the subject of an **intensive promotional effort by cigarette manufacturers**." Indeed, the evidence shows that Defendants' spending on the advertising and marketing of filtered cigarettes was disproportionately high. A 1997 FTC report, which includes information provided by the tobacco industry regarding their cigarette advertising and promotion expenditures, shows that, for every year from 1963 to 1995, Defendants' total expenditures on advertising and promotion of filtered cigarettes exceeded their domestic market share of sales. For example, the report states that, in 1964, while filtered cigarettes comprised 61% of the market, the cigarette manufacturers devoted 78% of their total advertising and promotional expenditures to those cigarettes. The FTC's 1967 report concluded that "**[t]he figures indicate that the cigarette companies were even more quick to promote filter cigarettes than was the American public to purchase them**." The 1967 report found that then current cigarette advertising contained "two principal elements – a portrayal of the desirability of cigarette smoking and assurances of the relative safety of smoking." FTC, 1976 Report at 4 (JD-003563) (A) (emphasis added); 92382035-2095 at 2049, 2052-2053 (US 57179) (A); HHS1311770-1805 at 1799 (US 76080) (A).

3094. Defendants' marketing spending on low tar cigarettes (i.e., cigarettes yielding 15 mg. or less tar per the FTC Method) also was disproportionately high. The FTC's report for 1997

revealed that for every single year from 1967 to 1992, Defendants' advertising and promotional spending for low tar cigarettes exceeded their domestic market share. Dr. Dolan testified that low tar cigarettes came to "substantially reshape and define the cigarette market," explaining that:

> [T]he real 'boom' time for these cigarettes is the late 1970s. In 1974, manufacturers devoted about 15% of their advertising and promotion dollars to these products. **By 1979, this spending grew to 67%. At the time, the percent of sales represented by low tar was only 30%, so spending was disproportionately high on these 'health reassurance' brands**. These products, which accounted for less than 15% of cigarette sales in 1975 came to hold the majority of the market by 1981.

Dr. Dolan further noted that it was not until the mid-1990s that the percentage of sales held by low tar brands finally equaled the amount that Defendants were spending to promote them, at about 70% of the industry total. The fact that Defendants' spending was disproportionately high on filtered and low tar cigarettes directly refutes Defendants' claim that they introduced low tar cigarettes only **in response** to consumer demand for them, and that their marketing of low tar cigarettes was not intended to increase demand for those cigarettes (see US FF § III.D(3)(c), infra, for a discussion of Defendants' false statements regarding their marketing of low tar cigarettes). HHS1311770-1805 at 1799 (US 76080) (A); Dolan WD, 125:6-126:7 (emphasis added).

3095. Dr. Dolan explained how Defendants successfully marketed health reassurance brands:

> [C]igarette manufacturers were perpetuating the controversy. They were not denying cigarettes carried negative health impacts, just saying that 'we don't know' if they do or not. Now, with the low tar cigarettes, in case you as a smoker are concerned, here is a way to address that concern. These brands were 'responsive' to consumers' health concerns and this ability to address these concerns was behind the success of new products.

Dolan WD, 119:22-120:13.

3096. As Dr. Samet explained, "tar" is what is generally referred to as the solid material in tobacco smoke, the material that certain members of the public health community had suggested from the very beginning was causing cancer in cigarette smokers. Dr. Dolan testified: "Defendants knew that smokers accepted the low tar and nicotine brands due to the 'health reassurance' they offered." For instance, an April 30, 2001 e-mail from Shari Teitelbaum, a Philip Morris consumer researcher, to Nancy Conrad, former Marlboro Brand Manager and Category Director, and others at Philip Morris stated: "As we have heard in recent qualitative research, **smokers seem to associate the risks of smoking with tar and nicotine levels** . . . ." Samet WD, 145:8-13; 161:1-10; Dolan WD, 120:14-23; 2712800348-0348 (US 46209) (O) (emphasis added); Conrad PD, United States v. Philip Morris, 7/30/03, 245:24-247:16.

3097. Dr. Burns likewise testified that Defendants "used low machine-measured tar and nicotine levels to reassure the public that smoking filtered or 'low tar' cigarettes was safe, or at least safer than unfiltered or high tar products." However, as Dr. Burns testified, "the term 'lights' as a brand descriptor is misleading to consumers of cigarettes;" Defendants in this case use the misperception associated with low tar cigarettes to allay smokers' health concerns, despite understanding that these cigarettes are not actually less harmful. Dr. Burns further testified that Defendants' documents "confirm the conclusions" in NCI Monograph 13 and "demonstrate that the tobacco companies recognized that the smoking public was being misled by the tar values and by the use of terms such as low tar and light." Burns TT, 2/16/05, 13652:18-21; Burns WD, 1:10-15; 12:10-11; 41:12-18; 49:11-20; 55:7-16 (citing US 58700 (A), US 20919 (A), and US 88621 (A)); Burns TT, 2/15/05, 13311:9-15.

3098. Dr. Henningfield, "drawing on [his] background and experience in drug labeling and providing information to consumers," which informed his review of "how smokers

understand information they are given about cigarettes," testified that smokers are not always familiar with the FTC rating of their cigarette, however they are aware of whether their cigarettes are "light" cigarettes or "regular." Dr. Henningfield further testified that consumers believe that "light" cigarettes deliver less tar and nicotine than regular cigarettes, and that consumers believe that regular cigarettes are more hazardous than "light" cigarettes. Henningfield WD, 56:12-57:10.

3099. Dr. Neil Weinstein, a psychologist with an expertise in the area of risk perception and a professor in the Department of Human Ecology at Rutgers University, has extensive experience in the study of risk perception associated with smoking and authored a chapter in Monograph 13 on the subject. Dr. Weinstein's expert testimony was that not only do most individuals not understand the risks associated with smoking low tar cigarettes, they believe that smoking low tar cigarettes is "healthier" or "less risky" than smoking full flavor cigarettes. See generally, Weinstein WD, 52-58.

3100. First, a phenomenon knows as optimism bias operates on the human psyche, allowing humans to believe that their own risk is less than the risk of others. Optimism bias affects smokers' perception of risk by enabling them to conjure rationalizations that lower their own perceived risk associated with their smoking. One rationalization that smokers engage in is the belief that smoking low tar or light cigarettes lowers the risk of health problems. Weinstein WD, 43:5-19 and 50:15-22.

3101. In conjunction therewith, research clearly reveals that a significant number of smokers believe that low tar cigarettes are healthier or less risky than full flavored cigarettes. For example, one survey on various issues related to smoking showed that 37% of teen smokers and 17% of adult smokers believe that low tar or light cigarettes are safer. Weinstein WD, 52:5-10

(citing Weinstein N. D., Slovic P., Public Understanding of the Risks from Smoking and Opinions About Smoking Control Policies. Unpublished survey summary. (New Brunswick, NJ, Department of Human Ecology, Rutgers University, 2001)). Another survey showed that 45.7% of ultralight smokers; 32.2% of light smokers; and 29.4% of full flavor smokers believe that low tar cigarettes reduce the risk of cancer. Benowitz WD, 60:11-21; Weinstein WD, 52:17-21 (citing Giovino, et al., Ch. 4 of NCI Monograph 7, "Attitudes, Knowledge, and Beliefs about Low-yield Cigarettes among Adolescents and Adults" ("Giovino, et al., 1996")). A consideration of the many relevant studies analyzing this issue reveals that the median result is that approximately 40% of people believe that it is safer to smoke light cigarettes than to smoke full flavored cigarettes. Weinstein WD, 52:11-17.

3102. In contrast, relatively few people understand that smoking low tar or light cigarettes can be – and often is – just as dangerous as smoking full flavor cigarettes. Weinstein WD, 54:21-55:20. Scientific research so establishes. A peer-reviewed, published study showed that 70% of low tar cigarette smokers believe that low tar cigarettes decrease one's daily intake of tar. Weinstein WD, 55:5-8 (citing Kozlowski et al., Smoker reactions to a "radio message" that Light cigarettes are as dangerous as regular cigarettes. Nicotine & Tobacco Research, 1(1);67-76(1999)). Similarly, another study showed that approximately half of all respondents did not know how many light cigarettes would have to be smoked to get the same level of tar intake as from one full flavor cigarette. Fewer than 10% believed that it would be one light cigarette. Weinstein WD, 55:12-15 (citing Kozlowski, L.T., Goldberg, M.E., Yost, B.A., White, E.L., Sweeney, C.T., Pillitteri, J.L. Smokers' misperceptions of light and ultra-light cigarettes may keep them smoking. American Journal of Preventive Medicine, 15, 9-16 (1998) ("Kozlowski, Goldberg, et al., 1998")).

3103. As Dr. Burns testified, "the perception of most smokers when they see a . . . low tar cigarette, is that they believe that when they smoke this cigarette, they're going to get less tar and nicotine. And that isn't true. They get the same amount of tar and nicotine as they would get if they were smoking a higher tar and nicotine cigarette." Burns WD, 45:14-18.

3104. Indeed, the evidence shows that Defendants have used this misperception to their advantage. As Dr. Dolan, a marketing expert, testified, "the tobacco companies' marketing had the impact of creating the belief among some smokers that there was a differential health impact, i.e., that low tar/nicotine brands were 'better for you' and less likely to cause health problems." A 1996 article in the American Journal of Public Health cited a 1993 Gallup survey in which 56% of smokers understood use of the term "low tar" to be intended to convey relative safety compared to full flavor cigarettes. The journal article also cited a 1987 National Health Interview Survey that found that 46% of smokers of cigarettes with tar yields of 6 mg. or lower (per the FTC Method) believed they had reduced cancer risk compared with smokers of cigarettes with higher FTC tar yields. Dolan WD, 118:15-22; 2074759740-9746 at 9741 (US 43526) (A); accord 99053048-3558 at 3112 (US 57494) (A) (2001 Institute of Medicine study stating "When filtered and low-yield cigarettes were introduced into U.S. markets, they were heavily promoted and marketed with both explicit and implicit claims of reducing the risk of smoking. Even as data accumulated, albeit slowly, that these products did not result in much – if any – decrease in risk, consumers have continued to believe otherwise. . . . Consumer misunderstanding is explained in part by the ways in which these products are marketed . . . . [T]he tobacco companies have appealed to health concerns of smokers at least since 1927. Claims about tar and nicotine levels appeared as early as 1942").

3105. Thus, many people smoke low tar cigarettes because of a perceived reduction in

risk. In fact, various research shows that approximately 61% of current low tar smokers offer reducing their health risk as one reason they smoke light cigarettes. Likewise, research shows that approximately 44% of low tar smokers smoke light cigarettes to reduce their health risks without having to quit smoking. Still other studies show that approximately 42% of individuals who switch from full flavor cigarettes to light cigarettes do so as a step toward quitting. Together, this research makes clear that approximately 50% of all low tar smokers smoke what they perceive to be a "healthier" cigarette, potentially as a step toward quitting. Weinstein WD 53:3-54:20; Benowitz WD, 60:18-21.

3106. A closer look at some of the specific studies elucidates these findings. For example, a 1987 National Health Interview Survey showed that 44% of current smokers had, at some point, switched to low tar cigarettes to reduce their health risk. Weinstein WD, 53:19-22 (citing, Giovino, et al., 1996). Correspondingly, another national survey showed that 58% of ultralight smokers and 39% of light smokers chose those cigarettes to reduce their health risks without having to quit. Furthermore, 49% of ultralight smokers and 30% of light smokers did so as a step toward quitting. Weinstein WD, 53:23-54:7 (citing, Kozlowski, Goldberg, et al., 1998). Finally, the 1993 Teenage Attitudes and Practices Survey showed that 21% of light or ultralight cigarette smokers chose those brands because they perceived them to be healthier. Weinstein WD, 54:13-15 (citing Giovino, et al., 1996).

3107. Dr. William Farone, former Director of Applied Research at Philip Morris USA and expert in "the chemistry and biochemistry of alkaloids and addictive drugs, the chemistry and physics of cigarette smoke, cigarette design and technology, and the chemistry and biochemistry of toxic substances and how they interact with living systems," testified that one reason that low tar cigarettes "are more dangerous" than full-flavor cigarettes is that "they lead people to believe

they are [safer] so that they smoke them in manners that cause them to get just as much toxins." Farone WD, 2:2-8; 2:15-19; Farone TT, 10/7/04, 1878:16-22; Farone TT, 10/12/04, 2171:25-2172:8; 2182:11-2190:7.

3108. Dr. Farone explained that:

> The problem is that when people see that word 'light', it is my opinion that they believe it's safer and, in fact, it isn't, so that's what this is all about. . . . they are more dangerous because people are smoking them thinking they are doing themselves some good, they think they are safer. . . . there is no benefit to a smoker from Marlboro Lights compared to Marlboro. That's the main point. So that makes it more dangerous.

Farone TT, 10/7/04, 1865:9-23.

3109. In relation thereto, smokers of light and ultralight cigarettes are more concerned about the risks of smoking than are smokers of full flavor cigarettes. A 1986 CDC control study showed that 85% of those who switched from full flavored cigarettes to light or ultralight cigarettes were concerned about the health risks of smoking, as compared to 70% of full flavor smokers. Weinstein WD, 56:13-20 (citing Giovino, et al., 1996). Ultralight smokers are also more likely to use tar numbers in judging the relative risk of cigarettes. A study showed that 56% of ultralight smokers rely on tar numbers to determine cigarette safety, as compared to 14% of the overall sample. Moreover, 83% of the ultralight smokers believed that switching from a 20 mg to a 5 mg cigarette would significantly reduce health risks, whereas 50% of other smokers shared that same belief. Weinstein WD, 56:3-12 (citing Cohen, J.B., Ch. 9 of Monograph 7, "Consumer/smoker Perceptions of Federal Trade Commission Tar Ratings").

3110. The evidence shows that Defendants have profited enormously from consumers' mistaken perception that filtered and low tar cigarettes are less hazardous. FTC reports demonstrate that **the market share of filtered cigarettes has increased from 58% in 1963 to**

97% in 1994. A 1967 FTC report states that "in 1964, when cigarette sales declined by about 10.7 billion, the sales of regular cigarettes dropped 20 billion while filter cigarettes sales increased almost 10 billion." Similarly, **the percentage of low tar cigarettes (i.e., cigarettes with an FTC-reported tar yield of 15 mg. or less) has increased from 2% in 1967 to 81.9% of total cigarette sales in 1998**. FTC, 1994 Report at Table 6A, Table 7 (US 86655) (A); 92382035-2095 at 2057 (US 57179) (A); FTC, 1979 Report at 8 (US 87925) (A); FTC, 1998 Report at 22-26 (Issued 2000) (US 60434) (A).

(a) Defendants Made False Statements of Reduced Harm and Used Misleading Brand Descriptors

3111. As detailed below, to effect their concerted campaign to reassure smokers and dissuading them from quitting, Defendants made, and continue to make, false and misleading statements regarding low tar cigarettes, including: (1) assertions that they deliver "low," "lower," or "less" tar and nicotine than regular cigarettes and claims that they are "mild" or deliver "clean" taste; and (2) brand names with descriptors such as "light" and "ultra light," with full knowledge that consumers interpret these claims and descriptors as an indication of reduced harm. In addition, Defendants use marketing imagery, such as lighter colors, to communicate low tar and health reassurance. Defendants' internal documents show that their campaign of deception has been a calculated – and extremely successful – scheme to increase their profits.

(i) Philip Morris

3112. As Jeanne Bonhomme, Director of Consumer Insights for Philip Morris, testified, "Philip Morris aims its low tar cigarette marketing at least in part at smokers of regular cigarettes who are concerned about the amount of tar they are inhaling and want to reduce it." Bonhomme, who has been conducting consumer research for Philip Morris since 1979, further testified that she has been "aware from Philip Morris's consumer research that some consumers were

switching to low tar cigarettes because they wanted to lower their tar for health reasons," and that she "knew when [she was] marketing low tar cigarettes for Philip Morris that some consumers were switching to them and buying them because they thought they were less harmful." Bonhomme WD, 43:11-14; 65:15-22.

3113. As demonstrated below, like all Defendants, over the last 50 years Philip Morris has used a variety of marketing techniques to reassure smokers that certain brands and types of cigarettes would reduce their health risk from smoking by reducing their exposure to tar. Philip Morris advertisements in the early 1950s made explicit claims of reduced harmfulness, such as the following:

1952: "If, like millions today, you are turning to filter cigarettes for pleasure plus protection . . . it's important that you know the Parliament Story." 696000888-0916 at 0894, 0905, 0908 (US 21387) (A); Harris WD, 70:3-6.

1952: "Parliament's exclusive Filter Mouthpiece gives you the important extra protection of the Parliament 'Safety-Zone' Construction . . . As the irritants, brown tars and colorless nicotine are trapped, they remain where they belong–in the recessed filter, completely out of contact with your lips." 696000888-0916 at 0894, 0905, 0908 (US 21387) (A)

1954: "You're So Smart to Smoke Parliaments." (US 2731) (A) (emphasis in original); see also (US 2756) (A) (1956 Parliament advertisement in Sports Illustrated magazine noting same).

1954: "The cigarette that takes the FEAR out of smoking!" 696000888-0916 at 0908 (US 21387) (A).

3114. In addition to explicit health claims, since the 1970s Philip Morris has used so-called brand descriptors such as "light" and "ultra light" to communicate that certain brands of cigarettes are low in tar and nicotine. James Morgan, who was Brand Manager of Marlboro from 1969 to 1972, around the time when Philip Morris introduced the first "light" cigarette – Marlboro Lights – gave a deposition in a 1974 trademark case in which he explained the intended meaning of the "lights" descriptor. Morgan testified that, from the very beginning, the "lights"

descriptor was intended to communicate that the brand was low in tar – as opposed to a brand that was lighter in taste:

> From the very beginning the phrase, 'Lowered tar and nicotine' was going to be on the package [of Marlboro Lights]. That was the phrase that described to the consumer what the product was in our judgment . . . . **We felt the brand name, Marlboro Lights, was a real help in terms of the description of the product being low in tar and nicotine** which appeared on the pack from the inception of the project . . . . [T]he proposition that we were going to push . . . was described on the pack with a lowered tar and nicotine cigarette . . . . **We are not talking, in my judgment, talking about light . . . as a taste**. It's not a term that means anything in terms of taste, and the name Marlboro Lights as I said before, a word which we feel has appeal in a different sense than suggesting what the cigarette even tastes like . . . . **It was our desire in this entire Marlboro Lights brand project to constantly position Marlboro Lights as being – as having lower tar and nicotine from Marlboro [Reds]**.

Morgan PD, Philip Morris Inc. v. R.J. Reynolds Industries, Inc., 10/15/74, 4:9-10; 10:15-11:4; 78:20-79:14; 79:25-80:5; 81:8-12; 85:23-86:4 (emphasis added); Morgan PD, Philip Morris Inc., 11/25/74, 247:11-14.

3115. Morgan, who later rose to become CEO of Philip Morris, testified in a 2002 deposition that rather than relying on the tar and nicotine numbers from the FTC Method, "the major influence in people's perceptions in the tar of a cigarette would have come from the marketing positioning of a brand as opposed to people literally reading the FTC [tar and nicotine figures]." Morgan explained that, "if you took the advertising, the point of sale, whatever may have been said on the racks or the cartons, the whole panoply of what the consumer saw about a cigarette brand would be more influential in that consumer's perception of the tar of that brand . . . than the fact that they may or may not have sat down and looked at a newspaper that had the latest Federal Trade Commission report." Morgan further testified that part of the image that Philip Morris was marketing was the concept of lowered tar and nicotine. Morgan testified in

1974 that although Philip Morris marketing research had, in 1974, found that to consumers, the phrase “lower tar and nicotine” meant not just less tar, but also better for you, Philip Morris decided to continue using the phrase lower tar and nicotine to market Marlboro Lights. Morgan PD, Price v. Philip Morris, Inc., 6/5/02, 45:2-45:25; 46:2-46:25; 47:2-47:25; 48:2-48:25; 49:2-49:25; 50:2-50:25; 51:2-51:5; 52:15-52:20; Morgan PD, Philip Morris Inc., 11/25/74, 174:10-175:4; 175:16-175:25; 502641641-1646 at 1641 (US 85008) (O) (1974 Philip Morris consumer research document stating that "Lowered Tar and Nicotine" on Marlboro Lights packs "clearly means ‘less tar' and ‘better for your health'" and that actual FTC tar and nicotine yield numbers have less of "this positive kind of connotation" with smokers).

3116. Morgan's testimony was echoed by that of Jeanne Bonhomme. Bonhomme testified that, in her experience, consumers are not aware of the specific tar levels of the cigarettes they smoke, and instead use descriptors such as "lights" or "lower" tar as indications of their tar levels: "Philip Morris was aware that consumers understood the ‘lights' brand descriptor from its advertising and marketing pieces to be equated with low tar." Bonhomme WD, 12:6-11; 13:17-19; 15:1-4; 16:1-7.

3117. Bonhomme testified that, in her experience, a cigarette's name as well as its packaging can cause consumers to perceive it as being lower in tar. Indeed, Bonhomme testified that in or around 1995, Philip Morris considered changing the name of Merit to Merit Lights, because "Philip Morris was concerned that consumer research showed that Merit marketing no longer effectively conveyed to consumers that Merit was low in tar." Bonhomme WD, 13:1-22.

3118. This contemplated name change is documented in a June 23, 1995 internal Philip Morris memorandum entitled "Merit ‘Filter' vs. ‘Lights' Test - Research Proposal," from Lauren Schwed, Philip Morris Analyst, to Jodi Sansone, then Brand Manager for Merit at Philip Morris

USA, and Rebecca Gordon, a Philip Morris USA Assistant Brand Manager under Sansone. The memorandum demonstrates that Philip Morris was aware that changing the name to "lights" would imply low tar, but at the same time could imply poor taste. The memorandum described the motivation behind an attached consumer research study as follows:

> Merit is considering changing the name on the Parent pack from 'Filter' to 'Lights' in order to clarify the tar level of the cigarette. **There is a thought that changing the wording on the pack to replace the word 'Filter' with the word 'Lights' would help clarify what the true tar level is** for Merit Parent. However, there is some concern that changing the name to 'Lights' could possibly detract from the brand's flavor heritage.

2045628330-8330 (US 26955) (A) (emphasis added).

3119. In a memorandum dated November 27, 1995, Shari Teitelbaum, a consumer researcher for Philip Morris, summarized the results of the "Merit 'Filter' vs 'Lights' – Final Report" for Sansone. Teitelbaum noted that the name change affected Merit smokers' perceptions: "Before tasting the cigarette, Merit smokers seemed to think that Merit Lights was lower in tar than Merit Filter." Indeed, Teitelbaum noted that changing the name to Merit Lights caused one third of current Merit smokers to "alter their perception of Merit in terms of taste and tar level." The study also confirmed Philip Morris's fear that changing the name to Merit Lights would imply a poor tasting cigarette: for current Merit smokers, "[t]he name change did seem to have a significantly adverse impact on perceptions of the brand's taste." 2045596010-6012 at 6011 (US 26952) (A); 2045596013-6040 at 6032 (US 26953) (A); Bonhomme WD, 14:1-15:4.

3120. Nancy Lund, Senior Vice President of Marketing at Philip Morris, testified in 2002 that Philip Morris changed the name of Merit Filters to Merit Lights, and that there was no difference in the cigarette. Brennan-Lund PD, Price v. Philip Morris, Inc., 9/20/02, 157:15-22.

3121. Similarly, Philip Morris marketed a 15 mg. cigarette as both Virginia Slims and

Virginia Slims Lights. 525311179-1223 at 1222 (US 52977) (A).

3122. Philip Morris has known for years that by communicating low tar, brand descriptors also communicate health reassurance. Jeanne Bonhomme testified that Philip Morris has known for years from its consumer research that some smokers "interpret brand descriptors as communicating a less hazardous cigarette than full-flavor brands." Bonhomme WD, 20:3-6.

3123. Indeed, in an October 21, 1994 memorandum entitled "Marlboro Medium Smoker Image Study," Marian Halpern, an employee in the Philip Morris consumer marketing research department, reported to Tom Keim, a Philip Morris brand manager, that the "Reasons for Smoking Medium" were as follows: "**Most smokers said they chose Medium because of its perceived health benefit**. Over half of the Medium smokers said they started smoking Medium because they wanted a cigarette with lower tar and nicotine (56%). For many respondents, the name ‘Medium' communicated information on this product feature, with almost one quarter (24%) of these smokers saying that ‘Medium' refers to the cigarette's lower tar and nicotine." 2063731671-1688 (US 22222) (A) (emphasis added); Bonhomme WD, 18:1-19:5.

3124. Bonhomme testified that she was unaware of whether or not Marlboro Medium actually delivered lower tar and nicotine to consumers, and as a result, she did not know whether the majority of people who started smoking Marlboro Medium started smoking it for something it actually provides. Bonhomme WD, 19:9-18.

3125. Bonhomme also testified that Philip Morris tries to create marketing pieces that communicate certain brands are low in tar, not just with words like the "lights" brand descriptors, but also with the imagery they present to consumers, such as the color it selects for the cigarette pack and tipping paper. Indeed, Bonhomme testified that when packaging decisions are made at Philip Morris, it is recognized that the color influences peoples' perception of the strength and tar

level of the product. Bonhomme WD, 20:10-17; 22:1-4.

3126. For example, Philip Morris knows that consumers perceive a blue cigarette pack and white tipping paper as an indication that a cigarette is low in tar, and that generally speaking, the lighter the cigarette package color, the lower its tar content is perceived to be by consumers. Philip Morris continues to this day to market and sell Marlboro Lights and Marlboro Ultra Lights with lighter color packaging and tipping paper. Bonhomme WD, 21:13-18; 23:20-22.

3127. Philip Morris's marketing department employees share this awareness that marketing imagery can convey the perception of low tar. As Jeanne Bonhomme explained, Philip Morris tests each of its marketing campaigns "for communication of the main idea, theme, or images of the campaign," and that "before any marketing campaign is run, the consumer research department tests to determine that the intended message is being effectively communicated to consumers." Bonhomme WD, 6:8-22.

3128. Nancy Brennan-Lund, Philip Morris Senior VP of Marketing, testified in 2002 that in order to communicate low tar in cigarettes, Philip Morris USA has used a "lighter, more white background" and a "white filter as opposed to a cork colored filter." Susan Norris, Marlboro Brand Manager from 1995-1999, testified that, in her experience, colors such as silver and light blue communicate to consumers that a cigarette is an ultra light brand. Brennan-Lund PD, Price, 9/20/02, 179:6-17; Norris PD, United States v. Philip Morris, 7/31/03, 162:6-165:8, 179:17-184:19.

3129. According to Jeanne Bonhomme, "[c]onsumer research conducted by Philip Morris has indicated that while consumers believe that all cigarettes pose some health risk, some consumers believe that low tar cigarettes are less harmful than regular cigarettes." Bonhomme further testified:

> I learned from various research that we conducted that some consumers do believe that low tar cigarettes are less of a health risk than non low tar cigarettes. These consumers had a perception that smoking is not good for me, so if I can smoke fewer cigarettes, it is probably better for me, if I don't smoke the cigarette all the way down on the rod, it is probably better for me, and if I smoke a lighter cigarette, it is probably better for me.

Bonhomme WD, 25:7-14.

3130. Bonhomme testified that Philip Morris was aware that some consumers were switching to lights in part because they believed it was better for them. Bonhomme WD, 45:20-22; 27:10-15.

3131. The evidence detailed below shows that, over the last five decades, Philip Morris has conducted massive amounts of consumer research to perfect the delivery of its "light" and low tar cigarette brand marketing message to ensure it provided smokers with health reassurance and offered an alternative to quitting.

3132. Marlboro Lights. Jeanne Bonhomme testified that, with respect to Marlboro Lights, Philip Morris designs the packaging to distinguish it from Marlboro Red and communicate to consumers that it provides "the best of both worlds," – low tar and good taste. Bonhomme WD, 22:5-18.

3133. A November 15, 1971 "Philip Morris U.S.A. Inter-Office Correspondence" to James Morgan from the Philip Morris USA Marketing Research Department set forth results of a Philip Morris consumer study on Marlboro Lights. Under the heading "Advertising Awareness," the report stated that "[l]ow tar and nicotine remained the most frequently mentioned comment." 1000292744-2762, 2745 (US 35205) (O).

3134. A December 1971 Marlboro Lights "Product Promotion Plan" distributed to the Philip Morris sales force discussed the introduction of Marlboro Lights and ways to market and

maximize sales of the brand. It stated: "The introduction of Marlboro Lights is a very timely move on the part of your company. The consumer is becoming increasingly aware of tar and nicotine contents in cigarettes and many are searching for one with low tar and nicotine content and full flavor. Marlboro Lights will fill this need." 2045404133-4163 at 4141 (US 85000) (O).

3135. A retrospective Philip Morris document dated September 1991 entitled "Background Information on PM Brands," stated: "To capitalize on the booming low tar market, Marlboro Lights was introduced in 1972. It became the first successful low tar line extension in the industry . . . Marlboro further broadened its appeal to low tar smokers with the addition of Marlboro Lights 100's in 1978, Marlboro Lights King Size Flip-Top Box in 1980 and Marlboro Lights 100's Flip-Top Box in 1984." 2070143190-4433 at 3192 (US 27257) (A).

3136. James Morgan, former President and CEO of Philip Morris USA, testified in 2002 that Marlboro Lights were positioned as "lower in tar and lighter in taste than Marlboro Red" and were marketed to people seeking a low tar and nicotine cigarette, including smokers of both high and low tar cigarettes. A circa 1974-1975 Philip Morris magazine advertisement for Marlboro Lights stated: "Marlboro Lights. The spirit of a Marlboro in a low tar cigarette." Morgan testified in 2003 that Philip Morris has used the phrases "lowered tar and nicotine" and "Lights" in association with Marlboro Lights for over 30 years. Morgan PD, Price, 6/5/02, 20:13-25, 21:2-6, 32:22-25, 33:2-25, 34:2-11; 2045404133-4163 (US 85000) (O); 03496228-6630 at 6323 (US 20057) (O); Morgan TT, Price v. Philip Morris, Inc., 2/18/03, 64:4-7.

3137. A May 31, 1988 Philip Morris USA Marketing and Research Department report co-authored by N. Stamell and K. Goldstein from Philip Morris's primary advertising agency, Leo Burnett, and Philip Morris consumer researchers Karen Eisen and Jeanne Bonhomme, that copied Nancy Lund, then in the Marketing and Research Department of Philip Morris USA,

recited focus group results and stated that "[m]any felt that Marlboro Lights was gaining in favor because of health concerns." 2044743883-3891 at 3885 (US 85001) (A); Brennan-Lund PD, Price, 9/20/02, 190:1-192:11; Bonhomme WD, 23:5-19.

3138. Benson & Hedges. A 1974-1975 advertisement for Philip Morris's Benson & Hedges Multifilter brand stated: "Today people not only want a great tasting cigarette, but one that's low in 'tar' and nicotine. Nothing's simple anymore. . . . we've managed to lower the 'tar' and nicotine and still give you a cigarette with full rich flavor for you to enjoy." (US 87184) (O); see also 03496228-6630 at 6326 (US 20057) (O).

3139. A September 1991 Philip Morris document entitled "Background Information on PM Brands," stated:

> Benson & Hedges 100's Lights and Lights Menthol were introduced in 1977 in response to consumer preference for a milder, lower tar cigarette . . . today Benson & Hedges is among the leading low tar cigarettes. In mid-1982, Benson & Hedges Deluxe Ultra Lights was launched to take advantage of dynamic growth in both the 100mm and ultra low tar markets. The regular and menthol packings, both at 5mg tar, were instant successes. Fueled by distinctive packaging and taste richer than that of other ultra low (hence the ad slogan "rich enough to be called deluxe"), Deluxe Ultra Lights is a major contributor to the image and sales strength of Benson & Hedges.

The document listed the following "Benefits Statement" regarding Benson & Hedges 100's Deluxe Ultra Lights: "Benson & Hedges 100's Deluxe Ultra Lights gives you only 5mg tar, yet is rich enough to be called Deluxe" and "Benson & Hedges 100's Deluxe Ultra Lights Menthol delivers cool, rich taste with only 5mg tar." 2070143190-4433, 3211-3214 (US 27257) (A); see also ADV004 1118-1120 (US 745) (O) (1982 advertisement).

3140. Cambridge. The misleading and deceptive use of brand descriptors by Philip Morris is demonstrated by Philip Morris's selective use of brand descriptors to name and market

products with similar or identical machine-delivered tar and nicotine yields. Notes from the scientist charged with recording the discussion at the regular "new products" meetings of Philip Morris scientists – known as "Richmond meetings" – demonstrated Philip Morris's awareness of the consumer appeal of low tar numbers and confirmed Philip Morris's intent to capitalize on consumers' perception of Cambridge as the lowest tar cigarette. Tom Goodale's handwritten notes from the October 15, 1979 Richmond meeting reflect Philip Morris's plan to create an impression in consumers' minds of Cambridge as extremely low in tar by introducing it with a tar level below the then-lowest FTC tar brand sold – Carlton – and then to raise the tar level over time. The notes reveal, under the heading Project Trinity (Cambridge's project name prior to commercial introduction), "Hit mkt [market] below Carlton tar - **afterwards can drift higher**." 1001507595-7596 at 7595 (US 85102) (A) (emphasis added).

3141. Dr. William Farone, Philip Morris USA employee from 1976 to 1984 and former Director of Applied Research at Philip Morris USA, testified that, based on his participation in numerous monthly meetings in 1979 relating to Cambridge:

> The long-range plan [for marketing Cambridge] was to introduce the product as a low tar product and then eventually to increase the tar of the product. . . . [I]t was anticipated that the product would not sell very well at that low tar and eventually they would increase the tar, and having sold it as a low tar product people still would think of it as a low tar product. In my view, and from my experience, the lowest yielding version of many brands, including the original Cambridge, but also B&W's Carlton, RJR's NOW, etc., were created to give the brands a lowest tar image, while the sales are in the higher tar and nicotine versions of those brands. Those lowest yield versions of the brand are very hard to find in stores.

Farone WD, 2:2-8; 2:15-19; 128:4-128:22.

3142. The evidence shows that in 1979, Philip Morris promoted Cambridge as a low tar brand yielding **0.0 mg tar** (less than 0.1 mg tar) on the FTC test. Dr. Farone testified that the 0.0

mg tar Cambridge cigarette was removed from the market and replaced by Cambridge light and ultra light brands, all of which that had considerably more tar than the original Cambridge cigarette, which did not have a "low tar" descriptor. Dr. Farone further testified that: "The plan all along was to deceive the public into thinking that the Cambridge Light cigarette was a low tar cigarette, when in fact it was not. . . . **the trend to increasing tar deliveries in the product is very clear and there is no advertising that says that such increases are being made.**" Farone WD, 129:18-132:17; 2024983860-3862 at 3860 (US 20015) (A).

3143. Dr. Farone further testified that "Philip Morris never even bothered to consumer test the 0.0 mg [Cambridge] version against the similar variant of Carlton and this is a major piece of evidence that they had no plans to keep it on the market." Dr. Farone's testimony is supported by a September 20, 1979 Philip Morris memorandum entitled "Project Trinity" states, with respect to the 0.0 mg tar version of Cambridge: "**Consumer testing is not required for this model**." Dr. Farone testified that an extremely low delivery Benson & Hedges brand was also marketed by Philip Morris without consumer testing. Farone WD, 128:23-129:17; 1000774422-4422 (US 35306) (A).

3144. Nancy Brennan-Lund, Senior Vice President of Marketing at Philip Morris, admitted in a 2002 deposition that Cambridge Lights had more tar and nicotine than the original Cambridge. She further admitted that, as the tar and nicotine numbers were not on the packs of Cambridge Lights cigarettes, the only way consumers could possibly know that Cambridge Lights had more tar than Cambridge regular was by a perceived taste difference. Brennan-Lund PD, Price, 9/20/02, 145:5-154:16.

3145. This Cambridge story demonstrates Philip Morris's ability to develop and successfully market a product that delivered no measurable tar by the FTC method, followed by

its misleading and deceptive use of brand descriptors. The brand descriptors were misleading and deceptive because, as demonstrated above, Philip Morris first sold a product called "Cambridge" with less than .1 mg tar without a low tar brand descriptor. Then, after establishing consumers' association with "Cambridge" as a low tar (i.e., "healthier") product, Philip Morris introduced "Cambridge Lights," and "Cambridge Ultra Lights," which in fact had many times more tar than the original Cambridge.

3146. Merit. Dr. Dolan testified that "in 1976 Philip Morris introduced a new brand, Merit, at 9 milligrams Tar with 'enriched flavor.' Merit formed the basis for line extensions to Merit Ultra at 4 milligrams and later Merit Ultima at 1 milligrams. The three were jointly advertised in a "low, lower, lowest" presentation of the product line." Dolan WD, 124:1-4; 1002325022-5022 (US 21510) (A).

3147. Jeanne Bonhomme testified that Philip Morris's marketing for some of its low tar cigarette brands, including Merit, "encouraged consumers [whom Philip Morris referred to as potential "down-switchers"] to switch from regular cigarettes to low tar cigarettes." Bonhomme testified that, historically, "Philip Morris targeted potential down-switchers with its marketing for Merit" and that "Merit [consumer] research is used to target potential down-switchers." Bonhomme WD, 13:4-5; 27:16-21; 29:3-30:5; see also 03297227-7249 at 7240 (US 88631) (A) (report prepared for Lorillard indicating: "In 1976 Philip Morris introduced Merit (9 mg tar), accompanied by the heaviest advertising spending plan since the arrival of Marlboro in the mid-1950's").

3148. Suzanne LeVan, Philip Morris Vice-President of Premium Brands from 1991-2001 with responsibility for Merit, testified at her deposition in this case that "the Merit strategy is to convince smokers who are switching down [in tar levels] and who are looking for a good

tasting cigarette that Merit is a brand that they should try." LeVan PD, United States v. Philip Morris, 6/25/02, 178:13-181:2; accord 2063690017-0018 (US 85002) (O).

3149. Philip Morris consumer research documents confirm Bonhomme's and LeVan's testimony that Philip Morris targeted potential down-switchers with Merit marketing. A September 21, 1995 memorandum from Esther Franklin of Leo Burnett to Shari Teitelbaum of Philip Morris's consumer research department recommended consumer research to "determine in the 'mature' world of low tar products, how the relationship between taste and tar impacts brand choice at all tar levels." The memorandum stated that this information would be used to "assist in the development of the 1996 direct communication messages and 1997 advertising messages which more clearly address the needs of smokers who are contemplating switching to a lower tar product." 2063711117-1117 (US 27137) (A); 2063711118-1120 (US 27138*) (A); Bonhomme WD, 28:18-30:5.

3150. Bonhomme further testified that "Philip Morris's marketing for Merit cigarettes targeted 'self-conscious' and 'uncomfortable' smokers." A Philip Morris memorandum entitled "The Uncomfortable Merit Smoker," dated January 6, 1993, stated: "'Self-conscious' smokers are defined as people who are uneasy with their status as smokers. They see smoking as a sign of personal weakness and are starting to feel ashamed that they smoke." 2044905001-5007 at 5001 (US 20454) (A); Bonhomme WD, 49:1-3; 47:8-48:11; see also Teitelbaum PD, United States v. Philip Morris, 4/16/02, 132:21-137:21.

3151. Philip Morris's targeting strategy was recorded in a retrospective June 13, 1995 document from Leo Burnett – Philip Morris USA's long-time marketing agency – entitled "Merit Advertising Overview Historical and Current for Jodi Sansone." Under the heading "Merit - Current 'You've Got Merit' Campaign," the document stated: "Strategy," "Convince:

Self-conscious and **uncomfortable** smokers who want to switch to a low tar alternative but won't sacrifice taste completely,""That: With Merit, **you can switch down to lower tar and still enjoy smoking,**" "Because: Merit delivers satisfying taste at every level of low tar." The document described the "Merit Brand Essence" as follows: "Since the brand's introduction twenty years ago, the core Merit proposition has been low tar with good taste. Once a smoker has made the decision to switch to a lower tar product, they are faced with the challenge of finding one that delivers on taste. Merit offers a positive solution–they can switch down to lower tar and still get satisfying taste." 2048200699-0727 at 0707 (US 38648) (A) (emphasis added – bold type); Bonhomme WD, 48:12-49:3.

3152. Jeanne Bonhomme testified at trial that Philip Morris's strategy was successful: "Philip Morris research confirmed that switching down in tar made some Merit smokers feel better about the fact that they smoked." In a July 1993 Philip Morris presentation prepared by Norma Suter Drew, Philip Morris Vice President for Portfolio Brands and former Brand Manager and Marketing Director for Merit cigarettes from 1992-1994, entitled "Merit Franchise," Drew reported that "Merit is a brand smokers switch to in order to reduce tar/nicotine." Elsewhere in the presentation, Drew wrote that one of the top two "Goals" for Merit advertising was to achieve a "[s]ignificant increase in Merit's highest brand image statement, 'Are among the lowest in tar/nicotine', versus Carlton and Now." The presentation also noted that "70% of industry switching is between tar levels." Under the heading "Merit Advertising," the presentation noted that "Merit smokers tell us that they come to the franchise because they desire a lower tar cigarette that still tastes good – **switching down makes them feel better about the fact that they smoke**." Bonhomme WD, 49:4-14; 2070661683-1727 at 1685, 1687, 1713, 1716 (US 40337) (A) (emphasis added - bold type).

3153. According to a retrospective Philip Morris document dated September 1991 and entitled "Background Information on PM Brands," the "Benefits Statement" of Merit was: "You'll enjoy low tar and good flavor with Merit." "At only 7 mg. of tar, Merit delivers the rich flavor of leading cigarettes with twice the tar." "With Merit Menthol you get rich menthol flavor at only 8 mg tar." The document indicated that Merit Ultra Lights and Merit Ultra Lights 100's were introduced in 1981. 2070143190-4433 at 3211-3214 (US 27257) (A); accord 2063724711-4714 (US 39838) (Confidential) (A).

3154. Consistent with the internal marketing documents detailed above, Merit advertisements communicated to consumers that, with Merit, they could reduce their tar intake and thus reduce their health risk, without sacrificing taste:

1976: "New Low Tar Entry Packs Taste of Cigarettes Having 60% More Tar." (US 5087) (A).

1976: "The greatest challenge to cigarette-makers in the last two decades has been how to make a low tar cigarette that wasn't 'low'; in taste. It seemed impossible. *Until now.* After twelve long, hard, often frustrating years, Philip Morris has developed the way to do it. The cigarette is called MERIT. **It delivers only 9 mg. tar. One of the lowest tar levels in smoking today**." (US 4981) (A) (emphasis added - bolded text); Biglan WD, 203:17-207:3.

1977: "New MERIT 100's. Only 12 mg of tar. Yet packed with extra flavor. The kind of **flavor that makes 'low tar, good taste' a reality** for 100's smokers." (US 5342) (A) (emphasis added); Biglan WD, 203:17-207:3.

1978: "Merit Solving Smoker Dilemma." (US 5704) (A); Biglan WD, 203:17-207:3; (US 5483) (A) (1977 advertisement).

1978: "Best Move Yet. MERIT['s] . . . . ability to satisfy over long periods of time could be the most important evidence to date that MERIT is what it claims to be: The first real alternative for high tar smokers." (US 5951) (O); see also (US 6112) (A) & (US 6131) (A) (1979 Merit advertisements in Sports Illustrated magazine stating same); Biglan WD, 203:17-207:3.

1978: "Research concludes MERIT taste makes move from high tar to low tar smoking unexpectedly easy." (US 5803) (A); Biglan WD, 203:17-207:3.

1988: "You Won't Miss What You'll Miss." (US 8505) (A).

1988: "Our Less Is Your Gain." (US 8556) (A).

1989: "If at first you don't succeed, try ours." (US 8659) (A); Biglan WD, 203:17-207:3.

1989: "Smoke This Page. If That Reminds You of Your Ultra Lights, Read This Ad." (US 8711) (A).

1994: "You can do it! You really can switch down to lower tar and enjoy satisfying taste." (US 12892) (A); Biglan WD, 203:17-207:3; 970469347-9474 at 9421; (US 85104) (O).

1994: "Yes you can! You can switch down to lower tar and still get satisfying taste. You've got MERIT." Jeanne Bonhomme testified that "one component of this advertisement's message is addressed to smokers contemplating downswitching." (US 9241) (A) (emphasis in original); Bonhomme WD, 30:6-18.

3155. A March 20, 1984 Philip Morris marketing report entitled "The Cigarette Consumer" stated, with regard to switching to low tar cigarettes, "[h]istorically, motivation has come from health issue. People willing to stick with lower tar because they feel are doing themselves a favor. Most successful new brands have had low tar/health motivation: Merit." Dr. Dolan explained that this document "indicates that Philip Morris's own consumer research showed that those who smoked low tar and nicotine cigarettes did so because they perceived them as a way to address the health issue. As of 1984, Philip Morris saw that the reason for most new brands' success was this health motivation." 2500002189-2207 at 2199 (US 21460) (A); Dolan WD, 122:21-123:8.

3156. A September 16, 1987 Leo Burnett U.S.A. research report for Philip Morris entitled "Merit Brand Image Study," noted in the section "Attitudes Toward Smoking" that "[w]hile health concerns are motivating factor, taste/enjoyment are still key." A summary at the end of the report stated: "Merit smokers we sampled are committed smokers . . . However, they have mixed feelings about smoking – health concerns/loss of control . . ." and their switching to

Merit "provides health reassurance." 2072735414-5500 at 5431, 5492 (US 41598) (A); Bonhomme WD, 27:22-28:17.

3157. A January 1991 document entitled "Merit Positioning Study" assessed "perceptions of Merit's positioning within the low tar category." The document stated: "While they are feeling pressure to quit, Merit smokers find low tar cigarettes to be a satisfying alternative." Under the heading "Attitudes that define Down Switchers," the document noted that an overwhelming majority of downswitchers agreed with the following statements: "I'm planning to cut down;" "I feel uncomfortable smoking when others are not;" "I feel more pressure not to smoke;" "Low tar cigarettes are a sensible choice;" "Friends pressuring me to quit;" and "I'm starting to feel self-conscious that I smoke." Under the heading "What Down Switchers want in a cigarette," the document noted that approximately half of downswitchers found "very low tar" (50%) and "very low nicotine" (48%) to be "absolutely essential." 2048976844-6906 at 6850, 6890, 6892 (US 85004) (A).

3158. Consumer feedback confirmed the successful delivery of Philip Morris's intended message. An August 1991 report prepared for Philip Morris entitled "Merit Positioning Strategy Development" observed that, "[i]n addition to advantages associated with lesser tar and nicotine delivery, low tar users note that **such brands allow higher volume, deeper inhalation smoking with few tradeoffs**." The report also commented that Ultra Light users "note their further downswitching to ultralights from lights for health benefits primarily." The report noted that **Merit users "like perceiving [Merit cigarettes] as rather safe, sensible, middle-of-the-road, non-threatening, and generating the feeling that they aren't doing anything wrong**." 2072735123-5247 at 5131, 5132 (US 41596) (A) (emphasis added); Bonhomme WD, 49:15-22.

3159. An internal Philip Morris memorandum dated May 16, 1995 from Lauren

Herman, an employee in the market information and planning group, to Norma Suter Drew, then acting Brand Manager for Merit cigarettes, entitled "Merit Alternative Campaign Qualitative Exploratory – Final Report," discussed the results of research conducted to gauge consumer interest and appeal of Merit marketing campaigns. Under the heading "Key Findings," Herman reported that "Competitive smokers appear to be most likely to respond to the concepts that offer the clearest product cues. These smokers require the most rational reason why they should smoke Merit, (e.g. lower tar)." Under the heading "Implications," Herman recommended that "[s]ince low tar is essentially the core of these alternative concepts, the low tar message should be more pronounced." 2063724960-4962 at 4960, 4962 (US 39842) (A).

3160. In a March 26, 1996 memorandum, Shari Teitelbaum, a consumer researcher for Philip Morris, delivered to Jodi Sansone, then Brand Manager for Merit cigarettes, a consumer research report commissioned by Philip Morris to "gain an understanding of consumers' perceptions of the lowest category, as well as the motivations and wants of smokers of Carlton, Now, and Merit Ultima, and potential down-switchers to this category." Under the heading "Reasons for and Perceived Benefits of Smoking Lowest Brands," it was reported that "perceived health concerns" was one of the two main reasons for initially switching to light cigarettes, and that "[w]hen perceived health benefits were cited as the reasons for choosing a lowest brand, the strongest analogy made by lowest smokers was with low fat considerations. Full flavored cigarettes were likened to high-fat food, while lighter and lowest brands of cigarettes were analogous to low-fat and light alternatives." The report found that many of the smokers who smoked Merit Ultimas had switched to a lower tar cigarette due to perceived health concerns. 2045628312-8328 at 8312, 8321 (US 22217) (A); Bonhomme WD, 15:5-17:1; see also Teitelbaum PD, United States v. Philip Morris, 4/16/02, 137:22-141:25 (discussing US 22217).

Jeanne Bonhomme admitted that Philip Morris was aware that some consumers were analogizing light and low tar cigarettes with light and low-fat foods, commonly considered to be healthier food choices. Bonhomme WD, 16:18-17:1.

3161. The research report further acknowledged that consumers smoke low tar cigarettes **despite**, not because of, their taste. Under the heading "Reaction to Alternative Merit Concepts," the report discussed consumer reactions to several proposed marketing concepts for the Merit Ultima cigarette. One marketing concept was as follows: "Concept M. Until New Merit Ultima, if you wanted lower tar, you had to settle for less taste. Not any more! New Merit Ultima, the new rule is Lowest tar, more Taste!" 2045628312-8328 at 8326 (US 22217) (A).

3162. A September 4, 1996 Leo Burnett document reported on an August 27, 1996 meeting held in New York between Leo Burnett and Philip Morris (Jose de Castro, Suzanne LeVan, and Jodi Sansone) to discuss Merit marketing for 1997. The document acknowledged that past Merit marketing focused heavily on communicating that it is low in tar, more so than sending a message about the brand's taste. Under the heading "Discussion/Agreements Reached," the document stated: "Client/agency agreed that we need to move the bar forward in terms of taste communication, as currently it is not as recognizable/prominent as low tar in Merit awareness ratings, yet it is a key driver of consumer choice/purchase." 2071522201-2203 at 2201 (US 27299) (O).

3163. A February 9, 1998 draft research report prepared for Philip Morris by the research firm Kane, Bortree & Associates, entitled "Merit Strategic Revitalization Plan, Stage I Learnings," analyzed ways to "build Merit's share of the low tar segment." Under the heading "Light Segment Learnings," the report noted that "[t]here are two very distinct benefits associated with the light segment," namely "[l]ight flavor that is not too strong" and "[b]etter for you." The

report found that low tar cigarette smokers could be divided into four attitudinal quadrants separated by the following two axes: "[w]hether or not consumers find a light taste satisfying" and "[c]onsumers' general level of comfort with smoking." 2063687348-7527 at 7350, 7353-7356 (US 39820*) (A); see also 2063686921-6942 at 6934 (US 88629) (A) ("Kane Bortree makes use of a variety of innovative, psychologically derived techniques. These techniques allow us to get inside the consumers' heads").

3164. The 1998 report discussed two types of low tar smokers who find the taste of light cigarettes unsatisfying and do not feel comfortable smoking: "Quitters" and "Validation Seekers." Quitters were described as follows: "I would really like to quit. I feel it will be easier to quit if I smoke a light. Even if I don't quit, which I may not, I believe it's better for me to smoke a light." The report cited Merit Ultima, Merit Ultra Lights, Camel Lights, and Marlboro Ultra Lights as brands for those who do not feel comfortable smoking. 2063687348-7527 at 7356, 7357, 7359 (US 39820*) (A).

3165. The "Merit Strategic Revitalization Plan, Stage I Learnings" draft research report was followed by a March 31, 1998 report by Kane, Bortree & Associates entitled "Merit Strategic Revitalization Plan, Stage II Learnings/Stage III Recommendations." Under the heading "Positioning Learnings to Date," the March report noted that "'Light' is a bigger promise than low-tar with opportunity for broad appeal" because it conveys "Tastes light," "Feels light," "Low tar," and "**Better for you**." The report recommended that Merit's "positioning should convey acceptability of smoking." The report further discussed a contemplated "Additive Free" Merit line extension, and under the heading "Additive-Free Learning" noted that: "Additive-free is an excellent fit with 'light'" because it "[r]einforces 'better for you.'" 2080486996-7108 at 7010-12 (US 45330) (A) (emphasis added); Bonhomme WD, 17:2-16.

3166. The report also discussed the results of consumer testing of contemplated Merit advertisements. For two proposed advertisements, the report noted that the advertisements' greatest strengths included the following communications to consumers: "Looks healthy. . . . Lower tar means better for you and still tastes good." Other strengths of these Philip Morris advertisements included: "For people who want to quit" and "Means are you ready to make a healthier choice." 2080486996-7108 at 7080, 7084, 7085, 7106 (US 45330) (A).

3167. A May 14, 1998 internal Philip Morris document entitled "Merit Brand Initiatives" incorporated the findings of the March 31, 1998 Kane, Bortree & Associates study, recreating that study's representation of the four segments of the lights market and stated, under the heading "Merit Strategic Positioning Copy Strategy": "What we would like smokers to believe - Merit offers a viable alternative to Light brands with full flavor heritage." In a section entitled "Star Market Segmentation Key Consumer Segments," the document described "Low Tar Seekers" as those who feel that: "I smoke light cigarettes because they're lower in tar. I would like to switch down to a lower tar than I am currently smoking." 2070657640-7650 at 7644, 7646 (US 22015) (A).

3168. Marlboro Ultra Lights. A June 1979 draft report prepared for Philip Morris by Goldstein/Krall Marketing Resources, Inc., entitled "Smokers' Reactions to an Ultra Light Brand Extension for Marlboro," discloses that Philip Morris began conducting consumer marketing research on a new cigarette line extension of the Marlboro brand, Marlboro Ultra Lights, as early as 1979. Discussing the reactions of Marlboro Red smokers to the concept of Marlboro Ultra Lights, the report stated: "The introduction of a Marlboro Ultra Light brand appeared to be viewed in the following manner: . . . "An attempt to produce a safer cigarette for those interested in cutting down their smoking and in a lighter cigarette . . . A ‘smart' way to prevent the loss of or

switching of Marlboro smokers to other brands if they are currently unsatisfied in their quest for a lighter/safer cigarette." 2041097977-7999 at 7984 (US 85006) (A); Bonhomme WD, 31:10-34:17.

3169. Under the heading "How Marlboro Ultra Lights Were Positioned," the report stated: "The following is a description of a brand image developed from the discussions [with consumers] in all three groups: . . . Safer cigarette–less tar and nicotine . . . Probably a better/innovative filter." The report further stated: "With regard to smoker image, respondents suggested: . . . People cutting down for health reasons/people trying to quit. More concerned people (about health). More aware people (those reading the numbers in the ads)." 2041097977-7999 at 7987 (US 85006) (A).

3170. On May 1, 1989, Philip Morris began test marketing Marlboro Ultra Lights, which it positioned as delivering 6 mg. of tar (per the FTC Method). In a February 8, 1989 internal Philip Morris memorandum, Richard Camisa delivered to colleagues at Philip Morris the "Marlboro Ultra Lights Marketing Plan Overview." The overview set forth the target audience for Marlboro Ultra Lights, noting that "[c]onsumer research suggests that there are vast numbers of smokers, including Marlboro smokers, who are seeking lower tar but who are also unwilling to sacrifice flavor and/or smoking satisfaction in return. The opportunity for Marlboro lies in its ability to offer smokers the lower tar they seek with less trade off in taste." 2070624747-4763 at 4748 (US 22014) (A).

3171. The document further stated: "A blue/gray pack with white tipping. . . provides traditional ultra low tar reassurance." Jeanne Bonhomme, Director of Consumer Insights for Philip Morris, testified that "low tar reassurance," as used in the document, referred to the fact that:

> Within the context of selecting a pack color for Marlboro Ultra Lights there was discussion about what pack color would make it readily apparent that the brand was an ultra low tar. Many of the lights and low tar products used blue packaging as a signal of being lower tar, so there were discussions about making sure that advertising and packaging easily communicated that Marlboro Ultra Lights was an ultra low tar.

2070624747-4763 at 4748 (US 22014) (A); Jeanne Bonhomme WD, 64:1-6.

3172. Philip Morris conducted research to determine how cigarette pack and tipping color influenced consumer perceptions of Marlboro Ultra Lights' strength and tar level. In a June 25, 1990 memorandum from Jeanne Bonhomme, then a contract consumer marketing researcher for Philip Morris, to Richard Camisa, entitled "Marlboro Ultra Lights Portfolio Test," Bonhomme reported the results of a cigarette ad pack test conducted on consumers for Marlboro Ultra Lights. Bonhomme reported that for consumers tested, "[p]redictably, expectations about [Marlboro Ultra Lights'] strength and tar level were influenced by the pack and tipping color. Red/Cork was viewed as being strongest tasting and higher in tar than the two white tipped options, particularly Blue/White." 2070197338-7340 at 7338 (US 40255) (A); Bonhomme WD, 21:4-22:4.

3173. A February 16, 1990 interoffice memorandum from Nancy Lund, former Marlboro Brand Manager, to David Dangoor, Senior Vice President of Marketing for Philip Morris, discussed a testing plan for Marlboro Ultra Lights. Lund wrote: "[a]ccelerated category growth could result from heightened health/social concerns and/or a marketplace destabilized by the introduction of a revolutionary product." 2041268603-8605 at 8603 (US 37934) (O).

3174. A November 15, 1990 interoffice memorandum from Richard Camisa to Nancy Lund, entitled "Nashville Focus Groups Top-line Report," noted that, from the Nashville focus group, "[c]learly, MUL [Marlboro Ultra Lights] is a brand for smokers looking to quit, cut down,

and/or otherwise concerned about health." 2062149029-9032 at 9029 (US 39406) (O).

3175. An internal Philip Morris memorandum dated May 7, 1996 from Natalie Ellis and Urvashi Kohli revealed that Philip Morris was aware that consumers believed ultra light cigarettes had poor flavor and that Philip Morris feared that introducing an ultra light would weaken consumers' perceptions of Marlboro as being a flavorful cigarette brand. The memorandum, entitled "Marlboro Ultra Lights Image Risk Study," summarized the results of an attached consumer research study conducted to determine the impact of the national launch of Marlboro Ultra Lights on Marlboro Red and Light brand images. Susan Norris, a fifteen-year Philip Morris employee who served as Brand Manager for Marlboro from 1995-1999 and was heavily involved in creating the marketing for the national launch of Marlboro Ultra Lights, testified that the research study was conducted because the Marlboro brand group "wanted to make sure that having a low tar brand available from Marlboro didn't change people's, you know, perception, belief, that now – that Marlboro has less flavor. They just didn't want to have any negative impact on consumers' understandings/perceptions that Marlboro stood for flavor." 2063716549-6549 (US 27140) (A); 2063716550-6586 (US 27141) (O); Norris PD, United States v. Philip Morris, 7/31/03, 96:14-98:19; 100:20-101:23; 102:19-102:25; 105:3-105:22; 106:19-107:10; 161:9-165:8.

3176. An internal Philip Morris cover memorandum dated August 19, 1996 from Natalie Ellis and Urvashi Kohli delivered a June 1996 presentation entitled "Marlboro Ultra Lights: A History" to a distribution list of Philip Morris employees, including Norma Suter Drew, then Director of New Products for Marlboro. In discussing the results of qualitative research conducted to determine consumer perceptions of Marlboro cigarette packages, the study reported that "[c]olor has a huge impact on perceptions of product strength," with the "[r]ed pack

considered the strongest and closely associated with Marlboro Red," the "[b]lue pack viewed as the mildest and consistent with an Ultra Light," and the "[g]old pack seen as positioned between red and blue and closer to lights." The Marlboro Ultra Lights study concluded that "[b]oth before and after trial, Blue/white better communicated the brand's taste and tar positioning to Ultra Light smokers." 2071535027-5090 at 5033, 5043 (US 22020) (A).

3177. Marlboro Ultra Lights was launched nationally on January 28, 1998, and Philip Morris continues to market and sell Marlboro Ultra Lights to this day. Susan Norris testified that Philip Morris targeted **all** Marlboro smokers with Marlboro Ultra Lights, not just current low tar smokers. Norris PD, United States v. Philip Morris, 7/31/03, 132:17-23, 162:6-165:8, 121:13-125:11; Bonhomme WD, 34:15-17.

3178. Marlboro Medium. In June 1991, Philip Morris launched Marlboro Medium, a lower tar line extension of the Marlboro brand. Jeanne Bonhomme, Director of Consumer Insights for Philip Morris, testified that the target consumer for Marlboro Medium was a full flavor smoker who wanted a lower tar cigarette. Bonhomme WD, 17:20-22.

3179. A September 1991 Philip Morris document entitled "Background Information on PM Brands" stated that Marlboro Medium was aimed at "consumers still looking for a satisfying low tar cigarette with flavor." 2070143190-4433 at 3206 (US 27257) (A).

3180. Philip Morris's November 1994 continuous smoker tracking survey (a random smoker phone survey Philip Morris has conducted continuously since the 1980s) provides an example of how Philip Morris targeted health-conscious smokers by promoting low tar cigarettes as less harmful. The document stated that male smokers of Marlboro Medium age 18-24 "need affirmation as smokers" and may be candidates for ultra lights. In this survey, Philip Morris created a profile of 18-24 year old male Marlboro Flavor Low (Marlboro Medium) smokers as

individuals who are less comfortable with smoking, feel pressure to quit, and do not enjoy some of the "image benefits" to the same degree as other smokers. The Marlboro Flavor Low (Marlboro Medium) male smokers age 18-24 are more likely to cite the low tar level as influential in determining their regular brand. 2048735500-5604 at 5562, 5543, 5548-5549 (US 21971) (A).

3181. A December 1994 report entitled "Report for a Concept Test for Marlboro Medium in Saudi Arabia," prepared for Philip Morris by Pan Arab Research Center W.L.L. found:

> Brand switching within the Marlboro family from the regular to the lights version, has been initiated due to a combination of health factors and the need for a lighter cigarette. In particular, Marlboro lights has been chosen because it is less harsh on the chest.

2501130255-0360 at 0287 (US 45898) (A).

3182. An internal February 10, 1995 Philip Morris memorandum from Marian Wood to Tom Keim, entitled "Marlboro Medium Brand Imagery," revealed that in 1991, Philip Morris spent $50 million on advertising for Marlboro Medium, 36% of Marlboro's total advertising budget for that year. 2063731689-1710 at 1695 (US 79820) (A).

3183. Philip Morris continues to sell Marlboro Medium. Bonhomme WD, 20:1-2.

3184. Parliament. Philip Morris marketed the Parliament brand as a low tar brand featuring a "recessed" filter. A Philip Morris document entitled "Background Information on PM Brands," dated September 1991, stated:

> It was during the proliferation of filtered cigarettes in the 1950's that Philip Morris gave Parliament its hallmark of today – the recessed filter. Unlike ordinary filter tip cigarettes, Parliament's famous recessed filter kept tar from touching the smoker's lips. Since the addition of this unique filter, Parliament smokers have enjoyed their brand's approach to smoking: clean, sophisticated, and distinctive. In 1979, Parliament's name was changed to

> Parliament Lights. This change reflected the brand's low tar status and helped capitalize on a growing low tar trend.

A "Benefit Statement" in the document was: "Parliament Lights – since tar on the filter tip never touches your lips, the taste is refreshingly light." 2070143190-4433 at 3217-3218, 3222 (US 27257) (A).

3185. A 1975 Parliament advertisement in Sports Illustrated magazine stated that, although cigarette holders gave "cleaner taste," there was "[n]o need for a cigarette holder today. Parliament's filter is recessed, so you taste only rich, clean tobacco flavor. It's the neatest trick in smoking." (US 4709) (A); see also (US 4885) (O) (1975 Parliament advertisement featuring recessed filter).

3186. A 1977 Parliament advertisement in Cosmopolitan magazine stated: "As you smoke, tar builds up on the tip of your cigarette filter. That's called 'filter feedback.' Ordinary flush-tipped cigarettes put that tar build-up against your lips. And that's where Parliament has the advantage. Parliament's filter is recessed to keep tar buildup from touching your lips." ADV029 0247-0249 (US 10614) (A); Bonhomme WD, 35:5-19.

3187. As noted in the 1981 FTC Report on cigarette advertising, Philip Morris's Parliament advertisements from the time period preceding the Report (i.e., late 1970s – 1981) implied that its "**special filters minimize the risks of smoking**." FTC, 1981 Report at 2-12 (JD-004744) (A) (emphasis added).

3188. Jeanne Bonhomme testified that although the recessed nature of the filter did not further reduce the tar delivery or make the cigarette any less harmful, she could "recall learning that some consumers believed that a recessed filter produced a cigarette that was better for you because it reduced tar and less tar was perceived to be less of a health risk." Indeed, a November 23, 1988 Philip Morris USA memorandum co-written by Bonhomme and Karen Eisen, with the

subject heading "Parliament Super Lights In-Depths," stated "[f]or many, the recessed filter implied a health benefit – 'keeps tar away.'" Bonhomme WD, 34:18-35:1; 35:20-36:15; 2071388176-8178 at 8178 (US 40452) (A).

3189. An April 12, 1995 Philip Morris memorandum from Lauren Herman to Shelby Rafferty, former Parliament Brand Manager, entitled "Parliament Menthol Research - Summary," reported consumer marketing research findings intended to "understand the awareness, attitudes and perceptions that white menthol smokers had toward light menthol cigarettes in general and Parliament in particular." In the memorandum, Herman reported to Rafferty that: "Approximately 4 in 10 of the smokers said they knew what a recessed filter was. There was a variety of perceptions regarding what a recessed filter is; however, the benefit most often associated with a recessed filter was lower tar levels. About one-quarter of these smokers, in total, had tried a recessed filter." 2063709250-9252 at 9250 (US 27136) (A) (emphasis in original).

3190. A Philip Morris document entitled "Parliament Menthol Lights Update, NPC Meeting March 27, 1996" stated that the marketing objectives of Parliament Menthol Lights advertising included: "Communicates low tar." 2072651442-1456 at 1448 (US 27339) (A).

3191. A Philip Morris presentation from January 1997 entitled

2080490776-0774 at 0779 (US 77751) (Confidential) (A).

3192. Philip Morris Research On the Low Tar Cigarette Category. Internal Philip Morris documents reveal that Philip Morris conducted consumer marketing research not just on

individual low tar cigarette brands, but on low tar cigarettes as a category. These documents reveal that Philip Morris has long known and intended that its advertisements and marketing for low tar cigarettes, featuring claims of lowered tar and nicotine and "light" and "ultra light" brand descriptors, contributed to and reinforced consumers' mistaken belief that low tar cigarettes are better for their health, and caused consumers to smoke them for this reason. For example, a July 24, 1958 Philip Morris memorandum from C.V. Mace to Dr. R.N. DuPuis, entitled "Brief comments on a program to produce a low delivery filter cigarette with flavor," proposed a push for developing a "low delivery cigarette having good flavor." The memorandum stated:

> I'll bet that the first company to produce a cigarette claiming: a substantial reduction (say 50% less than the present Parliament and Kent) in tars and nicotine, or an ersatz cigarette whose smoke contains no tobacco tars, and with good smoking flavor, will take the market. Further, if he has the intestinal fortitude to jump on the other side of the fence (provided he has some convincing experimental evidence to back him up) on the issue of tobacco smoking and health, just look what a wealth of ammunition would be at his disposal. Of course, we would have to be careful to infer that the reason for the change in dress was the continuing evidence linking cigarette smoking with health, and that although the evidence is not altogether irrefutable we have decided upon this course of action in the public interest. **In this way, we have protected our bridges behind us because we have not admitted there is a direct relationship between smoking and health, and we are building new bridges ahead which we will need if there is a flood, but which we will not need if there is no flood**. In other words, we are planning for the worst; and in the event it proves unnecessary in the future, the experience gained should be useful for other purposes.

1001920356-0357 at 0357 (US 85007) (O) (emphasis added).

3193. A June 1966 Philip Morris report prepared by researcher Myron E. Johnston, Jr. for Helmut Wakeham and others, entitled "Market Potential for a Health Cigarette," stated:

> Available evidence from surveys shows conclusively that smokers are concerned about the relationship of cigarette smoking to health but that they do not want to quit smoking. They are, however,

> changing their smoking habits, generally toward higher filtration, even at the expense of a loss of some tobacco flavor. That these changes are health motivated is clear from the timing of the shifts: The boom in filters came on the heels of the first health scare, and the Surgeon General's Report stimulated the shift to charcoal filters.

As expert historian Dr. Allan Brandt testified: "The public had been conditioned to accept the filtering effects of charcoal in other fields, and when charcoal was added to cigarette filters it proved to be an effective advertising gimmick." 1001913853-3878 at 3858-3859 (US 20123) (A) (emphasis added); Brandt WD, 135:15-136:11.

3194. Nancy Lund, Senior Vice President of Marketing at Philip Morris, testified in 2002 that Philip Morris was aware in the 1970s and 1980s that some consumers believed that light/low tar cigarettes were safer than full-flavored cigarettes. Lund further testified that, during this time period, Philip Morris marketed such cigarettes to these consumers and profited from those sales. Brennan-Lund PD, Price, 9/20/02, 158:6-161:15.

3195. James Morgan testified in 2002 that the trend in the 1970s toward low tar cigarettes was due in large part to consumer perception that they were less hazardous to health than higher tar cigarettes, specifically admitting that "the consumer was perceiving in the 1970s lower tar as tied to less hazardous." Although Morgan conceded that "we were aware of that," he testified that, despite being armed with this knowledge, Philip Morris took no additional steps to counter that mistaken perception. Morgan PD, Price, 6/5/02, 42:16-42:25; 43:2-43:25; 44:2-44:25; 45:2 - 45:25; 63:10-63:25; 64:2-64:25; 65:2-65:21; 1004888470-8484 (US 85009) (A); 502641641-1646 (US 85008) (O).

3196. A May 1976 study prepared for Philip Morris by The Roper Organization, entitled "A Study of Smokers' Habits and Attitudes With Special Emphasis on Low Tar Cigarette," stated:

> [T]his study shows that the smoking public is convinced that to the extent any brands are better for health, it is the low tar brands that are. . . Low tar brand smokers cite as the most liked characteristic of their brand . . . as compared with smokers of flavor filters, they say it is '**better for your health**' and cite its 'more effective filter.' . . . **Brands Thought Better For Health – The low tar brands have cornered opinion that to the extent any brands are better for your health, they are**. . . Three in ten of all smokers said some brands were better for health than others, and almost half of the low tar brand smokers said this. . . . Furthermore, it is the lower tar content of these brands that make people say they are better for your health.

2024921314-1612 at 1333, 1348, 1352-1353 (US 20403) (A) (emphasis added).

3197. A January 1979 study prepared for Philip Morris stated:

> **These ultra low tar smokers indicated that they are aware of the low tar levels in their brands and that they switched to them specifically because of advertising calling this fact to their attention** . . . As lower and lower tar brands become available, it would appear smokers are subject to advertising pressure and brand availability, and the opportunity for switching obviously occurs. . . Characteristics of ultra low tar smokers were: people who want to quit . . . more interested in health. . . When asked how they happened to switch to the brand they are now smoking many of the Carlton smokers cited advertising and tar and nicotine ratings. . . . When Carlton ads were shown in the groups, it was obvious that most respondents had seen them and were aware of the copy claims. It was these claims and other Carlton ads to which smokers referred prior to exposure and when discussing the fact that advertising had been one of the factors causing them to try the brand. **This would seem to indicate that ultra low tar smokers are paying attention to and being attracted by the advertising**. Respondents . . . appeared to react favorably to the Triumph ads. They said that 3 mg. tar was within the ultra low tar range implying that it represented a safer cigarette.

2040066740-6766 at 6747, 6748, 6751-52, 6754, 6756, 6757 (US 20435) (O) (emphasis added).

3198. A Philip Morris document circa 1979 prepared by Judy John and Helmut Wakeham and entitled "Breakthrough of the High Taste, Low Tar Cigarette: A Case History of Innovation," stated that the cigarette companies' "emphasis on low-tar products is the result of

consumer demand spurred at least in part by the smoking and health controversy." 1000208603-8625 at 8604 (US 85010) (O).

3199. A March 1979 report prepared for Philip Morris, entitled "A Study of Smokers' Habits and Attitudes With Special Emphasis on Low Tar and Menthol Cigarettes," stated:

> **The appeal of low tars is simple and single–better for you, less harmful, easier on the lungs, throat, etc.** The weakness or objection to low tars is also simple–tasteless, lacking in satisfaction, and the related factor of hard to draw on. At the same time **there is clear evidence that if the appeal–safety–is strong enough, people can over time grow used to, and in some cases come to actually like, the main objection to low tars–low taste**.

2049455309-5318 at 5315 (US 22218) (A) (emphasis added); Bonhomme WD, 25:15-26:14.

3200. A June 1979 draft report prepared for Philip Morris by Goldstein/Krall Marketing Resources, Inc. entitled "Smokers' Reactions to an Ultra Light Brand Extension for Marlboro, stated, under the heading "Awareness of Tar and Nicotine Levels":

> One of the points on which respondents were probed when first shown the array of packs used as stimuli was their awareness of tar and nicotine levels for the brands. While most smokers in the groups could not give correct tar figures for each brand, they seemed to know a general range in which brands fell . . . . **Respondents attributed their knowledge . . . to advertising. Evidently, the heavy weight of advertising concentrated against tar claims has penetrated these various groups of smokers to some extent**.

2041097977-7999 at 7990 (US 85006) (A) (emphasis added).

3201. A January 23-24, 1984 report by employees in Philip Morris's Product Evaluation Division, entitled "Product Testing Short Course," noted, after reciting how public dissemination of reports linking smoking as a cause of disease affected sales, that smokers' "susceptibility to **our traditional response to anti-smoking publicity – lower tar** – is . . . decreasing." Dr. Dolan explained that this document "shows that Philip Morris regarded low tar brands as a way to deal

with negative information about the effects of smoking." 202028817401-7576 at 7506 (US 20016) (A) (emphasis added); Dolan WD, 122:12-20.

3202. A July 27, 1987 Philip Morris Asia letter from Joe Tcheng to Cecil Yow stated: "The mild/lights segment is the fastest growing segment in the Hong Kong market. . . . There is definitely a growing health consciousness in the market due to regular Government anti-smoking campaign. . . . **Research shows that Lights = Mild = Less Harmful**. Government's anti-smoking measures will intensify and . . . . [t]his may further increase health concern and it is very likely that the mild/lights segment will continue its rapid growth." 2504046594-6601 at 6594 (US 85012) (A) (emphasis added).

3203. An August 13, 1987 research report prepared for Philip Morris by Leo Burnett entitled "Marlboro Ultra Low Tar Campaign Strategy," observed that "[l]ights smokers perceive current Ultra Low Tar smokers as: ‘a chronic smoker who's noticed a smoker's cough'." The report also found that smokers primarily try Ultra Low Tar cigarettes due to "health concerns = downswitching." 2049437636-7689 at 7666, 7678 (US 38741) (A).

3204. A February 12, 1988 Philip Morris USA memorandum from L. Suwarna to D.E.R. Dangoor, stated: "[T]he combination of increased consumer demand for 'safer' cigarettes with a technological breakthrough delivering acceptable tasting filter cigarettes led to the transformation from non filter to filter cigarettes." 2043876284-6291 at 6285 (US 26943) (A); Bonhomme WD, 54:2-12.

3205. A circa 1990 Philip Morris transcript of a conversation between Richard Carchman and John Tindall acknowledged that Philip Morris had used filters and claims of low tar as health reassurance mechanisms and that cigarette sales were tied to health concerns. Tindall stated:

> [T]he things that happened in the market in the past I put under basically three groups. One has to do with **people's health concerns which we addressed first through filters and then through low tar and ultra low tar**. . . . The main thing that has happened in the market over which we have some control is that we have addressed peoples' health concerns through the number of steps I have mentioned. . . . the[re] are opportunities in the market now in the area of smoking and health. People's perceptions of cigarettes with regard to their effects on them. . . . [I]f **we are going to do something significant enough to possibly even reverse the declining sales in the market, we're going to have to make advances in the area of people's health**.

2023148544-8550 at 8545-8546 (US 85098) (O) (emphasis added).

3206. A Philip Morris document circa 1990 relating to "New Brand Development" in Pakistan revealed Philip Morris's knowledge that cigarette packaging can communicate "mildness" to consumers anxious about the "health/safety issue":

> There was little doubt that the pack design with its reliance upon the central gold panel against a white background effectively projected the impression of a very mild cigarette. . . . The evidence as a whole seemed to indicate, in fact, that anxiety about the health safety issue had not yet reached the level where avowedly very mild cigarettes . . . could expect an extensive franchise. . . . Over time, anxiety levels would rise, as they have done in other markets and when this happened mild/light brands . . . would begin to achieve respectable sales.

2504008471-8519 at 8478, 8518 (US 85013) (A).

3207. A February 12, 1991 Philip Morris marketing research department report described the smoker profile of a Marlboro Extra Lights smoker as close to that of a traditional low tar smoker, which included "Health Conscious Smokers." 2041497481-7503 at 7485 (US 22145) (A).

3208. A September 26, 1991 research report entitled "Qualitative Research on Menthol/Nonmenthol Smokers," prepared for Philip Morris by the research firm ASI Market Research (Japan), indformed Philip Morris that the ideal cigarette for both menthol and

non-menthol smokers would present no risk or minimal risk to health. 2057096412-6532 at 6526, 6528 (US 87881) (A).

3209. Philip Morris USA's 1992-1996 Strategic Plan for Research and Development stated, under the heading "Perceived Health Concerns," that: "An analysis of the cigarette market over the last 50 years suggests that there have been only two major influences on smokers buying patterns; namely smokers seeking to address their perceived health concerns and smokers seeking price relief." The document further stated:

> The development of products which address perceived health concerns . . . is very much an R&D issue. **Previous product changes driven by 'perceived health concerns' were the growth of filtered products from 3 to 70% of the market between 1945 and 1953, and the growth of the low tar segment to nearly 50% of the market by 1985**. . . . Filtered cigarettes now make up over 96% of the market.

2021529528-9638 at 9608 (US 85084) (A) (emphasis added). Jeanne Bonhomme, Director of Consumer Insights for Philip Morris, referring to this document, testified: "I assume that Philip Morris's management would have been aware of its contents." Bonhomme WD, 54:2-55:12.

3210. An internal August 30, 1994 Philip Morris memorandum from Jeanne Bonhomme, then Manager of Marketing Research, to John Heironimus, entitled "Motivations for Merit and Low Tar In-Switching," examined reasons why consumers "switch down" to lower tar cigarettes. Reasons identified by Bonhomme included "[m]aking a responsible choice" and "thinking to the future." At trial, Bonhomme explained her reference to making responsible choices: "What I was referring to was the notion among some smokers that low tar cigarettes were a better choice, that they were healthier." 2071535456-5469 at 5456 (US 22021) (A); Bonhomme WD, 25:2-6.

3211. Faxes dated November 17, 1994 and December 7, 1994 from Thomas R. Keen of

the consumer research company Censydiam USA to Marian Halpern, an employee in the Philip Morris consumer marketing research department, described an agreement with Philip Morris whereby Censydiam would produce "write-ups" to Philip Morris on consumer "trends," including, among others, "Health & Fitness," "Delusions of Youth & Beauty," "Dieting Dilemma," and "Quality of Life." A November 14, 1994 fax from Censydiam USA to Philip Morris advised that with respect to the "Health & Fitness" trend: "Outside pressures have made consumers more concerned about health and fitness. They are interested in finding 'user friendly' ways of making their lives healthier without making dramatic changes in their current lifestyles." As examples of the consumer health trend, the document noted increased consumer interest in package labeling that included references to "low/no fat/salt" and "all natural," as well as an increase in the sale of products considered "good for you" such as fruits and vegetables. A 1994 Strategic Trend Analysis prepared for Philip Morris by Censydiam USA illustrating the "Health & Fitness" trend recognized how Defendants had capitalized on this trend, noting that: "Implications for Tobacco Companies: While **the trend toward health and fitness is still alive**, it has tapered off from its rage in the 1980's. The 1990's focus on moderation. The **importance of low/ultra low products should continue in the near future**." 2063704131-4132 (US 39829) (A); 2063704088-4091 at 4090-4091 (US 39827) (A); 2063704135-4136 (US 27135) (A) (emphasis added).

3212. In a March 26, 1996 memorandum, Shari Teitelbaum, a consumer researcher for Philip Morris, delivered to Jodi Sansone, then Brand Manager for Merit cigarettes, a consumer research report commissioned by Philip Morris to "gain an understanding of consumers perceptions of the lowest category, as well as the motivations and wants of smokers of Carlton, Now, and Merit Ultima, and potential down-switchers to this category." One of the "Key

Findings" of the report was that:

> Consumers do not appear to be generally aware of the lowest category as we define it. Few were able to discuss specific tar levels of their cigarettes. . . **Consumers tended to use the words light or lower when discussing tar levels of their brands**.

2045628312-8328 at 8312 (US 22217) (A) (emphasis added).

3213. A May 1996 research report prepared for Philip Morris by the Sun Research Corporation, entitled "Highlights of 17 Triads with Potential In-Switchers, Merit Ultima and Carlton/Now Smokers," was intended in part to "[b]etter understand the wants, motivations, and decisions of potential downswitchers about what they seek in the way of taste, lightness, and brand imagery for a lowest tar brand." The report hypothesized that "[p]otential in-switchers seem very far from actually switching to a lowest tar cigarette although they say they are 'definitely' or 'probably' interested. They <u>say</u> they are concerned about perceived health issues." The report found that "[e]ach potential in-switcher had a rationale for their particular choice in a light brand, believed that it was lighter . . . perceived to be better for them . . . than the brand they had previously smoked." 2048941177-1201 at 1180, 1183, 1187 (US 38731) (A) (emphasis in original).

3214. A September 10, 1999 Davis Polk & Wardell memorandum to Mark Berlind of Philip Morris includes "a series of questions that might arise, as well as possible answers, relating to low delivery cigarettes and brand descriptors." In answer to the question "If the brand descriptors do not indicate what smokers actually inhale or serve as a point of comparison among competing brands, what purpose do they serve?," the memorandum's proposed response states that Philip Morris's brand descriptors **do** communicate that Philip Morris's lower tar brands deliver less tar and nicotine than full-flavor brands: "For example, the 'Lights' in Marlboro Lights indicates that the smoke yields for Marlboro Lights is lower than that for Marlboro, and Marlboro

Ultra Lights delivers less smoke 'tar' and nicotine than Marlboro Lights." 2072675414-5417 at 5415 (US 27347) (A).

3215. This document's proposed response to a question as to whether "Philip Morris ever intend[ed] to or propose to take advantage of" the "perception" of consumers that "lower-yielding brands [are] 'safe' or 'safer' than full-flavor brands" reveals that Philip Morris has intended to take advantage of the perception that lower-yield brands are safe or safer: "Philip Morris has never**[?]** intended or proposed to take advantage of this perception. (although **over time various individuals in the Company may have suggested that the Company do so**)[.]" 2072675414-5417 at 5415-5416 (US 27347) (A) (emphasis added – bracketed material in original).

3216. Ellen Merlo, then Senior Vice President of Corporate Affairs at Philip Morris USA, testified in 2002 that, notwithstanding the placement of the Surgeon General warning on cigarette packs, some people were smoking low tar cigarettes because they thought they were better for their health. Merlo PD, Price v. Philip Morris, 10/2/02, 159:7-18; 160:13-24.

3217. As to whether Philip Morris took advantage of the situation (that smokers switched to low tar cigarettes under the mistaken perception that they are healthier and whether Philip Morris profited from the misperception), Nancy Brennan-Lund gave the following testimony in a 2002 deposition: "[D]id we take advantage of the fact that people wanted low tar cigarettes, the only answer I can give is yes, we did." Brennan-Lund PD, Price, 9/20/02, 160:18-161:15.

(ii) R.J. Reynolds

3218. Camel. Camel Lights advertisements in 1978 used the slogan "Introducing the solution," representing Camel Lights as the solution to the problem "[e]verybody knows," i.e.,

that low tar cigarettes do not have an acceptable taste (1978, Penthouse magazine: "New Camel Lights Introducing the solution."); ("Introducing the solution. New Camel Lights. Everybody knows the problem [referring to poor taste of low tar cigarettes]. Now Camel Lights has the solution."). (US 5872) (A); (US 87195) (A); (US 87192) (A); (US 87204) (A); (US 5709) (A); Orlowsky WD, 87:22-89:16.

3219. Camel Lights advertisements in the 1980s continued to promise the "solution" of low tar cigarettes that provided "[s]atisfaction" by containing acceptable "taste," which was lacking in low tar cigarettes:

> 1980: "Discover Camel Lights. Satisfaction. Low tar."
>
> 1980: "Discover satisfaction. Camel Lights. The Camel World of satisfaction comes to low tar smoking. . . . Camel Lights brings the solution to taste in low tar."
>
> 1981: "Camel Lights. Low tar. Camel taste."
>
> 1981: "Camel Lights. . . . Same low tar, same Camel taste."

519315781-5797 at 5788-5789, 5792-5793, 5795, 5796 (US 79583) (A).

3220. In the 1990s, RJR used slogans such as "GET ULTRA" to advertise its Camel Ultra Lights brand. 970469347-9474 at 9442 (US 85104) (O) (circa 1991 Camel "GET ULTRA" advertisement).

3221. RJR's 1994 marketing research on Camel Special Lights advertising ("Concept #17: The Special Lights Filter. Takes out impurities other filters can't touch") included the following statements from smokers that the advertisement conveyed to them:

- "It sounds like it's taking the poison out of the cigarette."
- "Takes out the impurities–makes it sound like a healthier cigarette."
- "The special filter would clean the cigarette and make it a healthier cigarette to smoke."

- "It makes me feel I can enjoy smoking without harming myself because the filter takes out impurities. It sounds safer to smoke."
- "[I]t's safer for you."
- "Sounds like it would save your lungs."

509619620-9625 at 9620, 9622, 9624, 9625 (US 85015) (O).

3222. Doral. RJR marketed Doral as a low tar cigarette brand in the 1970s. A January 1972 Doral advertisement in Newsweek magazine stated: "Doral, the low 'tar' and nicotine cigarette. . . [t]he filter system you'd need a scientist to explain. . . But Doral says it in two words: 'taste me.'" (US 87452) (O); Schindler WD, 68:12-13.

3223. A June 1975 RJR Doral advertisement in Sports Illustrated magazine implied a health benefit to smoking low tar cigarettes by analogizing them to a "Doral Diet." The advertisement, depicting a man lighting a cigarette, stated:

> "How I lost 700 mg. of 'tar' the first week . . . without losing out on taste. I'm not too big in the willpower department. But I lost 700 milligrams of 'tar' the first week on what I call 'The Doral Diet.' Now I can still enjoy smoking, and cut down on 'tar' and nicotine, too. . . . For a pack a day smoker like me, my Doral Diet really ads up."

(US 4746) (A); Schindler WD, 68:14-69:9; 03496228-6630 at 6329 (US 20057) (O).

3224. A June 24, 1975 advertising research report for the Doral "Diet Filter" advertising campaign prepared by Reynolds's Marketing Research Department and "conducted to aid in evaluating six 'Doral Filter' executions in recall impact and communication," recorded smokers' impressions and perceptions of Doral advertisements. The research report also noted that respondents, when asked about a specific "Doral Diet" advertisement, indicated that they believed that it promoted the notion that Doral cigarettes, because they were low tar, were healthier to smoke than other cigarettes. Consumers had the following perceptions of the

campaign:

"The ad said something about a diet of tar and nicotine. My impression was that they had less tar and nicotine than other brands. **The main idea was that they're better for you because of the cut-down in tar and nicotine**." (Id. at 7581).

"My impression was that they claim it's safer to smoke Doral than other cigarettes." (Id. at 7585).

"My impression was that it's worth a try if it is healthier for me." (Id. at 7585).

"The main idea was that it would be better to smoke it because it's lower in tar." (Id. at 7586).

"The main idea was that it's safer to smoke." (Id. at 7586).

"I got the impression that they want you to switch to Dorals and save your health." (Id. at 7587).

"They brought out the idea that it might be a good cigarette to try if you're worried about the amount of 'tar' and nicotine your lungs are absorbing. The main idea was to save your health, but if you still want to smoke, smoke Doral." (Id. at 7588).

"It showed a man sitting in a chair and lighting up a Doral. It said that it had less 'tar', but the taste didn't change. **The impression it brought out was just the fact that it's a safer cigarette for your health**, if you have to smoke. They were trying to get across that it has less 'tar', and is still as good in taste as the other cigarettes." (Id. at 7591).

"Nothing was brought out except, I guess, if you have to smoke, you should choose a low 'tar' cigarette for health reasons." (Id. at 7592).

"The main idea was that it's less dangerous to your health than any other cigarette." (Id. at 7593).

"The main idea was that you would get as much satisfaction, and it wouldn't be as bad for you." (Id. at 7595).

"The ad said it is lower in tar; therefore, it is healthier. **The idea brought out was it would be a safer cigarette**. The main point was it is healthier to smoke, since it is lower in tar." (Id. at 7599).

"The ad showed a man with a cigarette. It's a small black and white picture surrounded by writing. There's a pack of cigarettes. The ad said that this man lost so many mg. of tar on his Doral Diet. My impression was that by smoking Doral, you are taking in less harmful tar. **The main idea of the ad was to try a healthier smoke, try the Doral Diet**." (Id. at 7600).

"The main idea they were trying to get across was they're better for your health." (Id. at 7603).

"The main point of the ad was that they were safer for your health because of lower tar and nicotine." (Id. at 7607).

"A man was smoking a cigarette. The ad said that Doral is lower in tar and nicotine than any other cigarette. The impression that came across was that they would be less harmful if you smoked them. There's a lower tar and nicotine count. **The main idea of the ad was that smoking Doral is better for your health**." (Id. at 7608).

"Their main idea was that they would still taste good, but they're low in tar and nicotine and would consequently be better for you." (Id. at 7611).

"The main idea was you have less chance of danger to your health with Doral than another brand." (Id. at 7613).

"My impression was it's much less of a health risk." (Id. at 7613).

"My impression was that obviously because of dangers, cigarette companies are starting to cut down on tar." (Id. at 7614).

"The main point was it's safer because you take in less tar." (Id. at 7617).

The pitch was if you smoke Doral, you may have better health." (Id. at 7618).

"It gave me the idea if you are conscious of your health, you should smoke these." (Id. at 7619).

"The main point was that it's a healthy cigarette to smoke compared to other cigarettes." (Id. at 7620).

501457575-7706 at 7576 (US 22150) (A) (emphasis added); Schindler WD, 69:14-71:21.

3225. Two months after this Doral Diet research report, RJR placed another Doral Diet

advertisement in the August 4, 1975 edition of Sports Illustrated magazine that doubled the claimed loss of tar – to 1400 mg. – compared to the June 1975 advertisement, (US 4746) (A). The August 1975 advertisement featured the headline: "How I lost 1400 mg. of 'tar' the first week... without losing out on taste." (US 4789) (A); Schindler WD, 72:5-17.

3226. A 1975 study regarding the effectiveness of another Doral advertising campaign found that: "Attitude diagnostics indicated that smokers had no problem understanding the 'Wise Up' campaign. Respondents felt that 'Wise Up's' main point was a low tar and nicotine claim (84%) with some taste mentions (24%)." By way of example, some of the respondents noted:

> "The main idea they were trying to get across was it's less dangerous to the health and better tasting."
>
> "I guess the idea is that Doral is safer to smoke, as it has less tar and nicotine than others."
>
> "My impression was that Doral is less harmful."
>
> "The main idea they were trying to get across was to smarten up because the cigarettes have less tar."
>
> "The main point of the ad was you can have good taste and be a little less harmful, too."

501719738-9761 at 9738, 9748-49, 9752, 9755 (US 22075) (A); Schindler WD, 72:18-73:19.

3227. A July 27, 1976 letter to RJR employee Ed Blackmer discussed Doral's marketing positioning. The letter noted that the "**smoker we are going after must be concerned about the health controversy**. It is understood that we cannot necessarily target our media against 'concerned' smokers, but that this must be accomplished via creative. Nevertheless, we believe it is an important factor in further 'segmenting' our target audience." 50224143-4151 at 4147-4148 (US 22103) (A) (emphasis added).

3228. In discussing a Doral 4 advertising research proposal in June 1977, the copy

strategy was described as: "Convince the Prime Prospect that new Doral 4 is the solution to his concern about the smoking controversy because it offers the optimum combination of ultra-low tar and taste satisfaction." As a result, the advertising was to be addressed to smokers "seriously concerned about the alleged hazards of smoking," and who, "because of [their] concern, seek[] one of the lowest tar levels available (or an ultra-low level)." 501533008-3011 (US 22107) (A); Orlowsky WD, 69:1-23.

3229. Vantage. Martin Orlowsky, former Executive Vice President of Marketing and Sales for RJR, testified that RJR's advertisements for Vantage were targeted toward smokers who, due to their concerns about health risks, were seeking a low-tar cigarette. Orlowsky TT, 10/13/04, 2288:24-2289:19.

3230. Vantage advertisements from the 1970s used purported testimonials characterizing Vantage as delivering low tar to smokers and thereby reducing the health risk from smoking:

1972: "Why I smoke Vantage. I read the papers. I watch TV. I hear the things some of them are saying about smoking. . . . And then, frankly, all that the critics say about 'tar' and nicotine has to make an impression. Fact is, **they don't make me feel guilty about smoking Vantage**." (US 3683) (A) (emphasis added); Biglan WD, 377:12-379:22.

1977: "**Smoking. Here's what I'm doing about it** . . . . like a lot of people I'm . . . aware of what's being said [about the harm of cigarette smoking]. And like a lot of people I began searching for a cigarette that could give me the taste I like with less tar . . . . Vantage. It's everything the ads say it is . . . . **What am I doing about smoking? I'm smoking Vantage**." (US 5578) (A) (emphasis added); see also (US 324) (A) (1978 Vantage advertisement in Rolling Stone magazine noting same).

1977: "**Vantage is solving a lot of my problems about smoking**. (US 239) (A) (emphasis added).

1977: "Vantage is changing a lot of my feelings about smoking. . . . I'm not living in some ivory tower. I hear the things being said against high-tar smoking as well as the next guy. And so I started looking for a low-tar

smoke that had some honest-to-goodness cigarette taste. . . . As far as I'm concerned, when I switched to Vantage, I changed to a cigarette I could enjoy." (US 87456) (A).

1977: "My wife got me to switch to Vantage. . . . My wife . . . would remind me of the stories being told about high-tar cigarettes. Well, I began looking into those new low-tar cigarettes. . . . [Vantage] tasted really good and they actually had less than half the tar of my old brand. . . . So now, I smoke Vantage. **I get the taste I want and the low tar** . . . ." (US 87457) (A) (emphasis added).

1978: "'Why I choose to smoke. . . . **I'm not deaf to what's being said about tar. So I searched out a cigarette that would give me taste with low tar**. . . . Vantage has all the taste I enjoy yet, surprisingly, much less tar than my old brand." ADV017 1589-1591 (US 5756) (A) (emphasis added).

1978: "'Vantage gives us more taste and less to argue about. **My husband and I . . . . [are] both aware of the things being said against high tar**. So there we were facing each other every day, smoking our high-tar cigarettes and daring each other to switch to something lower. . . . Today, we both smoke Vantage. **You could say we're getting less tar** and we're getting along – with Vantage." ADV108 0001-0003 (US 87504) (A) (emphasis added).

1978: "These days, why do I smoke? . . . . With all the talk about smoking and high tar, it didn't take much imagination for me to conclude that the cigarette of the future would taste good and probably be low in tar as well. . . . Then I discovered Vantage. It was my kind of cigarette. It gave me taste. Pleasure. And the low tar I was looking for." (US 295) (A).

1979: "New Vantage Ultra Lights. Ultra taste. Never-before, silky smooth, truly satisfying taste – in an ultra low tar cigarette! (And we do mean ultra low. At only 6 mg of tar, it's lower than 90% of all the cigarettes that people buy.) How is it possible? Through a unique blend of very select, very flavorful tobaccos. That's the Ultra Cigarette – new Vantage Ultra Lights from Vantage." (US 6255) (A); (US 6286) (A); Biglan WD, 377:12-379:22.

1988: "Vantage Ultra Lights. How can anything so ultra light taste so ultra good? Find out for yourself. Try a pack today." (US 1613) (A); Biglan WD, 377:12-379:22.

See also Orlowsky WD, 73:1-76:22 (discussing US 5578 (A); 324(A); 239(A); 87456 (A); 87457(A); and 295 (A)); 76:23-77:11 (discussing US 6255 (A)); 77:12-78:21 (discussing US 5756 (A) and 87504 (A)); Orlowsky TT, 10/13/04 2284:14-2285:20 (discussing US 87504 (A)).

3231. Advertisements for Vantage from the 1970s also included the following, which encouraged health conscious smokers to switch to Vantage:

> 1974: "**Maybe the people who criticize smoking should stare the facts in the face. Then they might recommend that if you've decided to smoke, but are concerned about 'tar' and nicotine, you might smoke Vantage**. Vantage offers smokers the rich, tobacco flavor they've come to appreciate. With a substantial cut in 'tar' and nicotine. So if you're one of those smokers who is now deciding between high 'tar' and nicotine cigarettes that taste good, and low 'tar' and nicotine cigarettes that taste like nothing, you might appreciate Vantage . . . **Vantage is both high in flavor and low in 'tar' and nicotine**." 03496228-6630 at 6313 (US 20057) (O) (emphasis added).
>
> 1976: "Are you still smoking? In the years since the criticism against smoking first appeared, many people have given up cigarettes. But many more people haven't. . . . [W]e'd like to talk to. . . . [t]hat even larger group of people who are still smoking today. If you're a smoker, you've probably heard the charges leveled against 'tar' and nicotine. You may have become concerned. And chances are you even tried to do something about it. Like trying . . . low 'tar' and nicotine cigarettes. . . . **Vantage cuts down substantially on the 'tar' and nicotine you may have become concerned about. . . . So, if you still smoke, but would like to cut down on 'tar' and nicotine, Vantage is one cigarette you should seriously consider**."

500713420-3420 (US 48350) (O) (emphasis added).

3232. An internal February 11, 1975 B&W memorandum by "J.V.B." commenting on RJR's Vantage advertisements stated that RJR's advertisement ("Why do you smoke? With what you've been hearing about smoking these days, you probably wonder sometimes why you smoke at all") was "address[ing] the health issue for competitive purposes." 690007757-7760 at 7759 (US 21039) (A).

3233. The foregoing marketing campaigns demonstrate, and an April 19, 1978 memorandum makes clear, that "Vantage has traditionally limited its target market to 'concerned' full flavor smokers." That same memorandum points out, however, that "[m]any current VANTAGE smokers, in an effort to alleviate their concerns for smoking, are switching to lower

tar cigarettes offering compatible taste." 500210073-0075 (US 22108) (A); Orlowsky WD, 70:12-71:6.

3234. In a 1981 memorandum to M.M. Sheridan entitled "Reactions to the VANTAGE/Merit Image Study," K.A. Schmitt reported that, based upon the study, "smokers in our target category have two primary product desires: a lower tar product which addresses their safety/health concerns, and a product which provides taste satisfaction." The memorandum further reported that "VANTAGE is seen as not dealing as directly or effectively with the health/safety concerns of the consumer as Merit. Our current advertising approach focuses much more heavily upon the taste/pleasure aspects of our brand than on the safety/health aspects." As a result, the memorandum recommended that Vantage marketing be modified to better "target" smokers with health concerns: "Perhaps a more balanced approach is needed, both to tone down the perceptions of harshness and to renew the belief that VANTAGE does indeed address the target consumer's health/safety concerns." 523474848-4851 at 4848 (US 22156) (A); Orlowsky WD, 71:15-72:16.

3235. A 1981 RJR marketing document entitled "Vantage Family" discussed a "moderation" smoker, to whom they targeted Vantage Ultra Lights. The "moderation" segment "realizes that there are both positive and negative aspects of smoking, resulting in a desire to resolve the conflict by compromising/moderating on their brand choice." 502177978-8009 at 7981 (US 49058) (A); Orlowsky TT, 10/13/04, 2283:13-2284:13.

3236. An August 1981 consumer research study entitled "Vantage Personalities," prepared for RJR by Social Research, Inc., noted that people in the Vantage target market "have very definite concerns about the alleged health hazards connected with smoking. It is these qualms that have prompted many of them to seek out lower tar brands." That report likewise

noted that the target market "abandoned [] harsher brands in search of milder **brands with lowered tar and nicotine. This movement was almost always prompted by health concerns**. In some cases, people were experiencing actual problems such as coughing, throat irritation, and shortness of breath. Others may not have experienced actual symptoms, but were worried about the publicized alleged health hazards associated with stronger cigarettes." 503148009-8077 at 8006, 8070 (US 22159) (A) (emphasis added); Orlowsky WD, 80:18-81:3.

3237. An April 1982 research study entitled "Vantage and Merit Smokers," prepared for RJR by Social Research, Inc., stated:

> Both Vantage and Merit smokers have similar early smoking histories . . . switching to lighter cigarettes to relieve physical symptoms and as an acknowledgment of increased concerns about alleged health hazards. . . . [quoting a Vantage smoker]: 'They are lighter, lower in tar and nicotine. . . . They are satisfying like a full-tar cigarette, but they are better for my health. . . . The filter seems strong and effective as a trap for 'harmful' ingredients.' Vantage smokers believe that the filter itself is strong enough to catch these impurities. . . . These ideas make them think the end product is a milder and more 'healthful' smoke. . . . [Quoting a Vantage smoker]: 'I like the filter because there's a lot of it, like it's filtering out a lot of the harmful things, like the tar.'

511469097-9250 at 9105, 9116 (US 20842) (A) (emphasis in original); Orlowsky WD, 72:17-23; 81:4-8.

3238. Winston. An April 1974 Qualitative Consumer Evaluation for four Winston Lights Positionings noted that those who liked Winston Lights believed that a low tar cigarette was a "'safe' cigarette." Some of the panelists admitted to switching to a lower tar and nicotine cigarette for health reasons. It was further explained that "[f]or Winston smokers becoming concerned with health it could make the transition to a low tar cigarette easier by 'staying in the family.'" With respect to the target audience, it was understood that the "women felt that men and women are equally concerned about the harmful effects of smoking and would be glad to

switch to a brand which could deliver good taste with low tar and nicotine." 502041366-1415 at 1373, 1383, 1385, 1385-86, 1391 (US 22147) (O).

3239. A 1979 study prepared for RJR, entitled "An Exploratory Study of Smokers' Comprehension of and Reaction to Several Proposed Winston Lights Campaigns," noted, with respect to one of the Winston Lights advertisements, that consumers typically reported that they understood the advertisement to mean: "A low tar cigarette that tastes good, is satisfying and **safer**." 501071439-1530 at 1453 (US 22110) (A) (emphasis added); Orlowsky WD, 83:7-12.

3240. Similarly, advertisements for Winston Ultra Lights described them by indicating that they were ultralight cigarettes with rich taste: "New Rich Winston Ultra Lights The Search For Taste Is Over . . . . THE RICHER ULTRA 6mg. 'tar', .05 mg. nicotine av per cigarette by FTC method . . ." 970469347-9474 at 9435, 9437 (US 85104) (O).

3241. Now. Advertisements for RJR's Now cigarette in the late 1970s and 1980s described Now as "the lowest," "lowest in tar," and "lowest tar champion," and included the following:

> "Now. It's a Satisfying Decision." (US 5852) (A) (1978).
>
> "LOWEST TAR CHAMPION. NOW MENTHOL IS LOWEST By U.S. Gov't. testing method."
>
> "NOW is LOWEST Of All Softpack 100's."
>
> "Pick the Lowest. NOW IS LOWEST By U.S. Gov't Testing Method."
>
> "WHEN IT COMES TO THE LOWEST IN TAR, ONLY ONE MEASURES UP. NOW IS LOWEST Of All Soft Pack 100s. By U.S. Gov't. testing method."

970469347-9474 at 9430, 9429, 9427, 9431 (US 85104) (O).

3242. A 1983 Now Brand Image report prepared for RJR recognized that health

concerns played a major role in determining which cigarette individuals used and that the perception was that the lower the tar, the more healthy the product was. It stated that "[a] major motivation in brand switching has been concern over health. . . . The typical solution to this dilemma is the two pronged approach of trying to cut down and/or moving to a lower tar brand." The report went on to indicate that, when respondents were asked what the words "low" and "lowest" in the advertisements meant to them, "**[t]hey interpret this to mean that the two brands are 'safer' and pose less of a health hazard**. Consequently, they reason, this would make the brands more appealing to younger people who are very health conscious or to older, long-time smokers who are concerned about the long-range effects of tobacco." 506671319-1418 at 1379 (US 22160) (A) (emphasis added).

3243. R.J. Reynolds's Research on the Low Tar Cigarette Category. Internal RJR documents reveal that RJR conducted research not just on individual low tar cigarette brands, but on low tar cigarettes as a category. These documents establish that RJR has long known and intended that its advertisements and marketing for low tar cigarettes featuring claims of lowered tar and nicotine and "light" and "ultra light" brand descriptors contributed to and reinforced consumers' belief that low tar cigarettes are better for their health, and caused consumers to smoke them for this reason. For instance, an RJR report on tar and nicotine ("T&N") awareness stated: "In 1971, curiosity was the main reason for interest in T&N numbers. Since then, increased interest has been health related." In fact, by 1975, more than 60% of every age group (from 18 to 50+) exhibited a concern over the hazards of smoking cigarettes. At the same time, a 1974 survey showed that "**a substantial majority of smokers said they agreed with the statement, 'low tar and nicotine cigarettes are a major step in making smoking less harmful to their health**.'" Those concerned about health became labeled as "worriers" and were targeted

accordingly. 501238259-8269 at 8265, 8269, 8271 (US 22072) (A); 501238270-8357 (US 48736) (A) (emphasis added).

3244. An internal January 15, 1975 RJR memorandum, under the heading "UPDATED REVIEW AND ANALYSES OF 1974 COMPETITIVE BRAND DATA," stated: "The VANTAGE and Kent 100 brands performed better than expected according to the correlation. This was most probably due to the low ‘tar' and nicotine image." 500615944-5960 at 5949 (US 21786) (O).

3245. As part of a 1975 marketing plan to introduce a new low tar Salem product, RJR recognized that "[l]ow numbers are the primary benefit/feature which can solve the concerned smoker's anxiety about health." 50231320-3308 at 3253 (US 22151) (A).

3246. A November 17, 1975 report prepared for RJR by Rosenfeld, Sirowitz & Lawson, Inc., entitled "An Evaluation of the 120MM Market and Its Potential for RJR," stated:

> Currently RJR divides the total cigarette market into three basic categories: Full Flavor; Medium Flavor; High Filtration. However, the recent rapid growth of the High Filtration segment, may be a signal that the consumer is beginning to be more health conscious than ever before, and will be even more so as time goes on. If this is the case, we believe that consumers will ultimately divide the market into three categories which in their minds would be categorized as: ‘Least Safe Brands' ‘Safer Brands' ‘Safest Brands.'"

The RJR report defined the "Safer" and "Safest" brand categories as follows:

> Safer Brands: These are brands which are perceived to combine an acceptable level of taste with mildness. Smokers of these cigarettes, while not overtly concerned with health, do switch to them after feeling some physical discomfort from their previous brand. Although they are not aware of T&N numbers, they know they are ‘moving down' to a milder cigarette.
> Safest Brands: Cigarettes in this category are perceived to have a mild taste. Smokers of these brands are very concerned about health and quite aware of T&N numbers. Their concern – more than any physical discomfort – causes them to switch to brands

with low T&N numbers.

The report further stated: "We believe that the most dramatic evidence of the growing interest in Safer Cigarettes may be seen in the growth of the various Lights/Milds line extension products." 500671364-1454 at 1402, 1403, 1405 (US 22158) (A) (emphasis in original); see also Burger PD, Arch v. The American Tobacco Co., 8/21/97, 226:9-14 (E.D. Pa. 96-5903) (consumers told Reynolds that they wanted light cigarettes "because they believe [they're] better for them").

3247. In analyzing the reasons why smokers switched to their current brand, the RJR report recognized that:

> [S]mokers of High Filtration brands really believe they are killing themselves by smoking. While they have not been able to give up smoking to date, they feel the low tar and nicotine brands are much safer and much less of a health hazard. **They are readily willing to sacrifice taste for a 'longer life.'**

The report also stated: "As previous research has indicated, Smokers of Lights/Milds products (designated in this report as Safer Brands) are not aware of T&N numbers. Hence, the fact that a 120MM Lights entry will have high T&N numbers (on a total cigarette basis) should not impede its progress." 500671364-1454 at 1408, 1436-37 (US 22158) (A) (emphasis added); Schindler WD, 75:5-13.

3248. In 1976, the research firm Leber Katz Partners prepared a research report for RJR entitled "New Product Concepts." In a section entitled "Smoker Awareness of Tar and Nicotine Levels," the report identified "worried about my health" as a key reason for increased interest in knowing tar and nicotine numbers. The report also noted that there was an increase in familiarity with tar numbers between 1971 and 1975. Also at this time, smokers attributed harm to tar content. 500742394-2419 at 2401, 2409-2411 (US 48362) (A).

3249. A November 16, 1976 RJR document entitled "New Brand Development"

recommended introducing a "New, Single-Minded Advertising Campaign" that would "convey our lowest ‘tar' benefit." In terms of future plans, the document stated "[f]or example, in the new and special wants area, there is style and value which we met with MORE, extreme health concerns which we are meeting with NOW [brand cigarettes], and with the evolution of the market toward low ‘tar', many more opportunities will be present in this area . . . ." A section of the document entitled "Super Low ‘Tar' Products" stated: "We will also be working on super low tar products which address the wants of very concerned smokers. A growing number of smokers seek products with tangible/visible features to assuage their concern about smoking." 501282466-2513 at 2480-2481, 2488, 2496, 2502 (US 48813) (A).

3250. A 1980 internal RJR document entitled "Salem Lights" identified part of the "Psychographic Profile" for Salem Lights smokers as "[t]hey are health conscious and want low tar but still desire a satisfying, refreshing menthol taste from their cigarette." 503515298-5301 at 5298 (US 50406) (A); Orlowsky WD, 84:12-85:7.

3251. A May 8, 1980 "Copy Research Project Request Memorandum" from Vicki J. Forrest, Brand Research Manager, to Jack Bellis described a test advertising project for Salem HC, an ultra low tar Salem line extension. In the memorandum, the "Prime Prospect" to smoke Salem Ultra is identified as a woman who is ". . . very aware of the smoking and health controversy, but enjoys the light refreshing taste of a low tar menthol cigarette." 501357172-7189 at 7172, 7175 (US 48837) (A).

3252. A June 21, 1982 Product Research Report on Non-Menthol Ultra Low Tar Consumer Probes, published by RJR's Marketing Development Department, stated: "Most respondents [ultra low tar smokers] preferred a white filter to a cork filter because they considered white to be more indicative of ULT cigarettes. The white filter generated strong

associations with gentleness, purity, cleanliness, modernization, and innovativeness." 503394459-4485 at 4464 (US 85036) (A).

3253. A May 1991 consumer research report prepared for RJR by Gene Shore Associates, entitled "R.J. Reynolds Project XB," explored smokers' reactions to the following new cigarette concepts: (1) for full flavor/lights smokers: "A new ultra low tar cigarette with all the great taste and easy draw of the light cigarette you currently smoke. All the taste with less than half the tar"; and (2) for ultra lights smokers: "A totally new cigarette with the extra low tar of a Carlton or a NOW, but all the great taste and easy draw of the cigarette you currently smoke. All the taste with less than half the tar." The report found that "ULT [ultra low tar] smokers want more to believe smoking a lower tar cigarette has potentially more personal benefits than smoking a full flavor or FF/LT cigarette." The report further stated: "Some ULT smokers are more likely to express a desire to quit smoking. Although they enjoy smoking, some tend to describe it as a 'Bad habit.' Their negative feelings about smoking motivate them to experiment with a variety of lower tar brands." 514343517-3566 at 3522 (US 51848) (O).

3254. The report also stated: "Women are more optimistic about new brands that could offer lower tar. They are more **willing to compromise on taste if they feel a cigarette has more personal benefits, although 'It would be great if it has good taste, too.'"** The report further stated that ultra low tar smokers "want as little tar as possible, but they want taste to be at least on par with current ULT brands. They feel they have made taste trade-offs by smoking a ULT." The report continued: "It is unlikely ULT smokers would switch brands if the tar level of the new cigarette is equivalent to their current brand. Lower tar is a strong motivating factor." The report also recognized that smokers perceive low tar cigarettes as having less desirable taste, stating: "The main obstacle appears to be to convince smokers the new cigarette delivers a more

flavorful, richer taste, and lowering the tar does not reduce taste and smoking satisfaction." The report also noted: "Women seem to be more accustomed to moderation in their lifestyles. For example, they are inclined to trade-off some taste for the weight control and health benefits of low calorie and low fat foods. They **want some taste assurance, but are open to compromise. They are willing to tolerate an adjustment period as they become acclimated to a new product they perceive to be better for them**." The document further stated: "**ULT smokers perceive low tar claims to be credible**. They try to balance their desire to smoke and personal concerns." Finally, under the heading "ULT Mindset" the document stated that this smoker "[w]ould like to quit smoking . . . . [p]erceives smoking as a bad habit, although he/she enjoys it . . . . [and] [w]ants to believe lower tar cigarettes are safer." 514343517-3566 at 3522, 3524-26, 3530, 3540, 3556 (US 51848) (O) (emphasis added).

3255. Gary Burger, RJR Senior President of Research & Development, testified at a 1997 deposition that RJR was aware that consumers smoke low tar cigarettes for the perceived health benefit. Burger testified that "[c]ertainly, smokers perceive lower tar cigarettes in some ways to be better for them and therefore they want them." Burger further testified that consumers "have that impression that there are higher levels of bad stuff in high tar cigarettes and lower levels of bad stuff in low tar cigarettes." Burger PD, Arch v. American Tobacco Co., 8/21/97, 226:9-243:18.

(iii) Brown & Williamson

3256. Kool. A B&W document entitled "Kool Family Utopian Objectives 1979-1985" stated, under the heading "Share Objectives," that "Kool must move into the health reassurance segment so that 45% of KOOL business will be in the perceived product safety arena by 1982 which will approximate the 45% of total smokers who will be smoking hi-fi products by 1982."

Under the heading "Strategies," the document stated: "Provide product safety reassurance while enhance [sic] the satisfaction and refreshment perception of the appropriate KOOL styles through the successful national launch in 1979 of either: 1. Low ‘tar' parent [or] 2. Repositioned KOOL Milds." 680559149-9162 at 9149-9150 (US 54048) (A); Dolan WD, 122:12-15; Smith WD, 69:15-70:8.

3257. An internal March 25, 1983 B&W memorandum from A. J. Mellman, a B&W marketing employee, to R.A. Blott, B&W Senior Vice President of Domestic Marketing, regarding current cigarette project ideas for the Kool brand family, including low tar brands, stated: "KOOL maintained a three share level for over 30 years (through mid-60's) while positioning itself as a specialty cigarette to be smoked only for remedial or medicinal purposes." The fourth project idea was: "Improve health aspect: Anything that can be done to decrease the risks associated with cigarettes is a positive to most consumers." 514110006-0009 at 0007-0008 (US 21745) (A).

3258. An April 28, 1998 document prepared for B&W entitled "Kool Natural Lights Round I & II Focus Groups: Presentation of Findings Prepared for Brown & Williamson," under the heading "Highlights : Natural Lights Idea," stated: "Respondents assumed that a natural light cigarette would be less harmful than a regular cigarette, they did not assume it would be 'healthy'." Sharon Smith, former Director of Marketing Services and Operations at B&W, testified that "I agree that some consumers reported that they assumed such a cigarette was ‘less harmful.'" Smith further testified that B&W placed advertisements for Kool Natural Lights in magazines in 1998, and that Kool Natural Lights are still available for sale today." 210430297-0396 at 0322 (US 67711) (A); Smith WD, 83:18-84:20, 85:6-8, 85:14-15.

3259. Viceroy. B&W Viceroy advertisements in the early 1950s made express health-

related claims about the benefits of its filter. For example:

1951: "Filtered cigarette smoke is better for your health."

1951: "The nicotine and tars trapped by this Viceroy filter cannot reach your mouth, throat or lungs!"

1952: "Filtered Cigarette Smoke is Better for Your Health . . . Yes! The Nicotine and Tars Trapped by the VICEROY FILTER Cannot Reach Your Throat or Lungs!"

1952: "Prominent physician tells patients– 'Smoke Viceroy Filter-Tip Cigarettes. The nicotine and tars trapped by this Viceroy filter cannot reach mouth, throat or lungs!' . . . . For Greater Health Protection Get Viceroy with the new Health-Guard Filter."

1953: "New King-Size Viceroy gives Double-Barreled health protection." (US 87465) (A); (US 87466) (A); (US 87467) (A); Smith WD, 72:2-4.

1953: "[Viceroy] is safer for throat, safer for lungs than any other king-size cigarette."

1953: "Viceroy Gets the Votes . . . from Happy Throats."

696000888-0916 at 0914, 0915 (US 21387) (A); 682811354-1354 (US 21465) (A); 672010223-0223 (US 53895) (A); Harris WD, 70:13-20.

3260. Susan Ivey, former President and Chief Executive Officer of B&W, testified: "I believe the Viceroy ads contained health claims." Indeed, BATCo's Viceroy marketing campaign from 1955-1956 was "promising superior health protection." B&W's objectives for the 1957-1961 Viceroy advertisements were to "[a]ttract smokers . . . promising . . . implied health benefits because of filter" and "with substantial health benefit implications, because of blend and filter." Nearly each of these promises of health benefits resulted in a substantial increase in sales of Viceroy cigarettes. Ivey WD, 51:15-52:13; Smith WD, 71:18-72:1; 670001750-1766 at 1754-1755 (US 20962) (A).

3261. An internal B&W document stated: "The January 1950 issue of *Reader's Digest*

featured an article, ‘How Harmful Are Cigarettes,' that mentioned the value of filters. Within a week [of that article], VICEROY advertising headlined *‘Reader's Digest* tells why filtered cigarette smoke is better for your health.**' Sales increased from 700 million in 1949 to 1.2 billion in 1950**." 524000897-0917 at 0898 (US 20916) (A) (emphasis added).

3262. A retrospective 1985 internal B&W document explained that in 1946 "[a] comprehensive sampling plan [for Viceroy cigarettes] among dentists to secure their recommendation was started. Sales responded immediately even though the media budget was not increased until 1948." The document further explained that, in 1953, several things "combined to push the demand for VICEROY far beyond production capacity," most notably "the new filter" and "greatly increased public attention to the ‘Health aspect' of smoking. VICEROY advertising exploited this to the fullest extent as ‘double-barreled health protection' copy, which . . . was backed up with factual evidence of the nicotine and tar reduction offered by VICEROY . . . . Sales went to 6.0 billion in 1953 even though the brand . . . could not begin to supply the demand." 524000897-0917 at 0898 (US 20916) (A).

3263. A 1975 B&W document entitled "Viceroy Marketing Strategy" identified the "Problem Advertising Must Solve": "[A]dvertising must . . . cope with consumer attitudes about smoking, **providing either a rationale or a means of repressing the health concern**." 680113760-3763 at 3762 (US 20987) (A) (emphasis added); accord 680116947-6968 at 6959, 6961 (US 21877) (A) (circa 1975 document entitled "Viceroy Agency Orientation Outline" stating, under the heading "Test Market Campaigns": "Strategy-Given consumers awareness of the smoking and health issue, full flavor smokers must deal with their illogical behavior. Therefore, we attempted to communicate Viceroy's flavor/satisfaction benefits by providing consumers a rationalization for smoking or a repression of the health concern"); Smith WD,

73:2-17.

3264. A July 19, 1976 B&W internal memorandum from E.A. Willets III to G.T. Reid, entitled "VICEROY Advertising Objectives and Creative Strategies 1936-1975," demonstrates that B&W was aware that its deceptive marketing portraying its low tar cigarettes as less harmful was effective at misleading consumers. The memorandum noted the following marketing objectives:

- Prior to 1942: "[a]ttract smokers of competitive non-filter brands by promising mild, clean smoke and health benefits because of filter."
- 1942 -1946: same as prior to 1942, but adds the word "implied" in parentheses in front of the promise of general health benefits.
- 1950-1952 (3rd quarter): to "[a]ttract smokers of competitive non-filter brands by promising health benefits, supported by published research by independent body, because of VICEROY's filter."

The memorandum's "evaluation" found that this strategy had resulted in a "[p]rompt and effective exploitation of an advertising windfall" and, as a result, B&W developed a "[s]tronger commitment to high filtration, low risk positioning." 670001750-1766 at 1750-1752 (US 20962) (A); Smith WD, 72:5-73:1.

3265. The memorandum noted that, in 1953-1954, Viceroy's advertising campaign slogan was "'VICEROY's double barreled health protection' and ‘Better Your Health,' with the ‘objective and creative strategy' being to ‘[a]ttract smokers of all other cigarette brands by promising superior health protection because of more effective filtration from both a new filter and a longer length.'" The memorandum concluded that "**[t]hese two product changes firmly positioned VICEROY as a high-filtration**, **healthier cigarette and attracted smokers in droves**." The same theme continued in 1955-56, when one of the "Objectives and Creative Strategies" listed was to "Attract smokers of non-filter brands and the new filter brands by

promising good taste equivalent to non-filter brands and superior health protection because of blend and filter." 670001750-1766 at 1752-1754 (US 20962) (A) (emphasis added); see also (US 87468) (A); (US 87469) (A); (US 87470) (A) (1953 magazine advertisements featuring claim of Viceroy's "double barreled health protection").

3266. Carlton. Carlton is a low tar brand that was originally manufactured by American Tobacco until that brand was acquired by B&W in 1994, along with American Tobacco's Lucky Strikes, Pall Mall, & Tareyton brands. Gesell PD, State of Minnesota v. Philip Morris Inc., 9/18/97, 6:10-17; 117:3-15; 25:23-26:3; 93:2-13; see US FF § III.D(3)(a)(v), infra, for a recitation of American Tobacco's marketing of Carlton prior to 1995.

3267. Sharon Smith, former Director of Marketing Services and Operations at B&W, testified that "Carlton advertising focused on tar delivery." Smith explained: "For Carlton, it's not an imagery campaign. **It's more communication of tar levels**. I'm familiar with consumers of competitive brands to Carlton saying in focus groups that **to convince them to switch from their brand to Carlton, an understanding of what the tar levels are is more important to them**." Smith further testified that, for those smokers, her research has found that their understanding of the tar and nicotine numbers based "**certainly on our advertising, even on our competitors' advertising**." Smith WD, 69:10-14; 75:3-23 (emphasis added).

3268. A B&W document circa 1996-1997 entitled "Carlton Creative Plans" disclosed that the first "Primary" trait of Carlton's target audience was "Health conscious." With respect to print advertisements, the report stated: "Magazine [advertisements for Carlton] Will be Driven by Editorial That is: 'Health Conscious.'" Carlton's "brand strategy" was "to continue to defend the franchise while communicating its 'lowest' positioning to maintain switching inflows from those smokers trading down in tar levels." The document went on to state that "CARLTON packaging

issues will be explored to determine how best to communicate ultra light product cues . . . . hype its increased communication of ultra low tar." 176020783-0800 at 0785, 0792, 0798 (US 23351) (A); accord 176020856-0926 at 0868-0869 (US 23357) (A).

3269. In 1999, B&W began a promotional campaign promoting Carlton cigarettes as Ultra Ultra Light, including packs stating that Carlton delivered only "1 mg." of tar. Susan Ivey testified that B&W's advertisements featured the slogan "Isn't it time you started thinking about number one?" Ivey further testified that "many factors drove consumers' preference for Carlton, and for some smokers, one of those factors was a belief that ultra low tar could reduce one's risk." Marketing expert Dr. Anthony Biglan testified that this advertising slogan indicates the smoker depicted in the advertisement "is thinking about smoking a low tar cigarette to reduce her health risks." Ivey WD, 52:14-53:15; ADV027 0780-0782 (US 9846) (A) (1999 Carlton magazine advertisement); ADV045 0468-0470 (US 11362) (A) (1999 advertisement); ADV027 0924-0926 (US 9892) (O) (1999 advertisement); ADV032 0011-0013 (US 10678) (A) (2000 advertisement); Biglan WD, 281:17-283:22.

3270. In March 1999, Nicholas Brookes, B&W Chairman and CEO from 1995 to 2000, became aware of a discrepancy in the tar delivery of Carlton cigarettes. The cigarette, when smoked by human smokers, delivered 3 milligrams instead of the advertised 1 milligram. Because B&W had just introduced a new advertising campaign "touting Carlton as the ‘1' for you," Brookes attempted to delay the publication of a study that would have alerted the public to the findings. Brookes did **not** direct B&W's marketing department to discontinue the "Carlton is the ‘1' for you" campaign, even though he acknowledged that it might cause confusion for consumers. 190245079-5080 (US 85018) (O); Brookes PD, United States v. Philip Morris, 3/31/03, 146:18-148:12; 149:3-149:20; 150:14-150:18.

3271. A July 27, 2000 document prepared for B&W by Kay Harwood Marketing Analysts, Inc., entitled "Topline Report of Findings for Carlton Advertising Research," indicated that smokers continue to view Carlton cigarettes as healthier, stating: "Focus groups were allowed to submit two words in addition to those suggested by the group hosts. Among the words independently chosen to describe Carlton cigarettes were 'feeling healthier' and 'healthier.'" Among the Report's 'Key Findings' are the statements from the focus groups in response to several Carlton campaigns. The statements include:

> Healthier– **trying to sell a healthy cigarette** – Very few people have realized that Ultra is better . . . Purity/better for you . . . . Fewer people have health problems smoking this brand . . . This cigarette is best for you . . . . better for you . . . . Clean & improved – healthier brand; less nicotine. . . . Healthier living . . . . **Carlton is healthier for you** . . . . Gives next to nothing harmful – means healthier – Carlton is healthier for you. . . . safe cigarette. . . . They are much better for you – A healthier cigarette. . . . Healthier . . . . This is the best for you – lowest in bad stuff . . . . Better for you, lighter smoke . . . . Carlton will make you happier and healthier . . . . Health-minded, concerned people (get healthier). . . . The safe cigarette – Cut down your risk – Light and less harmful . . . . This will save you – this is the solution you have been waiting for.

250255336-5347 at 5340, 5343-5347 (US 22031) (A) (emphasis added). These statements were repeated in an August 8, 2000 document prepared for B&W by Kay Harwood, Marketing Analysts, Inc. entitled "Carlton Advertising Research: Report of Key Findings." 250255060-5075 at 5064, 5066-5068, 5071-5075 (US 22170) (A).

3272. A document entitled "Carlton Advertising Research: Four Focus Groups," bearing MAI (Marketing Analysts, Inc.) and B&W insignia on the cover, discussed July 2000 focus groups stating that both Carlton and competitive Ultralight smokers associated Carlton cigarettes with being "[b]etter for you/[h]ealthier." The Report concluded that the Carlton "It's the Least You Can Do" campaign (labeled the "U" campaign) created the impression that "Carlton is better

for you," and the Report's "Key Recommendations" include: "If the primary objective of the advertising campaign is to position Carlton as a lower/the lowest tar and nicotine cigarette, the current research suggests the "U" campaign (It's the least you can do) effectively conveys this positioning." 250221262-1294 at 1275, 1277, 1287 (US 22030) (A); Ivey WD, 59:20-6060:12.

3273. Belair. In a 1980 advertisement, B&W encouraged smokers to "Lighten Up!" with its Belair brand cigarettes. (US 6546) (A).

3274. Brown & Williamson's Research on the Low Tar Cigarette Category. Susan Ivey testified that she is aware that "some smokers choose lights because they perceive a health benefit," and that "Brown & Williamson's consumer research . . . indicates that certain smokers switch to low tar cigarettes because they believe that these cigarettes are 'less harmful' than regular cigarettes." As demonstrated below, these consumer research documents establish that B&W has long known and intended that its advertisements and marketing for low tar cigarettes, featuring claims of lowered tar and nicotine and "light" and "ultra light" brand descriptors, contributed to and reinforced consumers' mistaken belief that low tar cigarettes are better for their health, and caused consumers to smoke them for this reason. For instance, a 1967 B&W advertising and marketing strategy for high-filtration/low tar products describes B&W's marketing strategies to "capitalize" on smokers' perception that low tar cigarettes are less harmful by portraying them as such:

- [Vanguard brand strategy:] "To capitalize upon a prevalent smoker desire to lessen the health risk involved in his smoking via a switch to a low tar cigarette . . . . Advertising Objective – Communicate a dual smoker benefit: low tar and satisfying taste."

- Modified LIFE "Marketing Strategy - To fully capitalize on health vs. cigarette smoking publicity and publishing of tar/nicotine data by marketing LIFE as the lowest tar cigarette in the filter 85 segment."

- Filter 70's "Marketing Strategy – To capitalize on smoker concern of

> ‘smoking too much' by offering a means for reducing smoking without . . . cutting down on number of cigarettes smoked . . . . Advertising – Filter 70's would offer smokers the opportunity to smoke up to one-third less (shorter tobacco section), but they can light up as often."

Ivey WD, 57:22-58:10, 63:1-8; 670186789-6824 at 6790, 6792, 6798, 6802, 6804 (US 21431) (A); accord Smith WD, 51:11-19 (testifying that there exist "Brown & Williamson marketing research documents that talk about the fact that consumers perceive lower tar cigarettes to provide a health benefit"); see id. at 56:20-23, 74:11-14 (noting same).

3275. An August 1967 B&W document entitled "A Psychological Map of the Cigarette World" stated that "PEOPLE WHO SMOKE FILTER CIGARETTES . . . ARE MORE CONSCIOUSLY IN CONFLICT ABOUT SMOKING . . . . THEY CAN'T COMPLETELY ENJOY SMOKING BECAUSE THEY KNOW IT IS NOT HEALTHY. . . . THEY MAY BE RECEPTIVE TO ADVERTISING WHICH HELPS THEM ESCAPE FROM THEIR INNER CONFLICTS ABOUT SMOKING." 680282619-2668 at 2642 (US 85305) (O).

3276. A 1969 marketing document from B&W's files prepared by a consultant for Imperial Tobacco, the sister company of B&W, stated that the smoker "seeks a new covenant between himself and the tobacco industry" and has "**trust**" that the industry "**is going to provide him with a product that he can enjoy without fear of physical or psychological reprisal**." 680082943-3125 at 2959-2960 (US 20983) (O) (emphasis added).

3277. An October 21, 1971 Philip Morris document acknowledged that it "was abundantly clear" that manufacturers in the United States, and B&W in particular, "are concentrating on the low TPM [total particulate matter] and Nicotine segment in order to create brands with distinctive product features which aim . . . to **reassure the consumer that these brands are relatively more ‘healthy'" than regular full-delivery cigarettes**. "Hence B&W is devoting its efforts entirely to the Hi-Fi ["high filtration"] segment, and its two major projects . . .

demonstrate this strategy." 100028935-8937 at 8935 (US 20089) (O) (emphasis added).

3278. A September 1974 B&W marketing research study entitled "The 'New' Smoker," that examined the "Behavioral Factors" of new smokers, concluded that new smokers are "mis-informed on cigarette strengths." The study concluded that new smokers believed that low tar cigarettes were "**better for you**." 779217794-7833 at 7822-7823 (US 21055) (A) (emphasis added).

3279. A November 29, 1976 B&W memorandum from F.E. Latimer to B.L. Broecker and M.J. McCue, all B&W marketing employees, represented the role of cigarette advertising as allaying smokers' fears of the health consequences of smoking:

> [B]ecause such large numbers of the institutions and leaders he believes in are against smoking, the average smoker often seeks self-justification for smoking. Good cigarette advertising in the past has given the average smoker a means of justification on the two dimensions typically used in anti-smoking arguments. . . . **All good cigarette advertising has either directly addressed the anti-smoking arguments prevalent at the time or has created a strong, attractive image into which the besieged smoker could withdraw**.

680086039-6044 at 6039-6040 (US 20984) (A) (emphasis added).

3280. A January 1977 report prepared for B&W by Post Keyes Gardner, Inc., concluded that the most successful cigarette marketing has promised "'real' or 'perceived to be real'" health benefits by indicating that the cigarette is "the most reasonably 'safe'":

> The fundamental long term trends in the business are for smokers to move gradually to products that represent benefits of 'health' and modernity . . . . Successful brands have offered 'real' or 'perceived to be real' products benefits that are founded on smokers' needs for 'health' and modernity . . . . **Successful advertising in the cigarette business is achieved by establishing a brand image based on a product benefit that fulfills consumers' needs for taste, 'health' and modernity** . . . . Historically, brands that have achieved the most success are those that offer taste within the confines of 'health.' . . . . **[T]he real 'action' is in products that**

> **deliver, or are perceived to deliver, taste while representing the most reasonably 'safe' product available** . . . products have evolved along the long term continuum toward 'health' and modernity. Those that have **capitalized on these trends with a point-of-difference are the ones that have been the most successful** . . . . Viceroy was the first brand to directly capitalize on [the perceived health benefits of filters] by featuring its filter benefit, and sales were dramatic for the brand . . . . [In 1965,] Carlton was introduced – the first real response to the 'health' issue as we see it today . . . . **Three hifi [high filtration] brands, True, Doral and Vantage (with new, more modern filters) were successfully introduced [in the late 1960's], capitalizing on the 'health' atmosphere that the anti-smoking forces were creating** . . . . FORECAST FOR THE FUTURE . . . . In sum, the dynamics of 'health' and modernity trends will be dominant. The smoker appears to be ready to make another major shift, losing gratification and obtaining a 'safer' product, to a new generation of products with single digit tar numbers . . . . The smoker will be inundated with 'health' oriented advertising.

776158413-8426 at 8416, 8419, 8422-8423, 8425 (US 22339) (A) (emphasis added – bold type).

3281. B&W's 1977 New Products Annual Marketing Plan reviewed marketing strategies for new "health oriented" low tar brands to be directed at "the extremely health conscious (worried) segment of the market." According to the plan, the "Overall Objective" was "[t]o develop and successfully launch a product which distinctively positions itself as being the 'safest' alternative in smoking." In a review of Savannah brand cigarettes, the plan noted that the "Hi-Fi [high filtration] segment stems directly from the increasing concern over the smoking and health issue." The Savannah brand was to be "positioned against those consumers with serious health concerns who continue to smoke full flavor brands." 670156293-6424 at 6303, 6323-6324, 6342 (US 53746*) (O).

3282. This same 1977 Marketing Plan recommended that the:

> [a]dvertising copy should assume the tone of objectivity and genuine importance. **The authenticity and frankness of the copy must be arresting enough to gain the attention of those consumers concerned about their health. Taste reassurance**

> **for the brand should be subordinated in efforts to play up health reassurance claims**.

In a section titled "Market Review," the plan went on to say that "[t]he appeal of the brands competing in this segment [enriched flavor ultra low tar] is solely on the basis of implied health claims." 670156293-6296 (US 53745) (A); 670156297-6242 at 6324, 6327 (US 53746*) (O) (emphasis added).

3283. A May 1977 Brand Position Paper prepared for B&W identified a link between interest in low tar cigarettes and "smokers who harbor ‘health' concerns." The paper, entitled "B&W New Products Part II - Progress," noted that the "key growth segment" for that time was called "taste with a contemporary health benefit." The paper also stated that "[c]igarette brands that have succeeded have had consumer benefits which tend to evolve along the long-term continuum toward ‘health' and modernity." 660931250-1282 at 1250, 1252-1253, 1263 (US 53595) (A).

3284. A June 21, 1977 letter from D.A. Litwin, B&W Assistant Brand Manager in marketing, to Andy Millar, an attorney for the tobacco industry, included a chart illustrating B&W's recognition of a market share for "Taste with implicit health benefit," "Taste with contemporary health benefit," and "Explicit health benefit" cigarettes. It was anticipated that these market segments with health claims would increase their market share. 660041050-1051 at 1050 (US 20952) (O).

3285. A July 25, 1977 B&W Internal Marketing Study entitled "Low ‘Tar' Satisfaction, Step 1 Identification of Perceived and Underperceived Consumer Needs" recited the percentage of starters and quitters from 1969-1976, and stated:

> As the dynamic proportion of quitters continues to be larger than the proportion of starters, actual smoking incidence has declined about ten percentage points over the last ten years . . . . Increases

> in per capita consumption are assumed to correlate with lowered 'tar' delivery as well as other factors . . . . **HEALTH REASSURANCE: Almost all smokers agree that the primary reason for the increasing acceptance of low 'tar' brands is based on the health reassurance they seem to offer** . . . . It must be assumed that Full Taste smokers come down to 'low tar' expecting less taste . . . [t]hey are willing to compromise taste expectations for health reassurance.

Dr. Dolan explained that this document "shows that Defendants knew that smokers accepted the low tar and nicotine brands due to the 'health reassurance' they offered. This was a complement to the doubt creation campaign. Companies could not prove their product was safe so reassurance was offered by these 'health reassurance' cigarettes." 23775036039-6067 at 6043-6044, 6047, 6052 (US 21053) (A) (emphasis added); Dolan WD, 120:14-23; Ivey WD, 57:11-58:11.

3286. A document circa 1977 bearing the B&W seal strongly supports that B&W's Belair cigarette was intended to convey reduced harmfulness by providing "'health' reassurance" due to its low tar:

- "Does Belair have growth opportunities? – Increasing 'health'-orientation of cigarette marketing and the correspondingly greater potential for "lighter" cigarettes."

- "To realize this growth opportunity, Belair must: . . . – compete directly in the low 'tar' segment where greatest potential is. . . ."

- "Current Positioning Objective: To reestablish and maintain the relevancy of Belair's heritage as a cigarette which provides a light, yet, satisfying menthol alternative and a 'health' reassurance relative to full-taste brands . . . ."

- "July 1977 'tar' reduction . . . will allow for specific low 'tar' support of the important 'health' reassurance element of this brand positioning . . . ."

- "Overall Belair Operating Strategy: - Through advertising, make the Belair historical image/positioning as a "light" cigarette more relevant to the current 'tar' conscious environment . . . ."

- "Belair Copy Strategy: To position Belair as a cigarette which offers . . .

lower "tar" reassurance relative to full-taste brands. . . ."

- "Belair Prime Prospect: The current Belair smoker with whom the reassurance of the lower "tar" positioning addresses possible concerns which might otherwise prompt the user to switch to a competitive low "tar" cigarette."

779027336-7360 at 7339-40, 7350-51, 7354-55 (US 22163) (A).

3287. A September 26, 1977 letter from P.J. Tighe, B&W Senior Brand Manager of New Products, to colleague Don Johnson discussed additions to Low Tar Brand Plans. The letter stated that the "Low 'Tar' Menthol Plan" needed to provide "**Health Reassurance**." 660093935-3935 (US 53576) (A) (emphasis added).

3288. A document entitled "Fact Operational Plan for Fourth Quarter 1977 and 1978" noted that "[t]o the extent that health reassurance equates with smoking fewer of less 'harmful' cigarettes, the reassurance must be handled carefully, since **consumers clearly consume low 'tar' cigarettes in greater quantities**." The document also concluded that "[t]he greatest need in the marketplace is for a cigarette that promises and delivers: 1) Taste/Flavor, 2) Product Quality, and 3) Health Reassurance." 676038502-8796 at 8573, 8578, 8590 (US 53923) (A) (emphasis added); Smith WD, 59:12-61:6.

3289. A B&W document entitled "Fact Operational Plan for Fourth Quarter 1977 and 1978," discussed smokers who moved to the low tar segment. The plan stated that those smokers who switched to low tar "hold health reassurance as their primary need briefly. Once a commitment to the segment is made, taste/flavor takes over as the primary need and becomes the key brand selection criterion." Based on this theory, the plan concluded that "[h]ealth reassurance, then, is a short lived primary need that is satisfied, generally, by virtue of the brand's position as a low 'tar'. It continues as a secondary need after brand selection and may vary in importance over the long term dependent on external pressures." In a summary of information

taken from smoker group studies, the document maintained that "[t]he vanguard of low ‘tar' smokers consciously traded off taste and satisfaction to attain a greater measure of health reassurance. **Social pressures and advertising appear to be leading greater numbers of smokers to make this trade-off**." 676038502-8796 at 8691-8692, 8695 (US 53923) (A) (emphasis added); Smith WD, 59:12-61:6.

3290. A 1978 B&W document entitled "Purite Filter" acknowledged that the "common area of leverage" of successful brands was implied health benefits due to low tar:

> The move to hi-fi cigarettes is continuing, motivated by consumers who demonstrate personal concerns towards smoking in either the health, social areas, or both. To capitalize on these perceived consumer needs, **three successful positionings have emerged in hi-fi: health reassurance, taste reassurance, and social acceptability. All three positionings use low "tar" as a common thread**. . . . To stem the continued decline in smoking incidence, the industry must rapidly move to a point where it can address cigarettes in a totally positive light . . . . The modern hi-fi segment . . . has been growing dramatically over the last five years. This growth has been spurred by the consumer desire for health protection, as achieved through particulate matter reduction and the industry response in offering low "tar" brands with heavy marketing support. . . . Although the hi-fi segment is continuing its rapid expansion to a projected 50% by 1982, only three positionings are demonstrating vitality and durability among the freestanding low "tars": low "tar"/implied health, i.e. Carlton, True; extra flavor, i.e. Merit; social acceptability, i.e. Vantage. . . . Low "tar"/implied health is the common area of leverage with all these entries.

680559100-9124 at 9100, 9101, 9110, 9120 (US 21003) (A) (emphasis added).

3291. A March 22, 1978 "Private and Confidential" B&W memorandum from G. Reid to F.E. McKeon evidenced B&W's understanding that both low tar claims and the "low gas" claims it sought to promote with its FACT brand of cigarettes were understood by consumers to be claims of reduced harmfulness. The document stated: "Extensive testing of FACT advertising over a three-year period has indicated that consumers do not perceive low gas as a

different benefit than low ‘tar'. **They both are perceived as generic health ideas**." 667059296-9299 at 9296 (US 69068) (O) (emphasis added).

3292. A June 5, 1978 document entitled "Purite Filter Concept: Strategic Brand Review" listed as a decision requested from management: "[c]oncurrent initial pursuit of Health Reassurance and Social Acceptability positionings." The document also commented on the "[c]ancer concern" and "[h]ealth positioning." 300116546-6558 at 6547-6549 (US 46537) (A).

3293. A November 14, 1978 document entitled "Low Delivery Cigarette Project For Brown & Williamson Tobacco Corp." reported that, between 1974 and 1976, 60-74% of consumers believed that "‘low tar and nicotine cigarettes represent a major step in making smoking less harmful,'" and under the heading "'Health' vs. Image/Taste/Satisfaction" that B&W's marketing plan included "**using acceptably Low Delivery numbers to provide assurance that the brand is at least at parity with its health-oriented competitors**." 670133560-3690, 3572, 3581 (US 87887) (A) (emphasis added).

3294. An October 1979 "History and Key Trends in the U.S. Cigarette Market," compiled by E.T. Parrack, B&W Vice President of Brand Management, confirmed B&W's knowledge that smokers turn to low tar cigarettes in response to health concerns, stating that one of the studies "pinpoints the location of various market segments on a continuum from high ‘tar'/low health concern smokers to low ‘tar'/highly concerned smokers." 670624932-5364 at 4935 (US 53869) (A). The compilation contains the following statements, reflecting B&W's knowledge that the increase in filtered and low tar cigarette sales from the 1950s through the 1980s resulted from consumers' belief that these products were less harmful, as a result of Defendants' extensive marketing of these products:

- "The major developments in the cigarette market since 1950 are the most readily understood as a continuous effort by consumers and the industry to

mitigate the perceived dangers of smoking. . . . this is clear in the growth of filters and in the emergence and growth of successive generations of Hi-Fi and low-tar cigarettes." Id. at 4944.

- "[F]iltered products took off, rocketing from 3% of the market in 1950 to 53% in 1960. **The most important reason for this growth would have to be growing health concern**." Id. at 5277 (emphasis added).

- "Starting in 1953, filter cigarettes began a meteoric rise, growing 44 share points in five years. The pace of change reached its peak in 1957 and began to slow down to a low level in 1961. By then, filters had a 53% share." Id. at 4945.

- "Filter Brands' Share of Market . . . Spurred by health concerns." Id. at 5275.

- "Hi-Fi was catapulted into existence . . . 1957. . . . There was no doubt as to the underlying interest at the time in protection from the dangers of cigarettes. Id. at 5342.

- "**The success of hi-fi brands is due in part to the large sums being spent to advertise them**." Id. at 5279 (emphasis added).

- "[Between 1957 and 1960] the consumer was bombarded with messages regarding high filtration." Id. at 5036.

- "Among the troubles of the early entrants [in the filter cigarette category, referring to Parliament, Viceroy, Kent and L&M] were: . . . All got into trouble with the FTC due to their filter claims and had to change their advertising." Id. at 5321.

- "1964-1975 – Emergence of brands using low ‘tar' as primary appeal. . . . appearance of brands which actually based their appeal on low tar and nicotine numbers." Id. at 5275, 5277.

- "During th[e] period [from 1975 to 1976], unfiltered cigarettes continued to be crowded out at an increasing rate, corresponding to an increase in public concern about the dangers of smoking." Id. at 4937.

- "Personal Concern – the dominant trend in the market influencing all major shifts in smoking habits since 1980. . . . Historically, products offering taste and personal reassurance benefits have been most successful. . . . The move from non-filters to filters in the 1950's was spurred by personal concerns . . . . Menthols performed strongly due to perceived personal concern benefits. . . . [From 1966 to 1970] True, Doral, and Vantage (new high-filtration, free standing brands) are introduced and

successfully capitalize on the resurgence of personal concerns. . . . Currently . . . . [a] strong concern for health has drawn [smokers] . . . to the ultra-low 'tar' brands . . ., they are trying to eliminate the risks of smoking." Id. at 5222-5223, 5239.

- "The Hi-Fi smoker wants cigarettes that reduce or appear to reduce the risks of smoking. . . . In view of the interest of Hi-Fi smokers in low-tar and the stress that Hi-Fi brands have placed on it in the past, it seems likely that: – Hi-Fi smokers will be strongly attracted to the new lower-tar cigarettes." Id. at 4950.

- "Two forces are driving the current high rates of brand switching: Smoker concern about personal health [and] Smoker concern about social censure . . . . successful new brand development would have to be aimed at and satisfy the smoker needs arising out of these two key forces." Id. at 5165.

- "About half of the smokers express a significant degree of concern about smoking. . . ." Id. at 5170.

- "29% of smokers who have significant concerns about either health or social pressure . . . are a market of opportunity for new brand development." Id. at 5187.

- "The health concerned smoker, we suspect from these data, finds it difficult to give up [nicotine] impact or effect. Target Audience For Lts" [second sentence handwritten]." Id. at 5197.

Regarding the perceived health benefits of menthol cigarettes, the compilation stated:

- "[T]he split between menthol and Hi-Fi continued. Smokers were forced into a trade off of Hi-Fi vs. menthol. But was it indeed a trade-off? As we have noted, Salem was perceived as a relatively mild cigarette, and menthol itself had been promoted for years for soothing throats irritated by smoking and was the cigarette used by many when they had colds. Thus Salem and other menthols could be regarded as equivalent to a Hi-Fi." Id. at 5036-5037.

670624932-5364 (US 53869) (A).

3295. The B&W International Tobacco 1980 Preview, dated May 6, 1980, noted that "[r]egulation and publicity of an anti-cigarette nature could influence brand choice favorably for BWIT with its portfolio of reassurance products." 660912814-2879 at 2824 (US 53582) (A).

3296. A June 2, 1980 B&W memorandum from Brian R. O'Hare to J.F. Roberts stated:

"It now becomes necessary, in light of the increasing importance of the smoking and health issue and Kent's repositioning as the health reassurance brand[,]" to implement the remaining phases of B&W's plan to position Kent as a less harmful brand. The memorandum noted the importance of implementing this plan "as the smoking and health issue becomes more important on a worldwide basis." 660942115-2116 at 2115 (US 53580) (A) (emphasis in original).

3297. In a July 2, 1982 B&W report entitled "What Are the Obstacles/Enemies of a Swing to Low 'Tar' and What Action Should We Take?," B&W Assistant General Counsel J. Kendrick Wells opined that B&W should respond to attacks on low delivery cigarettes with a far-reaching campaign of misinformation:

> B&W will undertake activities designed to generate statements by public health opinion leaders which will indicate tolerance for smoking and improve the consumer's perception of ultra low "tar" cigarettes (5 mg. or less). The first step will be the identification of attractive scientists not previously involved in the low delivery controversy who would **produce studies re-emphasizing the lower delivery, less risk concept. Through political and scientific friends, B&W will attempt to elicit from the administrative and legislative branches of the federal government, and perhaps voluntary health groups, statements sympathetic to the concept that generally less health risk is associated with ultra low delivery cigarette consumption. The program is designed to produce statements of sufficient news interest to reach the public through the media**. In addition, B&W would seek to generate spontaneous mainstream media articles dealing with component deliveries, much as the old Readers Digest articles. . . . B&W will urge the industry to sponsor research in the ultra low delivery cigarette area which turns the principles used against the industry to positive use. . . . Industry positions favoring the low delivery cigarette can be effectively presented, but must be carefully structured.

680592164-2169 at 2164-2168 (US 21009) (A); (US 76213) (O) (emphasis added); Wells WD, 46:11-49:3.

3298. A March 27, 1985 B&W memorandum from E.T. Parrack, Jr., Vice President of

Domestic Marketing, to Thomas E. Sandefur, Jr., B&W's CEO, stated that "health reassurance" is one of the "'rational' benefits" that have been grafted on to the two "basic benefits" that cigarettes have always offered to consumers. The two basic benefits are: "physical smoking satisfaction" (i.e. adequate nicotine delivery) and "Emotional (image/social) reinforcement: 'The me I want to be.'" After superior product and brand imagery meeting specific consumer emotional needs, the third strategic priority was exploiting rational benefits. The memorandum added that "[n]ew or developing rational benefits represent the most direct and efficient means of obtaining short-term incremental volume." 528010755-0759 at 0755, 0757 (US 20926) (A); Smith WD, 58:12-59:11.

3299. A February 13, 1989 cover letter from Eugene Peck of Shook, Hardy & Bacon to Robert H. Sachs, General Counsel, Product Litigation for B&W, transmitting a memorandum entitled "A Proposed Response to the 'Bad' Ads: The Calfee Defense to Express Warranty Claims," written by Peck and based on the opinions of Jack Calfee regarding the company's potential liability for claims of breach of an express warranty of health or safety for the self-proclaimed "bad" cigarette advertisements of the 1950s, acknowledged that Defendants' advertisements during the 1950s contained explicit claims of reduced harmfulness:

> [R]oughly between 1952 and 1955, [cigarette advertising] continued to address symptomatic aspects of smoking but added a new element: fear appeals containing general, brand-related suggestions of safety . . . . This is the era of the most troublesome ads. Some advertisements stated that a particular brand was 'safer' or offered greater 'health protection' than another . . . . Calfee would agree that the manufacturers probably intended to reassure consumers by the 1952-55 health ads.

682718536-8559 at 8541, 8553 (US 21029) (O).

3300. A 1999 B&W document, "Current Trends in Lights and Ultra Lights," stated under the heading "Learnings": "Consumers were ready for low tar before Marlboro Lights. Health concerns. . . . Anti-smoking pressure and PM's initiative ignited the process.

Manufacturers' focus on Lights accelerated the growth." 430403186-3194 at 3193-94 (US 22084) (A) (emphasis added).

3301. A December 16, 1999 "Presentation of Findings" for "STAR Tobacco Focus Groups" prepared for B&W by "Rabid Research," identified "4 segments of light/ultra smokers (segmented based on motivation for smoking light/ultra variant)." One of the four segments was identified as "those who switched because they believed lights/ultras are less harmful than full flavor and who feel they will not quit smoking." The Presentation noted these smokers were "very interested in the concept" of STAR reduced-nitrosamine tobacco, and that they "know they want to quit and want to reduce their risk . . . . focused on less 'bad stuff.'" The Presentation went on to acknowledge that many consumers smoke low tar cigarettes because they believe they are healthier, stating: "It's important to understand that **not all** light/ultralight smokers are smoking a non-full-flavored cigarette specifically due to health concerns. . . . Of those who switched due to some sort of 'health' concern, respondents who were consciously seeking a less risky cigarette in their switch to lights/ultras are the most interested in the Star [reduced-nitrosamine] proposition." This document also illustrates that, as is the case with low tar cigarettes, the advertisements and marketing efforts of the Defendants were intended to (and did) condition consumers to respond favorably to Defendants' harm reduction claims: "Nobody knows what a nitrosamine is[.] Consumers are currently focused on tar & nicotine[.] A direct statement helps to add 'nitrosamines' to the list of things I don't want in a cigarette." 190200047-0116 at 0061, 0071, 0073, 0095 (US 22162) (A) (emphasis added).

3302. Sharon Smith, former B&W Director of Marketing Services and Operations, testified that her consumer research indicated that, as compared to ultra lights smokers, smokers of lights cigarettes "did not have the same level of understanding of the tar numbers, and instead

spoke in terms of full flavor versus lights," and as a result "rely primarily on brand descriptors like ‘light,' ‘medium,' and ‘ultra light' as relative indicators of the cigarette's tar level," and that they "think of light and ultra light cigarettes as being lower in tar and nicotine." Smith WD, 76:4-12.

(iv) BATCo

3303. du Maurier. Like the other Defendants' advertisements, BATCo's advertisements in the 1950s for its du Maurier brand included explicit health claims, including the following:

> 1954: "[N]ow you don't have to choose between a filter cigarette and a good smoke . . . you get both with Du Maurier." ADV01120001-0003 (US 88730) (O).
>
> 1954: "A new frontier in safer smoking."
>
> 1954: "If you have been concerned about your cigarette habit . . . du Maurier tip filters out so much harmful smoke it will also filter out much of the ‘worry' in every puff you take."

696000888-0916 at 0895 (US 21387) (A) ("A Review of Health References in Cigarette Advertising 1927-1964" – document contains a "Brown & Williamson – Louisville" variance sheet).

3304. BATCo's Research On the Low Tar Cigarette Category. Susan Ivey, who worked in marketing for BATCo from 1990 and 1999, testified that while she was at BATCo, the company "conducted market research on consumer perceptions of light cigarettes." Ivey WD, 75:5-7. As demonstrated below, BATCo's research documents indicate that BATCo has long known and intended that its advertisements and marketing for low tar cigarettes featuring claims of lowered tar and nicotine and "light" and "ultra light" brand descriptors contributed to, and reinforced consumers' notion that low tar cigarettes are better for their health, and caused consumers to smoke them for this reason.

3305. A 1972 BATCo memorandum explained that health reassurances usually result in

increased sales: "Over the years manufacturers have provided the public with a variety of platforms to . . . ‘enhance the association in smokers minds between the benefits of smoking and our cigarette products'. Increasingly, by implication, these claims have turned to a health orientation and **very often the closer these have come to relating the smoking benefit to being one of "health" the more successful has been the brand**." 100006864-6868 at 6864 (US 20076) (A) (emphasis added).

3306. A May 3, 1974 note from Anthony D. McCormick of BATCo's Legal Department "[t]o all Members of the Conference" enclosed a document for discussion by BATCo employees at an upcoming internal conference. Under the heading "SMOKING AND HEALTH ASSUMPTIONS," the enclosed document stated: "**On legal grounds alone it will continue to be to the industry's advantage not to make explicit health claims. The industry will make increasingly competitive use of products for which health claims are implied.**" The statements quoted above are repeated later in the document in a chart under the same headings. 100428581-8599 at 8581, 8583, 8599 (US 34649) (O) (emphasis added).

3307. An internal April 14, 1977 BATCo memorandum by P.L. Short, Manager of BATCo's Marketing Department, describing BATCo's marketing plan, stated that "[a]ll work" would be "directed toward providing consumer reassurance about cigarettes and the smoking habit . . . **provided . . . by claimed low deliveries, by the perception of low deliveries and by the perception of ‘mildness.'** Furthermore, advertising for low delivery or traditional brands should be constructed in ways so as not to provoke anxiety about health, but to alleviate it, and enable the smoker to feel assured about the habit and confident in maintaining it over time." 100427791-7800 at 7794, 7799-7800 (US 34641) (O) (emphasis added - bold text).

3308. An August 5, 1980 BATCo memorandum signed by J. Kendrick Wells III, B&W

Assistant General Counsel, demonstrated the Defendants' concern that their unsubstantiated representations that low tar products were less harmful could lead to legal liability, because smokers would likely rely on these representations: "Statements by a manufacturer that certain cigarettes may be smoked with reduced or zero health risk could constitute an express warranty. A plaintiff who followed the representation and then got lung cancer might have a stronger case because the defense of voluntary smoking could be eliminated." 680050983-1001 at 0986 (US 20981) (O).

3309. An April 1982 document entitled "Conference on Marketing Low Delivery Products: January 1982" stated: "The BATCo.'s Board policy stated in the Market Expansion document is to lead the industry in the trend towards lowering deliveries. . . . [C]onsumers will probably believe that lower deliveries mean less ‘risky' products." 690120722-0756 at 0726, 0728 (US 21043) (A); Ivey WD, 80:14-81:9.

3310. A March 29, 1976 BATCo report entitled "The Product in the Early 1980s," indicated that BATCo's focus was on portraying the "image" that its products were less harmful, as opposed to producing products that were, in fact, less harmful. The report stated that "opportunities exist for filter and cigarette designs which offer the **image** of ‘health re-assurance.'" 110069974-9982 at 9974, 9979 (US 20268) (A) (emphasis added).

3311. An undated BATCo document entitled "Lights Segment Project Consumer Insight Into Smoking Lights" listed under the heading, "How to Create a Positive Lights Culture," the following three ways to "differentiate the lights from full flavor smoking . . . Color, Cues e.g. Blues & Whites . . . Lighter Lifestyles e.g. water related outdoor fun activities . . . Light symbols e.g. Bubbles[;] Air balloons[;] Light winds." 321546706-6724 at 6719 (US 46770) (O).

3312. Susan Ivey, who worked in marketing for BATCo from 1990 and 1999, testified

that, in her experience, "while many smokers know they are buying a lights product, their actual understanding of what the specific delivery numbers are is quite limited. For example, consumers might know they are smoking a lights version of a brand, but they wouldn't know what the machine-measured tar yield was for that cigarette." Similarly, a September 1992 BATCo Business Review prepared by Norma Simamane, BATCo Lights Project Manager, stated that "[g]enerally, the specific meaning of Tar and Nicotine is not understood by consumers. However, **they perceive a strong association between the numbers with 'perceived health effects'. Basic understanding is that 'the higher the numbers, the stronger the negative health effects'**." Instead of prohibiting advertisements intimating that low tar cigarettes are healthier, the document stated: "**Reference to overt communication of health related issues must be avoided**." The document also advocated using brand descriptors such as "'Light,'" "'Ultra'" and "'Suave (indicating Lights)'" as opposed to tar and nicotine yields, because "T&N numbers . . . tend to highlight negatives and to remind consumers of the negatives of smoking thereby increasing the 'guilt' feeling." The document further stated: "The importance of the Lights segment is demonstrated by the growth trend that is 5 times faster than total world cigarettes volume . . . . In addition to being profitable, future projections indicate an even faster growth of lights." Ivey WD, 76:10-12. Ivey WD, 82:4-11, 76:10-18; 321683062-3099 at 3087, 3090, 3065 (US 28586) (A) (emphasis added).

3313. A November 1994 BAT presentation entitled "Low Tar Band Market Overview and Lights Review" sought to use recent and previous studies and other market data to provide a review of "the dynamics and characteristics of the 0-4mg tar band segment and the perception of Lights" within the Australian cigarette market. A goal of this presentation was to provide feedback for "the expansion of Lights and lower tar deliveries in other BATCo markets." In

discussing smoker understanding of lights descriptors, the document conceded that the lights descriptors misled smokers into believing that the lights brands had less tar than they actually did, stating: "**Respondents got a 'surprise' when they read the mg content of the proposed range. They feel they have been somewhat mislead from the point of view that these are really 'normal' mild's posing as 'something' healthier**." 500262133-2183 at 2134, 2170, 2174 (US 48139) (A) (emphasis added); Ivey WD, 75:12-76:9.

3314. The same document reported as a "Key Finding" that Lights were "**perceived as a clever psychological ruse intimating that the smoker was indulging in a low tar content, an innocuous cigarette**." The presentation cited a September 1992 survey that found more than half of the smokers reported being under pressure to quit, and wished to quit, and **the group that most wanted to quit was in the Ultra Low Tar category**. 500262133-2183 at 2155-2156, 2173-2174, 2179-2182 (US 48139) (A) (emphasis added).

3315. A January 1995 research report prepared for BATCo entitled "Silk Cut Brand Status Check & Concept Evaluation" stated, under the heading "Attitudes to LTN [low tar and nicotine]":

> There was universal agreement . . . amongst ff [full flavor] smokers that they would switch to LTN if and only if a lights brand with taste could be produced. But that seemed almost a contradiction in terms for many of them as many ff [full flavor] smokers described a direct correlation between tar and nicotine levels and taste. Regular lights brands smokers – even Marlboro Lights – were reassured about health concerns by choosing to smoke such brands.

800056515-6581 at 6526 (US 31643) (A).

3316. A July 28, 1995 research report, prepared for Malaysian Tobacco Company Marketing by Acorn Marketing and Research, entitled "Project Grasshopper: Exploratory Research into the Lights and Menthol Segments," was directed at better understanding consumer

dynamics in relation to Menthols and Lights. The research suggested that brands were successful when a market niche was created, and that there was now a niche for Lights, in that social forces have worked ". . . to create a gap for a cigarette less hazardous to health." The report also concluded that "[l]ights are compatible with the 'healthy', 'moderation' lifestyle of the new generation," and that "**[h]ealth considerations would provide the rational justification for overcoming the 'less taste' attribute of Lights**." Under the heading "Understanding and Perceptions of Lights" the report noted that "[most] Smokers know that lower tar and nicotine relates to health considerations," and one focus group respondent was quoted as saying "[lights] is not so bad for the body." 800504239-4268 at 4241, 4244-4247, 4257-4259, 4267-4268 (US 56650) (A) (emphasis added).

3317. A report prepared for BATCo in January 1995 entitled, "Ultra-Lights Consumer Dynamics: Research to Assist BATCo to Better Understand Consumer Motivations, Behaviour & Requirements," examined the Ultra Lights segment in the Swiss market, and advised that "[r]isk management" is a "Key Motivation" for the terminology "Ultra Low Tar." 700326442-6455 at 6446, 6449 (US 54501) (A); Ivey WD, 76:19-77:6.

3318. A June 1995 draft report prepared for BATCo by Marketing Improvements Research entitled "Low Tar Consumer Dynamics Phase 2 Report" examined various aspects of Light, Ultra Light, and low tar cigarettes, including attitudes towards smoking, consumer behavior and usage patterns, and impacts of market terminology. The report noted: "Lights/UL smokers described their ideal cigarette as offering," among other things, "lowest possible damage to health." The report concluded that one of the "transitions in attitude and behaviour that need to be achieved" was that "[f]ear of negative health consequences" needed to change to an attitude of "[p]ersonal gain in physical well-being." The report also stated that some smokers who "trade

down" to Lights/Ultra Lights "report stronger inhalation" and that "[p]hysical sensation (associated with intake of "active" substances) . . . can be achieved by UL smokers very quickly by smoking several cigarettes." 500154681-4727 at 4689-4692, 4695, 4699-4700, 4706, 4716, 4721 (US 67903) (A); Ivey WD, 77:7-22.

3319. A June 23, 1995 document entitled "B.A.T. Industries Strategy Review" stated that "BAT must take advantage of the opportunity to develop a free-standing Lights brand." The first reason given for this "strategic imperative" was that "[t]he world market is gradually shifting to lower tar and nicotine levels. This is partly in response to health concerns and partly because Lights brands are seen as more contemporary." 321797455-7518 at 7489 (US 67830) (A); Ivey WD, 73:18-74:4.

3320. Two documents entitled "Kent Filter Issue Q&A Draft: September 21st 1995" reflect that BATCo's proposed response – "Some consumers probably choose lighter products because they believe they are safer" – to the question: "Do filters make cigarettes safer?" was edited out by hand by BATCo lawyers. 800493953-3954 at 3954 (US 56649) (O).

3321. A BATCo document bearing the heading "Barclay Business Review 1996" concludes both that consumers rely on product packaging and marketing (as opposed to FTC tar and nicotine deliveries) to indicate low tar level and that reduced tar level significantly increases purchase interest:

> Consumers – with the exception of 1MG smokers – are not able to quote correct tar/nic deliveries of the brand they are smoking currently. This means that the consumer does not segment the market in terms of deliveries but he uses colour coding and descriptors to distinguish FF, Lights and Ultra Lights. . . . shelving according to [FTC tar and nicotine] deliveries has a positive impact on the awareness of the Lights category in general. The willingness to try Barclay increased significantly.

700767443-7457 at 7452 (US 22123) (A); accord 321184656-4672 (US 22045) (O).

3322. This BATCo document further found that, "[i]n non-developed light markets" such as Norway, "[t]he growth of the [brand] family is driven by Barclay Number One which is an attractive offer for smokers switching down because of health concerns." It went on to state that:

> The results of the . . . smokers motivations study in Belgium show that the key drivers to the [ultralights] segment are health concern and peer/family pressure. . . . In the past the key driver to lights was consumers switching down from higher delivery products predominantly because of health concerns. Within this scenario Barclay attracted full flavour smokers around the age of 25-35.

700767443-7457 at 7444, 7448, 7451 (US 22123) (A).

3323. A February 8, 1996 report entitled "Project Tailight," prepared by On Track Marketing and Research Consultants for BAT Services Limited, Taiwan Branch, summarized "exploratory qualitative research" undertaken to analyze the growth of the lights/mild segment in Taiwan due, in part, to "[i]ncreased anti-smoking and health pressures." The report stated that the "Lights Phenomenon" was attributed in part to "[c]onsumers . . . growing awareness and concern for health" and that those not interested in lights were "[n]ot concerned/worried about health yet." It further noted that "[t]he stronger the addiction or need, the more likely 'lights' cannot fulfill the 'satisfaction'." A "key finding" listed in the report was that "true lights" smokers "claim to be smoking a light cigarette due to concerns about the health-related dangers (particularly death) of smoking." 800493562-3773 at 3565, 3569-3571, 3588 (US 56616) (A).

3324. An October 6, 1997 BATCo document stated: "The Lights segment is growing fast for the last two years due to the strong adoption among YAUS [young adult urban smokers] who smoke Lights for being less harmful for the health." 760008107-8111 at 8107 (US 54587) (A).

3325. In a BATCo Kent Super Lights Brand Plan, BATCo discussed ways in which to

"accelerate its lights segment growth." Under the heading of "Key Insights from 1997," the plan reported that "[l]ights franchise is skewed towards upscale 35+ female smokers, this is consistent with associated smoker (who is assumed to be health conscious)" and that "'[h]ealth conscious' brand choice is seen by ASU [adult smokers under] 30s as purchase pattern for 40+ smokers." 321551304-1323 at 1304, 1305 (US 22057) (A); Ivey WD, 78:1-13.

3326. A "Qualitative Research Report on Light Cigarette Brand Perceptions" dated January-February 1997, and also contained in BAT Russia's 1999 Brand Plan, stated, under the heading "Benefits Sought From Lights":

" The "Conclusions" Section stated:

760008596-8803 at 8686, 8692-8693 (US 54588) (Confidential) (A) (emphasis added).

3327. A 1998 BATCo research report entitled "Poland - The Drive to Lights" examined the "phenomenal" growth of the lights segment in Poland to "provide an insight into the key factors driving the remarkable development of the Lights segment in Poland" and "develop key learning's [sic] to share with Markets in order to support their Lights business and help drive the Lights Segment." The report found that the lights segment had "the greatest penetration in the ASU [adult smoker under] 30 group" and that this was caused in part by the fact that "[t]he ASU 30 group will also plan the future that they have ahead of them and are therefore looking for a

potentially less harmful substitute." 321541810-1835 at 1810 (US 22053) (A).

3328. A 1998 BATCo research report entitled "Hungary – The Drive to Lights" examined the growth of the lights segment in Hungary to "develop key learning's [sic] derived from the Hungary example to share with markets in order to support their Lights business and help drive the Lights segment." The report concluded that "the primary motivator for people smoking Lights cigarettes in Hungary is related to health." Noting the prevalence and influence of Western culture in the country, the BATCo report found that: "Western culture advocates a healthier way of life educating consumers about potential health and social issues associated with consumable products. Through this exposure, consumers begun [sic] to make the association between Lights cigarettes and their perceived 'health' benefits." The report also examined consumer perceptions of the word "lights," and found that the word 'Light' is "associated with a 'healthier' product that is less harmful to the health," while "Lights products are perceived to serve as an intermediate stage between healthy and harmful, mainly in the case of cigarettes." 321629213-9245 at 9213, 9222, 9243 (US 22065) (A).

3329. A February 1998 internal BATCo report entitled "The Evolution of Lights in the USA" provided "an analysis of the light evolution for the cigarette category in the unique scenario of the USA market" in order to "identify the forces that ignited and accelerated the [lights] segment development and extract learnings from the strategies that the key players applied to take their brands to top positions." The report noted that the "Ultra Lights segment's franchise is mainly composed by 51+ year smokers who are willing to trade off taste by ultra low tar due to their health concerns." 321629186-9196 at 9190, 9194 (US 22062) (A); Ivey WD, 80:1-13.

3330. A February 24, 1998 BATCo document contained in BATCo's "Kent BAT Russia

1999 Brand Plan" noted that

760008596-8803 at 8768-8769

(US 54588) (Confidential) (A) (internal numbering omitted).

3331. A March 4, 1998 internal BATCo draft report entitled "Lights Information Kit," that provided "a summary of British American Tobacco's understanding of Lights cigarettes" to assist BATCo in its attempt to "take an increasing share of this segment," equated cigarette brand descriptors with brand descriptors used for food and drink products. The report noted that "[t]here has been a clear trend over the past two decades in many food and beverage categories towards lighter products, often on the basis of an offer of lower calories or lighter taste but also often portrayed as a modern choice." Citing diet colas, light beers, and lower fat foods as examples, the report noted that "[t]rends for lighter food and beverage products can act as an indicator of trends towards lighter cigarette brands." 321478980-8985 at 8980, 8982 (US 22049) (A); Ivey WD, 74:5-75:4.

3332. A BATCo document from 1998 or thereafter entitled "Perception of Lights," based on BAT research in Hungary, reported under the heading "Advantages of Lights" that clearly the most cited reason that smokers choose light cigarettes (given by 40.5% of the smokers questioned) is that they are believed to be "[l]ess damaging to overall well being." The document

stated that "**[p]eople see advantages of 'Lights' to mainly be 'less damaging to overall well-being', 'milder, lighter', and 'less nicotine, tar'**. . . . Lights smokers cite reasons for smoking them as – health, social pressure, prestige and as an attempt to reduce addiction." Taste was not mentioned as a "reason for smoking" light cigarettes. 321541609-1679 at 1609, 1644, 1652 (US 22052) (A) (emphasis added); Ivey WD, 78:14-79:4.

3333. A 1999 BATCo document entitled "Lightning – Extreme Smoking Regimes Testing Results and Implications for IT and The Light-Mild Issue" cited a "Smokers' attitudes report" that found that 39% of those who switched to a Light/Mild brand did so for "[h]ealth reasons" and 18% did so as a "step to quit[ting]." Further results showed that more smokers perceive the terms "light" and "mild" to indicate low tar than to connote taste or any other characteristic. 321989078-9276 at 9121-9122 (US 28819) (O).

3334. A 1999 BATCo presentation on marketing in Europe bearing the headings "Research" and "Heathrow Proposition" stated that many smokers want to "trade down" in tar in order to minimize risk and harm caused by their cigarettes: "[S]trong potential for a new low tar brand – many smokers looking to trade down. . . . Low tar Minimise Risk, Maximise Pleasure. . . . New Product Proposition Low tar product with smoother yet fuller smoking experience[.] All, bar quitters, welcome proposition – more fun/enjoyment, less harm." 321628040-8076 at 8056, 8059, 8061 (US 22060) (A).

3335. A document on BAT Russia letterhead contained in BATCo's "Kent BAT Russia 1999 Brand Plan" demonstrates British American Tobacco's plan to exploit, for profit, smokers' false perceptions that low tar cigarettes are less harmful.

A

November 8, 2002 BAT Russia document entitled "Market Research – Initiating Project Brief" contained a nearly identical admission:

760008596-8803 at 8770, 8800 (US 54588) (Confidential) (A).

3336. A Market Research Summary Report bearing a BAT legend and contained in BAT Russia's 1999 Brand Plan presented the following "Key Conclusions" from research conducted for BAT in Moscow

760008596-8803 at 8676-8679 (US 54588) (Confidential) (A).

3337. A January 2001 BATCo file entitled "Consumer Concept Trial Notes Jan 2001 Project Baltec II" contains a section dated January 10-12, 2001, entitled "Philadelphia – General Impressions and Summary," that revealed the results of consumer research on low tar cigarette smokers.

325238922-8994 at 8981, 8991-8994 (US 22079) (Confidential) (O).

3338. A January 10, 2001 BATCo document written by Steven Coburn, entitled "Project Balcony," that referenced Philadelphia, Pennsylvania marketing studies related to proposed campaigns, acknowledged that low tar and nicotine messages in advertising imply a health benefit. The document stated "3rd board impresses the low nic/tar idea – **appears to imply healthier though no cig is healthy**." 325239028-9036 at 9029 (US 22083) (O) (emphasis added). An identically titled document from the same author dated January 11, 2001, stated under the heading "Benefit": "Lights are supposed to be more healthy." 325239035-9036 at 9035 (US 22083) (O). A BATCo document dated January 15, 2001 with the same title and author, but which referenced Santa Monica, California marketing studies related to proposed campaigns, stated "less tar nic – less harmful." 325239014-9027 at 9015 (US 22082) (O). A January 23, 2001 document with the same title and author and referencing Tokyo, Japan smokers stated "low nic tar idea is positive – healthier." 325239001-9005 at 9004 (US 22081) (O). Another document with the same date, title and author (also regarding smokers in Tokyo and Japan) stated "3rd board – sounds healthier – lower nic/tar. . . . Other Benefits/potential issues: What do you look for if you change brands? Tar/nic levels – low as possible but still get satisfaction from cig[;] Taste[;] Health consciousness – lower tar." 325239006-9007 at 9006-9007 (US 22081) (O).

3339. Dr. Sharon (Boyse) Blackie, former Head of the Smoking Issues Department at BATCo, testified that she has "been aware for some time that some smokers believe that low tar cigarettes are less hazardous to their health," and that "some smokers believe that by switching to low tar cigarettes, they will achieve a health benefit." Blackie WD, 184:14-21.

(v) American Tobacco

3340. American Tobacco's brands included Carlton, Lucky Strikes, Pall Mall, and

Tareyton, until they were acquired by B&W in 1995. Gesell PD, State of Minnesota v. Philip Morris Inc., 9/18/97, 6:10-17; 117:3-15; 25:23-26:3; 93:2-13. Like the other Defendants, American Tobacco used descriptive terms and low FTC tar ratings to convey misleading and unsubstantiated health messages to the public regarding their low tar cigarettes. For instance, a "1969 Survey of Cigarette Smoking Behavior and Attitudes" performed for American Tobacco illustrates American's understanding that consumers perceived certain brands as less harmful to smoke than others. The survey contained the following questions: "What brand or brands of cigarettes come to mind when I say: Is safest to smoke? Is most effective in eliminating the things that are bad for you? Can prevent cigarette cough? Is best for people who are just starting to smoke regularly?" 650340129-0193 at 0151 (US 20948) (A); (US 22117) (O).

3341. A November 11, 1976 report prepared by Fay Ennis Creative Research Services for F. William Free & Company, an advertising agency used by American, summarized focus group sessions relating to low tar cigarettes. The report noted that all of the group participants had switched to low tar cigarettes "because they felt that low tar cigarettes are healthier than high tar cigarettes." The report identified as another reason for switching, "[t]here was a feeling low tar cigarettes are packed with less tobacco than the high tar variety and therefore are less harmful because there is actually less tobacco, i.e., less tar and nicotine in each cigarette." When asked to define a low tar cigarette, some participants responded: "Lets less tar and nicotine get into my lungs." ATC013 7310-7324 at 7318-7319 (US 87890) (O).

3342. Carlton. American Tobacco led the way in the use of low tar brands as a marketing tool to keep smokers in the market with its introduction of Carlton. For nearly 30 years, American placed advertisements in nationally-circulated magazines that touted Carlton's purportedly low tar. For instance, American's advertisements in Time and Newsweek in 1964 for

Carlton cigarettes stated: "Everything about Carlton is selected and crafted to produce this one result: A cigarette that is low in ‘tar' and nicotine – yet high in smoking pleasure. Carlton is so low in ‘tar' and nicotine that we print test results on all packs, on all cartons. . . . Carlton – lightest smoke of all. See for yourself." ATX040070514-0519 (US 21125) (O); see also ADV011 1575-1579 (US 3028) (A); ADV107 0020-0022 (US 88689) (A); ADV107 0023-0027 (US 88690) (O) (1964 Carlton advertisements).

3343. A June 8, 1964 report prepared by Gardner Advertising Company for American Tobacco, entitled "A Summary Report of Two Carlton Research Studies," summarized "Carlton Concept Research" and "Carlton Penetration Research." The report stated as a "Highlight" that "Based on Ad Exposure Before Product Availability," smokers "[s]aw CARLTON as a high filtration cigarette, low in tar and nicotine. Although the advertisement made no mention of it, there was a tendency to interpret CARLTON as lower in tar and nicotine, safer, less harmful." ATC2503644-3706 at 3650 (US 87891) (O) (emphasis in original).

3344. A 1967 Annual Report of American Tobacco shows that its Carlton cigarette, which "was developed to appeal to those smokers preferring a light cigarette – one that is low in ‘tar' – and nicotine yield," achieved "sizeable sales increases in 1967" resulting from "favorable publicity" as a low tar, low nicotine cigarette. MNAT00029170-9201 at 9176 (US 21222) (O).

3345. American Tobacco labeled Carlton an "unusual new cigarette" that is "so low in ‘tar' and nicotine we print test results on all packs and cartons." In 1968, American's Carlton advertising stressed the fact that it was found lowest in ‘tar' by U.S. Government testing and cited its "unique Air-Stream Filter" as the source of its ability to reduce tar to 4 mg. (as compared to a then industry average of over 20 mg.). ATX40397140-7141 (US 85020) (A); MNAT00386652-6652 (US 85112) (A); Dolan WD, 124:12-17.

3346. By using the FTC machine test yields to imply that the Federal Government had endorsed the company's "low tar" claim, American Tobacco's advertisements in the 1970s suggested that Carlton cigarettes were less harmful:

1973: "For 10th straight published Gov't Report Carlton. Still lowest in ‘tar' of all regular filter kings tested . . . . For the last 10 consecutive Government Reports. Carlton has been found lowest in ‘tar' of all regular filter kings tested. That's every Report since October 1968." ATX040070514-0519 at 0515 (US 21125) (O).

1974: "Of all filter kings tested: Carlton is lowest. For the 12th straight time, the U.S. Government has reported Carlton to be the lowest in tar of all filter kings tested." (US 87178) (O).

1975: "Of all filter kings tested: Carlton is lowest. Look at the latest U.S. Government figures for other brands that call themselves low in tar." US 4605 (A); Biglan WD, 281:17-283:22; (US 87183) (O).

1975: "U.S. Government Report shows only one is lowest... Carlton." (US 88691) (O).

1978: "U.S. GOVERNMENT REPORT: CARLTON LOWEST. Carlton claim confirmed. Many cigarettes are using national advertising to identify themselves as ‘low tar.' Consumers, however, should find out just how low these brands are–or aren't. Based on U.S. Government Report: 14 Carltons, Box or Menthol, have less tar than one Vantage. 11 Carltons, Box or Menthol, have less tar than one Merit. 11 Carltons, Box or Menthol, have less tar than one Kent Golden Lights. 6 Carltons, Box or Menthol, have less tar than one True . . . . This same report confirms of all brands, Carlton Box to be the lowest with less than 0.5 mg. tar and 0.05 mg. nicotine." (US 5961) (O); (US 5978) (O).

1978: "Carlton is lowest. See how Carlton stacks down in tar. Look at the latest U.S. Government figures [table comparing Carlton favorably with Winston Lights, Vantage, Salem Lights, Kent Golden Lights, Merit and True cigarettes]" (US 5811) (O); (US 5707) (O).

1978: "Based on latest U.S. Government Report: Carlton is lowest. See how Carlton stacks down in tar. Look at the latest U.S. Government figures [referring to table indicating Carlton has lower tar than Winston Lights, Vantage, Salem Lights, Kent Golden Lights, Merit and True cigarettes]." (US 5948) (O).

1983: "Read the numbers on the pack. Carlton is lowest." (US 7637) (A); Biglan WD, 281:17-283:22.

ATX040070514-0519 (US 21125) (O); 03496228-6630 at 6309, 6310, 6580 (US 20057) (O).

3347. A September 1973 report prepared for American entitled "Tareyton, Iceberg 10, Carlton" discussed marketing strategies for these three brands. In the "Advertising Strategy Statement" for Carlton, in a section entitled "The Prospect's Problem," the report noted that in focus group interviews "the 'health' problem is most frequently mentioned, but people tend to ignore the negatives and continue to smoke out of pleasure or habit." The report went on to say that "Carlton's copy strategy for 1973/1974 will continue to be straight forward and factual, **appealing to those smokers whose concern for 'health' hazards leads them to seek out a cigarette with truly low 'tar' and nicotine content**." ATC2472182-2243 at 2216, 2225 (US 87892) (O) (emphasis added).

3348. When Eric Gesell, designated representative of American who worked for American from 1963-1994, was asked in a 1997 deposition what American intended by its Carlton cigarette advertisements from 1974 and 1978 with the slogans "Carlton is lowest" and "Carlton lowest," Gesell testified that, "[w]hat [American is] doing in this ad is using the FTC figures in order to try to sell a cigarette." Gesell also testified that "[w]hat [consumers] would get from" the advertisement "is that Carlton is the lowest in tar." Gesell had no evidence that smokers are aware that the way they smoke a cigarette significantly affects the tar delivery. Gesell PD, State of Minnesota v. Philip Morris Inc., 9/18/97, 5:8-25, 6:5-6, 6:10-17, 115:19-118:14; ATX040070514-0519 (US 21125) (O).

3349. Carlton's 1981 Marketing Plan, dated August 18, 1980, discussed ways to make Carlton cigarettes "the brand of the 1980's." The forward of the plan noted that "[t]he Ultra Low segment of the market is continuing to grow rapidly as more and more smokers search for smoking pleasure at tar levels more in tune with the mores of the times. **Carlton, as innovator**

and category leader, is well poised to capitalize on this trend by its inherent positioning."

ATC0735197- 5261 at 5199 (US 87893) (O) (emphasis added – bold type).

3350. The Carlton 1981 Marketing Plan also discussed "1981 Specific Problems and Opportunities." In this section, the report stated:

> [i]t is anticipated that a new FTC Report will be released in January, 1981. Although the Report may cite the tar and nicotine data of a Box product we are not currently marketing, **we will create new advertising to capitalize on the Report as fully as possible**.

ATC0735197- 5261 at 5237-5238 (US 87893) (O) (emphasis added).

3351. A circa 1983 letter to H.W. Bahrenburg, American Tobacco Product Manager, from Tom Keane of Laurence, Charles & Free, Inc., discussed advertisements for American's Carlton cigarettes, stating that American would proceed with the advertisement that best communicated that Carlton was "'lowest'" in tar and nicotine: "Our recommendation was to go with the B ad – 'Compare' with the 'U.S. Gov't Report.' This ad did very well in the general low-tar area and in fact it was the only ad which showed a 'lowest' playback on the primary question – 'What do you get out of this ad?' . . . . [W]e are proceeding with 'Compare' and 'U.S. Gov't' on the new . . . ad." The advertisements attached to the letter stated: "Compare to your brand . . . . Box King – lowest of all brands – less than 0.01 mg. tar, 0.002 mg. nic. Carlton is lowest. . . . U.S. Gov't Report – no brand lower than Carlton Box King – less than 0.5 mg. tar, 0.05 mg. nic . . . . FTC Report Mar. '83." 991034809-4816 at 4809, 4816 (US 85113) (O); see also (US 7536) (O) (1983 Carlton advertisement that appeared in Sports Illustrated magazine).

3352. An August 4, 1983 American Tobacco memorandum from John A. McGinn, Product Manager, to W.J. Moore, Marketing Director, entitled "CARLTON Slims," stated: "At a 6 mg. tar level, this 100 mm product would be responsive to those consumers seeking low tar . . .

. It would also extend CARLTON's 'lowest' position to yet another cigarette category." 991341428-1440 at 1428 (US 85114) (O).

3353. A February 1987 magazine advertising campaign for Carlton also prominently featured claimed tar and nicotine reduction: "If you smoke . . . Compare your cigarette to Carlton. If you're interested in smoking an ultra low tar and nicotine cigarette, you should compare the tar and nicotine content of your cigarette to Carlton. Most cigarettes sold today have 10 times the tar and nicotine of Carlton Box Kings & Box 100's." Another Carlton advertisement campaign from the late 1980s also had lowest tar as its centerpiece and implied a United States Government endorsement, listing Carlton as having lower tar than Philip Morris's Merit and RJR's Vantage cigarettes:

> If you smoke . . . Here's the latest comparative information for smokers who want lower tar & nicotine. . . . CARLTON became the first brand to put these figures right on the pack. . . . In the last 21 reports issued by the U.S. Government, no cigarette has tested lower than Carlton. . . . If you are interested in the tar content of your cigarette, you should compare the tar content of your cigarette vs CARLTON. If you are interested in the lowest . . . LATEST U.S. GOV'T REPORT CONFIRMS: no brand lower than Carlton Box King.

MNAT00746229-6229 (US 21230) (O); (US 8246) (O) (1986 Carlton advertisement that appeared in Sports Illustrated magazine).

3354. A 1987 advertisement for American's Carlton cigarette stated: "**Carlton cuts tar by 40%! . . . . Carlton is lowest**. Reduced to 3 mg. tar." Eric Gesell testified in 1997 that American did not place any disclaimer with this advertisement to indicate that the FTC yields that were the basis of American's claim that "Carlton cuts tar by 40%" did not refer to the amount of tar and nicotine to which a smoker of these cigarettes would be exposed. Gesell PD, Minnesota, 9/18/97, 5:8-25, 6:5-6, 6:10-17, 128:4-17, 131:22-132:19.

3355. A February 29, 1988 American Tobacco memorandum from R.E. Smith, Director of Brand Management, to K.P. Noone, Product Manager, stated:

> The singular objective of all consumer communication should be registering Carlton's lowest positioning. We must continue to hammer this lowest message home to our current franchise. It's why they came to Carlton. As switching losses to Now show, it's the best way to lure them away. . . . It is my belief that most smokers will continue to seek lower tar. They have switched for it in the past, often several times.

991216857-6858 at 6857 (US 85115) (O).

3356. In the 1990s, American's advertisements for Carlton also featured purported testimonials of smokers who claimed to have reduced their exposure to tar by switching to Carlton, including the following:

1994: "**I switched to less tar**. Like many other smokers, I wanted less tar. But I thought I'd have to sacrifice flavor... and isn't that what smoking's all about? Then I tried Carlton... and I switched! Carlton is the lowest in tar. . . I figure if you're going to switch to less tar, why not go the distance!" (US 9257) (O); ATX040268971-8971 (US 21127) (O) (emphasis added).

1994: "I switched to lowest tar." (US 9285) (A).

1994: "If you want less tar please try Carlton . . . . U.S. Gov't. Test Method confirms of all king soft packs: Carlton is lowest in tar and nicotine." 970469347-9474 at 9460 (US 85104) (O).

See also 970469347-9474 at 9452-9457 (US 88612) (O) ("Carlton Creative" collection of advertisements including Carlton's "I Switched To Lowest Tar" advertisements); 970557462-7465 (US 85116) (O) (Dec. 6, 1993 letter on American Tobacco letterhead from James M. Murray to Nancy Gavlick attaching similar "print ad comps" for Carlton).

3357. American Tobacco also placed advertisements for Carlton in the 1990s claiming that smokers could smoke ten packs of Carlton and still receive less tar than they would from smoking one pack of Marlboro, Camel, Winston, Kent, or Viceroy. (US 9182) (A) (1993

advertisement in Sports Illustrated magazine stating: "10 packs of Carlton Menthol have less tar than 1 pack of these brands"); (US 9122) (A) (1992 advertisement noting same); Biglan WD, 281:17-283:22; (US 9093)(O) (1992 Carlton advertisement stating same); 970469347-9474 at 9464-9466 (US 85104) (O) (1990s Carlton advertisements stating same); (US 9186) (O) (1993 advertisement stating: "A WHOLE CARTON OF CARLTON . . . HAS LESS TAR THAN 1 PACK OF THESE BRANDS. . . Carlton is lowest in tar and nicotine"); Smith WD, 68:15-21.

3358. A September 13, 1994 document prepared for American Tobacco entitled "LCF & L Agency Orientation Handbook" describes American's print advertising strategy to "[p]rompt competitive target smokers to question their Brands Tar Level and present CARLTON as a contemporary, satisfying answer for those smokers seeking lower tar. The strategy and presentation should start and build from a common 'truth' in our prime prospects mindset – to serve as a reminder that they too want less tar." The "Positioning Statement" was: "Carlton is the brand chosen to 'switch' to in the ULT category because it is the lowest in tar and nicotine, as confirmed by the U.S. government FTC method. By smoking Carlton you get the lowest and you do not have to sacrifice flavor." 970469347-9474 at 9354, 9411 (US 85104) (O).

3359. Lucky Strikes. In 1974, American Tobacco advertised that by switching to Lucky Strikes, smokers could: "Cut your 'tar' in half with Lucky 100's." (US 4405) (A); (US 4415) (A); Smith WD, 74:3-14; Ivey WD, 52:4-8.

3360. Pall Mall. American Tobacco advertisements for Pall Mall Gold cigarettes in the 1950s and 1960s featured claims of "mildness" and lowered tar and nicotine, and stated: "You make out better at both ends." Eric Gesell testified in 1997 that this advertisement indicated two benefits, "flavor at one end on the cigarette, and the other is a longer filter." Regarding a Pall Mall Gold advertisement with the same slogan, Gesell testified that: "[T]his is an ad that says

Pall Mall Gold is now lower in tar than the best-selling filter king." (US 88720) (O) (1953 Life magazine advertisement); (US 87209) (O) (1969 Life magazine advertisement); ATX040696413-6413 (US 88613*) (O) (1968 Time magazine advertisement); (US 87476) (O) (1968 Time magazine advertisement); MNAT00282147-2147 (US 88614) (O) (1969 Life magazine advertisement); Gesell PD, Minnesota, 9/18/97, 5:8-25, 6:5-6, 6:10-17, 93:2-21, 94:10-17, 96:3-12.

3361. A 1976 advertisement for American's Pall Mall Extra Mild cigarettes published in Sports Illustrated magazine stated: "Lower in tar than 95% of all cigarettes sold. De-tarred but not de-tasted." (US 5232) (O); MNAT00742048-2048 (US 21229) (O) (1976 New York Post advertisement stating same).

3362. Tareyton. A 1954 Tareyton advertisement explicitly stated that its cork filter provided health protection, stating: "Tareyton's genuine cork tip protects your lips." 696000888-0916 at 0913 (US 21387) (A).

(vi) Lorillard

3363. Kent. Lorillard introduced Kent cigarettes in the early 1950s as a health reassurance brand with advertising featuring explicit claims of health protection. Early Kent advertisements emphasized the supposed benefits of its Micronite filter and stated that it rendered Kents less hazardous to health. Dolan WD, 123:21-125:5; Harris WD, 68:19-69:18.

3364. Explicit health claims in Lorillard's Kent advertisements from the 1950s included the following:

1952: "No other cigarette approaches such a degree of health protection and taste satisfaction. Stop and think . . . and you'll start to smoke KENT." 91797854-7855 (US 74413) (A) (*Daily News* advertisement).

1952: "This is the story of the birth of a new cigarette and the birth of a new idea in health protection for cigarette smokers." 696000888-0916 at 0897 (US 21387)

(A).

1952: "[A] new freedom from worry about the effects of tobacco irritants." 696000888-0916 at 0897 (US 21387) (A).

1953: "The new KENT can make a world of difference in your smoking pleasure and in the effect smoking has on your health." (US 87185) (A).

1953: "First cigarette ever to give you black and white proof of greatest health protection!" (US 88703) (A); 696000888-0916 at 0897 (US 21387) (A).

1953: "Kent-the one cigarette that can show you proof of greater health protection. . . . Kent with exclusive MICRONITE Filter full smoking pleasure . . . plus proof of the greatest health protection ever." (US 87481) (A).

1953: "To 1 out of 3 smokers: Here's how science solved your problem of sensitivity to nicotine and tars... with a great new cigarette KENT. . . . Health protection that's not a matter of opinion. . . . KENT gives smokers the combination they've wanted *– a really good smoke and real health protection.*" (US 88705) (A) (emphasis in original).

1953: "To 1 out of every 3 smokers: Which cigarette gives you the greatest health protection? . . . . Kent with exclusive MICRONITE filter." (US 87187) (A); (US 87483) (A).

1953: "To 1 out of every 3 smokers . . . get the health protection you definitely need . . . . Kent with exclusive 'MICRONITE' FILTER. . . . on these pages is visual proof of KENT's greater health protection. . . actual photographs of the now-famous KENT demonstration performed in thousands of stores, and every week on TV's 'The Web.'" (US 87482) (A).

1953: "You are about to see something vital to 1 out of every 3 smokers. . . . Kent – and Kent alone – offers the health protection they need." (US 87188) (A); (US 87484) (A).

1953: "If you're looking for pleasure, plus the greatest health protection ever developed . . . . If you think you need the kind of protection that only KENT offers–the greatest in cigarette history–you should smoke KENTs . . . . see if KENT doesn't add to your feeling of well-being." (US 87189) (A).

1953: "If you're looking for pleasure plus the greatest health protection ever developed, this may help you find it! . . . . of all these 27 brands, there is ONE which in impartial tests proved to give sensitive smokers far greater health protection than any of the others. This cigarette is KENT with the 'Micronite' Filter - undoubtedly the greatest filter development in cigarette history. . . . In an exhaustive and continuing series of chemical and physiological tests - conducted

both in the P. Lorillard laboratories and by independent research scientists–KENT is providing convincing additional evidence of health protection. These findings – which show the effects of various types of cigarettes on the human system, and put KENT in a class all by itself where health protection is concerned– have been made available to doctors." (US 88704) (A) (emphasis in original).

1953: "There are many reasons why KENT has skyrocketed into the greatest popularity of any new brand of cigarette introduced in the last twenty years. . . . the biggest reason for KENT's success is right before your eyes. It is the fact that KENT's 'Micronite' Filter removes up to seven times more nicotine and tars than other filter cigarettes." (US 87186) (A).

1954: "If you need the protection of a filter cigarette... get KENT, the cigarette that takes out *far* more nicotine and tars than *any* other filter cigarette, old or new. . . . KENT has the exclusive Micronite Filter . . . the safest, most effective filter material ever used on a cigarette." (US 88698) (A).

1954: "The **American Medical Association** voluntarily conducted in their own laboratory a series of independent tests of filters and filter cigarettes. As reported in the Journal of the American Medical Association, these **tests proved** that of all cigarettes tested, one type was the **most effective** for removing tars and nicotine. This type **filter is used by Kent** . . . and only Kent! . . . For the greatest protection of any filter cigarette." (US 88731) (A); 82159133-9133 (US 67414) (A); 92437410-7410 (US 57188) (A) (emphasis in original); Harris WD, 70:6-12.

1954: "The difference in price is just a few pennies . . . the difference in protection is priceless! Only Kent goes to the extra expense to protect you with MICROSCOPIC FILTERING." (US 88728) (A).

1954: "If you're the 1 in every 3 smokers who needs protection against tars and nicotine . . . Look at Kent's proof of greatest filter protection and see why you should change to Kent! . . . . the greatest filter protection in cigarette history!" (US 88700) (A).

3365. Kent marketing serves as an illustrative example of Defendants' evolution from using explicit health claims – which established in consumers' minds that low tar/filtered cigarettes are less harmful – to later implicit health claims that added to and reinforced their earlier explicit claims. This approach is evident in Lorillard's advertisements for its Kent cigarettes. Kent advertisements from the late 1950s and 1960s including the following:

1955: "Your voice of wisdom says SMOKE KENT." (US 2746) (A); (US 2749) (A); (US 2747) (A).

1955: "KENT... for those who really care." (US 2751) (A).

1956: "If you smoke a lot, you'll relax even more with…KENT." (US 2775) (A).

1956: "If you smoke a lot…CHANGE TO KENT…CHANGE TO KENT." (US 2777) (A); (US 2780) (A).

1962: "KENT with the MICRONITE filter refines away harsh flavor. . . makes the taste of a cigarette mild and kind!" (US 10104) (A); see also (US 10110) (A); (US 10111) (A); (US 10113) (A); (US 10114) (A) (1963 Kent advertisements in Cosmopolitan magazine featuring claims that Micronite Filter "[r]efines away harsh flavor... refines away rough taste... for the mildest taste of all!").

1963: "Kent with 'MICRONITE' filter gives you the best combination of filter-action and satisfying taste." (US 3003) (A).

1963: "KENT with the Mirconite Filter offers smokers the best balance of filtration and mild, satisfying taste." (US 10115) (A).

1966: "A filter that does its work." (US 3147) (A); (US 3152) (A).

3366. In a May 20, 1958 letter to Morgan J. Cramer, Lorillard's Director of Export & Government Operations, the General Manager of a Venezuelan distributor of Kent cigarettes noted that "the health angle" had been "our main selling and advertising point" for Kent advertising in the United States. The letter added: "We have succeeded in covering a good part of the American colony who are by far the majority of people who are sticking to Kent. **No doubt they are influenced by American advertising and no doubt the mildness of Kent chimes in with the 'protection' angle**." 95508397-8398 (US 32365) (O) (emphasis added).

3367. A July 31, 1963 Lorillard memorandum from R.F. Kieling, Director of Market Research, to M.J. Kramer, President of Lorillard, that bore the subject heading "1963 Gallup Attitude Survey on Smoking," reached the following conclusions concerning the public's perception of the "safest" cigarette brand based on Gallup polling: "As in the past two studies (1959 and 1962) Kent leads the field here, with 18% of all cigarette smokers saying this brand is 'safest' to smoke. Among filter smokers, Kent rates even higher (21%) . . . . Winston and Salem

are second and third choice brands, although considerably below KENT. . . . Filter and mentholated cigarettes are considered most favorably, with most people voting them ‘very safe' or ‘moderately safe'. . . ." The "General Wrap-Up" stated: "Although the American public is considerably more antagonistic towards the cigarette industry this year, the Kent brand continues to stand alone as the one brand believed ‘safest' by a significant proportion of other brand smokers, as well as among Kent smokers themselves." 89836071-6076 at 6074-6076 (US 32095) (O).

3368. A September 15, 1964 Lorillard memorandum from M. Yellen to Morgan J. Cramer, President and CEO, concerning Lorillard's marketing and sales policies, stated that, for several months before the release of the first Surgeon General's Report in January 1964, "LARK [a Liggett cigarette brand] was setting a base for future sales activities through the use of hospitals via rumors or otherwise . . . that medical scientists endorse LARK as the safest cigarette. This marketing technique on the part of LARK proved successful." This memorandum also acknowledged that Lorillard's marketing of Kent cigarettes as a less harmful brand contributed to its increased sales:

> **As all of us are aware, KENT was marketed as a ‘safer' cigarette for the smoker who was concerned about smoking and health**. In 1956 when an innocent third party (Reader's Digest) created an awareness to the consumer that KENT was the ‘safest' of all popular cigarettes, Lorillard exploited this advantage so that within a short period of two years the KENT volume grew from less than four billion cigarettes to thirty-eight billion annually. . . . I feel we were successful in accomplishing our objective and maintaining the safety image of KENT among consumers sensitive to health.

01124257-4265 at 4259, 4257-4258 (US 20033) (A) (emphasis added).

3369. In the early 1970s, Lorillard returned to the Micronite filter, refocusing on the product feature it had promoted for decades as providing health benefits to smokers. With

respect to Kent's "marketing strategy," the "Lorillard Brand Reviews & Projections 1970/71" report stated: "Losses sustained as a result of moves to higher filtration brands will be stemmed through revitalization of the Kent health assurance heritage provided by the 'Micronite' Filter." 04105292-5384 at 5296 (US 29394) (O).

3370. A May 1971 Report prepared for Lorillard entitled "A Study of the Meaning of the Micronite Filter to Smokers Today" demonstrated that Lorillard targeted "health-anxious" smokers with "health reassurance:" "The marketing strategy has been to hold on to its current Kent smokers and to attract lo-fi smokers by promising taste satisfaction plus health reassurance. With the growth of the hi-fi segment, a third target is those health-anxious hi-fi smokers who are looking for more taste satisfaction than these current hi-fi brands can deliver." The report added that "Kent and micronite filter may be, after years of advertising, strongly associated in smokers minds. . . . Prior research suggests that dropping micronite for five years had little effect on Kent's health filter image. This does not mean, however, that if Kent had not dropped micronite for those 5 years that Kent might not have been even more strongly perceived as a health brand." 03340192-0201 at 0195-0196 (US 29265) (O).

3371. A Lorillard document circa 1972 entitled "Kent Status" stated: "Kent became a major brand after the 1957 *Reader's Digest* article had proclaimed it as the brand with the most effective filter. In the next years of gains and consolidation, the micronite filter was advertised as a unique Kent benefit, giving health reassurance to its growing franchise of older, better-educated, health concerned smokers." 03300409-0418 at 0411 (US 29263) (O).

3372. A document entitled "Kent Local Newspaper Support Summary Apr/August '73," under the heading "Kent Creative Strategy," stated: "1) Consumer Benefit To convince smokers that Kent offers a combination of satisfying taste . . . . With **health reassurance** through

superior filtration." 03078097-8110 at 8100 (US 74705*) (emphasis added - bold type).

3373. A November, 1976 study entitled "Lorillard 1976 Switching Study Summary," prepared for Lorillard by Marketing Corporation of America, found that "low T&N [tar and nicotine] brands, seem to be satisfying smokers' intellectual T&N concerns." The study noted that the results "fully support the Lorillard strategy in the 5-year plan (updated 11/15/76) to: 1. Focus marketing and R&D efforts against brands responsive to the cigarette controversy." Dr. Dolan explained that because "many people wanted to quit because of their concerns over health," this Lorillard study "showed the role of low tar and nicotine brands in addressing these concerns." Dr. Dolan further explained that "[i]t also shows that in 1976, Lorillard planned to focus its marketing on the low tar brands with the foundation of a false premise of being more responsive to consumers' health concerns." 03296482-6544 at 6485, 6498 (US 46455) (A); Dolan WD, 121:1-14.

3374. A March 21, 1978 "Kent Advertising Brief" was prepared for the consumer research firm Foote, Cone and Belding, to provide "the background and brand information necessary to develop a global creative strategy for the Kent brand." In a section entitled "Brand Positioning," the brief recommended that "[a]dvertising and support materials should emphasize Kent's mildness in taste and health terms. The white pack and tipping will be exploited to reinforce this positioning." Also in this section, it was noted that "Kent Deluxe will present an image consistent with the King Size styles in offering health reassurance." In a section entitled "Target Audience," the brief stated that "[a]s the Smoking and Health controversy expands, it is assumed that some smokers from all socio-economic and age groups will be prepared to switch to milder, healthier brands which provide an acceptable taste and prestige." The brief maintained that "**we wish to try and develop advertising for the Kent parent brands which clearly**

offers the smoker health reassurance. . . . The Come/Stay campaign goes some way to projecting a health image for Kent while retaining a taste message and communicating prestige." 661076440-6453 at 6445, 6446 (US 53620) (O) (emphasis added).

3375. Also on March 21, 1978, a "Kent Golden Lights Advertising Brief" was prepared for Foote, Cone and Belding, to provide advertising guidelines for Kent Golden Lights, that stated: "In industrialized nations the target consumer is unlikely to need education on the benefits of smoking low deliver products in general terms. . . . Prospective Golden Lights' consumers will know and understand the vocabulary of mildness, low tar and nicotine." 464012420-2429 at 2424 (US 47672) (O).

3376. Lorillard's implicit health claims in Kent advertisements from the 1970s and 1980s included the following:

1972: "Micronite filter. Mild, smooth taste. For all the right reasons. Kent." (US 3785) (A); (US 87460) (A); (US 3837) (A); (US 10229) (A); (US 3797) (A); (US 3816) (A); see also (US 10257) (A); (US 3932) (A); (US 3949) (A) (1973 magazine advertisements noting same).

1982: "Kent. When you know what counts." (US 7275) (A); (US 7379) (A) (1983 magazine advertisement noting same); (US 7504) (A); (US 7702) (A); (US 7746) (A) (1984 magazine advertisements noting same).

3377. True. In 1966, Lorillard introduced True brand cigarettes, which Lorillard touted as being low in tar and nicotine. Martin Orlowsky,Chairman, President, and Chief Executive Officer

of the Lorillard Tobacco Company, testified that Lorillard's True advertisements were targeted toward smokers who, due to their concerns about health risks, were seeking a low-tar cigarette. Orlowsky TT, 10/13/04, 2288:24-2289:19.

3378. A report entitled "Lorillard Brand Reviews & Projections 1970/71" stated that one of True's "marketing objectives" was to "[s]eek out highly health-conscious smokers from all

filter brands." One of True's "marketing strategies" was to "[p]roject TRUE's low tar and nicotine benefit in a way that is compelling to health oriented smokers." The report also listed the following as the "copy strategies" for True: "1. Capitalize on the basic True low tar and nicotine image and the thought that health-conscious smokers have devoted to the cigarette/health issue [and] 2. Switch to True characterized as being the logical, appropriate and popular thing to do." 04105292-5384 at 5328-5329 (US 29394) (O).

3379. As demonstrated in Section III.D(2)(g), supra, Lorillard's True advertisements from the mid-1970s expressly portrayed True as an acceptable alternative to quitting smoking. Dr. Dolan testified that, through its advertisements, Lorillard positioned True as "a means of making not only smokers but also those concerned about a smoker's health feel better." As an example, Dr. Dolan cited a circa 1974 True advertisement that stated:

> "My wife bugged me into it, would you believe it? It seemed every time I'd light up a cigarette, my wife would put on that look . . . So, we had one of our little talks . . . Look hon, I said . . . would it make you feel better if I changed to a low tar and nicotine cigarette? She smiled. So I bought a pack of True next morning."

01767161-7161 (US 74702) (A); Dolan WD, 124:18-23.

3380. Lorillard's True advertisements in the early 1970s made the following statements, which implied that switching to True brand cigarettes would provide health benefits:

1971: "Think about it. Doesn't it all add up to True?" (US 3436) (A).

1973: "U.S. Government tests show True lower in both tar and nicotine than 98% of all other cigarettes sold. . . Think About It." (US 4029) (A); see also (US 3846) (A) (1972 True advertisement); Biglan WD, 233:20-235:22; (US 4221) (A) (1974 True advertisement).

1973: "The True System: (Patent No, 3,396,733)." (US 4117) (A); Biglan WD, 233:20-235:22.

1974: "True. Easy on your mind. Easy on your taste. . . . because True is so low in tar and nicotine, every cigarette is as easy on your mind as it is on your

> taste. Think about it." (US 4491) (A); see also 03496228-6630 at 6271 (US 20057) (O) (circa 1974 True advertisement noting same).

3381. Several other True advertisements from 1974-1975 implied a government endorsement of True cigarettes as less hazardous based on the FTC method tar and nicotine measurements:

> "U.S. Govt. tests show True is lower in both tar and nicotine than 98% of all other cigarettes sold. That means True is not only gentle on your mind, it's gentle on your taste."
>
> "No other cigarette can make this statement: U.S. Government tests of all cigarettes show True is lowest in both tar and nicotine of the 20 best-selling cigarettes. In fact, True is lower than 99% of all cigarettes sold. . . . Doesn't it all add up to True?"

03496228-6630 at 6272, 6274 (US 20057) (O).

3382. A May 1987 report prepared for Lorillard entitled, "AN EXPLORATORY STUDY – AN OVERVIEW OF THE TRUE BRAND," which bears the handwritten notations "draft copy" and "This is the most exciting report I've drooled over in a long time!" discussed smokers' perceptions of Lorillard's True cigarette. The report contained the following statements:

> **Use of the True brand or consideration of it via trial is viewed as an expression of health concern**. . . . Both True smokers and those who smoke other brands expressed awareness of the way True has been advertised. It was not uncommon to attribute initial trial of the brand to being attracted by that presentation of the brand. Respondents specified having noticed the emphasis on tar count and filter. . . . Based on these findings, it would appear important to continue to stress True as a low tar brand with taste, and the "specialness" of the filter, since those are clearly important factors in motivating trial, and in conversion to the brand. . . . The respondents were also asked whether they think the image of True has changed over a period of time. Most felt unable to answer this, but it was suggested that **True stood alone originally, as the brand for the health concerned**.

93359378-9437 at 9378, 9385, 9387, 9420 (US 57295) (O) (emphasis added).

3383. Advertisements for Lorillard's True cigarette in the 1980s and 1990s stated:

1980: "Now you don't have to smoke higher than 5 mg tar to get that good taste you've been hoping for in a low tar." (US 6538) (O); see also (US 6682) (O); (US 6711) (O) (True magazine advertisements stating "Still only 5 mg tar").

"The Lowest With True Satisfaction True Ultra Low Tar. True Smooth Taste. TRUE DELIVERS." 970469347-9474 at 9433 (US 85104) (O).

3384. Lorillard's Research On the Low Tar Cigarette Category. As demonstrated below, internal Lorillard documents reveal that Lorillard conducted research not just on individual low tar cigarette brands, but on low tar cigarettes as a category. These documents demonstrate that Lorillard has long known and intended that its advertisements and marketing for low tar cigarettes, featuring claims of lowered tar and nicotine, and "light" and "ultra light" brand descriptors, contributed to and reinforced consumers' notion that low tar cigarettes are better for their health, and caused consumers to smoke them for this reason.

3385. A February 1972 report prepared by the Lorillard Market Research Department indicated that numerous health conscious smokers switched to lower tar cigarettes for health reasons: "HEALTH About 25% to 30% [of smokers] gave health reasons for switching. As anticipated, health conscious smokers gave this reason more frequently (33%) than did taste conscious smokers (20%), and current Hi Fi [high filtration] smokers gave it more often (42%) than smokers of other types. The nature of the health reason varied by current cigarette type smoked. Hi Fi smokers and health conscious smokers emphasize the tar-nicotine-cancer reasons, while the . . . Lo Fi users, and taste oriented smokers emphasize throat irritation." 89824702-4785 at 4720 (US 32092) (A).

3386. A November 13, 1973 presentation by Alexander Spears, a Lorillard scientist and later Lorillard's CEO, noted in a discussion of "Health psychology" that smokers' concern about the health effects of smoking "has been used to an advantage in marketing both the KENT and TRUE brands." The document further stated: "Clearly the consumer is concerned about smoking

and health, and is convinced in varying degrees that smoking is a possible detriment to his health. Presently, this factor is of active interest to R&D, since it has been used to an advantage in marketing both the KENT and TRUE brands." 80634635-4642 at 4639 (US 21063) (O).

3387. Lorillard was well aware in 1976 that consumers perceived its low tar brands as less harmful. A November 30, 1976 Lorillard memorandum from R.E. Smith to fellow Lorillard marketing executive J.R. Ave, with the subject heading "1976 Switching Study," stated:

> I share MCA's overall conclusion that the Switching Study confirms the rightness of our 5 Year Plan; focussing [sic] Company effort against smokers' health concerns. . . . This view suggests sensible positionings for those Lorillard brands that directly address smokers' health concerns. (I believe these are totally compatible with ongoing work).

03918494-8495 at 8494 (US 74777) (A), 03296482-6544 at 6485 (US 64511) (O).

3388. A December 10, 1976 Lorillard memorandum from R.E. Smith to J.R. Ave, Lorillard marketing executive, with subject heading "NEW PRODUCT STATUS: DECEMBER, 1976," under the heading "New Brands," stated: "Low irritation, low tar menthol – Reasons for interest in this project are: a) Many sources indicate that irritation and health concern are the two major (related-but-different) reasons for brand switching . . . ." 03364622-4624 at 4622 (US 74748) (A) (emphasis in original); Orlowsky WD, 67:22-68:7.

3389. Lorillard's "CONFIDENTIAL" 1976 "DOMESTIC CIGARETTE MARKETING 5 YEAR PLAN 1976-1980" stated:

> Consumer preferences have shown a dramatic shift since World War II away from non-filter brands towards brands more responsive to the cigarette smoking and health controversy, and less harsh, filtered cigarettes, and, most recently, towards filtered brands offering low tar and nicotine.

The document further stated: "The most recent 6 year period has followed the traditional pattern in many essential characteristics. . . 2) impressive gains by brands offering a perceived solution

to health concerns." 03357128-7178 at 7137 (US 85023) (A); Orlowsky WD, 65:10-19; 65:20-66:2.

3390. Lorillard's Five Year Plan for 1977-1981 stated: "The structure of the market is changing in the direction we forecast in 1976 – toward brands responsive to the cigarette controversy." The plan further pointed out: "The success rate of new products. . . is again on the uptrend with the emergence of products responsive to very specific and tightly focused concerns about the cigarette controversy." Dr. Dolan explained that this document "shows that in the mid-1970s, Lorillard believed that low tar and nicotine products, being perceived by smokers as responsive to their health concerns, were changing the entire structure of the market." 904100641-0706 at 0642, 0646 (US 74853) (A); Dolan WD, 119:22-120:13.

3391. A document entitled "LORILLARD NEW BRANDS 1977" stated, under the "PLANS" heading: "[M]arket at least one brand that uses enriched nicotine technology to meet the growing need for good taste and health reassurance." 91792750-2766 at 2752 (US 57078) (A); Orlowsky WD, 66:3-9.

3392. A January 26, 1977 Lorillard memorandum from Dick Smith to J.R. Ave stated:

> CONCLUSIONS The Nowland Research **strongly confirms the rightness of Lorillard's marketing concentration in the area of health concern**. Smokers are extremely and increasingly health-concerned. And these smokers are actively interested in better ways to lessen/eliminate this concern – while continuing to smoke. More specifically, our going projects are on target . . . . I suggest that both the Kent and TRUE Brand Groups analyze the complete Nowland Report. Our established health concern brands should be able to develop specific strategic and executional actions from this rich, diagnostic research.

01244406-4408 (US 74669) (A) (emphasis added); Orlowsky WD, 66:10-67:5.

3393. A June 14, 1978 Lorillard document stated:

> There is a major opportunity for a brand which can simultaneously

> satisfy smokers and address the concerns arising from the cigarette controversy. 1. Very low tar products – line extensions and independent brands – have been the fastest growing cigarette segment during the last two years which indicates that an ever increasing number of 'concerned' smokers are striving to go as low in tar as possible while still getting acceptable taste. There is no reason to believe that these smokers have found their ultimate reduced tar brand. More likely, they are prime candidates to move even lower over time. Comparing 1976 with 1977 sales, the ultra low tar segment grew 14% and is now accounting for a total of 24 billion units. We project that by 1981, the category will increase to 47 billion units, a growth of 96%."

00138232-8233 at 8232 (US 74655) (A) (emphasis in original).

3394. A June 23, 1978 memorandum from George R. Telford to R.E. Smith stated, under the heading "Lorillard Needs," that "[t]here is an excellent opportunity to become entrenched in one of the fastest growing segments of the industry responsive to the cigarette controversy and thereby compete more effectively with Lights/Milds extensions . . . ." 91792851-2853 at 2853 (US 57091) (O).

3395. A July 13, 1978 Lorillard memorandum from G.R. Telford to R.E. Smith stated that "EFII", a proposed new Lorillard low tar cigarette, was "designed to strengthen Lorillard's position in the rapidly growing Very Low Tar market by providing non-menthol smokers responsive to the cigarette controversy with a superior tasting, reduced tar cigarette." 91792854-2855 at 2854 (US 57092) (O).

3396. A January 31, 1980 Lorillard memorandum from Larry DuLude to fellow consumer researcher Gordon Flinn stated, under the heading "Consumer Attitudes toward Smoking": "Increasing interest in Low Tar . . . Increased number of health-concerned smokers." 01782312-2322 at 2313 (US 74959) (A).

3397. A February 13, 1980 "secret" Lorillard memorandum from Richard E. Smith to J.R. Ave, J.G. Flinn, and Dr. A.W. Spears stated: "Levels of health concern vary, and are directly

related to the T&N [tar and nicotine] level of regular brand." 01394380-4381 at 4380 (US 21543) (O); 95539778-9779 at 9778 (US 22808) (O).

3398. A Lorillard document circa 1984 reported that Laurence Tisch, who served on Lorillard's Board of Directors in 1969 and 1985, and who from 1959 was the Chairman of the Board of Loew's, which merged with Lorillard in 1968, stated at a Department of Insurance hearing:

> Lorillard was the leader in the so-called health cigarettes, the low tar, the low nicotine cigarettes. They first introduced Kent with the micronite filter ten or fifteen years ago. It was a very successful entry because that was when the health scare first came into vogue. They followed that with the successful entry of True by Lorillard . . . . **We feel that we make cigarettes that are healthier than other cigarettes – low in tar and nicotine.**

91780361-0398 at 0362-0363, 0375, 0394 (US 85024) (O) (emphasis added).

3399. A Lorillard document discussing its three-year plan for 1985-1987 stated, below the "Influence of Low Tar" heading: "More smokers will continue to see low tar brands as a way of dealing with the smoking controversy. Reduced Tar volume now represents 48% of the total industry, up from 37% in 1979." 80403362-3376 at 3362 (US 55377) (A).

3400. Stephen Jones, a Lorillard chemist who, at the time of his April 22, 1997 deposition in Reed v. Philip Morris, had been working for Lorillard for twenty-eight years and had participated in the design of almost all the Lorillard cigarette brands, including Newport, Kent Golden Lights, Kent III, Triumph, Maverick, Style, Old Gold, and Max, testified that he believed that it was reasonable to assume that, starting in the mid to late-1950s, smokers began to prefer filtered cigarettes because they thought that filtered cigarettes reduced the risk of smoking by reducing levels of tar and nicotine, and that the switch to filtered cigarettes was due to the health perspective. Lorillard's marketing plans sought to address what the company thought

consumer preferences would be. Jones believed that consumers felt that there was a health advantage to smoking reduced tar or filtered cigarettes. Jones PD, Reed v. Philip Morris, 4/22/97, 136:5-139:21.

3401. Jones testified that he believed that, by and large, smokers of all ultra low tar cigarettes, including Lorillard's True brand, perceived such cigarettes to be more healthy. Jones PD, Reed, 4/27/97, 141:12-141:18; 143:12-143:15.

(vii) Liggett

3402. Like the other Defendants, Liggett's advertisements in 1950s featured explicit health claims. As Dr. Harris testified, in 1952 "Liggett & Myers widely publicized the results of tests run by Arthur D. Little, Inc. purporting to show that 'smoking Chesterfields would have no adverse effects on the throat, sinuses or affected organs.'" Harris WD, 69:19-70:3.

3403. Liggett advertisements in the early 1950s included the following:

1953: "L & M Filters . . . entirely pure and harmless to health." 696000888-0916 at 0900 (US 21387) (A).

1953: "Chesterfield is Best for YOU! For a full year now, a medical specialist has given a group of Chesterfield smokers thorough examinations every two months. He reports: no adverse effects to their nose, throat or sinuses from smoking Chesterfields." (US 88718) (A); (US 88723) (A); (US 88715) (A).

1953: "The medical specialist, after a thorough examination of every member of the group, stated: 'It is my opinion that the ears, nose, throat and accessory organs of all participating subjects examined by me were not adversely affected in the six-months period by smoking the cigarettes provided.' And it's so satisfying to know that a doctor reports no adverse effects to the nose, throat and sinuses from smoking Chesterfield." 696000888-916 at 0894 (US 21387) (A).

1954: "L & M Filters are Just What the Doctor Ordered!" (US 88732) (A); (US 88733) (A); (US 63543) (A).

3404. A March 25, 1970 Liggett research document prepared by Max Samfield, Liggett scientist, recounted that, following the Surgeon General's Report linking smoking with several

adverse health consequences, the average tar levels of cigarettes had decreased, and added that "it is obvious that the trend cannot be ignored." LATH00312742-2784 at 2746-2747 (US 21181) (O).

3405. In an e-mail dated September 5, 2001, from Dr. Anthony Albino to a number of recipients, including Bennett LeBow, Chairman of the Board and Chief Executive Officer of Vector Group, Ltd., and VGR Holding Inc., Dr. Albino admitted: "the adoption of 'light' cigarettes over the past 25 years was mainly due to the PERCEPTION of safety." VDOJ6743-6744 at 6743 (US 64727) (A) (emphasis in original); LeBow TT, 4/4/05, 17594:24-17596:17.

3406. Although Liggett sold its Chesterfield, Lark, and L & M brands to Philip Morris in 1998, Liggett Group Inc. continues to market light cigarettes under its brands Class A, Eve, Jade, Liggett Select, Montego, Pyramid, and under a generic Private Label. Bennett LeBow admitted that his company continues to market light cigarettes under these brand names because Liggett could not cease marketing light cigarettes and remain in business. LeBow further testified that every cigarette manufacturer in the industry must continue to sell light cigarettes in order to stay in business. (US 93254) (A); LeBow WD, 66:10-12; LeBow TT, 4/4/05, 17597:6-17598:16, 17600:4-17603:2.

3407. Harold Petch, President of Liggett's Northern Sales Business Unit, testified at his deposition in this case that the company does not do any market research to determine how its marketing of those low tar brands affects consumers. Petch PD, United States v. Philip Morris, 10/12/01, 128:1-7, 83:10-85:25.

(b) Defendants Knew that Smokers Were Switching to Low Tar Cigarettes For a Perceived Health Benefit, *Despite* their Poor Taste

3408. As demonstrated in Sections III.D(1), (2) & (3), supra, for decades Defendants have marketed and promoted low tar cigarettes using claims of low tar and nicotine and so-called

low tar "brand descriptors" to reassure health conscious smokers that low tar cigarettes are better for them, and are an acceptable alternative to quitting. Despite overwhelming evidence detailing Defendants' fraudulent marketing and promotion of low tar cigarettes, Defendants have stated publicly that they produce low tar cigarettes only to accommodate consumer taste preferences for "lighter," "milder" tasting cigarettes, and that they do not intend their use of brand descriptors or their marketing of low tar cigarettes to imply a less harmful product. See US FF § III.D(3)(c), infra (Defendants' false statements regarding their low tar cigarette marketing).

3409. As demonstrated below, and contrary to Defendants' public statements, Defendants' internal marketing documents establish beyond a preponderance that Defendants have known for decades that consumers prefer the taste of regular cigarettes to low tar cigarettes but are willing to forgo that preferable taste and smoke the worse tasting and less enjoyable low tar cigarettes because they believe low tar cigarettes are better for their health. Indeed, for decades, Defendants have treated the concept of cigarette taste as distinct from that of low tar, claiming that their lights products tasted good **despite**, not **because of**, the lowered FTC tar and nicotine levels. Defendants' conduct reflects both that they intended to downplay, not promote, the "lighter" taste of their low tar cigarettes, and that, in numerous instances, Defendants attempted to convince consumers that their low tar cigarettes had the same taste as regular "full-flavor" cigarettes, but with the benefit of less tar and nicotine.

(i) Philip Morris

3410. Refuting Philip Morris's post-hoc claim that it makes low tar cigarettes to accommodate consumer taste preferences, Jeanne Bonhomme, Director of Consumer Insights for Philip Morris, testified that, in her experience, "there is a general perception among consumers that as you go down in tar, cigarettes have less taste." For this reason, Philip Morris planned to

produce a low tar Merit cigarette that tasted like a cigarette with higher tar. A June 30, 1993 document from a Philip Morris USA New Products Meeting entitled "Marlboro New Product Development" stated that the "Project" was to "**[b]uild the Merit business by introducing a 3 mg product that tastes like a 5 mg**." Philip Morris also planned to "**[d]evelop a 6 mg Tar Cigarette with the Sensory Attributes of an 8-9 mg Tar Cigarette**." Bonhomme WD, 56:13-57:6; 2041453659-3754 at 3681, 3743 (US 23906) (A) (emphasis added); see also 2021323470-3540 at 3478 (US 85034*) (O) (Philip Morris's 1992 R&D Operational Plans for the Product Development Department issued to Cliff Lilly of Philip Morris USA included the following objectives: "Design and develop an 3mg [Merit] product with the subjective attributes of a 6mg cigarette. . . . Design and develop a 6mg [Merit] product with the subjective attributes of a [sic] 8mg cigarette. . . . Develop 6 mg [Marlboro Ultra Lights] line extension . . . providing enhanced subjective quality and Marlboro character. . . . **LOW TAR HIGH FLAVOR Objective: Develop new technologies which will allow us, within the next two to four years, to produce**. '**Ultra Low' tar, 2 to 4 mg, cigarettes with the sensorial experience of** '**Lights' or** '**Full Flavored' cigarettes**") (emphasis added).

3411. Bonhomme further testified that "Philip Morris's own marketing research shows that there are consumers who switch to low tar cigarettes even though they do not prefer the taste or flavor, because they believe it is better for them," and that "for those people the reason for switching to a low tar brand is not taste or flavor, but perceived health benefits." Bonhomme testified that these smokers are willing to sacrifice taste for perceived health benefits. Bonhomme WD, 56:6-12; 60:21-61:1; 63:13-18.

3412. Thus, Philip Morris's marketing for low tar cigarettes has attempted to communicate that Philip Morris's low tar cigarette brands have acceptable taste **despite**, not

because of, their claimed lower tar delivery. For instance, Bonhomme testified that Philip Morris's Merit brand of cigarettes utilized a marketing strategy entitled "Merit Solutions," that was intended to communicate to consumers that "Merit was a solution to the problem of finding a low tar brand with good taste." Bonhomme WD, 59:10-17.

3413. The deposition testimony of Defendants' own expert, A. Clifton Lilly, demonstrates that Philip Morris did not intend to market Merit as a "lighter tasting" cigarette, but rather as one that tasted just like a full flavor cigarette, yet with a health benefit. Lilly, Vice President of Technology and Research for Philip Morris at the time of a 1998 deposition, testified that:

> The Merit brand, as I remember, came out in 1976. . . . R&D did a lot of basic research on taking tobacco and actually getting compounds for a flavor system that were the most flavorful ones in smoke, **so that the cigarette would be lower tar but taste like it was more like the popular cigarettes, and they were all at that time full flavor**.

Lilly PD, Engle v. R.J. Reynolds Tobacco Co., 5/7/98, 34:3-39:2 (emphasis added).

3414. An undated Philip Morris document entitled "Background Information on Philip Morris Brands" included "Benefit Statements" for Philip Morris's various "light" brands that revealed Philip Morris's intent was not to market these cigarettes as "lighter" tasting, but rather as cigarettes that taste like full-flavor cigarettes but with the purported benefit of low tar and nicotine:

- Marlboro Medium: "gives you a flavorful smoke in a low tar cigarette" and "bridges the flavor gap between low tar and full flavor cigarettes."
- Benson & Hedges 100's Lights: "premium tobacco flavor in a satisfying low tar smoke."
- Benson & Hedges 100's Deluxe Ultralights: "only 5 mg tar, yet is rich enough to be called Deluxe . . . is an ultra low tar cigarette that gives you satisfying taste. . . . delivers cool, rich taste with only 5 mg tar."

- Merit: "You'll enjoy low tar and good flavor . . . . At only 7 mg tar, Merit delivers the rich flavor of leading cigarettes with twice the tar . . . get rich menthol flavor at only 8 mg tar."

- Merit 100's: "flavor that makes low tar and good taste a reality for 100's smokers."

- Merit Ultra Lights: "cool, flavorful smoke with only 5mg tar."

- Merit Ultra Lights 100's: "an ultra light with flavor."

- Virginia Slims Ultra Lights: "gives flavor and taste – and is an ultra low tar smoke."

- Parliament Lights: "enjoyable taste in a low tar cigarette."

2070143183-4433 at 3209, 3211, 3212, 3214, 3215, 3219, 3222 (US 40253) (A).

3415. A November 15, 1971 document to James Morgan, former CEO of Philip Morris, from the Marketing Research Department, bearing the letterhead "Philip Morris U.S.A. Inter-Office Correspondence," set forth results of a Philip Morris consumer research study on Marlboro Lights. Under the heading "Likes and Dislikes," the report stated: "Complaints continued to center around taste mentions (23%) and too mild (22%)." 1000292744-2762 at 2745 (US 35205) (O).

3416. Morgan testified in a 1974 deposition that Philip Morris **did not** intend for the name Marlboro Lights to communicate that it had light or lighter taste:

> I have trouble in describing what light taste really means . . . . Light taste, first of all, is not a positive attribute if it does mean anything . . . in my judgment, light taste is really a meaningless and nebulous claim . . . . **the bigger proposition is the lower tar and nicotine** . . . . We are not talking, in my judgment, talking about light . . . as a taste. It's not a term that means anything in terms of taste, and the name Marlboro Lights as I said before, a word which we feel has appeal in a different sense than suggesting what the cigarette even tastes like.

Morgan PD, Philip Morris Inc., 10/15/74, 82:25-83:13; 85:9-15; 85:17-86:4.

3417. Morgan testified in 2002 that around the time of the launch of Marlboro Lights in 197[4], a marketing dilemma existed: on one hand, the fact that a cigarette had a "lighter taste" was a **negative limitation in the minds of consumers** that made the cigarettes more difficult to sell, but, on the other hand, the term "light" also conveyed the beneficial message of low tar. Morgan PD, Price, 6/5/02, 39:19-25, 40:2-25, 41:2.

3418. Morgan further testified that Philip Morris's Marketing and Research and Development departments held regularly scheduled meetings where they discussed, among other things, how to increase the market of low tar cigarettes through research and development. Morgan testified that many discussions focused on the poor taste of low tar cigarettes: "marketing, represented by me, kept saying people don't like the taste of a low tar cigarette. They are finding it unsatisfactory . . . What can we do to develop a low tar cigarette that really tastes good. That to me looks like the great market opportunity. I remember lots of discussions about that." Morgan PD, Price, 6/5/02, 95:13-25, 96:2-25, 97:2-25, 98:2-25, 99:2-25.

3419. Ellen Merlo, then Senior Vice President of Corporate Affairs at Philip Morris USA, testified in 2002 that she "think[s] there was a general perception that low tar cigarettes did not taste as good as full flavor cigarettes." Merlo added that Philip Morris's Merit cigarette "was the first free standing cigarette entry in the light category that was positioned as tasting good." Merlo PD, Price v. Philip Morris, 10/2/02, 152:12-153:10.

3420. Dr. Jerry Whidby, Philip Morris scientist from 1972 to 1998 and presently a paid consultant for Philip Morris, who held the title of Senior Fellow - the highest non-management scientific position at Philip Morris, testified that "Philip Morris has designed low tar cigarettes that taste like they are higher tar cigarettes." In the context of Philip Morris's attempts to design low tar cigarettes that tasted like higher-tar cigarettes so they would have "maximum consumer

acceptability," Dr. Whidby testified that "the general direction we were trying to go was trying to add more flavor to the low-tar cigarettes so the consumers would accept those." Whidby WD, 2:3-7; 4:18-5:3; 5:14-19; 56:22-57:3; Whidby TT, 2/22/05, 14007:9-14008:9.

3421. For instance, an October 1975 Philip Morris USA Special Report distributed widely throughout the Research Center, titled "Low Delivery Cigarettes and Increased Nicotine/Tar Ratios, a Replication, confirmed that the "optimum nicotine to tar (N/T) ratio for a 10 mg tar cigarette is somewhat higher than that occurring in smoke from the natural state of tobacco. . . ." As a result, in the study, Philip Morris added additional nicotine in the form of nicotine citrate. The document urged development of a "low delivery cigarette that will both look and taste like a regular filter cigarette and thus will appeal to current regular filter smokers." The document further stated:

> If a low delivery cigarette with impact and flavor were developed, it may cause the segment of current regular filter smokers who are concerned about their health but demand a flavorful cigarette to voluntarily switch to the low delivery cigarette. . . . Furthermore, some portion of current low delivery smokers may desire to switch to a more flavorful cigarette and others may follow as consumer experience results in changing the image of low delivery cigarettes so that smokers believe a flavorful cigarette can really be 'healthy'.

1003288950-8967 at 8951, 8954, 8952 (US 20166) (A); Whidby WD, 57:4-58:3.

3422. Dr. Whidby testified that Philip Morris has a "Low Tar/High Flavor" Program, and developed cigarettes that tasted like they had more tar, for example, cigarettes that deliver "only 9 mg of tar but provide a full-flavor smoke," and "a 6 mg product designed to have subjectives [qualities such as taste and flavor] typical of a 10-12 mg cigarette." Dr. Whidby testified that these and other similar statements in Philip Morris documents "represent Philip Morris research efforts directed at making lower tar cigarettes that had the taste and flavor of higher tar cigarettes." Whidby WD, 58:9-62:16; 1000736380-6385 at 6384, 6385, 6381 (US

35282)(A); 2075820928-0939 at 0929, 0939 (US 43690)(A); 2021553929-4266 at 3930, 4114 (US 36768)(A) ("Low Tar/High Flavor" listed as one of "1990 Major Programs"); 2029114211-4357 at 4214, 4215, 4219-4221 (US 37444)(A) (objective to design 3 mg tar cigarette with subjectives of 6 mg cigarette); 2021348294-8725 at 8311, 8318, 8481, 8488 (US 36734) (A) (objective to develop 3 mg Merit cigarette to replace 5 mg Merit, so that smokers could reduce tar "without a taste sacrifice").

3423. Draft Philip Morris remarks dated January 7, 1976 relating to Merit cigarettes acknowledged explicitly that low tar cigarettes appealed to smokers because of their purported reduced harmfulness, but that smokers disliked the taste of low tar cigarettes:

> Undoubtedly because of the health allegations against cigarettes, many smokers have clearly wanted cigarettes that deliver less and less tar. . . . [D]espite the intense promotion efforts and the strong interest among smokers, ... [t]hey have been tried and rejected by the overwhelming majority of smokers. Obviously, there has been a conflict between the desire for low tar and the desire for the rich, satisfying taste that until now has been associated with higher tar delivery.

PM3000136418-6422 at 6420-6421 (US 61504) (A).

3424. A 1979 Philip Morris Merit advertisement entitled "Merit Taste Eases Low Tar Decision" appeared in national magazines, stating: "'Enriched Flavor' tobacco proving real alternative to high tar smoking. . . . Confirmed: Majority of high tar smokers rate MERIT taste **equal to – or better than – leading high tar cigarettes tested**! Cigarettes having up to twice the tar. [Merit's] ability to satisfy over long periods of time could be the most important evidence to date that MERIT science has produced what it claims: The first real alternative for high tar smokers." 1002325022-5022 (US 21510) (A) (emphasis added – bold type).

3425. A January 1979 study prepared for Philip Morris by Goldstein/Krall Marketing Resources, Inc., shows that consumers perceived light cigarettes as a compromise on taste in

order to smoke cigarettes that they believed delivered reduced tar and nicotine: "There appears to be a concept involved that might be called ‘limiting.' They have moved to limit their tar and nicotine intake. At the same time **they have accepted a limit on taste**." 2040066740-6766 at 6755 (US 20435) (O) (emphasis added).

3426. A September 1991 Philip Morris document entitled "Background Information on PM Brands" stated that, notwithstanding the introduction of Marlboro Lights in 1972 and the introduction of several variations on Marlboro Lights in 1978, 1980 and 1984, when Marlboro Medium was introduced in 1991, "consumers [were] still looking for a satisfying low tar cigarette with flavor." Marlboro Medium apparently "was successful in bridging the flavor gap between full flavor Marlboro and Marlboro Lights." 2070143183-4433 at 3206 (US 40253) (A). The document listed as separate features for Marlboro Lights "Lighter in taste" and "Lower in tar." 2070143183-4433 at 3207 (US 40253) (A).

3427. By way of a November 23, 1994 internal Philip Morris memorandum, Shari Teitelbaum, a consumer researcher for Philip Morris, delivered a study to certain Philip Morris employees entitled "Attitudes Toward Smoking - Final Report," that was based upon interviews conducted with 2,300 Americans aged 18 and older to gauge public opinion on a range of topics, including potential product concepts. The study's "Summary of Findings" reported: "Of all the new product concepts shown, **there is the most interest in a cigarette with reduced tar but the taste of a higher tar cigarette** and one that does not leave a lingering cigarette odor in the room." 2072251926-1980 at 1932 (US 22022) (O) (emphasis added).

3428. An internal Philip Morris memorandum dated January 17, 1995 from Rebecca Wallach Gordon to Virginia Murphy, a Philip Morris attorney, entitled "Merit RGA Claims" listed various Merit advertising claims used in the past. One such claim was: "Even if the

cigarette tested had 60 percent more tar than Merit, a significant majority of all smokers tested reported new 'Enriched Flavor,' Merit delivered **more** taste. In similar tests against 11mg to 15mg menthol brands, 9mg tar Merit menthol performed strongly too, delivering **as much – or more** – taste than the higher tar brands tested." 2048248129-8131 at 8130 (US 38670) (A) (emphasis added).

3429. Nancy Lund, Senior Vice President of Marketing for Philip Morris, testified in a 2002 deposition that when light cigarettes were first introduced, their largest drawback was that consumers disliked their taste. Lund further testified that **nine out of ten consumers did not like the taste of light/low tar cigarettes**. Smokers were buying them, nonetheless, because they were perceived to be less harmful. An April 20, 1987 memorandum on Leo Burnett letterhead from Elinor Bowen of Leo Burnett and Carolyn Levy of Philip Morris addressed to Nancy Brennan (later Nancy Brennan-Lund) of Philip Morris, among others, stated of light cigarettes generally: "Thus far in the cigarette category, lightness has been associated with low tar or ultra low tar products which represent, for many smokers, an absence of taste and an avoidance of problems associated with smoking." Brennan-Lund PD, Price, 9/20/02, 140:14-144:11, 186:12-189:19; 2040904809-4811 at 4809 (US 85035) (A).

3430. A Philip Morris document circa 1979 prepared by Judy John and Helmut Wakeham, entitled "Breakthrough of the High Taste, Low Tar Cigarette: A Case History of Innovation," stated that consumer demand for low tar cigarettes was spurred by indications that cigarette smoking caused disease in humans, but that "market research analysis ha[d] shown that nine out of ten smokers had tried low-tar brands, but had failed to accept them as their choice of cigarette." The document also stated: "Apparently not enough smokers could adapt to the diminished 'flavor' of the highly filtered low-tar cigarettes available at that time." 1000208603-

8625 at 8605 (US 85010) (O) (internal citation omitted).

3431. A June 1, 1994 document prepared for Philip Morris USA by Kane, Bortree & Associates, Inc., in its "Conclusions Product/Positionings" section, reported that Merit's "We Lowered The Tar...But Kept The Taste" slogan "generated interest among male Low Tar Seekers because of the fact that they are committed to lowering their tar consumption." The concept of lowering the tar, but keeping the taste, was referred to as a "product improvement." 2045629674-9712 at 9696 (US 88630) (A).

3432. A March 26, 1996 memorandum from Shari Teitelbaum, a consumer researcher for Philip Morris, to Jodi Sansone, then Brand Manager for Merit cigarettes, accompanying a consumer research report commissioned by Philip Morris, explained that once consumers made the decision to switch down to the category of low tar cigarettes based on health concerns, they then pick their low tar brand within that category based on taste preference. Under the heading "Reasons for and Perceived Benefits of Smoking Lowest Brands," the document stated: "Although many of these smokers made the decision to go lighter based on perceived health concerns, taste seemed the major reason to choose or stay within a particular brand." 2045628312-8328 at 8312, 8321 (US 22217) (A).

3433. A February 9, 1998 draft research report prepared for Philip Morris by the research firm Kane, Bortree & Associates entitled "Merit Strategic Revitalization Plan, Stage I Learnings" analyzed ways to "build Merit's share of the low tar segment." The report labeled low tar smokers who find the taste of light cigarettes unsatisfying but feel comfortable smoking "Taste Compromisers," summarizing the thought process of this group with the following quotation:

> I feel that I can really taste the difference between cigarettes. I try to smoke the best tasting light since I know that smoking a light is

> better for me. **I feel that smoking a light is a huge tradeoff but I know that it's worth it. I much prefer full flavor taste and do not think it's too strong**. I choose my brand on taste. I feel like I am on a permanent ‘diet' because I smoke a light.

The report listed Winston Lights, Marlboro Lights, and Camel Lights as brands for taste compromisers. 2063687348-7527 at 7362, 7357 (US 39820*) (A) (emphasis added); Bonhomme WD, 45:1-22; see also 2063686921-6942 at 6924 (US 88629) (A) (indicating that a goal of Kane Bortree was to "[i]dentify marketable positioning opportunity(ies) for revitalizing Merit via low tar technology (3 mg tar cigarette that smokes like a 5 mg tar or possibly higher levels)").

3434. Under the heading "Consumer Learnings," the report noted that "Merit can secondarily target Taste Compromisers by promoting taste," and under the heading "Preliminary Recommendations," the report recommended that Merit "[p]romote the benefits of light flavor rather than ‘apologizing' for the fact that it is less than full flavor." Under the heading "Positioning Learnings" and the subheading "Exploratory Positionings," the report stated: "'Low tar' should not be highlighted, but may be needed as reassurance to more health conscious smokers." 2063687348-7527 at 7352, 7354, 7376 (US 39820*) (A).

3435. An October 5, 1998 internal Philip Morris presentation regarding Philip Morris's premium cigarette brands discussed the Merit brand's positioning. Under the heading "Merit - Brand Essence," the document stated that "[s]ince the brand's introduction twenty-two years ago, the core Merit proposition has been low tar with satisfying good taste. Merit is the brand that understands the desire to seek a lower tar alternative." Under the heading "Merit - Brand Strategy," the document revealed that Merit's strategy was to "Convince: Smokers who want to switch to a low tar alternative, but won't sacrifice taste completely, That: With Merit, you can switch down to lower tar and still enjoy smoking Because: Merit delivers satisfying taste at every level of low tar." 2063690668-0687 at 0675-76 (US 39825) (A).

(ii) R.J. Reynolds

3436. An April 1974 Qualitative Consumer Evaluation for four Winston Lights Positionings noted that those who liked Winston Lights believed that a low tar cigarette was a "'safe' cigarette." **Consumers were excited by the possibility of having full flavor and low tar simultaneously** because it offered "a 'safe' cigarette with a taste if not exactly the same at least similar to their current brand." Some of the panelists admitted to switching to a lower tar and nicotine cigarette for health reasons. A reservation about the cigarette was noted as "believability." The report stated that "[t]hey were generally skeptical that a less harmful cigarette could give them what they want in a cigarette – taste – or would the taste be sacrificed in some way." Communications with smokers indicated that the target audience was "concerned about the harmful effects of smoking and would be glad to switch to a brand which could deliver good taste with low tar and nicotine." 502041366-1415 at 1373, 1383, 1385-1386 (US 22147) (O).

3437. A 1975 report entitled "An Evaluation of the 120MM Market and Its Potential for RJR" recognized that "smokers of High Filtration brands . . . feel the low tar and nicotine brands are much safer and much less of a health hazard. **They are readily willing to sacrifice taste for a 'longer life.'"** 500671364-1454 at 1436-1437 (US 22158) (A) (emphasis added).

3438. A circa 1976 Doral Brand Performance report noted in a section entitled 'Other Brand Measurements Psychographics' that with respect to lifestyle, Doral smokers (relative to total smokers) were "more conscious and anxious about health" and, with respect to attitudes and needs, would "sacrifice taste to get lowest 'tar' and nicotine." 501229581-9590 at 9589 (US 22118) (O).

3439. A document written by Murray Senkus, RJR scientist and eventually Director of

Scientific Affairs at RJR, reflecting talks Senkus delivered at RJR in late 1976 and early 1977 entitled "Some Effects of Smoking," revealed RJR's belief that nicotine was "the key" to cigarette taste: "[T]his is the key to taste – the transfer of nicotine to taste buds and body fluids in the mouth during the short time you hold the smoke in your mouth before inhalation. For any tar level – there is the right pH for maximum taste. For any tar level – if the pH is too high – the smoke is intolerable – if pH is too low – the smoke will produce very little so-called cigarette flavor in the mouth. . . . Nicotine and nicotine-like compounds are the major factors in the taste one discerns while the smoke is held in the mouth before inhalation." 500251711-1722 at 1717, 1719 (US 48076) (A).

3440. A 1979 study related to Camel Lights indicates that the marketing campaign stressed that Camel Lights provided a product to individuals who wanted to smoke a low tar cigarette, but did not want to compromise on "rich taste and smoking satisfaction." The message itself was "a specific low tar message." 500731672-1707 (US 22168) (O).

3441. A June 21, 1982 Product Research Report on Non-Menthol Ultra Low Tar Consumer Probes, published by the RJR Marketing Development Department, classified ultra low tar non-menthol smokers into two groups: (1) smokers who are extremely concerned about tar levels and (2) smokers who are moderately concerned about tar levels. The report went on to explain that "extremely concerned" smokers "primarily seek products that are lowest in tar. **These smokers are willing to trade-off such smoking benefits as strength, taste/flavor and ease of draw for brands which may not deliver these benefits but which are lowest in tar**." The report also explained that as compared to smokers of higher tar brands, "respondents generally characterized ULT cigarettes as having a harder draw, reduced smoke density - which they expressed as ‘smoking air,' less taste/strength/flavor, and less smoking sensation."

503394459-4485 at 4460-4461, 4463, 4467 (US 85036) (A) (emphasis added); Schindler WD, 75:14-76:16.

3442. A 1984 Vantage Family "Moderation" Situation Analysis explained that "relative to other segments, 'Moderator' smokers realize there are both positive and negative aspects of smoking, resulting in a desire to resolve the conflict by compromising/moderating on their brand choice." This process was depicted as adding the positives of smoking (personal ritual, anxiety reduction, social confidence) to the negatives of smoking (alleged health hazards and smoker image), compromising on the idea of taste and satisfaction with low tar products, and the image that they are "doing something positive." 502118237-8267 at 8241 (US 22119) (A).

3443. A December 16, 1988 RJR marketing presentation stated that: "For a successful product the **perceived health benefit must balance any sacrifice that must be made in terms of taste**, satisfaction and traditional smoking pleasures." 650900829-0849 at 0831 (US 20951) (O) (emphasis added).

3444. In 1990, RJR undertook a marketing campaign promoting the fact that Now cigarettes had the lowest tar and nicotine levels of any product in the industry. The campaign focused solely on the fact of Now's "lowest" tar and nicotine levels, implying that a low tar and nicotine rating made the product better. The campaign did not focus on taste. In fact, some of the advertisements implicitly admitted that good "flavor" or "taste" was intuitively less likely in a low tar cigarette. For example, one advertisement asked, "Merit Ultra Lights Smokers: Is there a way to get 60% less tar and nicotine **and still get flavor in a cigarette**? NOW is the way." Similarly, another advertisement asked, "Benson & Hedges Deluxe Ultra Lights Smokers: Can you get 50% less tar and nicotine **and still get taste in a cigarette**? NOW you can." Still another advertisement asked, "True Smokers: How can you get 67% less tar and nicotine **and**

still get real cigarette taste? NOW is how." Finally, an advertisement in this campaign asked, "Carlton Smokers: Can a cigarette have just 2 mgs. of tar **and still be satisfying to smoke**? NOW can." Along those same lines, one of the advertisements indicated, "THE LOWEST IN TAR & NICOTINE. Try Now. **Surprisingly** good taste." 2070717114-7436 at 7334, 7336, 7408, 7410, 7432 (US 22172*) (O) (emphasis added).

3445. A May 1991 consumer research report prepared for RJR entitled, "RJ Reynolds Project XB," stated: "Most respondents are interested in a new cigarette that could deliver the great taste and easy draw of current brands, with low tar equivalent to Carlton or NOW. They recognize Carlton and NOW are very low tar, but they perceive the taste and draw to be disappointing." The document further stated that "[r]espondents suspect there is a correlation between reducing the amount of tar and weakening the taste." As a "positive" of a proposed marketing concept, the document stated: "There is interest in an extra low tar cigarette that tastes great and has an easy draw. There is a consensus a lower tar product would be better for them." The document noted that the claim of "[e]asy draw is compelling" because it "addresses a major complaint that lower tar cigarettes are hard to draw, and less satisfying." As a "positive" of a different proposed marketing concept, the document stated: "Respondents, especially women, feel this cigarette could alleviate their concerns about tar levels. They expect the cigarette to be better for them." 514343517-3566 at 3559 (US 51848) (O).

(iii) Brown & Williamson

3446. Sharon Smith, former B&W Director of Marketing Services and Operations, testified that internal B&W research documents "indicate that some smokers are willing to smoke low tar cigarettes, even though these smokers feel they don't taste as good." Smith WD, 52:7-16, 55:16-22.

3447. A January 1977 report prepared for B&W by Post Keyes Gardner, Inc., stated that "health" was the most important driver of consumer trends, compared to mildness, which would not, of itself, cause smokers to switch brands:

> "Health": In our opinion, this is by far the most important factor and trend in the market. All major shifts in smoking habits seem to be a function of 'health' concerns, as they pose a deep psychological question that every smoker must somehow answer. The manifestation of 'health' concerns can be seen in the filter revolution of the 1950's, the emergence of menthol, as well as new hifi's in the 1960's and today . . . . Mildness: This is more or less a taste experience. It is best characterized by the acceptance of filter cigarettes – not the reason for them. In our view, mildness is not a dominant trend, and thus does not cause major shifts in smoking habits . . . . **It, therefore, is unlikely that smokers would switch to milder cigarettes primarily because they are milder. We suspect that the deeper concern of 'health' is the dominant motivator to mildness** . . . . Some smokers will seek justification (rationalization) for staying with a full taste brand, others will move on to the continuing compromise of less satisfaction while continuing to smoke [by switching to low tar cigarettes]. . . . the latest compromise between taste and tar.

Sharon Smith testified that this document shows that some smokers "were choosing their cigarette not due to a preference for a "milder" tasting cigarette, but out of health concerns." 776158413-8426 at 8418, 8419, 8425 (US 22339) (A) (emphasis added); Smith WD, 54:21-56:15.

3448. A July 25, 1977 B&W internal marketing study stated: "It must be assumed that Full Taste smokers come down to 'low tar' expecting less taste . . . [t]hey are willing to compromise taste expectations for health reassurance." 775036039-6067 at 6052 (US 21053) (A); Ivey WD, 57:11-58:11.

3449. An October 1979 B&W "History and Key Trends in the U.S. Cigarette Market" compiled by E.T. Parrack, Vice President of Brand Management, stated that some of the then "new products" such as Merit and Real "seem to be capable of attracting some smokers from the

Full Taste segment, thus drastically changing the terms of the basic tradeoff between taste and low tar in effect for 25 years." It added:

> Viceroy [is] perceived as smooth and perhaps mellow, but it is not significantly weak, mild, bland or light as are the Hi-Fi brands. . . . STRATEGIC ALTERNATIVE Increase Viceroy share of market by positioning Viceroy between full-filter flavor and Hi-Fi as the ideal compromise between the need for full taste and the need for low tar.

The document added that some smokers "have **struck a compromise between taste/satisfaction and personal concerns**. They smoke low 'tar' line extensions hoping for the full taste of high 'tar' brands and the relative benefits of lower 'tar.'" 670624932-5364 at 4942, 5102, 5157, 5240 (US 53869) (A) (emphasis added). Sharon Smith testified that "this document indicates that Brown & Williamson was aware that some smokers smoke lower tar cigarettes even though they prefer the taste of higher tar cigarettes because they wish to lower their tar intake." Smith WD, 52:17-53:21.

3450. A March 12, 1981 B&W memorandum from Sue Finley to B.L. McCafferty entitled "Apollo Strategy Recommendation," revealed that consumers were smoking ultra low tar cigarettes because they wanted to lower their tar intake, despite the fact that they disliked the taste:

> In 1980 the number of ultra low 'tar' (1-6 mg 'tar') cigarette brand styles on the market went from 24 to 38 and the segment's share grew from 6.28% in 1979 to 8.73% in the 4th Quarter of 1980 . . . **The segment's growth has been generated primarily by smokers' 'tar' concerns, as most of the ULT products have no other perceivable consumer benefits**. The products are considered extremely hard to draw and weak tasting. In qualitative research, smokers have said that drawing on ultra low products could 'cause hernias' and that they taste like 'sucking straws' and 'there's nothing to them' . . . . While cigarette marketing has historically been image oriented, initial ultra low 'tar' cigarette advertising was very clinical. All ULT brands advertised extremely low 'tar' with little, if any, taste support or smoker

imagery.

Discussing the marketing for the proposed new ultra low tar cigarette, APOLLO, the document stated:

> Smokers are subjected to relentless pressures to quit smoking or reduce ‘tar'. They continue to smoke because they derive pleasure for the experience and, while they may trade down in ‘tar', **they view ‘tar' reductions as pleasure reductions**. To make the switch to low ‘tar' a more satisfying experience, APOLLO should be presented in a positive, warm and enjoyable manner.

Sharon Smith testified that "this document states that people were smoking ultra lights because they wanted to lower their tar intake, despite the fact that they viewed it as a pleasure reduction." 670635571-5593 at 5571, 5576 (US 85037) (A) (emphasis added); Smith WD, 53:22-54:20.

3451. An April 1985 consumer research report prepared for B&W by ADI Research, Inc., entitled "Brown & Williamson Tobacco Corporation Light and Ultra Light Smokers Concept Reaction Study," attempted to "determine perceived taste and other problems with ultra products and assess the Barclay Brand Ad Copy communication of problem solution to light and ultra consumers." The report stated: "The light and ultra light categories are problematic to consumers because of problems with taste and inhaling and drawing. There is overwhelming agreement by all groups." The report discussed how Barclay's position was succeeding at getting consumers to believe that Barclay provided a solution to taste and draw problems. The report also noted, however, that "[t]hose in the minority that did not perceive a solution thought there would be drawbacks. If Barclay is better tasting and drawing, then it would have to be higher in tar and nicotine, hence, less safe and more harmful." 465626645-6722 at 6647, 6656-6657 (US 87911) (O).

3452. A B&W document circa 1996-1997 entitled "Carlton Creative Plans" stated that "CARLTON is the trademark of choice for smokers who have made an intellectual decision to

seek the ‘lowest' in tar and nicotine without unduly compromising taste." Carlton's "TARGET AUDIENCE" was described as: "**Smokers who want to cut down in tar and nicotine as much as possible and are willing to sacrifice some product performance**." The first "Primary" trait of the target audience was "Health conscious." The then-current brand positioning of Carlton as "The Lowest" was said to "satisf[y] the brand positioning." 176020783-0800 at 0783-0786 (US 23351) (A) (emphasis added); Smith WD, 66:23-67:21.

3453. A B&W document entitled "B&W 1997-1999 Plan" indicated that consumers "switch down" in tar primarily for health reasons, and that this switch down in tar represents a sacrifice in terms of cigarette taste. "Carlton Target Markets" were identified as "Smokers Who Want To Cut Down In Tar And Nicotine As Much As Possible And Are Willing To Sacrifice Some Product Performance – Primary – health conscious. . . . CARLTON Is The Trademark Of Choice For Smokers Who Have Made An Intellectual Decision To Seek The ‘Lowest' In Tar And Nicotine Without Unduly Compromising Taste." The document even discussed plans to reduce the emphasis on taste indicated by Carlton packaging to ensure that the message that Carlton had lowest tar and nicotine was conveyed: "CARLTON's Packaging May Contribute To The Low Awareness Of The ‘Lowest' Tar Positioning By Communicating A Higher Level Of Tar And Taste Than The Product Actually Delivers." 462224560-4766 at 4706, 4709-4711 (US 22085) (A) (emphasis in original).

3454. A B&W document faxed from "Marketing Operations" on January 20, 1999, entitled "Current Trends in Lights and Ultra Lights," stated under the heading "Learnings": "Consumers were ready for low tar before Marlboro Lights. Health concerns . . . . **First low tar cigarettes failed due to: Lack of flavor and smoking satisfaction** . . . . Smokability is critical for success." 430403186-3194 at 3193-3194 (US 22084) (A) (emphasis added); Ivey WD,

58:11-22.

(iv) BATCo

3455. A September 1992 BATCo Business Review prepared by Norma Simamane, BATCo Lights Project Manager, stated that consumers felt, regarding low tar cigarettes, that "'**[t]he lower the [tar and nicotine] numbers, the higher the sacrifice on smoking pleasure**.'" Lights represented "a total compromise," and negative aspects included: "'It's like smoking hot air'" and "'Deprive you of a true smoking experience.'" Lights were perceived as "for people who . . . want to quit but can not." The aspects of the "Inadequate product performance" of low tar cigarettes were: "lack of satisfaction/not satisfying"; "lack of smoking quality"; "poor quality of flavor"; "not strong enough"; and "need to smoke more." 321683062-3099 at 3087, 3090 (US 28586) (A) (emphasis added).

3456. A BATCo document circa 1996 entitled "Lights Segment Project Consumer Insight Into Smoking Lights" stated, under the heading "Benefits of Smoking," that "[l]ight smokers criticized Ultra's as bad tasting 'air' = less taste intensity and no positive flavor development. Ultra smokers agree but accept this lost taste characteristic." The document further stated "light cigarettes (especially ultra) = pleasure sacrifice." The document further stated that "Ultra smokers find it necessary to explain to others and themselves why they consume a product that provides hardly any pleasure (taste)" which led to the "negative cliche" of a 'weak willed addict.'" The document stated that to counter this, "**we need to reassure light/ultra smokers that it is okay to smoke lights through communication**." 321546706-6724 at 6707, 6708, 6709 (US 22052) (A) (emphasis added).

3457. A BATCo document bearing the heading "Barclay Business Review 1996" demonstrates that the main motivators for smoking light and ultralight cigarettes are health-

related, and the lighter taste of light and ultralight cigarettes is appealing insofar as it is an indication of lower tar: "The results of the 1MG smokers motivations study in Belgium show that the key drivers to the [ultralight] segment are health concern and peer/family pressure. Consumers expect a reduction of negative aspects . . . . As amount of taste is the main consumer indicator for strength, 1mg. products are expected to have the least taste among all cigarettes." 700767443-7457 at 7448 (US 22123) (A).

3458. A BATCo document entitled "Firefish Kent in Dublin Qualitative Research Debrief July 2000" concluded that, with respect to Kent's charcoal filter, consumers found communications providing health reassurance "more appealing" than communications about taste: "'Kent Taste System' The Charcoal Filter communication was appreciated . . . . However, they felt the emphasis should be on Filter – rather than taste – help **filtering out the 'crap' was more appealing than advantages in taste**." 321626872-6906 at 6901 (US 22059) (O) (emphasis added).

3459. In a document entitled, "What is a Light Cigarette," dated September 29, 1998, BATCo scientist David Creighton described two "main types of Lights smokers[:] Those who start smoking a Lights ... and those who have been smoking a full flavour product and wish to switch down to a Lights." Creighton explicitly acknowledged that Lights smokers who "switch down" do so because they believe it is a "conscious ... exchange" of taste for "the reassurance of the lower tar delivery":

> [T]he down switcher, who has been used to a higher taste level[,] would prefer to maintain as much taste as possible with the reassurance of the lower tar delivery of a Lights. ... **The down switcher makes a conscious decision to give up some taste satisfaction in exchange for the lower delivery potential**.

770009958-9964 at 9962 (US 78253) (O) (emphasis added).

3460. A January 15, 2001 BATCo document written by Steven Coburn and entitled

"Project Balcony," which referenced Santa Monica, California marketing studies related to proposed campaigns, reported that smokers prefer the taste of higher tar cigarettes, but smoke lower tar cigarettes because they believe lower tar cigarettes are less harmful: "[L]ights don't satisfy as much as a heavier cig when trading down . . . . less tar less nic – less harmful." 325239017-9018 at 9017 (US 22082) (O). A January 17, 2001 document with the same author and title that also referenced Santa Monica smokers stated under the heading "Benefit": "Has carcinogens of a lights but taste of full flavor[.] May be not as harmful – which is why some people smoke lights." 325239023-9024 at 9023 (US 22082) (O). An additional document with the same date, title, and author, referencing Santa Monica smokers stated: "**Benefit** . . . Lights that smoke like a full flavor – not sacrificing anything[.] Lights with a full flavour – important – lights better for you but still taste like a cig." 325239025-9026 at 9026 (US 22082) (O).

(v) American Tobacco

3461. A 1967 Annual Report prepared by American, describing American's Carlton cigarettes, defined a "light cigarette" as "one that is low in 'tar' and nicotine yield," and made no mention of any particular taste characteristics. MNAT00029170-9201 at 9176 (US 21222) (O).

3462. A March 2, 1976 American document entitled "Background and Product Positioning Recommendation Project LOTC," predicted that:

> [T]he most significant growth will take place in the 'middle ground' where taste claims prevail, yet where the perception of a 'health benefit' is still strong. In other words a compromise between low-tar and taste (which is unmistakable to consumers) may not represent as traumatic a change for full flavor smokers as a change to 'super low tar.'

ATC0494235-4235 (US 87912) (O).

3463. A January 1984 document from American Tobacco's files prepared by Andrew Thurm Associates entitled "'NO ADDITIVES' CONCEPT TEST" concludes that low tar

cigarettes are associated with weak taste and that Carlton cigarettes have a weak, negative taste perception with consumers: "Carlton . . . shows traces of an additional impediment – weak taste perceptions . . . . Carlton's weak taste image acts as a secondary impediment . . . . In a certain sense, being low in tar peripherally suggests a flavor identity because of its connotations to mildness at the expense of taste strength." 970384072-4111 at 4076-4078 (US 85121) (O).

3464. Eric Gesell, designated representative of American Tobacco, testified in 1997 that a 1987 advertisement for American's Carlton cigarette that stated "Carlton cuts tar by 40%! . . . . Carlton is lowest. Reduced to 3 mg. tar," did not "imply that [Carlton] is a safer cigarette." Gesell further testified that "taste is the primary motive" for smokers switching to light cigarettes. Gesell PD, Minnesota, 9/18/97, 5:8-25, 6:5-6, 6:10-17, 128:4-17, 131:6-21.

3465. A February 29, 1988 American Tobacco memorandum from Richard E. Smith, Director of Brand Management, to K.P. Noone, Product Manager, stated:

> If the switching motivation is better taste, [smokers] . . . . will certainly not switch to Carlton, a brand which their experience has often taught them is lower taste. . . . [M]ost smokers will continue to seek lower tar. . . . **They have demonstrated a disciplined willingness to sacrifice taste. . . . Carlton brings less than nothing to the better/stronger tasting party**.

991216857-6858 (US 85115) (O) (emphasis added).

3466. A February 29, 1988 American Tobacco memorandum from J.M. Murray, Assistant Product Manager, to T.M. Keane, Senior Product Manager, stated:

> The Carlton and Now Groups almost unanimously cited "Lowest in Tar" as the single most important motivating factor in brand selection. . . . Importantly, the 0-3 mg. groups identify "Lowest" as the driving force – they seem to have been prepared to make a taste compromise. There is nothing to indicate that [ultralight smokers] won't become available to Carlton. At present, they aren't ready to make a taste compromise . . . . As these people become prepared to step down, they will be ready to give up some level of taste and seek the "Lowest in Tar" (e.g. Carlton or Now). . . . present

> Carlton smokers . . . have already made the taste compromise and focus primarily on "Lowest." . . . In conclusion, I believe we should focus our efforts on developing suitable advertisements which single mindedly communicate our "Lowest" positioning.

980355176-5177 (US 85122) (O).

(vi) Lorillard

3467. A June 1978 Report prepared for Lorillard by Foote, Cone & Belding Advertising, Inc., "to assist Lorillard in understanding the . . . attitudes of reduced-tar smokers and their motivations in selecting brands" relayed smokers' beliefs that lower tar cigarettes had an unsatisfying lack of taste, and indicated that a low tar cigarette "with good taste" had not yet been developed, stating:

> The major problem with [ultra low tar] brands was decided lack of taste/smoking impact. "Sucking on a straw in an empty glass–nothing" was a typical reference to such brands. In point of fact, this was probably very close to the truth. . . . There is every reason to believe that ultimate technological breakthroughs will yield a tobacco product that is low in tar, with good taste. In that event, ultra low-tar products will serve as a viable net for **all** smokers who desire reduced tar plus the satisfaction of good taste.

03297227-7249 at 7229, 7233, 7246 (US 88631) (A).

3468. This document, discussing one of Lorillard's competitors' brands, added: "Carlton's success was all the more surprising in light of the fact that it was totally unable to offer any taste benefits to the consumers. Apparently, there existed a strong need among a sub-section of reduced-tar smokers for a cigarette that was 'as low as you can go' in its tar and nicotine levels." 03297227-7249 at 7240 (US 88631) (A).

3469. A December 1976 report prepared for Lorillard by the Nowland Organization, Inc., stated: "Those who do not now smoke SHF [super-high filtration] cigarettes perceive low tar and nicotine cigarettes in very much the same way as do current smokers – i.e., as **'better for**

you' but not as enjoyable." 84053616-3706 at 3638 (US 55997) (A) (emphasis added).

(vii) Liggett

3470. An undated Liggett press release stated: "The 'lighter' cigarette is achieved by lowering total smoke delivery," and made no mention of lighter taste. LWDOJ6135692-5692 (US 21215) (O).

(c) Defendants Continue to Make False and Misleading Statements Regarding Their Marketing of Low Tar Cigarettes

3471. The evidence in this section shows that Defendants continue to disseminate false and misleading public statements regarding the true intent of their marketing of low tar cigarettes. As Dr. Dolan testified, Defendants have consistently, and falsely, maintained publicly that "all of their marketing activities had one and only one purpose: to impact the brand choice of adults who had already chosen to smoke." Dr. Dolan further testified that, contrary to fact, "[t]he tobacco companies expressly stated they had no interest in either (1) increasing the likelihood of anyone's beginning to smoke or (2) decreasing the likelihood that a current smoker would quit." Similarly, Dr. Brandt testified that the industry has falsely "continued to insist that the rise of filter cigarettes merely reflected the nature of consumer demand." Dolan WD, 56:3-14; Brandt WD, 137:22-138:18.

3472. In an August 26, 1958 letter from Clarence Cook Little, Scientific Director of the Tobacco Industry Research Committee ("TIRC"), to Timothy Hartnett, Chairman of TIRC, Little admitted that the cigarette industry's statements of reduced tar and nicotine were perceived by the public as indications that these cigarettes were less harmful, and cautioned that insofar as industry advertisements promised a reduction in health hazard, they contained an implicit admission that cigarettes are harmful. Little stated that "[a]lthough this serious danger exists, I believe that it can and should be eliminated by prompt and unanimous action by the industry" in

the form of a denial that cigarettes are harmful and **a statement that the cigarettes and corresponding advertisements regarding filters and reduced deliveries are "in response to public demand and to nothing else**." 1002607478-7481 at 7480 (US 20138) (O) (emphasis added - bold text).

3473. In his testimony before the Court, Dr. Brandt cited a 1958 article in which James P. Richards, President of the Tobacco Institute, stated:

> The cigaret industry has not changed its mind. Our position was and is based on the fact that scientific evidence does not support the theory that there is anything in cigaret smoke known to cause human lung cancer. . . the production and marketing of filter cigarets are matters of individual company competitive business. Anyone familiar with the tobacco industry knows that **tobacco manufacturers constantly compete to make products to please customers**.

TIMN0122775-2775 (US 21326) (A) (emphasis added).

3474. Consistent with the approach recommended by Little in 1958, in April 1964, the Cigarette Company Defendants adopted the Cigarette Advertising and Promotion Code ("Code"). The Cigarette Company Defendants have claimed publicly that they obeyed and continue to obey the 1964 Code, last revised in December 1990, which includes provisions prohibiting "advertising which makes a representation with respect to health." Krugman WD, 164:6-21; see also US FF §§ III.E(3)(a)-(b), infra (Youth Marketing) for a more detailed discussion of the history of Defendants' Advertising Code and their false public statements about the Code.

3475. Defendants have repeatedly made public their adoption of the Code. Each Cigarette Company Defendant continues to state to the public on its website and in other public statements that it has adopted the Code and that it follows the Code in planning and executing its cigarette marketing. For example, a December 1990 pamphlet published by the Tobacco Institute, entitled "Cigarette Advertising and Promotion Code," emphasized that Defendants

continue to follow the Code. These statements are knowingly false and misleading. 2070557699-7702 (US 20519) (A). 2025345360-5362 (US 20414) (A); MNAT00608606-8614 (US 78779) (A); TIMN0102493-2494 (US 21271) (O); TIMN0015615-5617 (US 21265) (A); 2022976326-6335 (US 20370) (O); ATX040294056-4056 (US 58599) (A).

3476. More recently, Defendants agreed in the 1998 Master Settlement Agreement ("M.A.") not to make "any material misrepresentation of fact regarding the health consequences of using any tobacco product." Section III(r) of the M.A. states:

> Prohibition on Material Misrepresentations. No Participating Manufacturer may make any material misrepresentation of fact regarding the health consequences of using any Tobacco Product, including any tobacco additives, filters, paper or other ingredients.

Master Settlement Agreement, § III(r) (JD-045158) (A).

3477. Throughout trial, counsel for Defendants denied that Defendants' actions were responsible for consumer demand for low tar cigarettes, and instead attempted to claim that the Government was responsible for the consumer demand, because of a few, limited statements of the United States Department of Health and Human Services in the late 1960s to early 1970s. Andrew Schindler, Executive Chairman of Reynolds American Inc., claimed that Reynolds "developed and markets light and ultra light cigarettes in response to recommendations by the government and public health community and in **response to consumer demand** for those products as a result of government and public health community recommendations." Schindler WD, 65:11-18 (emphasis added). See also TT, 9/22/04, 288:16-22 (counsel for Defendants claiming during Defendants' opening statement that "[t]he evidence will establish that the government and the public health community helped to create demand for lower tar and nicotine cigarettes"); TT, 6/8/05, 23225:14-17 (counsel for Defendants claiming in closing argument that "these defendants did what the government and public health community wanted them to do").

3478. Defendants' statements recited immediately above are not credible in light of the overwhelming evidence adduced at trial that directly contradicts Defendants' claims. First, the evidence shows that Defendants intentionally marketed and promoted low tar cigarettes as a healthier alternative to regular cigarettes to **prevent** smokers from quitting, (see US FF §§ III.D(2)-(3), supra), in direct contravention of the Surgeon General's primary advice to smokers, which has always been, first and foremost, to quit smoking entirely. Dolan TT, 12/8/04, 8071:8-8074:12 (testifying that the "consistent" message from the public health authorities was to quit smoking, and that, by contrast, Defendants had a profit motive in using low tar cigarettes to keep smokers from quitting); 99054900-5150 at 4902 (US 74603) (A) (1981 Surgeon General's Report, stating that "smokers who are **unwilling or as yet unable to quit** are well advised to switch to cigarettes yielding less 'tar' and nicotine, provided they do not increase their smoking or change their smoking in other ways") (emphasis added); VXA0300208-0848 (US 64591) (A) (1988 Surgeon General's Report, stating "even the lowest yield of cigarettes presents health hazards very much higher than would be encountered if they smoked no cigarettes at all, and that the **single most effective way to reduce the hazards associated with smoking is to quit**") (emphasis added).

3479. In addition, as demonstrated previously (see US FF § III.D(3)(a), supra), Defendants' spending on the marketing and promotion of filtered and low tar cigarettes over multiple decades exceeded the market share of those cigarettes. This evidence directly refutes Defendants' claim that they were merely responding to consumer demand, and indicates that instead Defendants were attempting to increase demand. As Dr. Brandt explained, Defendants' false claim that they were only responding to consumer demand is merely an attempt by the industry to explain the inconsistency between Defendants' public position denying that any

cigarettes caused disease and their marketing of filtered and low tar cigarettes as less harmful. Brandt WD, 137:22-138:18.

3480. Second, Defendants' claim that they "did what the government and public health community wanted them to do" is belied by the fact that there is no evidence in the record of internal industry documents where Defendants stated that they were designing and marketing filtered and low tar cigarettes because the mainstream scientific community or the FTC had asked them to. See, e.g. Dolan TT, 12/8/04, 8077:1-6 (Dr. Dolan testifying that, during his review of internal industry documents, he saw no representation by Defendants that they were making, advertising, or promoting low-tar cigarettes because the government told them to). The overwhelming evidence proves Defendants did the exact opposite of what the Government and public health community wanted. The evidence shows that Defendants withheld and suppressed their extensive knowledge and understanding of smoker compensation from public dissemination, and instead used this knowledge to secretly design their low tar cigarettes with "elasticity" of delivery, so that they would register deceptively low tar and nicotine yields on the standardized testing machine operated by the Federal Trade Commission ("FTC"), while at the same time enabling smokers to compensate and obtain much higher deliveries of nicotine (and with it, tar); deliveries high enough to create and sustain addiction. Thus, rather than producing cigarettes that actually were less harmful, **Defendants did exactly the opposite of what the Government and the public health community had requested**, introducing instead cigarettes that merely gave the **appearance** of being less harmful, to the great detriment of smokers' health. See generally US FF §§ III.D(4)(a)-(c), infra (health effects, smoker compensation, and Defendants' deceptive design of low tar cigarettes, respectively).

3481. Therefore, Defendants' claim that the Government "endorsed" low tar cigarettes is

misleading and not credible. See, e.g. TT, 6/8/05, 23227:11-19 (counsel for Defendants claiming in closing argument that there were "specific endorsements by the public health community of lower tar and nicotine cigarettes and that they are safer for you than higher tar and nicotine cigarettes"). As explained more fully in Section III.D(4)(a), infra, the statements of the public health community were premised on the existence of a dose-response relationship between the amount that a person smokes and that person's risk of adverse health effects, and on the concurrent proposition that cigarette smoke with less tar and nicotine in it therefore may be less likely to cause lung cancer than smoke with more tar and nicotine. However, as Dr. Burns testified, unbeknownst to those outside the tobacco industry, low tar cigarettes, as designed by Defendants, did not deliver less tar to smokers, and therefore did not reduce smokers' health risks. Had the Surgeon General known what the tobacco companies knew and concealed regarding cigarette design and the extent of smoker compensation, the 1981 Report never would have made the recommendation that smokers who could not quit switch to low tar cigarettes. US FF § III.D(4)(a); Burns WD, 1:10-15; 12:10-11; 36:3-37:12; 55:17-56:13; 56:21-57:17; Burns TT, 2/15/05, 13311:9-15; Burns TT, 2/16/05, 13666:25-13667:24.

3482. Consistent with their scheme to defraud, Defendants have made statements in depositions and submissions to the Federal Government that directly contradict the vast amount of internal information developed by or for Defendants about consumer perceptions of low tar cigarettes and Defendants' deliberate efforts to exploit those perceptions in marketing those cigarettes. For example, in direct contrast to overwhelming evidence that for decades Defendants intentionally marketed low tar cigarettes as less harmful – and that consumers smoked them for that reason – Defendants Philip Morris, RJR, B&W, and Lorillard jointly stated to the FTC in February 1998: "The **manufacturers do not claim that lower-yield cigarettes are 'safe' or are**

‘**safer' than higher yield cigarettes**." Comments of Philip Morris Inc., RJR Tobacco Co., Brown & Williamson Tobacco Corp., and Lorillard Tobacco Co. on the Proposal Entitled FTC Cigarette Testing Methodology Request for Public Comment (62 Fed. Reg. 48,158) at 3, 94 ("Joint Comments") (US 88618) (A) (emphasis added).

3483. Despite clear evidence showing that Defendants know that consumers are generally unaware of the FTC tar and nicotine ratings of their own brands, and rely on brand descriptors as an indication of relative safety of the cigarette (see US FF § III.D(3)(a), supra), Defendants stated to the FTC: "**Smokers are familiar with the ratings produced by the current test method**, and continued use of the current test method assures historical continuity of the data. For these reasons, testing under the current FTC test method should continue." Joint Comments at 4 (US 88618) (A) (emphasis added).

3484. Despite evidence showing that Defendants have known for decades that consumers perceive brand descriptors such as "light" and "ultra light" to signify reduced harm products (see US FF §§ III.D(3)(a)-(b), supra), in response to the FTC's question regarding the need for official guidance on brand descriptors, Defendants stated: "**The manufacturers are not convinced that there is a need for official guidance with respect to the terms used in marketing lower rated cigarettes**." Defendants further stated that regarding terms like "light" and "ultra light," "**[t]he manufacturers believe smokers understand that these descriptors are terms of comparison rather than signifiers of absolute value**." Joint Comments at 94 (US 88618) (A) (emphasis added).

3485. In response to the following FTC query:

> What data, evidence, or other relevant information on consumer interpretation and understanding of terms such as ‘ultra low tar,' ultra light,' ‘low tar,' ‘light,' ‘medium,' ‘extra light,' and ‘ultima,' as used in the context of cigarettes exists? Do consumers believe they

> will get significantly less tar from cigarettes described as ‘light' or ‘low tar' than from regular full flavor cigarettes, and do they believe they will get significantly less tar from cigarettes described as ‘ultra low tar' or ‘ultra light' than from ‘light' or ‘low tar' cigarettes? Do the brand descriptors convey implied health claims?

Defendants Philip Morris, RJR, B&W, and Lorillard jointly stated in their joint comments to the FTC:

> **The manufacturers believe** that consumers choose ‘light' or ‘ultra' products for a variety of reasons, including lighter flavor, lighter taste, less menthol (or other flavor) taste, and smoother smoking characteristics. Some consumers may choose such products for other reasons. **The manufacturers do not intend the descriptors to convey any level of safety with regard to their products**.

Defendants' joint comments further stated: "**The manufacturers are not aware of evidence that consumers use descriptors in lieu of the FTC numbers as their primary source of information about the ‘tar' and nicotine yields of different brand styles**." Joint Comments at 95 (US 88618) (A) (emphasis added).

3486. The mountain of evidence adduced in this case shows Defendants' statements immediately above are misleading at best, if not outright false. See US FF §§ III.D(1), (2), (3)(a)-(b), supra.

3487. Defendants' statement to the FTC fails to make any reference to the vast amounts of consumer research Defendants conducted, and had conducted for them by their numerous advertising and marketing consultants, that expressly found that many consumers disliked the taste of low tar cigarettes, but were smoking them because they believed they were better for them. Accord 2041186475-6517 at 6478, 6504 (US 22181*) (A) (November 29, 1994 submission to the National Cancer Institute on behalf of B&W, American Tobacco, Lorillard, and Liggett contending that smokers use FTC tar and nicotine ratings primarily for information

relating to taste considerations, referring to what Defendants called "the well-established significance of the FTC's machine-determined yields for comparing the **flavor, richness and satisfaction** of different brands of cigarettes," and adding that if modifications to the FTC Method occurred, "[c]onsumers . . . would be deprived of important information about the **flavor, taste and feel** of cigarettes – information consumers consider to be highly relevant in distinguishing among" brands) (emphasis added).

3488. In response to the FTC's question:

> What available evidence exists concerning how consumers view cigarettes with relatively low tar and nicotine ratings and their perception of the relative risks of smoking such cigarettes rather than full flavor cigarettes?

Defendants Philip Morris, RJR, B&W, and Lorillard jointly stated:

> "**The manufacturers are unaware of evidence concerning such consumer views and perceptions except to the extent that such evidence is presented in [the National Cancer Institute's Smoking and Tobacco Control Monograph No. 7]**.

Joint Comments at 89 (US 88618) (A) (emphasis added).

3489. As shown above, Defendants have conducted a staggering amount of research on **exactly** this question, and this research has unequivocally found that most smokers view low tar cigarettes as better for them and smoke them for that reason, despite the less desirable taste. See US FF §§ III.D(3)(a)-(b), supra.

3490. Nancy Lund, Philip Morris Senior VP for Marketing, acknowledged that, as part of its mission statement, Philip Morris claims that it will keep the public fully informed, especially about health risks. Lund further admitted that in order to keep the public fully informed about the health risks of Philip Morris's cigarettes, she needs to know what the health effects of its cigarettes are. However, Lund testified that she was not aware of tests that the

company has done on its light cigarettes to indicate there are a greater number of harmful constituents in the lights than there are in regulars. She further testified that the company's internal research has never been discussed in any of the weekly Senior Team meetings of Philip Morris's top executives. Ms. Lund was also unaware of studies that showed that smokers of Marlboro Lights get as much tar and nicotine as smokers of regular Marlboros. Although she admitted that the research on tar yields was the kind of information that should, under the Mission Statement the company purports to follow, be communicated to consumers, they have not been discussed at any of the Senior Team meetings, nor has Ms. Lund, the most senior marketing executive at Philip Morris, been made aware of the company's internal research in this area. Brennan-Lund TT, Price v. Philip Morris, 2/25/03, 4:4-6; 4:8-5:5; 8:4-9:22; 21:16-22:18; 24:8-14; 70:10-19; 101:11-102:18; 103:7-13; 103:16-104:18; 104:22-105:8; 105:11-106:1; 106:22-107:8; 107:10; 107:13-107:15; 114:24-115:14; 115:22-116:5; 116:24-117:15.

3491. As Dr. Dolan testified, contrary to their repeated public statements from the 1970s, 1980s and 1990s, Defendants sought to maintain, and even increase, the overall number of cigarettes sold by controlling the number of new people (including teenagers) entering the market and becoming smokers, the number of smokers who quit, and the consumption rate of people who do smoke, as well as the number of people who have quit "restarting" as smokers. As Dr. Dolan explained:

> Contrary to their public statements, Defendants used marketing to decrease the number of people who quit smoking. My review of tobacco company documents shows that they were well aware that most people wanted to quit. The tobacco companies tracked how much business was lost to quitting and they devised programs to deter smokers from quitting. They were aware of how prevalent smokers' desire to quit was. The tobacco companies regularly collected data on this while claiming quitting was a phenomenon they had no interest in impacting.

Dolan WD, 62:7-65:16; 101:14-102:7.

3492. As such, as detailed below, Defendants' public statements on their websites, the statements of their executives in depositions, and their internal documents detailed in this section are false and/or misleading, and serve as further evidence of Defendants' scheme to conceal the truth about low tar cigarettes and defraud and mislead the American public.

(i) Tobacco Institute

3493. In a May 3, 1967 Lorillard letter from Manuel Yellen, Chairman of the Board, to the Board of Directors of the Tobacco Institute, Lorillard acknowledged Defendants' lack of candor and withholding of information regarding the health effects of cigarette smoking, stating: "The failure of the Institute for a number of years to conduct a reasonable dialogue with those agencies of the Federal Government most interested in the cigarette and health controversy seemed to us unwise and ultimately damaging to the industry." As an example, Lorillard cited the Institute's actions at a "meeting . . . to discuss the Federal Trade Commission's Special Report Order of March 17, 1967." 03768870-8872 at 8870-8871 (US 46515) (O).

3494. In 1979, the Tobacco Institute's pamphlet "Fact or Fancy?" stated: "The tobacco industry does not try to persuade anyone to smoke. Nor does it discourage anyone who makes up his of her mind to quit." TIMN0133740-3798 at 3786 (US 21280) (A).

(ii) Philip Morris

3495. Recent testimony of Philip Morris executives underscores Defendants' scheme to maintain their false public denials and to conceal their intent to market low tar cigarettes as less harmful. Jeanne Bonhomme, Director of Consumer Insights for Philip Morris, testified that to her knowledge:

- "Philip Morris has always denied publicly that it markets low tar cigarettes as safe or safer than full-flavor brands;" and

- "Philip Morris has always denied publicly that it uses brand descriptors such as ‘light' and ‘ultra light' to communicate they are safe or safer than full-flavor brands."

Bonhomme WD, 11:18-20; 12:12-15.

3496. In May 1996, representatives from Philip Morris, including Denise Keane, Philip Morris General Counsel, RJR, B&W, and Lorillard met with the FTC to discuss in part "how Philip Morris and other tobacco companies use FTC test results in their advertising," and "whether the FTC test method could be modified to more accurately reflect actual smoker intake." Keane testified that, at that meeting, "the FTC referred to published research showing that smokers believe brand descriptors like ‘low tar' and ‘light' to convey relative safety messages." Keane further testified that, at the meeting, the FTC requested that the industry representatives provide the FTC with "any information the companies had concerning the issue of consumer perception of low tar, so-called "light" cigarettes." Despite the decades of consumer and marketing research conducted or commissioned by Philip Morris concerning consumers' interpretation of these terms (see US FF §§ III.D(3)(a)-(b), supra), Keane testified that "Philip Morris did not provide any such information" to the FTC. Keane WD, 46:18- 48:23; Keane TT, 1/18/05, 10369:20-10370:25; 2048216131-6135 at 6134 (US 38655) (A).

3497. Following publication of the NCI's Monograph 13 in November 2001, ABC News.com requested information from Philip Morris regarding low tar cigarettes and, as stated in a November 26, 2001 email from Philip Morris employee Christina Malito, "whether or not there are real health benefits to them." In an internal reply e-mail sent that same day, Ellen Merlo, then Senior Vice President of Corporate Affairs at Philip Morris United States and a decades-long Philip Morris employee, wrote that Philip Morris's response to the inquiry should be: "**[W]e make no claims. Started producing them in response to consumer demand** for lighter tasting

cigarettes." 2085802175-2176A at 2175B (US 85123*) (O) (emphasis added).

3498. In a 2002 deposition, Merlo testified that:

> [A]s far as Philip Morris's position publicly, **we would advise people not to in any way infer that light or lighter cigarettes are any safer than full flavor cigarettes** . . . my communication, both through our website and in any public statements that I make, would be that **the general public should not in any way infer that light or lighter means that that cigarette is safer than a full-flavor cigarette**.

Merlo PD, Price, 10/2/02, 96:24-101:24 (emphasis added).

3499. Susan Norris, former Marlboro Brand Manager from 1995-1999 who was heavily involved in creating the marketing for the national launch of Marlboro Ultra Lights, testified at her July 31, 2003 deposition that virtually no consumers smoked Marlboro Ultra Lights because they believed these cigarettes delivered less tar and it was a "rarity" that consumers believed doing so was better for their health. Norris PD, United States v. Philip Morris, 7/31/03, 125:2-130:4, 162:6-165:8.

3500. Nancy Brennan-Lund, then Senior Vice President of Marketing at Philip Morris USA, testified in a 2002 deposition that Philip Morris's use of the word "lights" in its marketing of low tar cigarettes is intended to mean a lighter tasting cigarette. Brennan-Lund PD, Price, 9/20/02, 19:21-24.

3501. As recently as 2003 and 2004, the Board of Directors of Altria (formerly known as Philip Morris Companies), publicly made false and misleading statements to its shareholders and to the U.S. Securities and Exchange Commission ("SEC") in documents it filed with the SEC. In a March 17, 2003 Proxy Statement, a group of Altria shareholders, proposed (at p. 34-35) to the Altria Board of Directors that "the Board find appropriate ways of informing our customers about the actual health risks of smoking ‘light and ultralight' cigarettes to disassociate them from any

belief that such products are safer and deliver less tar and nicotine," citing a NCI study that found that "most smokers believe ‘Lights' and ‘Ultra Lights' are less harsh and deliver less tar and nicotine," and that, "on average, smokers believe that Lights afford a 25% reduction in risk, and Ultra Lights a 33% reduction in risk;" the Canadian Government's conclusion that the terms low tar, light and ultra light are deceptive to the consumer; and that the World Health Organization recommends banning the terms light and ultralight as misleading. The Board of Directors of Altria recommended a vote against this shareholder proposal, stating: "for those adults who choose to smoke, PM USA and PMI believe descriptors such as ‘low-tar,' ‘mild,' and ‘light' serve as useful points of comparison for cigarette brands regarding characteristics such as strength of taste and reported tar yield." (US 87741) (O).

3502. In May 2004, Philip Morris, in clear contradiction to the substantial evidence presented in Sections III.D(1), (2) and (3)(a)-(b), supra, falsely stated on its website: "**Philip Morris USA does not imply in its marketing**, and smokers should not assume, that lower-yielding brands are safe or safer than full-flavor brands." TLT0770066-0088 at 0077 (US 72408) (A) (emphasis added); accord TT, 2/24/05, 14340:19-20 (counsel for Defendants referring to Philip Morris website and stating "we don't tell people that these cigarettes are safer"); see also PM3000185282-5319 at 5289, 5291-92 (June 2003 Philip Morris website stating same) (US 88095) (O).

3503. Philip Morris further stated on its website:

> Because smokers have varying preferences, Philip Morris USA offers products with differing yields of tar and nicotine, as measured by machine methods. We believe that it is appropriate to continue to differentiate our brands on this basis and that descriptors such as "lights," "ultra-lights," "medium" and "mild" help communicate these differences to adult smokers.

TLT0770066-0088 at 0077 (US 72408) (A); see also PM3000185282-5319 at 5289 (June 2003

Philip Morris website stating same and further stating "we believe that [low tar brand] descriptors serve as useful points of comparison for cigarette brands regarding characteristics such as strength of taste and reported tar yields . . .") (US 88095) (O).

3504. Similarly, on August 22, 2002, although Geoffrey Bible, former CEO of Philip Morris Companies, claimed he had never been presented with any data as to how consumers actually perceive brand descriptors, he testified that he believes that they "simply convey taste preferences." Bible PD, United States v. Philip Morris, 8/22/02, 165:3-166:7.

(iii) R.J. Reynolds

3505. In direct contrast to substantial evidence showing that RJR marketed low tar cigarettes to prevent smokers from quitting smoking (see US FF § III.D(2)(c), supra), RJR's website in May 2004 stated: "Reynolds Tobacco is not interested in trying to persuade any nonsmokers to begin smoking or in persuading any smokers not to quit." Andrew Schindler, Executive Chairman of Reynolds American Inc., testified that "Reynolds Tobacco is not interested in trying to talk any smokers out of quitting." TLT0770095-0128 (US 72410) (A); Schindler WD, 76:17-77:5.

3506. RJR's website further stated:

> Our company, like other cigarette manufacturers, uses brand descriptors such as ‘full flavor,' ‘lights' and ‘ultra lights' to differentiate cigarette brand-styles in terms of such characteristics as strength of taste, and reported ‘tar' and nicotine yield. **These terms do not, and are not meant to, imply that any cigarette brand-style or any category of cigarettes is safer than any other**.

TLT0770095-0128 at 0111 (US 72410) (A) (emphasis added); Schindler WD, 64:19-65:3.

3507. Andrew Schindler testified that "Reynolds intends for the public to rely on its statements as accurate reflections of the views and/or policies of the company." Schindler WD,

64:11-18.

3508. A March 21, 2003 RJR statement to stockholders presented a proposal to sharholders "to find appropriate ways of informing our customers about the actual health risks of smoking ‘light and ultralight' cigarettes to disassociate them from any belief that such products are safer and deliver less tar and nicotine." This proposal cited the conclusions of NCI Monograph 13 that low tar cigarettes present no significant reduction in harmfulness relative to full-flavor cigarettes, and that "'many smokers choose these products as an alternative to cessation'" out of a mistaken belief that they are less harmful. The proposal also referenced several pending lawsuits against one or more of the Defendants alleging fraudulent marketing of low tar cigarettes as less harmful. The Board of Directors of RJR recommended a vote **against** this proposal. One of the reasons for rejecting this proposal was that, "if implemented, this proposal could significantly interfere with RJR's defense of pending litigation." TLT0960025-0029 at 0027-0028 (US 87993) (A); Schindler WD, 66:4-67:16.

(iv) Brown & Williamson

3509. Susan Ivey, former B&W President and CEO, testified that since she joined B&W in 1981, the company's public position has been that "it has never marketed filtered or low tar cigarettes as less harmful than regular cigarettes." Similarly, Sharon Smith denied that the words "low tar" communicates any health benefit, testifying that "I would not say that low tar implies any sort of benefit, other than it's lower in tar." Ivey WD, 51:9-13; Smith WD, 66:19-22.

3510. Notwithstanding that B&W internally acknowledged that its low tar marketing portrayed low tar cigarettes as less harmful, a June 17, 1999 B&W Question & Answer ("Q&A"), labeled a "working document," stated that B&W did not lower the tar and nicotine in its cigarettes for health reasons and that B&W does not "claim that [low tar] cigarettes are any

better/safer for you than any other cigarette on the market." 127030138-0138 (US 22113) (A).

3511. In March 1999, Nicholas Brookes, B&W Chairman and CEO from 1995 to 2000, testified that B&W had not conducted research on consumer perception of light cigarettes and whether reduced risk was associated with these cigarettes. Brookes PD, United States v. Philip Morris, 3/31/03, 162:13-163:9.

3512. In direct contradiction to the multitude of documents cited in Section III.D(a)(iii), supra, establishing that B&W tailored its marketing of low tar cigarettes to communicate their supposed health benefits, Sharon Smith, former Director of Marketing Services and Operations at B&W, testified that "Brown & Williamson has only used the terms 'low tar' or 'light' with respect to its cigarettes to communicate lighter taste – lighter taste and nothing else," and that "consumers have overwhelmingly responded that lighter taste is the only benefit that Brown & Williamson's advertising for its low tar brands has indicated." Similarly, Susan Ivey testified that "[m]y experience is that most consumers choose lights for taste, because they prefer a lighter tasting cigarette." Smith WD, 50:7-51:2; Ivey WD, 57:18-21.

3513. Paul Wessel, a B&W Marketing Vice President who has worked for B&W since the 1970s, testified that, as of March 19, 2002, he was not aware of any B&W focus group research conducted "to determine whether consumers perceived light [cigarettes] as either a potentially safer[,] less harmful" or "potentially less hazardous cigarette." Nonetheless, Wessel testified that smokers switch to light cigarettes to "lower[] their perceived health risk." Wessel PD, United States v. Philip Morris, 3/19/03, 37:23-38:12, 63:25-66:10.

3514. Despite substantial evidence that B&W intentionally marketed low tar cigarettes to potential quitters to keep them from quitting (see US FF § III.D(2)(iv), supra), B&W stated on its website: "**We do not believe that people who are concerned about the health risks of**

smoking should view lower tar products as an alternative to quitting." TLT1040050-0055 at 0055 (US 88620) (A) (emphasis added); Ivey WD, 63:9-16, 64:1-6; Smith WD, 61:19-23.

3515. Despite substantial evidence that B&W has intentionally marketed low tar cigarettes as safer (see US FF § III.D(3)(a)(iii), supra) and was aware that consumers interpreted its low tar brand descriptors as indicating a less harmful cigarette, in May 2004, B&W stated on its website that brand descriptors were intended only to communicate taste:

> Cigarette brands in the U.S. are usually identified on packs, cartons and advertising as belonging to the following categories: 'Ultra Lights' or 'Ultra Low Tar', 'Lights' or 'Low Tar', and 'Full Flavor" . . . . Recent published studies suggest that **the majority of smokers use descriptors to guide their product selection based on taste**. . . . **It is not Brown & Williamson's intention to suggest that any individual brand, regardless of the category descriptor terminology used, or tar yield, is safer than any other.**

TLT1040056-0062 at 0061 (US 88628) (A); Ivey WD, 70:5-14.

(v) BATCo

3516. Susan Ivey, who worked in marketing for BATCo from 1990 and 1999, testified that BATCo's public position was that the use of low tar brand descriptors was "not intended to make any health claims," and was "not meant to imply that light or ultra-light cigarettes are less harmful." Ivey WD, 71:20-72:3.

3517. A February 17, 1999 BATCo memorandum entitled "EU- Labeling Directive" from Rolf Bielefeldt to Adrian Marchall and copied to B&W President Susan Ivey, discussed the European Union's proposal to prohibit the use of the terms "'low tar, light, ultra light, mild,' or any similar terms that have the aim or the direct or indirect effect of conveying the impression that a particular tobacco product is less harmful than others." The memorandum stated:

> CECCM [a European tobacco association] replied to these proposals on December 18th, 1998 that 'the use of these terms by manufacturers is **not intended as an explicit nor an implicit**

health claim and such terms are not used for such purposes.'

321625509-5511 at 5509 (US 46875) (A) (emphasis added); Ivey WD, 72:4-73:17. However, an earlier BATCo public relations document indicates that the company **did** intend to communicate that its low tar cigarettes were less harmful than full flavor cigarettes. A BATCo document entitled "P.R. – Questions & Answers File" from October 1974 to November 1977 stated: "[W]e have progressively modified our products to reduce those smoking constituents which are alleged to be harmful." 202006722-6736 at 6729 (US 87903) (O).

(vi) American Tobacco

3518. Notwithstanding the extensive evidence presented above establishing American Tobacco's knowledge that smokers chose low tar cigarettes primarily because they believed they were less harmful and American's design of its marketing program to appeal to consumers' desire for a less harmful product, Eric Gesell, designated representative of American, when asked in 1997 what the significance was of a cigarette being lower in tar, testified: "It's lighter, lighter taste." When asked: "Isn't there also an implied health claim there?" Gesell testified: "No, there isn't." Gesell also testified that the company "didn't have an understanding that people tended to smoke low-tar cigarettes because they were concerned about their health." Gesell PD, Minnesota, 9/18/97, 5:8-25; 6:10-17; 97:8-13; 130:25-131:4.

3519. With respect to an advertisement that, in Gesell's words, "says that [American's Pall Mall cigarette is] lower in tar than the best filter king," Gesell testified that he did not know if the advertisement "suggests that" smokers "would receive less tar when they smoke the cigarette," stating: "I don't know if it suggests that. I know what it tells you. It tells you that it has less tar than the leading filter king. It's lower in tar." Gesell PD, Minnesota, 9/18/97, 5:8-25, 6:10-17, 97:22-98:9.

(4) Defendants Knew What They Told the Public About Low Tar Cigarettes Was False and Misleading

(a) Defendants Knew – and the Evidence Shows – That Low Tar Cigarettes Are Not Less Harmful than Regular Cigarettes

3520. As demonstrated in Sections III.D(1)-(3), supra, for decades Defendants have intentionally marketed filtered and low tar and nicotine cigarettes to convey health reassurance in an attempt to keep people smoking, while at the same time denying publicly that that was their intention. The evidence, as detailed in this Section, shows that, while Defendants marketed lower tar cigarettes as less harmful, they knew that filtered and lower tar cigarettes, as Defendants designed them, would not provide any significant reduction in harm to smokers switching to them.

3521. An example of Defendants' early appreciation on this is found in the minutes of a May 24, 1968 meeting at a Liggett facility to discuss the FTC Method, attended by the heads of research of Philip Morris (Helmut Wakeham, Vice President of Corporate Research and Development), RJR (Murray Senkus, Director of Research), B&W, and Liggett (William W. Bates, Research Director), as well as Allan Topol of the law firm of Covington & Burling. These minutes demonstrate that these Defendants knew that any claim that lower FTC tar and nicotine yields resulted in lowered exposure to smokers was unsubstantiated: "We expect to be able to show that FTC Tar and Nicotine are of limited or questionable value as a measure of potential exposure to the smoker. . . . [T]he principal determinate of exposure is the individual smoker's smoking behavior pattern." 1003287730-7731 at 7730 (US 20162) (O).

3522. Similarly, testimony of Defendants' senior officials roughly contemporaneous with the pendency of this litigation demonstrates a lack of evidence that lower tar cigarettes are less harmful. As Dr. Dolan testified, the Presidents and CEOs of Philip Morris USA (James

Morgan) and RJR (Andrew Schindler) testified in 1998 that there was no reason to believe low tar cigarettes were any less harmful than full-flavor cigarettes. Dolan WD, 118:15-22; Morgan PD, State of Minnesota v. Philip Morris Inc., 9/4/97, 6:24-7:2; 9/5/97, 271:19-273:13 (testifying that, in his 30 years at Philip Morris USA, the company never advertised any cigarette as safer or less harmful, because "on a smoking and health basis I don't know that there's any documented evidence that any cigarette can make that claim. . . . I just don't think it can be done because I don't think you can document it."); Schindler WD, 63:9-64:1 (acknowledging that he "cannot say with certainty that any RJR cigarette is or was any safer than any other cigarette, and admitting that he has "no new information today that would establish that low tar cigarettes are safer").

3523. Bennett LeBow, Chairman of the Board and CEO of Vector Group, Ltd., and VGR Holding Inc., testified in 2005 that he does not dispute the findings of National Cancer Institute Monograph 13, and of the United States Surgeon General in the 2004 Surgeon General's Report, that there is no evidence that light cigarettes carry any reduced risk compared to cigarettes marketed as full-flavor cigarettes. While Liggett made certain concessions and disclosures in the late 1990s, "Liggett did not identify that its low-tar cigarettes were not less hazardous." LeBow TT 4/4/05, 17596:2-17597:17; Burns TT, 2/16/05, 13647:5-6.

3524. Moreover, the overwhelming evidence adduced at trial confirms what Defendants have long known: that lower tar cigarettes are not less harmful than higher tar cigarettes. Dr. Burns, an expert on "the science of tobacco and health, including disease causation," who has studied the health consequences of smoking for 30 years and been "an author, editor or reviewer for each of the annual Reports of the U.S. Surgeon General on the Health Consequences of Smoking since 1975," testified that low tar cigarettes have not reduced the risks of smoking relative to full-flavor cigarettes. Dr. Jonathan Samet, expert, physician and epidemiologist with

extensive experience treating patients with lung cancer and COPD, who served as author and/or editor of several Surgeon General's Reports over more than 25 years and contributed to several National Cancer Institute Tobacco Control Monographs, including serving as an author of Chapter 4 of Monograph 13, and who was qualified as an expert in the science of tobacco smoking and health, including epidemiology, pulmonary medicine, and internal medicine, testified that the use of lower tar and lower nicotine cigarettes "has had no clear benefit on the health risks of active smoking." Similarly, Dr. William Farone, fact and expert witness and former Director of Applied Research at Philip Morris USA, testified that, based on his training and experience, "'light' cigarettes – because they generally permit easy compensation and employ levels of dilution that increase the mutagenicity of the tar – are not any less hazardous than their full flavor versions." Burns WD, 1:10-15; 12:10-11; 30:5-12 ("I have concluded that the changes in cigarettes that resulted in a lowering of the FTC tar and nicotine yields over the past 50 years have not resulted in a reduction in the disease risks of smoking cigarettes for the smokers who use these cigarettes."); Burns WD, 41:1-2 ("[T]here is not evidence that establishes any benefit to these products."); Burns WD, 61:14-16 (reiterating his "opinion that low tar cigarettes are no better for you"); Burns TT, 2/15/05, 13311:9-15; Samet WD, 1:3-12; 2:20-3:3; 3:7-11; 3:19-23; 10:16-12:16; 14:1-15:13; 18:12-16; 168:17-19; Samet TT, 9/29/04, 10-18; Farone WD, 123:21-124:4.

3525. Recent studies, including the National Cancer Institute's Monograph 13 and the 2004 Surgeon General's Report, have confirmed that low tar and filtered cigarettes are no less harmful than regular delivery and unfiltered cigarettes. DXA0310399-0650 at 0422-0423 (pp. 9-10) (US 58700) (A) ("Monograph 13") (concluding that "[e]pidemiological and other scientific evidence" does not indicate a health benefit to low tar cigarettes).

3526. Dr. Samet testified that he agrees with the conclusions and recommendations in NCI Monograph 13, stating: "**The evidence is clear. We have tracked the risk of lung cancer closely and not seen a fall in relative risks to smokers.**" Samet WD, 169:14-16 (emphasis added).

3527. The NCI's Monograph 13 was based on the **totality of the scientific evidence**; more specifically, the considered evidence was "derived from research on human behavior and exposures, cigarette design and yields, smoke chemistry, epidemiological [and other] population-based data on human disease risk." The 2004 Surgeon General's Report also reached this conclusion, again based on the **totality of the evidence**. DXA0310399-0650 at 0422-0423 (pp. 9-10) (US 58700) (A); TLT0930001-0949 at 0042, 0340, 0911 (pp. 25, 324, 901) (US 88621) (A) (2004 Surgeon General's Report) ("In this report, one major conclusion finds that cigarettes with lower machine-measured yields of tar and nicotine (i.e., low-tar/nicotine cigarettes) have not produced a lower risk of smoking-related diseases." In addition, the Report concludes that "[s]moking cigarettes with lower machine-measured yields of tar and nicotine provides no clear benefit to health" and that, "[a]lthough characteristics of cigarettes have changed during the last 50 years and yields of tar and nicotine have declined substantially, as assessed by the Federal Trade Commission's test protocol, the risk of lung cancer in smokers has not declined."); VXA100001-0604 (US 77217) (A) (NCI Monograph 8); MTP0032477-2481 (US 76212) (A) (11/7/97 CDC MMWR article); VXA1611681-1689 (US 77222) (A) (1996 Samet et al. article); VXA1601456-1742 (US 64059) (A) (1984 Surgeon General's Report).

3528. Dr. Samet explained how the extensive research into the relationship between research of biomarkers of nicotine in humans to FTC tar and nicotine yields leads inexorably to the conclusion that lower tar cigarettes do not provide a reduction in harm:

> Generally speaking, research using these biomarkers has indicated little, if any, correlation between the FTC-yield of tar or nicotine, and the levels of the biomarkers measured in smokers. . . . These results suggest that there is little difference in the levels of biomarkers comparing smokers of higher yield tar/nicotine cigarettes and lower yield tar/nicotine cigarettes, as measured by the FTC method. This implies that doses of carcinogens or other toxic materials that smokers ingest have little relationship, if any, to the FTC tar yield. This, in turn, suggests that the gradual reduction in tar yield over the past several decades has not resulted in a reduction in smokers' exposure to carcinogens, and that the FTC test method is not informative with respect to lung cancer risk or to the risk of smoking-caused diseases generally. . . . In fact, evidence with respect to smoker compensation and biomarkers shows that those smokers who switch to "Low Tar" cigarettes modify their pattern of smoking to obtain the same or similar amounts of tar and nicotine as from the "High Tar" cigarettes they used to smoke. **The bottom line is that a "Low Tar" label-based brand under the FTC protocol does not mean that a smoker is actually ingesting "Lower Tar" than from any other cigarette.**

Samet WD, 147:11-148:21; 149:23-150:4.

3529. Dr. Samet explained that, "when you look at smokers smoking in the real world, as opposed to findings with the FTC machine, you see that there isn't a significant difference in the amount of nicotine smokers are ingesting, regardless of the nicotine yield." Dr. Samet added that this "is important because we know that the tar in smoke is very closely linked with nicotine. The more nicotine a smoker ingests, the more tar he or she ingests. If smoking a 'low tar' yield cigarette does not result in a change in the amount of nicotine obtained by the smoker, then intake of other components is also not reduced." Samet WD, 165:8-11; 166:6-12.

3530. Scientific Consensus. As Dr. Burns testified, the conclusions of Monograph 13 – that lower tar cigarettes do not provide a health benefit – "represent[] the consensus view of the scientific community on this issue." As Dr. Burns further explained, the conclusions reflected in Monograph 13 "absolutely" have "withstood the test of time since its publication;" in fact, "the

same issue has been reviewed by other groups and [those groups] reached the same conclusion." In addition to the National Cancer Institute, the Institute of Medicine, the World Health Organization, and the United States Surgeon General have agreed with the conclusions of NCI Monograph 13. Burns WD, 1:10-15; 31:6-9; 41:12-18; 58:20-61:13 (discussing Monograph 13 (US 58700) (A); IOM Report (US 20919) (A); WHO Sactob Report (US 86658) (A); and 2004 Surgeon General's Report (US 88621) (A)); Burns TT, 2/15/05, 13311:9-15; 13668:1-8; see also Benowitz WD, 72:21-24 ("Most authorities are now convinced that there is little if any benefit with respect to health risk to smoking low yield versus regular cigarettes"); Canadian Expert Panel, Putting an End to Deception: Proceedings of the International Expert Panel on Cigarette Descriptors. A report to the Canadian Minister of Health form the Ministerial Advisory Council on Tobacco Control 9 (2001) (US 86657) (A) ("There is no convincing evidence of a meaningful health benefit to either individuals nor to the whole population resulting from cigarettes marketed as 'light' or mild'").

3531. At trial, Defendants tried to create the impression that the epidemiological evidence indicates that lower tar cigarettes are less harmful, by inappropriately reviewing, in isolation, select observations in Monograph 13. However, as Dr. Samet testified, all the major scientific bodies that have addressed this question in recent years have clearly concluded that lower tar cigarettes provide "no clear benefit" to health:

> I think there's no evidence of clear benefit. . . . I think the state of the evidence has been well summarized in the reports of the Surgeon General, IARC, the Institute of Medicine, **each group that's looked at the question of whether today's lower yield cigarettes are likely to produce** – – are likely to produce **lower risk of lung cancer, has said**, you know, **no clear benefit**.

Samet TT, 11/29/04, 1168:12-16; 1169:2-18 (emphasis added); accord Samet TT, 11/29/04, 1163:1-1165:1 (examining Dr. Samet on isolated observations from Chapter 4 of Monograph 13

and omitting reference to the conclusions).

3532. Dr. Samet explained his agreement with recent reviews by the Institute of Medicine and the International Agency for Research on Cancer of the WHO to the effect that "there is little evidence for an important benefit of lung cancer risk from smoking reduced yield cigarettes," stating: "This means that for smokers who switch to low tar cigarettes – by the FTC definition – there is no meaningful benefit in terms of reducing their risk of lung cancer. **There is no health benefit associated with changing the type of cigarette that you smoke. This is my opinion as well**." Dr. Samet added that "several expert reviews carried out by major health agencies over the past several years have reached the same conclusion," including the 2004 Surgeon General's Report and NCI Monograph 13. Samet WD, 153:3-23 (emphasis added).

3533. When defense counsel asked Dr. Burns if one excerpt of the IOM Report stating that "low-yield products are associated with far less health benefit than predicted" was inconsistent with Monograph 13, he testified:

> The statement that you've just read includes 'no benefit'. The statements in this report, the IOM report, says that no potential reduced exposure product has been established to reduce risk. That includes all of the cigarettes on the market. **That is identical, as far as I can determine scientifically, with the conclusion that we drew**, which is that all of the changes introduced over the last 50 years have not resulted in a proven benefit in terms of reducing risk.

Burns TT, 2/15/05, 13412:11-13413:12 (emphasis added); see also Samet TT, 9/30/04, 1239:6-1240:15 (testifying, when asked if the 2002 report of IARC was inconsistent with NCI Monograph 13, that "the IARC report obviously reviewed the same epidemiological evidence as Monograph 13 and gave a similar description to that evidence").

3534. Echoing the conclusions of Monograph 13 and the 2004 Surgeon General's Report, a January 2004 article in the *British Medical Journal* reported on a study intended "to

assess the risk of lung cancer in smokers of medium tar filter cigarettes compared with smokers of low tar and very low tar cigarettes":

> There was no difference in risk among men who smoked brands rated as very low tar . . . or low tar . . . compared with those who smoked medium tar brands. The same was seen for women . . . . Men and women who smoked very low tar . . . and low tar . . . brands had risks of lung cancer indistinguishable from those who smoked medium tar . . . brands. . . . Our finding that there was no difference in the risk of lung cancer between people who smoked medium tar filter, low tar filter, and very low tar filter cigarettes is consistent with evidence of compensatory smoking.

TLT1020160-0167 at 0160, 0164, 0166 (US 88622) (A) (1/10/04 Harris, Thun et al. article in *British Medical Journal*); see also VXB3290083-0087 at 0083 (US 88623) (A) (1989 Palmer et al. article in *New England Journal of Medicine*) (finding that the risk of nonfatal heart attacks in women, which is higher in smokers than nonsmokers, "did not vary according to the nicotine or carbon monoxide yield of the cigarette").

3535. Dr. Burns also explained that the *British Medical Journal* study did not conclude that the increased lung cancer risk for older, higher-tar cigarette smokers was related to the tar level of the cigarettes they smoked:

> [W]hat [the Harris/Thun article] showed was that there was no difference between what they called low tar and what they called ultralow tar or very low-tar cigarettes. So there was no risk reduction with that group. But that **the other group who smoked older very high-tar cigarettes had a higher risk. They were unable to explain that risk as due to the cigarette because that group also had higher rates of blue collar employment, occupational exposures, exposure to asbestos, and a variety of other characteristics that may have increased their lung cancer risk.**

Burns TT, 2/16/05, 13505:1-13506:10; TLT1020160-0167 (US 88622) (A) (emphasis added); (JD-011998) (A).

3536. Defendants tried to intimate that there was a lack of consensus on this issue

through selective quotation of an IARC Monograph, published in 2004, that represents the views of a panel that met in June 2002. Defendants view the following passage in isolation:

> Nonetheless, after considering the limitations of the evidence, the Working Group concluded that changes in cigarettes since the 1950s have probably tended to reduce the risk for lung cancer associated with **the smoking of particular numbers of cigarettes** at particular ages.

This selective quotation is deceptive for two reasons. First, it ignores the statement later in that paragraph that: "**[T]he Working Group could not estimate the net impact of changed in cigarettes on national mortality rates**." Second, it does not indicate that lower tar smokers have a reduced risk; only that, **if you assume** that smokers who switched to lower tar brands between the 1950s and today continued to smoke the same number of cigarettes as before the switch – an **assumption** that, as explained later in this section, is **contradicted by both expert testimony and voluminous documents of Defendants** – these smokers would have received a reduction in risk. As indicated below, however, numerous documents of Defendants show that smokers who switch down customarily smoke more cigarettes. Thus, when viewed in its proper context, this statement is entirely consistent with the statements of every major public health organization that has examined this issue: that lower tar cigarettes offer no significant health benefit. US FF § III.D(4)(a) (citing, in discussion of Dr. Wecker's opinions, voluminous documents of Defendants over decades showing that smokers who switch down smoke more cigarettes per day); 1000861953-1953 (US 35484) (A) (Wakeham 3/24/61) ("As we know, all too often the smoker who switches to a hi-fi cigarette winds up smoking more units in order to provide himself with the delivery which he had before.").

3537. American Cancer Society's CPS-I and CPS-II. Among the evidence showing that

lower tar cigarettes are not less harmful are two American Cancer Society's Cancer Prevention Studies ("CPS") that were "conducted approximately 20 years apart." As Dr. Burns testified, these studies show that lung cancer death rates have not gone down as a result of the introduction of low-tar cigarettes. CPS-I was conducted in the late 1950s and early 1960s, and CPS-II was conducted in the 1980s. Because of this 20 year gap, the smokers in the CPS-I study were smoking mostly high-tar, unfiltered cigarettes, and the "vast majority" of the smokers in the CPS-II study were smoking filtered cigarettes with much lower machine-measured tar and nicotine yields. CPS-I and CPS-II are "the two largest studies of smoking and disease risks"; they included "over a million men and women each," and "followed those individuals for" 12 to 18 years. The results of these studies showed that, "**[d]espite the substantive reduction in tar yield of the cigarettes smoked in CPS-II, lung cancer disease risks increased rather than decreased in comparison to CPS-I.**" Burns WD, 1:10-15; 12:10-11; 33:18-34:6; 35:14-35:9 (emphasis added); Burns TT, 2/15/05, 13311:9-15; 13313:9-13314:6; 13316:19-13317:15; 13322:9-10.

3538. Dr. Burns testified that, despite the dramatic shift to filtered and "light" cigarettes in the last 50 years, "the effect we were expecting to see from a change in the type of cigarettes smoked in the U.S never arrived." Dr. Burns elaborated, with reference to the CPS-I and CPS-II studies:

> For males, when you look at the risk of smoking, you see that it just about doubled between CPS-I and CPS-II. . . . For females, it went up almost fourfold. . . . [E]ven after adjustment for differences in number of cigarettes smoked and the duration of smoking, the rates increased for males and increased for females between these two studies that were conducted over a period of time when there was approximately a 50 to 60 percent decline in the tar value of the cigarettes being smoked and a dramatic increase in the number of smokers who were smoking filtered cigarettes. So, instead of seeing a reduction in the risk of smoking with the

> introduction of these products, we have seen the risk of smoking actually increase over that interval. . . . we had watched and waited for the decline in lung cancer to occur. It did not.

Burns TT, 2/15/05, 13322:22-13323:22; 13325:6-13326:22; (no bates) U.S. 17802 (A) (depicting the "sales-weighted tar and nicotine values for U.S. cigarettes" over time); (no bates) U.S. 17803 (A) (depicting data from the CPS-I study); (no bates) U.S. 17804 (A) (comparison of lung cancer risk for nonsmokers and smokers based on CPS-I and CPS-II data); (no bates) U.S. 17806 (A) (graph showing that risk of lung cancer from smoking has not declined, notwithstanding the drastic shift to filtered cigarettes and those with lower machine-measured tar and nicotine deliveries).

3539. As Dr. Samet explained, concerning his analysis of CPS-I and CPS-II – which he considered among "the most telling epidemiological evidence" regarding health effects of low tar cigarettes – "[i]f there were substantial benefits of the change in tar yield over the 20 years between [CPS-I in the 1960s and CPS-II in the 1980s], we would expect lower relative risks; instead they increased." Dr. Samet also explained that the British Physician's study, which was conducted over two 20-year periods, also "shows that the relative risk values [for lung cancer] have gone up comparing the first 20 years (1951-1971) to the second 20 years (1972-1991)." Samet WD, 154:21-156:4; 156:5-12; 157:20-158:15; VXA1601833-1843 (US 64058) (A) (published article on British Physician's Study, cited in Samet Written Direct).

3540. Any Incremental Reduction in Tar is Insignificant to Health. Defendants have falsely suggested that low tar cigarettes are better for smokers if they result in any incremental lowering of tar exposure for those who smoke them. This claim is both unproven and not credible. In response to a question from the Court, Dr. Henningfield explained that, even if you postulate that lower tar cigarettes result in some tiny, incremental reduction in tar, they do not

provide any meaningful health benefit relative to higher tar cigarettes "from the perspective of human exposure . . . or meaningful exposure":

> It would be a little bit like low fat cheese has 100 grams, lets say, of X, and then there is another type that gave you 98 grams, and you could say, yes, that's lower, and the next lower one is 97 grams, but **that's a meaningless difference, even though it's accurate and reliable by a machine test and you can say it does go down, it's a meaningless difference**. . . . In this case, what Benowitz['s] study, and then many other studies showed, is that **if you looked at actual intake of people, there was virtually no difference at all in intake**. And it wasn't just that the ranking was off a little bit, it was that, for example, the Marlboro Light, according to the Massachusetts data can get – give you about three times as much nicotine as it was rated, and more than twice as much as the Marlboro regular, so it's off by several orders of magnitude, but most importantly, it is just – **if [a] consumer says, okay, I want to get lower tar and nicotine and they pick a light versus a regular, they're not getting biologically meaningful lower tar and nicotine. . . . There is no meaningful difference in exposure to people**. . . . what U.K. realizes now, what U.S. realizes, the World Health Organization realizes is that it is still a **meaningless difference**. And that's why . . . . the resistance to even using the . . . label "light" cigarettes.

Henningfield TT, 11/30/04, 7295:2-7298:2 (emphasis added); see also Henningfield TT, 12/1/04, 7535:12-7536:23 (explaining that the "light cigarette debacle" centers around "the fact that" the historical reduction in machine-measured tar "was **biologically meaningless**," citing NCI Monograph 13).

3541. Dr. Samet echoed these conclusions, testifying that, "while some earlier studies suggested a modest benefit in terms of lung cancer risk, late, more recent evidence suggests otherwise, namely that there is no benefit," and adding that, even excluding the more recent evidence and postulating some reduction in risk, **the "overall risk [of smoking these cigarettes] is so high that even a small reduction is of no public health or medical significance**." Samet WD, 170:11-23 (emphasis added).

3542. Increased Harmfulness. The evidence shows that, to the extent Defendants conducted research on the comparative harmfulness of lower tar cigarettes, for example by studying low tar "reference cigarettes" (as opposed to cigarettes actually sold to consumers), Defendants' research found that low tar cigarettes, as Defendants designed and marketed them, were unlikely to be any less hazardous than regular cigarettes. Indeed, the research showed that the very cigarette design feature – ventilation – that Defendants promoted as one successful method to reduce FTC tar deliveries not only failed to reduce the carcinogenicity of smoke, but actually increased it. Thus, **even if certain smokers do receive less tar from low tar cigarettes, the tar they receive is likely more mutagenic – potentially offsetting any potential benefit to such smokers from a reduced tar intake**. 2001243600-3673 at 3610-3611 (US 20298) (O); 2022180219-0219 (US 21479) (O); 1000135419-5439 (US 20078) (O); 514903578-3610 at 3579, 3585-87 (US 20863) (A); Lilly PD, United States v. Philip Morris, 5/14/02, 229:17-231:21.

3543. Dr. Farone testified that: "[W]here a 'light' cigarette is largely identical to its full flavor counterpart – as is the case for Marlboro and Marlboro Lights, except that the 'light' has dilution levels in that middle . . . range – **the tar from that light cigarette is likely more mutagenic**." Dr. Farone also testified that, "except for the 1980 Cambridge," which Philip Morris discontinued, "Philip Morris didn't commit to the very high dilution that, in my opinion, can substantially decrease the toxicity of smoke." Dr. Farone also testified, based on his review of documents from Defendants other than Philip Morris, that "at least RJR and Lorillard also recognized" that "'light' versions of full flavor cigarettes have higher mutagenicity on a per milligram of tar basis." Farone WD, 57:23-58:16; (emphasis added) 122:15-21 (citing US 20863 (A) (RJR); US 20863 (A) (RJR); US 56344 (A) (Lorillard)).

3544. Dr. Farone further testified that, to his knowledge, none of Defendants "disclosed to smokers the results of its studies that reveal that its 'Light' cigarettes test more mutagenic than their full flavor counterparts." Farone WD, 123:14-20.

3545. Defendants' Attempted Challenge of Monograph 13. Notwithstanding the widespread acceptance and independent validation in the scientific community of Monograph 13 and its conclusions, Defendants tried to challenge several aspects of Monograph 13, including the selection of its contributors. Defendants' claim is not credible. As Dr. Burns testified, while many of the contributors to Monograph 13 have testified in litigation against Defendants, "they represent some of the more distinguished scientists and experts on this issue in the country" and "[t]hey were all selected for their scientific expertise rather than their litigation experience." While Defendants alleged that this litigation work would create individual or "collective biases," and intimated that there was some impropriety in not listing the contributors' litigation work in Monograph 13, Dr. Burns explained that the extensive review and agency clearance process ensured that neither individual nor collective biases were reflected in the final volume:

> [T]here is no place where [contributors' litigation work] is recorded in the volume, and it is not something that would be appropriate to be included in this volume as it does not represent the individual perspectives of the authors, but rather the consensus statement of the organization, that is the NCI. . . . [I]t prevents individual opinion from being presented as the consensus of scientific thought. . . . The way that you know that [collective biases are not influencing the final document] is by taking it through a series of reviews by the governmental organization. . . . The organization that then produces the volume and puts its seal of consensus approval on it, that is the National Cancer Institute, that undergoes a series of reviews that it takes to ensure that the data contained in the volume are scientifically accurate and represent the consensus of scientific thought.

Burns TT, 2/15/05, 13383:1-13389:4.

3546. Moreover, Dr. Burns testified that there was a "very good reason" Defendants'

scientists were not involved with the production of Monograph 13:

> At the time which this was undertaken, **the tobacco industry's position was still that . . . there were no disease risks that were causally associated with cigarette smoking**. . . . For that reason, the tobacco industry has not been included in the Surgeon General's Report process and various other processes because they weren't part of the consensus of scientific thought at that point in time. **They were perceived as adopting positions that had so little scientific credibility that they could not be meaningfully utilized in the formation of a consensus**.

Burns TT, 2/15/05, 13389:11-13391:21 (explaining also that Monograph 7, in which RJR scientists participated, "was not a consensus document, it was simply the results of the proceedings of a meeting. Those proceedings come out under the author's name, are understood to be the individual opinions of the authors. That was not what was being requested with Monograph 13.").

3547. Monograph 13 Reflects the Conclusions of NCI and of Its Authors. Dr. Burns, co-author of Chapters 1 and 4 and editor of Monograph 13, testified that the conclusions of Chapter 4 of the Monograph "were worked out word by painful word with all of the authors, all the principal authors, myself, Dr. Samet, Dr. Thun, and overseen by the NCI in that process, and it was only once all of us agreed on the specific language, the exact words, that those conclusions were written and went forward in the final version." Burns TT, 2/16/05, 13662:11-21.

3548. Therefore, Defendants' attempt at trial to portray certain portions of the testimony of Dr. Samet as inconsistent with the conclusions of Chapter 4 of Monograph 13 is not credible. Specifically, the testimony Defendants seized upon is a statement by Dr. Samet that, if the machine-measured tar reduction from 40 to 10 milligrams of tar actually corresponded to human smoker intake, then one would expect a reduction in risk:

> So if, in fact, what we observed earlier comparing the unfiltered, filtered reduction risk, remains true for today's product, my – – I

> mean, my opinion would be that **presumably** the direction is a lower risk for today's cigarettes compared to the – – those of the '50s.

Dr. Samet added that, "of course, **we can't make that comparison**." The Court also notes that Dr. Samet was asked about the harm of these cigarettes "on a per cigarette basis," which is a comparison that ignores the effect on harm of the fact that many smokers who switch down smoke more cigarettes per day. Samet TT, 9/30/04, 1231:10-1234:9 (emphasis added); Burns TT, 2/15/05, 13396:13-18 ("**What [Dr. Samet] talked about was [machine-measured] yields and then said if the yield reduction were real, you will expect a reduction in risk**. And yield reduction is not real, and **I know from discussions with Dr. Samet during Monograph 13, and during the preparation of the most recent [2004] Surgeon General's Report, what his opinion on that question is**. . . . If you read the two paragraphs above it, he . . . [makes] a statement about the sales weighted average measurement for the FTC method. Then he says, 'If, in fact, those are true.'") (emphasis added).

3549. Defendants' attempts to portray the testimony and/or publications of Drs. Benowitz, Harris, Farone, and Thun as inconsistent with the conclusions of Monograph 13 or Dr. Burns' opinions also lack credibility. Burns TT, 2/15/05, 13398:6-13399:7 (indicating that Dr. Burns disagrees with an excerpt of Dr. Benowitz' testimony "**in the context in which [defense counsel] just phrased it.**") (emphasis added); 13399:8-13402:5 (indicating that questioning of Dr. Harris on whether specific cigarette design features "appear to" make cigarettes safer is a non-sequitur, because "[i]f you look at what I have said, I have said that all of the changes taken together are what we can evaluate. It is not possible to evaluate the individual changes because there aren't studies on those individual changes that define the risks. So that all that can be evaluated is the sum total of all of the changes taken together [what Monograph 13 examined].");

Burns TT, 2/15/05 13402:6-13405:19 (responding to Dr. Farone examination about whether investigating certain design features was "'a good thing'": "**I don't disagree with Dr. Farone, I disagree with [defense counsel's] inference** from that that Dr. Farone is saying that there is evidence to establish that reconstituted leaf has resulted in a reduction in human disease risk. . . . **I would disagree with [defense counsel's] inference from that** that Dr. Farone is saying that the use of a reconstituted leaf has evidence to support it that establishes that it has reduced human disease. . . . I would disagree with a statement that said that there was adequate evidence to establish that any of those individual changes produced a benefit for human disease. As to whether it was useful for Philip Morris to explore lots of different technologies . . . I think that would be a very legitimate thing for Philip Morris, or other companies to do."); Samet TT, 9/29/04, 1212:12-1213:11 (pointing out that defense counsel's characterization of Dr. Thun's acknowledgment of a "hypothesis" that was "possible" as inconsistent with Monograph 13 was incorrect).

3550. The Court also notes that, given that the final conclusions of Monograph 13 were specifically developed under the supervision of the National Cancer Institute and adopted as its official statement on this issue, Defendants' attempts to portray the comments by NCI scientists, including Drs. Tarone and Lubin, on draft portions of the Monograph as inconsistent with the final conclusions of Monograph 13, are not credible. Samet TT, 9/29/04, 1201:13-12034:17 (explaining that **defense counsel's characterization** of the Monograph's approach as "attributing all of the risk reduction that has been shown in prior EPI studies to an increase in cigarettes per day" was **incorrec**t, and pointing out that the comments of Drs. Tarone and Lubin addressed "the **draft** monograph," as opposed to the final, published version) (emphasis added).

3551. Other Reviewer Comments to the Draft Monograph. Dr. Burns further testified

that the contributors to Monograph 13 "paid very close attention to" all of the reviewer comments for the drafts of Monograph 13. Specifically, Dr. Burns testified that Sir Richard Peto's comments as a reviewer were "absolutely" considered and reflected in the final volume:

> He [Sir Peto] recommended to us that the appropriate way to examine this issue was to look at age specific death rates across time in the population. We then went back and examined the age and cohort specific death rates for the U.S. and for the U.K., we went back and obtained as much information as we could about the smoking behaviors that occurred in those birth cohorts and those ages in the U.K. and the U.S., we wrote an extensive section of the Monograph that presented all of that information and discussed it and drew conclusions from it. So we were – I was very responsive and very interested in the perspective that Richard Peto brought to analysis of this problem, and we worked very hard to fulfill it. [Ultimately, in examining the issues raised by Sir Peto, the Monograph's contributors] reached the conclusion that . . . the U.S. data was adequately explained by changed in smoking prevalence plus changes in ages of initiation in the birth cohorts.

Burns TT, 2/16/05, 13655:21-24; 13656:9-13658:5; 13658:15-22; see also Samet TT, 9/29/04, 1213:12-1214:24 (testifying that Richard Peto's analysis of U.K. lung cancer data relating to the draft monograph was "one of the pieces of information that those of us who have taken on the challenge of trying to understand changing cigarette yields have used," and is only "one line of evidence that I have considered and others have considered").

3552. Dr. Burns further explained that, "at the end of the meeting [of the contributors to Monograph 13 on this topic] in Toronto where this was the core issue that was being discussed, Richard Peto was the only person in the room who felt that the only possible explanation for that decline [in lung cancer rates among young males] in the U.K. was the change in type of cigarette being smoked." Burns TT, 2/15/05, 13454:10-13455:7; 13473:23-13474:17; 13475:9-22.

3553. Defendants' Internal Documents Revealed Flaws in the Previous Interpretation of the Epidemiological Data: the 1981 Surgeon General's Report. Defendants champion prior

erroneous interpretations of the epidemiological evidence as indicating that lower tar cigarettes cause a reduction in lung cancer, and cite prominently to the 1981 Surgeon General's Report as an indication that lower tar cigarettes are less harmful. In addition to the fact that Defendants mischaracterize the statements of the 1981 Surgeon General's Report (as discussed in Section III.D(3)(c), supra) the evidence is clear that the prior interpretation of the epidemiological data, including that in the 1981 Surgeon General's Report, was wrong, and that this erroneous conclusion would never have been made, but for Defendants' concealment of their superior knowledge of nicotine addiction, smoker compensation and cigarette design. TT, 2/24/05, 14332:10-20; 14333:6-21; 14335:7-14 (Defendants' interim summation); Burns WD, 1:10-15; 12:10-11; 36:3-37:12; 55:17-56:13; 56:21-57:17; Burns TT, 2/15/05, 13311:9-15; Burns TT, 2/16/05, 13666:25-13667:24; see also Burns WD, 56:14-20.

3554. Dr. Burns, who was an editor of the 1981 Surgeon General's Report as well as "an author, editor or reviewer for each of the annual Reports of the U.S. Surgeon General on the Health Consequences of Smoking since 1975," testified that, in his expert opinion, "**had the information available to the tobacco industry** [including many of the documents discussed in Monograph 13 and in Dr. Burns's testimony] **been available to the scientists preparing the 1981 Surgeon General's Report, that Report would not have drawn the erroneous conclusion that lower tar cigarettes produced lower risk or have made the recommendation that smokers who could not quit were 'well advised to switch to cigarettes yielding less "tar" and nicotine**.'" Burns WD, 1:10-15; 12:10-11; 36:3-37:12; 55:17-56:13; 56:21-57:17 (emphasis added); Burns TT, 2/15/05, 13311:9-15; Burns TT, 2/16/05, 13666:25-13667:24 ("Had that information [in Defendants' internal documents] been available to us, we would not have then offered the recommendation to the population of the United States that it would be a

good idea to shift to these products."); see also Burns WD, 56:14-20 ("The Surgeon General clearly expressed a concern [in the 1981 Report] about reduced yield smoking leading to compensatory increases in smoking behaviors; but, at that time, the public health community was not aware of the role of nicotine addiction in altering puffing behavior, the elasticity of delivery designed into cigarettes then on the market which facilitated compensation on the part of the smoker, or the observations made by the industry that showed compensation was essentially complete for some 'light' cigarettes. Had we known that, the recommendation would not have been made."); Burns WD, 38:10-13 (indicating that "some of the same concerns [relating to the lack of a health benefit to lower tar cigarettes] were expressed in the 1989 Surgeon General's Report").

3555. Dr. Samet testified, based on his education, training, expertise in smoking and health and review of the literature, that one of the main reasons the 1981 Surgeon General's Report reached erroneous conclusions is that "scientific information was less comprehensive at the time," and the Report "did not fully take into consideration the phenomenon of compensation, and how smokers smoke to get a certain amount of nicotine, and will even adjust their smoking behavior to get the amount of nicotine they seek or are accustomed to. . . . **we didn't know in 1981 the extent to which smokers would compensate after switching to a 'low tar' and low nicotine yield product**." Samet WD, 164:15-165:5 (emphasis added).

3556. Dr. Burns provided the "three principal reasons" that "the traditional epidemiological approaches that were employed at the time of the 1981 Surgeon General's Report" yielded results erroneously suggesting that lower tar cigarettes provided less lung cancer risk:

(1) "[T]hat people who smoked low-tar and nicotine cigarettes" were smoking them largely "based on the understanding that these cigarettes . . . offered

less risk." As a result, the people who choose these cigarettes "have different health behaviors" and often "different smoking characteristics" than smokers of higher tar cigarettes, leading to different expectations of health outcomes.

(2) That "very few people in the epidemiologic studies started out smoking low tar and nicotine or even filtered cigarettes." Most smokers who smoke the high-tar cigarettes very intensely are not able to switch down to lower tar cigarettes, whereas people who do not smoke the higher tar cigarettes very intensely, "when they switched to a low-tar cigarette . . ., may be successful because they didn't have much nicotine intake that they needed to satisfy, and correspondingly they didn't have much tar intake. **So the process of switching to low tar and nicotine starts to separate individuals who have different intensities of smoking, different amounts of tar that they are ingesting and, therefore, will have different risks.**"

(3) That "a substantial fraction of people who switch from high-tar and nicotine cigarettes to low-tar and nicotine cigarettes use increased numbers of cigarettes . . . as a mechanism of compensation. . . . In order to control for intensity of smoking, the epidemiologic studies used the number of cigarettes smoked per day as a measure of intensity with the mistaken assumption that people wouldn't change the number of cigarettes they smoked per day. That leads us to underestimate the actual number of cigarettes smoked per day as a measure of exposure in low-tar and nicotine cigarette smokers," because the epidemiological analysis compares people who smoke a higher number of cigarettes per day after switching to a lower tar cigarette to people who smoked this higher number of cigarettes per day of the higher tar cigarette. "That produces an erroneous, or incorrect, perception that switching to [the lower tar] cigarette lowered your lung cancer risk as an individual."

Burns TT, 2/15/05, 13327:21-13331:3; 13334:6-13337:5; see also (no bates) U.S. 17805 (A) (demonstrative depicting the erroneous effect of controlling for cigarettes per day due to instances when smokers increase the numbers of cigarettes per day when switching down in tar); Burns TT, 2/15/05, 13334:6-13335:20 (explaining that the issue of "increases in number of cigarettes per day smoked by those who switch to lower tar brands of cigarettes" is "not the only [reason and], for that matter, it's not the principle one" for Monograph 13's conclusion that lower tar cigarettes provide no reduction in harm relative to higher tar cigarettes).

3557. Dr. Samet further explained that epidemiological studies may underestimate the risks for lower tar smokers because these smokers may have other characteristics – such as healthier lifestyles – that contribute to a reduction in risk regardless of the type of cigarette smoked:

> Epidemiological studies often assume that smokers who switch to low-yield products are similar to smokers who do not. There is evidence that this may not be true. For example, **switchers** may smoke their cigarettes differently, they may have started smoking later as teenagers, they **may attempt to quit more often**. Switchers may have smoked less intensely before they switched, when compared to their high-yield, non-switching counterparts. Switchers may have smoked less at younger ages. **When these aspects of smoking behavior are not accounted for, study results may be misleading**. In addition, **switchers are [a] generally healthier group in terms of diet, exercise, and lifestyle in comparison to smokers who do not switch to a low yield product**. The cumulative effect of these group differences is that any reduction in the risks among switchers may be the result of these differences, rather than the fact that they switched to a low yield product. This was also an observation in Monograph 13.

Samet WD, 167:13-168:2.

3558. Dr. Samet added that the practice in epidemiological studies of controlling for cigarettes per day tends to erroneously underestimate the risk for smokers of lower yield cigarettes: "Since smokers of lower tar-yield products tend to smoker more cigarettes per day than smokers of higher-yield cigarettes, this analysis approach would tend to reduce the estimated risk for smokers of lower yield cigarettes. This was the conclusion reached by Monograph 13." Samet WD, 167:7-12.

3559. The United States' Witnesses On This Issue Are Highly Credible. The Court finds that the testimony of Dr. Burns is immensely credible on each of the issues as to which he offered testimony, including low tar cigarettes and the relative health effects thereof. Dr. Burns, qualified by the Court without objection as an expert in "[t]he science of tobacco and health,

including disease causation," is a medical doctor and professor of family and preventive medicine with 30 years experience studying the health consequences of smoking. Dr. Burns has extensive experience, including as an instructor, in various medical areas, including smoking and health, and has studied epidemiology, addiction, nicotine, cigarette design and ETS in the context of smoking and health. He has over 200 publications in the area of smoking and health, including chapters in both of the principal medical textbooks. Furthermore, Dr. Burns has studied and taught extensively specifically in the area of lung diseases, including lung cancer, and has personally participated in the treatment of thousands of patients with lung disease. In addition, he has served as "an author, editor or reviewer for each of the annual Reports of the U.S. Surgeon General on the Health Consequences of Smoking since 1975," and has served as contributing author and Senior Scientific Editor for several of the National Cancer Institute Tobacco Control Monographs. Dr. Burns has also received numerous award and honors for his work in the area of smoking and health, including the Surgeon General's Medallion. In addition, Dr. Burns's demeanor during his live examination, which spanned nearly two full days, further revealed the highly credible nature of Dr. Burns's testimony. Burns WD, 1:3-5; 1:10-15; 12:10-11; (no bates) (US 78526) (A) (Dr. Burns' *curriculum vitae*).

3560. As set forth at length in Sections III.C(1) and III.A(1) & (3), the Court also finds that the testimony of Drs. Samet, Henningfield, Benowitz, and Farone is highly credible.

3561. Defendants Failed to Rebut the United States' Evidence. Defendants failed to call a witness at trial with sufficient qualifications to challenge the powerful testimony of Drs. Burns, Samet, Henningfield, Benowitz, and Farone relating to the relative harmfulness of lower tar cigarettes. Instead, Defendants called a statistician, William Wecker, who, by his own admission, has "never been qualified by a Court as an expert in the subject of smoking and

health." Dr. Wecker is not a medical doctor, has "never treated people with smoking related diseases or nicotine addictions," and has "never published any peer-reviewed articles regarding health consequences of smoking." Dr. Wecker has "been involved in consulting and testifying on behalf of the defendants for about a decade now, at least," and has been retained by Defendants in "at least a dozen different" lawsuits. In addition, Dr. Wecker has "**never done any analysis in the smoking and health arena that wasn't at the request of counsel**," and no portion of the analyses that he offered in this case was ever published or submitted to an academic journal. Wecker TT, 3/15/05, 15650:5-7; 15648:10-15649:1; 15665:3-16; 15672:16-19; 15651:21-15652:2 (emphasis added).

3562. Because he is a **statistician**, and neither an epidemiologist nor a medical doctor, Dr. Wecker, per se, is "not able to offer opinions as to **causation**" relating to the relative health effects of lower tar cigarettes. Therefore, Dr. Wecker "cannot confirm for this Court that higher tar yield cigarettes **cause** greater risk of disease," and "cannot confirm for this Court that lower tar yield cigarettes **cause** a reduced risk of disease." Because **Dr. Wecker lacks the requisite qualifications to opine on causation, he is not competent to challenge the opinions of the United States' experts, such as Drs. Burns and Samet, who have been qualified by the Court to make causal determinations**, and who have concluded that lower tar cigarettes, relative to higher tar cigarettes, provide no meaningful reduction in the death and diseases they cause. As such, Dr. Wecker's testimony is entitled to no weight. Wecker TT, 3/15/05, 15666:6-15667:2; 15670:20-15671:8 (emphasis added).

3563. In addition to the fact that Dr. Wecker lacked the education, training, and qualifications to testify credibly regarding the health effects of low tar cigarettes, Dr. Wecker's opinions are entitled to no weight because they are based on analyses that are fatally flawed.

First, Dr. Wecker considered only irrelevant portions of the evidence in his analysis. Dr. Wecker testified that, in forming his opinion on this issue: "I don't reach my opinion by weighing all the evidence, but mainly on my own statistical work replicating and correcting figure 4-5" of NCI Monograph 13. This stands in stark contrast to the exhaustive work of the contributors to Monograph 13 and the 2004 Surgeon General's Report, who reviewed **the totality of available evidence** – including data obtained from various scientific disciplines – to reach the conclusion that lower yield cigarettes provide no meaningful health benefit. Wecker TT, 3/15/05, 15656:22-15657:14; Samet WD, 15:3155:16 (testifying, as Senior Scientific Editor of the 2004 Surgeon General's Report, that "[t]he report looked at [the issue of relative harmfulness of lower tar cigarettes] in-depth, **considering the full range of evidence**.") (emphasis added); i-236 at 10 (US 58700) (A) (explaining that its first Main Conclusion of Monograph 13, on relative health effects of lower tar cigarettes, is based on "[e]pidemiological and other scientific evidence, including patterns of mortality from smoking-caused diseases").

3564. That Dr. Wecker's conclusions on relative health effects are based "mainly on" his reanalysis of Figure 4-5 of Monograph 13 is particularly significant, because Figure 4-5 illustrates one of the new analyses that were performed as part of the production of NCI Monograph 13 relating to change in number of cigarettes smoked per day by smokers switching down in tar yield. However, **the Conclusions of Chapter 4 of Monograph 13 were not based on any new analyses**. Dr. Burns, co-author of Chapter 4 of Monograph 13, testified that the new analyses in Chapter 4 of Monograph 13 "**didn't play any significant role in the conclusions**. The new analyses were simply demonstrations on various issues that we had raised as concerns or as issues in the volume":

> That was the statement that I made to the other authors as we drew up the conclusions and that they agreed with. **We made it clear**

> **that we were not going to base the conclusions that we were drawing on the new analyses**, for very good reasons, and because that had been one of the questions that was raised in the review. So **we made it very clear in the process of the authors and editors writing the conclusions, that they weren't going to be based on the new analyses that were presented**.

Burns WD, 30:13-18, 58:4-19; Burns TT, 2/16/05, 13498:1-9 (emphasis added); DXA0310399-0650 at 0509-0510 (US 58700) (A).

3565. Dr. Burns further explained that the issue of "increases in number of cigarettes per day smoked by those who switch to lower tar brands of cigarettes" is "not the only [reason and], for that matter, it's not the princip[al] one" for Monograph 13's conclusion that lower tar cigarettes provide no reduction in harm relative to higher tar cigarettes. Moreover, "the potential for people to change the number of cigarettes smoked per day" when switching down is not "dealt with" in Monograph 13 by the new analyses; "it is dealt with by the examination of the published literature on this issue." The new analyses – that form the core of Dr. Wecker's reanalyses and resulting conclusions – were merely "part of a demonstration" of the effects of increasing cigarettes per day on the epidemiological results. Burns TT, 2/15/05, 13334:6-13335:20; 13501:1-13502:20.

3566. In fact, the first sentence in the Monograph under the heading for these new analyses of CPS-I data states that new analyses of cigarettes per day were **inconclusive** and, as such, could not have been the basis for Monograph 13's conclusions:

> A **reexamination** of the CPS-I data set **was inconclusive** as to whether compensatory changes in the number of cigarettes smoked per day when smokers switched to a lower nicotine cigarette introduce a bias sufficient to explain the observed increased lung cancer risk among smokers of high yield cigarettes.

DXA0310399-0650 at 0509 (US 58700) (A) (emphasis added); Wecker TT, 3/15/05, 15683:5-15687:14.

3567. Dr. Wecker's reanalysis of another new analysis – Figure 4-7 on page 115 of Monograph 13 (relating to the cigarettes per day issue) – in addition to suffering from numerous methodological problems, is, again, commenting on new analyses that did not form the basis for Monograph 13's conclusions. Burns WD, 58:4-19 (explaining that the Monograph's conclusions were not based on new analyses); Burns TT, 2/15/05, 13334:6-13335:20; 13501:1-13502:20 (same); Burns TT, 2/16/05, 13498:1-9 (same); Burns TT, 2/16/05, 13513:24-13514:8; 13514:20-13516:11 (explaining that Dr. Wecker's reanalysis of Figure 4-7 reflects "one of the many misconceptions in Dr. Wecker's Report"); Burns TT, 2/16/05, 13516:12-18 (testifying, with respect to the reanalysis of Figure 4-7, that "Dr. Wecker reported many flat lines, very few of which I thought were the result of appropriate analyses. . . .").

3568. Therefore, given that the primary basis for Dr. Wecker's opinions about the relative health effects of lower tar cigarettes are charts depicting analyses that "didn't play any significant role in the conclusions" of Monograph 13, those opinions on this issue are not credible. Burns WD, 30:13-18, 58:4-19; DXA0310399-0650 at 0509-0510 (US 58700) (A).

3569. The next fatal flaw in Dr. Wecker's analysis is that he failed to refute, or even consider, the conclusions reached by several other prominent scientific bodies, including: the 2004 Surgeon General's Report; the recent publication of the Scientific Advisory Committee to the World Health Organization; and the 2001 report to the Canadian Minister of Health from the Ministerial Advisory Counsel on Tobacco Control in Canada – which all reached the same conclusion as did the NCI in Monograph 13: that lower tar cigarettes provide no significant reduction in lung cancer or other health benefit – in direct contrast to Dr. Wecker's conclusions. Wecker TT, 3/15/05, 15661:11-15664:23.

3570. Dr. Wecker also failed to even address – or offer any criticism of – several of the

core lines of evidence relied upon by the contributors of Monograph 13 to reach the conclusion that lower tar cigarettes offer no meaningful health benefit. He ignored Monograph 13's analysis of lung cancer death rates from the American Cancer Society's **CPS-I and CPS-II** data, which showed an increase in lung cancer deaths in the United States at a time when machine-measured yields were drastically reduced. He also failed to address the Monograph's analysis of the **British Physician's Study**, which "showed an increase in the lung cancer rate" during a time period when "substantially more individuals" were smoking lower tar cigarettes. Wecker TT, 3/15/05, 15675:10-15679:13.

3571. In addition, Dr. Wecker's core opinion – that smokers who switch to lower delivery cigarettes do not increase the number of cigarettes per day that they smoke – is flatly contradicted by Defendants' voluminous research reports and other documents, spanning decades, which demonstrate that smokers who switch to lower deliveries **do** smoke more cigarettes per day. 1000861953-1953 (US 35484) (A) (1961 PM); 2022244449-4450 at 4449-4450 (U.S. 36855) (A) (1970 PM); 1000350158-0188 at 0161-0162 (U.S. 20176) (A) (1971 PM); 1003285403-5416 at 5403 (U.S. 20159) (A) (1972 PM); 1003285403-5416 at 5403 (U.S. 20159) (A) (same); 1003293476-3493 at 3480 (US 85073)(A) (1974 PM); 2040066740-6766 at 6750-6751, 6754-6755 (US 20435) (O) (1979 PM); 2071376833-6834 at 6833 (US 27273) (O) (1992 PM); 501525355-5366 at 5360-5361 (US 29531) (O) (1974-1976 RJR); 679009843-9867 at 9843 (US 85055) (O) (1977 B&W); 775036039-6067 at 6050 (US 21053) (A) (same); 536000000-0090 at 0050 (US 22338) (A) (1984 B&W); 760008596-8803 at 8760 (US 54588) (Confidential) (A) (1998 BAT); 00044522-4523 at 4522 (US 22012) (A) (1976 Lorillard).

3572. Furthermore, Dr. Wecker made several changes to the analyses in Monograph 13 that reflected his lack of understanding of the relevant subject matter. For instance, Dr. Wecker

included women in his analysis of Figure 4-5, unaware of whether the contributors to Monograph 13 excluded women because the later increase in smoking prevalence of women resulted in the lack of a valid baseline dose-response relationship. Wecker TT, 3/15/05, 15691:18-15695:11; Burns TT, 2/15/05, 13323:23-13325:4 (explaining the temporal differences in the rise of prevalence of male and female smoking, which led to exclusion of women in graph); 13342:8-20 (explaining the gender differences in prevalence in the United States and France).

3573. Also, while Dr. Wecker's analyses of Figure 4-5 are based on the assumption that the last set of bars in the figure were "intended to be people who had flat" cigarettes per day and "flat tar," such was not the case. Dr. Burns explained, after being questioned about these issues in depositions, that Thomas Shanks, a statistician who worked on Monograph 13, and he "re-examined this issue looking at the code and looking at what was intended. . . . the intent was never to exclude those individuals who did not change the tar category." Burns TT, 2/16/05, 13527:7-13528:6; 13529:1-5.

3574. Dr. Burns acknowledged that Dr. Wecker did locate a small calculation error in the analysis "in excluding some individuals," but testified that Shanks "re-did the analysis [correcting the error] and reached a descriptive effect that was essentially the same interpretation" as before the minor error was corrected. Dr. Burns clarified this and the "flat tar" issue in a deposition in February 2003, more than two years ago. Burns TT, 2/16/05, 13529:1-7; 13533:20-13534:20; 13535:2-9.

3575. Dr. Burns testified that, "when you do the analysis [of Figure 4-5] that Dr. Wecker presented, you are left with so few people that you cannot derive a statement about whether there is or is not a dose/response relationship." Indeed, Dr. Wecker acknowledged that, because his analysis excluded so many people, the resulting margins of error were so great that their

depiction as "whisker hairs" on Dr. Wecker's demonstratives – in contrast to those in Monograph 13 – "go right off the page," i.e., they are larger than the entire chart. Moreover, Dr. Wecker acknowledged that many of his reanalyses of Figure 4-5 showed no statistically significant difference in risk for smokers of the various tar levels, which is entirely consistent with the conclusion of the authors of Monograph 13, quoted above, that the results on this issue were "inconclusive." Burns TT, 2/16/05, 13526:4-6; Wecker TT, 3/15/05, 15687:15-15691:17.

3576. Regarding "the flat line Dr. Wecker reports" in his unpublished reanalysis of Monograph 13's Figure 4-7 for change in cigarettes per day by smokers who change the tar levels of their cigarettes, upon which Dr. Wecker relies for his opinion that switchers do not smoke more cigarettes per day, Dr. Burns noted: "**I don't believe that Dr. Wecker's analysis is consistent with any published literature that I have seen because it contains conceptual errors as to how you would address these questions.**" Burns TT, 2/16/05, 13517:5-10.

3577. Indeed, Dr. Burns explained that studies done by Garfinkel et al. reported in the 1980 Banbury report, which Dr. Wecker claimed are "consistent with [his] conclusions," were not "consistent with Dr. Wecker's findings . . . because it's a different analysis." Dr. Burns also noted: "We cited both of the [Garfinkel] studies that examined cigarettes per day in Monograph 13. We looked at them carefully." Burns TT, 2/16/05, 13517:11-13518:23; Wecker WD, 31:10-14.

3578. Dr. Samet explained that comparing Dr. Garfinkel's calculations, published 20 years ago, to those performed for Monograph 13, is a case of comparing apples to oranges, as the analyses sought to answer markedly different questions:

> They're very different. . . . Dr. Garfinkel said: If people changed their brand, did they smoke more, the same or less? Just those three bins, if you will. What [the Monograph 13] analysis sais is: Let's look at whether there's a relationship between the reported

> numbers of cigarettes smoked on the first brand and on the second brand and the difference in nicotine yield on the first brand and the second brand. So [the Monograph 13 analysis] is a more quantitative analysis and Dr. Garfinkel's was more sort of: Did people change from smoking more than they used to [or] to less than they used to?

Samet TT, 9/29/04, 1185:11-1186:19; 1191:12-16; 1193:8-1195:11.

3579. In his analysis, Dr. Wecker maintained that examining lower tar and higher tar smokers' lung cancer rates, without controlling for cigarettes per day, provides "other empirical support" for his claim that epidemiological studies of the relative health effects of low tar cigarettes are not biased by controlling for cigarettes per day. Wecker WD, 49:5-11. However, Dr. Burns explained that neglecting to control for cigarettes per day fails to resolve "the core issue" necessary to have a reliable analysis, because it "introduce[s] other biases that are equally important":

> The core issue is having comparable groups, that is, having groups [where] you can adjust for those characteristics other than the type of cigarettes that they smoke. If you include numbers of cigarettes for controlling, you over control. If you don't, then **you're left with the two populations likely to have differences in intensity of smoking and no method by which you can control for that difference**. **Then you can't tell whether the difference you're seeing is due to a difference in intensity of smoking, i.e. completely independent of the type of cigarette** or is a characteristic of the cigarette that you've chosen to smoke.

Burns TT, 2/16/05, 13661:14-13662:6 (emphasis added); see also Burns TT, 2/16/05, 13484:18-13485:10; 13486:8-21 ("If you don't control for cigarettes per day, you have two different groups of individuals who have different intensities of smoking and, therefore, you can't compare their exposures without looking at intensity."); Burns TT, 2/16/05, 13512:7-10 ("When you eliminate control for cigarettes per day, you eliminate the bias that it creates, but **you introduce other biases that are equally important**."); Burns TT, 2/16/05, 13493:7-10 ("Q. One way to test

whether or not controlling for cigarettes per day introduces a bias into an epidemiologic study is simply to remove that control, isn't it? A. No.").

3580. Similarly, when defense counsel suggested to Dr. Samet the use of the analysis proposed by Dr. Wecker – failing to control for cigarettes per day – Dr. Samet rejected it, stating: "It's not the comparison I would make." Samet TT, 9/29/04, 1197:3-1198:19.

3581. The next fatal flaw is Dr. Wecker's analysis of actual versus predicted death rates, which he testified was prepared "in the manner described on page 140 of Chapter 4" of Monograph 13. Monograph 13 indicated that this chart would have "no discernable slope" between actual and predicted death rates, indicating no reduction in harm from use of lower yield cigarettes. Dr. Wecker claimed that his chart demonstrates that, contrary to the indications of Monograph 13, there was a discernable slope, indicating that actual rates of lung cancer deaths had declined in recent years beyond what was predicted. Dr. Wecker admitted on cross-examination that there were several discrepancies between his analysis and that described in Monograph 13. The discrepancies included the fact that Dr. Wecker used mortality data – taken from the National Health Interview Survey – from after 1992 and continuing on to 2000, that was not contained in the calculations in Monograph 13. Dr. Wecker was unaware that the contributors to Monograph 13 specifically excluded data after 1992 because the National Health Interview Survey "changed the definition of smoker in 1992," making the later data inconsistent. Wecker WD, 51:3-21; Wecker TT, 3/15/05, 15698:14-15701:18.

3582. Dr. Wecker also acknowledged that, while Monograph 13 suggested examining lung cancer death rates at ages under 50, Dr. Wecker's chart included only ages 40-50, excluding death rates for all ages under 40. Dr. Wecker's chart also displayed all death rates in a ratio "relative to" the first group of death rates, despite the fact that there is no statement in

Monograph 13 to do so. Dt. Wecker was confronted with an analysis that corresponded to the instructions in Monograph 13; it showed, contrary to the testimony of Dr. Wecker, that there was, as Monograph 13 predicted, no discernable slope. Attempting to avoid acknowledging this, Dr. Wecker testified: "I can't tell. I would have to explode this bottom part, **it's all crushed together**, I can't see it." Wecker TT, 3/15/05,15702:5-15706:2.

3583. Dr. Burns testified, upon review of a chart based on Dr. Wecker's calculations of actual versus predicted death rates, purportedly based on Monograph 13: "The data presented in this graph have essentially no meaning whatsoever. This is not the analysis that Sir Richard Doll was suggesting be done and it is not an analysis that has any valid, scientific or technical meaning." Burns TT, 2/16/05, 13666:20-23; see also Burns TT, 2/16/05, 13664:10-24 (testifying that, to his knowledge, the chart has never "appeared in published peer reviewed literature").

3584. Dr. Jerry Whidby volunteered his "beliefs" on the relative harmfulness of low tar cigarettes, while admitting that he is not an expert in the area of whether lower tar cigarettes are less harmful. Dr. Whidby's lay "beliefs" on the relative harm of lower tar cigarettes were demonstrated to be contradicted by both NCI Monograph 13 and the 2004 Surgeon General's Report. Dr. Whidby also acknowledged that, while the Philip Morris website tells its viewers to read the press release for Monograph 13 and the full volume, it contains no mention of Dr. Whidby's beliefs on low tar cigarettes. Whidby TT, 2/22/05, 13952:21-22 (volunteering "beliefs" on relative harm); Whidby TT, 2/22/05, 13949:19-13952:8 (beliefs contradicted by Monograph 13); 13954:4-13955:23 (beliefs contradicted by 2004 Surgeon General's Report); Whidby TT, 2/22/05, 13959:12-13960:11 (beliefs "in conflict with" Monograph 13); Whidby TT, 2/22/05, 13960:12-13961:9; (US 90171) (Philip Morris website).

3585. Dr. Whidby's testimony and "beliefs," particulaly to the extent they purported to

contravene Monograph 13 and the United States' expert witnesses on the relative health effects of lower tar cigarettes, are not credible. Called to testify by the United States as an adverse witness, Dr. Whidby admitted that he was a paid consultant **for Philip Morris** when he testified and was to earn $2,800 per day **by Philip Morris** (total amount $14,000 for 5 days) for providing and preparing to provide his fact testimony; that his agreement with Philip Morris obligates him to testify on behalf of Philip Morris in litigation, and does not leave him the option of not testifying if called to testify by Philip Morris; and that, under the consultancy agreement, Dr. Whidby gets paid more by Philip Morris to testify in litigation than he does to work for Philip Morris on scientific matters. In addition, Dr. Whidby was repeatedly impeached with prior inconsistent statements during his live examination. In some instances, portions of Dr. Whidby's Corrected Written Direct Testimony were in conflict with each other. Whidby WD, 2:5-3:15 (addressing consultancy agreement); Whidby TT, 2/22/05, 13942:23-13943:17 (same); Whidby TT, 2/22/05, 13945:23-13947:5 (impeached with prior inconsistent testimony relating to whether increased ventilation has on biological activity); Whidby TT, 2/22/05, 13947:6-13948:10 (impeached with prior inconsistent testimony relating to whether witness had any empirical evidence that Marlboro Reds sold today are any less harmful than those sold in 1960); Whidby TT, 2/22/05, 13948:8-13949:18 (impeached with prior inconsistent testimony on whether witness had any evidence that Philip Morris's general reduction and selective reduction techniques have led to one fewer case of lung cancer in the United States); Whidby TT, 2/22/05, 13952:23-13954:3 (impeached with prior inconsistent testimony on whether witness had any empirical evidence that Philip Morris's general and selective reduction techniques have in fact made its cigarettes less harmful); Whidby TT, 2/22/05, 14007:9-22; 14008:1-3 (in what the Court described as "a compassionate question," Dr. Whidby was asked if he wanted to change his testimony, which

maintained that Philip Morris designed low tar cigarettes to taste like higher tar cigarettes for "maximum consumer acceptability," but disclaimed knowledge of whether Philip Morris designed cigarettes that way "because that's what most smokers prefer.").

3586. Finally, Defendants offered the testimony of Joseph Mulholland, a staff economist with the FTC Bureau of Economics, that, although the FTC, as an agency, has never taken an official position on whether low tar cigarettes have reduced the health risks from smoking, based upon his review of the epidemiological evidence, he **personally** does not agree with the conclusion of Monograph 13 that the introduction of low tar cigarettes has not materially reduced health risks from smoking. Mulholland WD, 12:12-15, 14:3-6, 15:15-23, 16:3-11 (Monograph 13 has not changed the FTC's position, as the FTC has not taken an official position on the issue); Mulholland TT, 4/25/05, 19854:16-19855:3.

3587. The Court, while recognizing that Dr. Mulholland has extensive knowledge in his capacity as an FTC **staff economist** concerning and experience (approximately 17 years) with cigarette-related matters, concludes that little or no weight can be given to his testimony concerning (a) whether the introduction of low tar cigarettes has materially reduced the health risks of smoking and (b) the other matters as to which Defendants presented his testimony. First, as the Court observed at the trial, Dr. Mulholland's "testimony is not that overwhelmingly relevant." As Dr. Mulholland himself made abundantly clear, both at his deposition and at trial, he was "not giving the views of the [FTC] as a formal governmental institution," which presents its policy views and positions only through formal written statements, but rather offered only his own personal opinions. As such, the testimony has little relevance. Mulholland WD, 3:5-9; Mulholland TT, 4/25/05, 19938:16-19939:1; accord, id., 19783:15-19784:1, 19787:12-22, 19789:14-20, 19825:5-12, 19870:13-15 ("Obviously, his answer has to be taken by me with

many grains of salt given his current position. . ."), 19931:1-6. Second, as the Court further observed at trial, it appears that Defendants called Dr. Mulholland as a witness not because of his unique knowledge concerning the FTC and cigarette-related issues ("there are probably many other people at the [FTC] with varying views on this subject . . ."), but rather "[b]ecause his views agreed with theirs." Id., 19934:15-19, 19938:16-19939:1. Finally, although Defendants could have sought to introduce Dr. Mulholland as an expert witness, they chose not to do so, instead calling him only as a fact witness. Id., 19917:21-19918:16, 19931:16-20, 19932:3-4.

3588. Notwithstanding Defendants' failed attempts to discredit Monograph 13 at trial, several of Defendants' websites, including those of Philip Morris USA and B&W, purport to defer to the public health community's conclusions that lower tar cigarettes provide no significant health benefit, and direct readers to NCI Monograph 13. TLT10400560062 at 0062 (US 88628) (A) (B&W website) ("**Based on the available science, Brown & Williamson cannot state at this time that any cigarette, regardless of its delivery, is safer than another.**") (emphasis added); Ivey WD, 63:9-16; Brennan-Lund PD, Price v. Philip Morris, Inc., 9/20/02, 107:22-108:14; 109:16-110:22; 114:9-114:10 ("what we say on our [B&W] web site we believe to be true"); (no bates) (US 90171) (A) (Philip Morris website); Whidby TT, 2/22/05, 13949:19-13952:8; 13954:4-13955:23; 13959:12-13960:11 (acknowledging that beliefs that lower tar cigarettes are less harmful are contradicted by Monograph 13 and 2004 Surgeon General's Report).

3589. Defendants' own documents show that Defendants made health claims regarding low tar cigarettes when they lacked evidence to support those claims or knew those claims were false.

(i) Philip Morris

3590. Dr. Farone revealed that researchers at Philip Morris knew that low tar cigarettes were no less harmful because they offered no significant reduction in tar exposure:

> I think the question is how much do you have to lower it to get what level of benefit. . . . I think it's called a limbo stick hypothesis, **how low [in tar] must you go in order to see a benefit, and we [at Philip Morris] knew that that level was extremely low**. Again, 70 percent reduction isn't enough, 80 percent is not enough. **You've got to get the reductions way down before you start to see a benefit**.

Farone TT, 10/7/04, 1853:16-18; 1854:12-16 (emphasis added).

3591. Dr. Farone testified that Philip Morris's Marlboro full-flavor and Marlboro Lights cigarettes are "essentially identical except for dilution" – i.e. that Marlboro Lights have more dilution, dilution referring to ventilation that dilutes the smoke, particularly when machine-smoked by the FTC method, with ambient air. Dr. Farone further testified that all of the data in his reliance materials "shows that **as you increase dilution, the toxicity in [the Ames] test increases, which is more likely than not associated with a toxicity increase in smokers.**" Farone TT, 10/7/04, 1888:2-1889:5; 1891:17-19; see also Farone WD, 113:21-114:1 ("The principal difference is that Marlboro Lights has extra ventilation holes, raising its dilution levels . . . . All other major design parameters – tobacco blend, nicotine-to-tar ratio, filler material – are essentially the same."); Farone WD, 57:10-14 (testifying that "relatively low levels of ventilation," such as in Marlboro Lights, "actually increase the toxicity of the smoke according to Ames test mutagenicity studies"); see also Whidby WD, 43:13-16 (testifying that, to his knowledge, from 1971 and until 1998, when he retired from Philip Morris, there was no difference in any of the ingredients used in a Marlboro Light and those used in a Marlboro Red).

3592. Dr. Farone testified that the very Ames mutagenicity testing that Philip Morris has

conducted for the past 25 years, and that "Philip Morris has concluded . . . predicts carcinogenicity" have indicated that Philip Morris's Marlboro Lights cigarettes are, as designed, more mutagenic than Marlboro full-flavor cigarettes:

> [I]n the case of Marlboro Lights, the Philip Morris test data that I have reviewed on that level of dilution for equivalent blends indicated that the product design for their Light cigarettes was more mutagenic than the full flavor Marlboro, Marlboro Reds, and therefore predictive of more potential cancer risk. These studies were repeated multiple times over the past 20 years and continue to be repeated to this day. The Philip Morris data, as was used by Philip Morris, was a strong warning that their product design change between a Marlboro Red and a Marlboro Light – increased ventilation – resulted in a potentially more dangerous product.

Farone WD, 119:7-120:15; Farone TT, 10/7/04, 1866:2-17; see also Farone WD, 57:20-22 (testifying that "Marlboro Lights have more mutagenic smoke on a per milligram of tar basis" than Marlboro full-flavor cigarettes); Farone WD, 121:20-23 (testifying that "[v]irtually every Ames assay test ever conducted by Philip Morris resulted in data that showed the mainstream smoke condensate from a low tar cigarette is higher in specific mutagenicity than the mainstream smoke condensate from a regular cigarette of otherwise comparable design").

3593. Dr. Farone testified, based on knowledge he gained as Director of Applied Research at Philip Morris USA and his review of internal documents, that Philip Morris has not "changed the design of 'Light' cigarettes in response to its studies and knowledge concerning mutagenicity." Farone WD, 121:3-9.

3594. Dr. Farone's testimony is corroborated by internal Philip Morris documents from as early as the 1960s. An October 28, 1964 internal presentation to Philip Morris's Board of Directors explained that Philip Morris's primary goal was not to develop less harmful products, but to develop products that would be perceived by consumers as less harmful: "**Please recall that our number one objective is to develop products having maximum consumer appeal in**

the current and future health conscious marketplace." 1000307159-7164 at 7159 (US 20092) (A) (emphasis added).

3595. Dr. Farone's testimony also is corroborated by the testimony of Philip Morris consultant and former employee Dr. Whidby, who acknowledged that "increased filter dilution," one of the techniques Philip Morris uses to lower the FTC tar yield of its cigarettes, "is associated with increased biological activity." Dr. Whidby agreed that biological activity in the context of Philip Morris's biochemical testing reports generally refers to biological reactions such as tumor growth, cell mutations, and toxic reactions, and that it was "a bad thing" that should be reduced. Whidby TT, 2/22/05, 13964:18-25; 13967:22-13968:19.

3596. Dr. Whidby also acknowledged that "the chemical composition of tar bears directly on the harm it causes," and that **two different types of tar in the same amounts can have two different levels of biological activity**. Dr. Whidby acknowledged that the quantity of tar is meaningless regarding health effects unless you also examine its chemical composition and that "how a cigarette is smoked changes not just the amount of smoke delivered to the smoker but it also changes the chemical composition of the smoke." In fact, Helmut Wakeham of Philip Morris so acknowledged in a March 1, 1974 document. Whidby TT, 2/22/05, 13963:17-13964:17; 13965:1-17; 1003293476-3493 at 3492 (US 85073)(A).

3597. Dr. Whidby admitted to being unaware of a 1996 scientific article that found that "Taking puffs of larger volumes and drawing puffs more frequently, practices observed among most smokers of cigarettes with low nicotine yield, results in high TSNA [tobacco-specific nitrosamine] values in the MS [mainstream smoke]." As Dr. Farone explained, TSNAs are "generally very toxic" and among the "major categories of smoke constituents that . . . contribute to smoking causing cancer and other serious diseases." Whidby TT, 2/22/05, 13971:10-13972:8;

13973:15-13974:2; 13974:9-10; 121-137 at 133 (US 90179)(A); Farone WD, 46:21-47:7.

3598. To promote Philip Morris's stated goal of creating the perception of reduced harm, Helmut Wakeham, Philip Morris's Director of Research, in a 1964 memorandum, recommended: "The health value of filters is undersold in the [Surgeon General's] report and is the industry's best extant answer to its problem. The Tobacco Institute obviously should foster the communication of the filter message by all effective means." Wakeham acknowledged in his memorandum that Defendants did not have evidence to support their contemporaneous marketing claims that filtered cigarettes were safer than unfiltered cigarettes, and proposed such research. However, **there is no evidence in the record that, at any time prior to 2001, any Defendant undertook any such study relating to the cigarettes sold by Defendants**. 1000335612-5625 at 5622-5623 (US 22986) (A).

3599. An April 1974 Philip Morris review of smoking and health literature found that no low tar cigarette in existence was less harmful than regular cigarettes, and that the low tar cigarettes it had designed may in fact be **more** harmful:

> **Safer though it may be to take in less nicotine, tar and CO**, to what extend [sic] is this achieved by changing to a low nicotine cigarette? The information available is scanty and conflicting . . . . [A] cigarette with a high nicotine yield would enable heavy smokers to curb their tobacco consumption, and **harmfulness would be further reduced if, at the same time, the tar and CO yields were low**. At present a cigarette combining a high nicotine yield with a low tar and CO yield does not, so far as we know, exist. . . . **If nicotine is the addictive compound in the tobacco smoke, cigarettes with low content of nicotine may even be more dangerous than the usual cigarette, due to their supposed higher degree inhalation** . . . .

2015041685-1739 at 1721 (US 20324) (O) (emphasis in original) (internal footnote omitted).

3600. A March 1, 1977 Philip Morris memorandum by Stanley Schachter to Thomas Osdene, Director of Research, concluded that low tar/low nicotine cigarettes are not less harmful:

"[I]t would certainly seem that **the campaign for low nicotine cigarettes is misguided and rests on a set of fallacious premises. . . . It is . . . clear . . . that the major body of data that has been used to justify the campaign for low nicotine cigarettes does nothing of the sort**." 1000046626-6661 at 6655, 6660 (US 20074) (A) (emphasis added).

3601. A November 1977 Philip Morris memorandum to Dr. Robert Pages from J. Booker and S. Drew about Ames testing stated: "**The take home lesson from this experiment is that dilution of a cigarette appears to increase the activity of the WSC [whole smoke condensate] (more dramatically for some cigarettes than for others).**" Dr. Farone testified: "this document directly supports my statements that dilution – in a certain range – increases the mutagenicity of tar." 1002978361-8363 at 8362 (U.S. 35635) (A); Farone WD, 120:16-121:2.

3602. By 1978, Philip Morris had substantial evidence that "filter dilution [which Philip Morris used to reduce FTC tar and nicotine yields] was somehow acting to increase" the "activity" of the whole smoke condensate ("WSC") collected from its cigarettes. Further experiments confirmed that the tar from ventilated low tar reference cigarettes measured higher on mutagenicity tests than non-ventilated products. Additional research conducted in 1979 yielded the same result. 2001243600-3673 at 3610-11 (US 20298) (O); accord 2022180219 (US 21479) (O).

3603. A May 11, 1982 Philip Morris document from INBIFO (Philip Morris's overseas research facility) revealed that Philip Morris learned from its testing of low tar reference laboratory cigarettes (i.e., cigarettes used for research purposes and not actually sold in stores) in Europe that these cigarettes registered higher in standard biological tests than the regular-delivery reference cigarettes – i.e., were "more active" – and thus were more likely to cause cancer: "Low tar reference cigarette . . . [m]ay be slightly more active than [the regular delivery reference

cigarette] as a complete carcinogen." 1003121638-1643 at 1638 (US 20153) (A).

3604. Philip Morris's 1993-1997 Research and Development Strategic Plan acknowledged that Philip Morris had not reduced the amount of harmful components of cigarette smoke in its conventional cigarettes, including its low tar cigarettes, either by removing specific harmful components or reducing the total quantity of harmful components. Philip Morris's Plan indicated an effort to "[e]volve programs to address known product benefits **which cannot be currently implemented on conventional cigarettes**." The first product benefit was: "**Perceived** health and social – specific or total mainstream and sidestream smoke component reduction." 2021323192-3347 at 3201 (US 85099) (O) (emphasis added).

3605. A January 28, 1994 report from INBIFO to Philip Morris in Richmond, Virginia stated that increased cigarette filtration, porosity, and ventilation (primary methods used by Philip Morris to reduce the FTC Method tar and nicotine yields in its cigarettes) would result in an increase in the degree to which cigarette smoke was toxic to living cells (i.e., cytotoxicity), the irritation it caused to smokers, and the likelihood of the smoke to generate mutations such as tumors and/or cancer (i.e., mutagenicity). The document stated: "Increased filtration will result in a relative enrichment of gas phase constituents, leading to increased cytotoxicity and irritancy . . . . Increased porosity and ventilation will . . . increase the specific mutagenicity." 2024005509-5512 at 5509-5510 (US 20399) (A); Farone WD, 122:1-14 (citing to, and agreeing with, INBIFO conclusions).

3606. Testimony and documents produced in this case confirm that the tar in Philip Morris's cigarettes that are marketed as light or low tar can register higher mutagenicity than the tar in the full flavor version of that brand. For example, A. Clifton Lilly, Senior Vice President of Technology, confirmed that data from tests run at Philip Morris's INBIFO facility showed that

the Ames test for mutagenicity from Marlboro Lights is significantly higher than the tar from Marlboro full flavor products. 2001243600-3673 at 3610-11 (US 20298) (O); 2022180219-0219 (US 21479) (O); 1000135419-5439 (US 20078) (O); Lilly PD, United States v. Philip Morris, 5/14/02, 229:17-231:21.

3607. Similarly, Lilly testified in 1998 that he did not know whether ultra low tar cigarettes are any less hazardous than any other cigarette. Lilly PD, Engle v. RJ Reynolds Tobacco Co., 5/7/98, 25:6-27:4, 522893332-3483 at 3356-3358 (US 80293) (O).

3608. A May 1, 2000 Philip Morris e-mail from David Ring to Vic Han attached a speech to be given by Louis Camilleri, Senior Vice President and Chief Financial Officer of Philip Morris Companies, Inc., on May 10, 2000. This speech reveals Philip Morris's underlying belief that low tar cigarettes are not less harmful than full-flavor cigarettes. After stating that Philip Morris International would "continue to benefit from" its prominent low tar brands such as Marlboro Lights, Philip Morris, Merit and Parliament, the speech revealed that Philip Morris **also** was attempting to develop cigarettes that **may actually be less harmful**: "We are also committed to the development of a commercial cigarette that may reduce the health risk of cigarette smoking." 2071040801-0801 (US 40375) (O); 2071040802-0812 at 0807-0808 (US 40376) (O).

3609. Dr. Farone, explaining a Philip Morris document relating Ames mutagenicity testing results in a 2001 document from Philip Morris's INBIFO laboratory in Germany, explained that, for testing on several different days, "you'll see that in every case, the Lights number [reflecting the mutagenicity of Marlboro Lights] is higher than the regular [reflecting the mutagenicity of Marlboro full-flavor]." 2505913831-3836 (US 46079) (A); Farone TT, 10/12/04, 2115:14-2116:4; 2116:12-21; 2117:13-2118:5; 2118:19-2119:6.

3610. James Morgan, former President and CEO of Philip Morris, testified at a 2002

deposition that, in his opinion, lower tar cigarettes are not any safer than higher tar cigarettes. Morgan PD, Price v. Philip Morris, Inc., 6/5/02, 75:3-15.

3611. Nancy Brennan-Lund, Philip Morris Senior Vice President of Marketing, testified at a 2002 deposition that she agrees with Philip Morris USA's website statement that there is **no such thing as a safer cigarette**. Lund testified that "what we say on our web site we believe to be true." Philip Morris USA's position is that low tar cigarettes are no less harmful than full-flavor cigarettes, "based on what the Monograph 13 came out with." Lund later qualified this statement – – it has "not been proven" that light cigarettes are less harmful, so one cannot assume they are less harmful. Brennan-Lund PD, Price v. Philip Morris, Inc., 9/20/02, 107:22-108:14; 109:16-110:22; 114:9-114:10.

3612. Ellen Merlo, then Philip Morris USA Senior Vice President of Corporate Affairs, testified in 2002 that Philip Morris's policy at the time was that lights or low tar cigarettes are not safe or safer than any other cigarettes, and that she agreed with the statement. Merlo PD, Price v. Philip Morris, Inc., 10/2/02, 80:3-80:15.

3613. Dr. Whidby, Philip Morris scientist from 1972 to 1998 and now a paid consultant for Philip Morris, who held the title of Senior Fellow – the highest non-management scientific position at Philip Morris – and who claimed that he and his co-workers were trying to make cigarettes less harmful, testified that he "doesn't know that Marlboro Lights [low tar cigarettes] are less harmful" than Marlboro Reds, which are higher-tar, full-flavor cigarettes. Whidby WD, 2:3-7; 4:18-5:3; 6:16; 13:14-16.

3614. On its website, Philip Morris, in effect, adopts the findings of the National Cancer Institute's Monograph 13, which found that low tar and filtered cigarettes are no less harmful than regular delivery and unfiltered cigarettes. In May 2004, Philip Morris's website provided a

link to the Monograph 13 Press Release, and stated: "It is important to remember that, as of today, there is no cigarette on the market which the public health community endorses as offering 'reduced risk.'" (US 88624) (O).

(ii) RJ Reynolds

3615. RJR's internal documents show that, like the other Defendants, RJR has long known that low tar cigarettes are no safer than regular cigarettes and, thus, that RJR made health claims regarding low tar cigarettes when it either lacked evidence to support them or knew they were false.

3616. In May 1980, RJR scientist C.T. Mansfield performed the Ames test for mutagenicity "on the tars from twenty-four domestic brands of cigarettes with various [FTC] 'tar' deliveries," and found "a trend for low 'tar' cigarettes to show higher revertent numbers per mg 'tar,'" indicating that the low 'tar' cigarettes caused more mutations. 514903578-3610 at 3579 (US 20863) (A).

3617. A September 29, 1992 RJR internal presentation reported that lower tar cigarettes were more likely to cause mutations such as tumors and cancer than higher tar cigarettes. The presentation stated: "Higher tar cigarettes tend to have lower Ames activity . . . than lower tar cigarettes." 509643825-3832 at 3825 (US 20830) (O).

3618. Gary Burger, then RJR Senior President of Research & Development, testified in a 1997 deposition that he was uncertain whether low tar cigarettes are in fact better for smokers' health, admitting that "we can't prove that it causes less onset of disease" and, as a result, "that's the main reason we shouldn't tout them as lower risk products because we can't prove it." Specifically, Burger conceded that whether low tar cigarettes provide less risk for cancer is "not provable," and that "I don't know if [low tar cigarettes] helped at all with cardiovascular disease."

Burger further testified that RJR had not done any long term studies to determine if smokers of low tar cigarettes truly are inhaling less tar. Burger PD, Arch v. American Tobacco Co., Inc., 8/21/97, 226:9-232:12, 234:15-18, 235:12-243:18.

3619. Schindler, RJR President and CEO, testified that RJR does not "use the terms ‘safe' or ‘safer' to refer to cigarettes," including low tar cigarettes. Schindler further testified that he did not have any new information that would establish that low tar cigarettes are safer. Schindler WD, 63:12-64:1.

3620. Arnold Mosberg, RJR scientist, testified in a 2003 deposition that in 2003 he and other RJR scientists (Doolittle and Morgan) reviewed "data [they] have had for decades" (some for more than two decades) to conduct a comparison of the relative harmfulness of lights and full flavor cigarettes, using various tests, including animal skin painting tumorgenicity, rodent inhalation, and Ames mutagenicity studies. Mosberg testified that the results of these studies indicated that low tar cigarettes do not reduce risk relative to full-flavor cigarettes. Mosberg PD, Turner v. RJ Reynolds, 8/19/03, 2:12-16, 6:7-12:4, 14:21-15:19, 15:24-16:1, 16:13-24, 19:3-5, 21:20-22:10; 22:19-26:8; 55:1-11, 57:15-58:16; 97:15-100:12; 103:23-104:1 (discussing in part Deposition Exhibit 2).

3621. According to RJR's genotoxicity scientist, David Doolittle, when comparing full flavor and low tar cigarettes by the FTC method, Ames and other studies show differences, but these differences disappear when measured in terms of actual yield. Doolittle PD, Turner v. RJ Reynolds, 6/20/03, 36:12-46:7; 63:20-64:17. Accordingly, these tests indicate that lights are no less harmful than full flavor cigarettes. Id. at 66:24-69:7, 71:4-12.

(iii) Brown & Williamson

3622. By 1968, senior scientists at B&W and BATCo already viewed the low tar

cigarette as a sham. Minutes from a BATCo research conference held September 24-30, 1968 in Hilton Head Island, South Carolina and attended by BATCo scientists including Dr. S.J. Green, Scientist, Manager, and Director of R&D from 1961-1979, stated: "Research staff should lay down guide lines against which alternative products can be chosen in everyday operations. Although there may, on occasions, be conflict between saleability and minimal biological activity, two types of product should be clearly distinguished, viz: a) A Health-image (health reassurance) cigarette. b) A Health-oriented (minimal biological activity) cigarette, to be kept on the market for those consumers choosing it." 110075139-5144 at 5140 (US 85044) (A); 109880405-0410 at 0406 (US 20262) (O). As Dr. Burns testified, this exhibit "shows that BAT clearly understood the difference between the changes in cigarette design that would create a false reassurance and those that would actually reduce risk. BAT scientist S.J. Green distinguished between cigarettes that only 'reassured' smokers as to the health benefit form those cigarettes that demonstrated an actual reduction in 'biological activity.'" Burns WD, 50:14-18.

3623. In a December 4, 1968 letter from R.A. Sanford, B&W Director of Research and Development, to Dr. S. J. Green, BATCo scientist, regarding "conclusions from the Hilton Head Meeting," the researchers made a distinction between what they called "health-image" and "health-oriented" cigarettes, with the former providing merely the appearance, and the latter the substance, of reduced health hazard. The letter acknowledged that low tar cigarettes are not less harmful, but merely are perceived by the public as such, stating: "It was also recognized that there are two types of health products possible and that they should be distinguished: (a) Health image (health reassurance cigarette) such as a low tar – low nicotine cigarette which the public accepts as a healthier cigarette and (b) Health-oriented cigarette which has minimal biological activity; for example, one which would yield a near zero reading in a mouse skin painting test."

689033123-3126 at 3124 (US 22186) (O); 689033184-3185 at 3184 (US 21036) (O).

3624. A February 4, 1976 memorandum from Ernest Pepples, B&W Senior Vice President, entitled "Industry Response to Cigarette/Health Controversy" reveals Defendants' knowledge that the low tar and filter cigarettes they were marketing as less harmful were not likely to actually be less harmful:

> The industry has moved strongly toward filtered cigarettes, which have increased from 0.6% in 1950 to 87% in 1975. . . . This became known as the 'tar derby' of the late 1950's. It was characterized by sharply intensified advertising competition. . . . The new filter brands vying for a piece of the growing filter market made extraordinary claims. . . . It was important to have the most filter traps. Some claimed to possess the least tars. **In most cases, however, the smoker of a filter cigarette was getting as much or more nicotine and tar as he would have gotten from a regular cigarette**. **He had abandoned the regular cigarette, however, on the ground of reduced risk to health**. . . . The manufacturers' marketing strategy has been to overcome and even to make marketing use of the smoking/health connection . . . . Thus the 'tar derby' in the United States resulted from industry efforts to cater to the public's concern and to attract consumers to the new filtered brands. . . . The current duel between True and Vantage and between Carlton and Now are other examples of competitive efforts to capitalize on the smoking/health controversy.

170042567-2574 at 2568, 2574 (US 20292) (A) (emphasis added); Smith WD, 79:5-22. Dr. Burns testified that this document demonstrates "[d]efendants' clear understanding that they were deceiving both the smokers and the public health authorities." Burns WD, 54:11-55:4.

3625. An August 5, 1980 B&W document signed by J. Kendrick Wells III, B&W Assistant General Counsel, acknowledged that "[t]here was question about the degree of support . . . at the present time" for the "scientific opinion that certain low levels of 'tar' consumption are relatively safe to the smoker," and that "for the longer term the support may be quickly eroding." 680050983-1001 at 0990 (US 20981) (O).

3626. At trial, Wells, B&W Assistant General Counsel, testified regarding a December 9, 1981 meeting he attended with L.C.F. Blackman (Director of Research for BATCo), Bob Ely (Director of Public Relations at BATCo), Timothy Finnegan (tobacco industry attorney), Donald Hoel (Shook, Hardy & Bacon attorney), and other tobacco industry lawyers regarding "what BAT group companies should or should not say concerning the health effects of low tar products," and "whether statements made by the companies about low tar products could be construed as admissions that other products cause disease." Wells summarized the meeting in a December 28, 1981 memorandum that demonstrates why the tobacco industry wanted to avoid making explicit health claims with respect to low tar cigarettes, as well as why the industry has falsely maintained publicly that it introduced low tar cigarettes only in response to requests from the public health community and in response to consumer demand. At the meeting, Mr. Northrip stated: "Evidence that BAT has modified its products based on medical studies which presume cause would devastate a B&W product liability defense which relied on witnesses who said causation was not proven." Similarly, Mr. Hoel stated that BATCo should "refer to public statements by government and media commentators urging smokers to smoke lower ‘tar' products; the companies reduce the ‘tar' to reach these consumers. **The industry must not say that it led consumers down the ‘tar' scale**." Referring to the question of why B&W makes low tar cigarettes, Mr. Blackman stated: "One answer is by making both types of products (high and low ‘tar'), so that the consumer can take his own informed risk. **We can then override the warning notice on low ‘tar' cigarettes**, but leave the warning notice on high ‘tar' cigarettes." 680584928-4934 at 4929, 4933 (US 21005) (A); Wells WD, 52:20-60:2.

3627. An October 31, 1989 B&W internal memorandum entitled "Objections to Product Innovation Strategy" from Wells to RJ Pritchard, B&W executive and member of the

Tobacco Institute's Executive Committee, conceded that "**it is not established that the reduction or removal of specific smoke constituents or of smoke constituents across the board, such as in low tar cigarettes, is significant for smoking and health**." 680701034-1038 at 1035 (US 21010) (A) (emphasis added); Wells WD, 60:3-61:10.

3628. Sharon Blackie, Director of Scientific Communications and a spokesperson for B&W on scientific issues as late as 1998, testified that, "based on [her] experience as an employee within the cigarette industry, [she has] been aware for some time that some smokers believe that low tar cigarettes are less hazardous to their health [and that] some smokers believe that by switching to low tar cigarettes, they will achieve a health benefit." Blackie further testified that, from at least as early as 1998, B&W's position was that the company "did not know whether low tar cigarettes were, in fact, less hazardous," and "was not confident that the science showed any health benefit from low tar cigarettes." Blackie WD, 184:22-185:5.

3629. Susan Ivey, former B&W President and CEO, testified that B&W's public position on low tar cigarettes, "as stated on its website, is that 'there is no such thing as a "safe" cigarette,' that '[s]moking "low tar" or "light" cigarettes is not an alternative to quitting and does not eliminate the health risks of smoking,' but that 'lower tar cigarettes will generally deliver less tar and nicotine than higher tar cigarettes.'" B&W's website admits that low tar cigarettes are not safer than regular cigarettes. It states that "**despite a dramatic lessening of tar yields, the hoped-for reduction of smoking-related illnesses has not been conclusively demonstrated**." Furthermore, the website directs the reader to the National Cancer Institute's Monograph 13, citing its conclusions that "[e]pidemiological and other scientific evidence, including patterns of mortality from smoking-caused diseases, does not indicate a benefit to public health from changes in cigarette design and manufacturing over the last fifty years," and that "[w]idespread

adoption of lower-yield cigarettes in the United States has not prevented the sustained increase in lung cancer among older smokers." The website further states: "[W]e continue to believe that smokers should rely on the public health authorities' views on low tar cigarettes and other smoking issues." Ivey WD, 63:9-16; (US 86656) (A) (emphasis added).

(iv) BATCo

3630. A circa 1976 BATCo document from S.J. Green to P.L. Short and P. Sheehy revealed both that BATCo planned to market low tar cigarettes as safer and that BATCo did not have a sufficient basis to believe that low tar cigarettes were safer, stating: "Before we do work aimed to sell low delivery cigarettes, unless we are already satisfied, we should do some work to establish that in fact they are safer." 110076428-6432 at 6430 (US 34957) (A).

3631. A June 9, 1982 BATCo document, "Technical Exchange Meeting," noted that Ames testing revealed that "[t]he specific activity [a measure of mutagenicity] of a plain cigarette was found to be lower than that of a ventilated filter cigarette." 109883189-3192 at 3191 (US 20265) (O).

3632. A February 18, 1988 BATCo study of cigarette mutagenicity from the B&W Research & Development Library's E.D. Massey demonstrated BATCo's awareness that the cigarettes Defendants had designed to deliver low levels of FTC tar and nicotine were **more** biologically active than regular cigarettes, according to BATCo's own research. The report found that the "lighter" the purported delivery of the cigarette, the higher the mutagenicity. Using Philip Morris cigarettes as an example, Merit cigarettes had higher mutagenicity than Marlboro Lights, which in turn had more mutagenicity than regular Marlboro cigarettes. 620000021-0032 at 0027, 0030 (US 20944) (A).

(v) American Tobacco

3633. Notwithstanding that the internal American documents, discussed above, evidence American's intent that its marketing communicate to consumers that its low tar brands were less harmful than full flavor cigarettes, Eric Gesell, designated representative of American, testified in a 1997 deposition that American never conducted "any studies to determine whether or not low-tar cigarettes are safer than high-tar cigarettes." Gesell PD, State of Minnesota v. Philip Morris Inc., 9/18/97, 5:8-25; 6:10-17; 127:6-10.

(vi) Lorillard

3634. Asked whether low tar/low nicotine cigarettes are any safer than conventional, full-flavor cigarettes, Christopher Coggins, Senior Vice President of Science and Technology at Lorillard, stated: "[O]ur policy is that cigarettes can cause cancer and that goes for all cigarettes." Coggins D, United States v. Philip Morris, 8/16/01, 115:22-116:4.

(vii) Liggett

3635. Comments by Liggett scientists on a "Memorandum of June 13, 1966; C.F. Woodward and C.L. Ogg to P.A. Wells" acknowledged that there was no basis to conclude that reductions in tar and nicotine and/or the use of filters reduced the harmfulness of cigarettes:

> Although the public does have a right to know what it is buying, extreme care must be exercised to avoid leading a non-technically oriented public to erroneous conclusions regarding the relative merits of one brand versus another based on minimal differences in 'tar' or nicotine – neither of which can be attached any quantitative measure of health hazard . . . . We would question if any differences between any filter brands would show correlation with tumorgenicity. We know of no correlation of tar delivery among filter brands with tumor production in mice–or for that matter, even among non-filter cigarettes. The level of uncertainty in current biological testing is so great that distinction between cigarettes is not possible on this basis.

LWDOJ00068944-8949 at 8944-45 (US 21214) (O) (emphasis in original).

(b) Defendants Had Extensive Knowledge of Smoker Compensation

3636. The evidence shows that Defendants have been aware, since before the adoption of the FTC Method, to test tar and nicotine yields that smokers' nicotine addiction would drive them to compensate for the delivery of lower tar cigarettes by smoking them more intensely and/or increasing their consumption, rendering Defendants' marketing claims that these products delivered lower tar and nicotine misleading. Moreover, Defendants concealed their superior knowledge of nicotine-driven smoker compensation, and, as discussed in Section III.D(4)(c), supra, designed their cigarettes to deliver low tar and nicotine yields when tested by the FTC Method, but deliver much more tar and nicotine to smokers.

3637. As Dr. Neal Benowitz, an expert on smoker compensation who has performed extensive compensation research and published extensive articles on the topic, testified:

> Compensation refers to the behavior of smoking cigarettes of different machine measured yields more or less intensively, and/or smoking more or fewer cigarettes **to achieve a particular level of intake of nicotine**. Compensatory smoking behavior implies that there has been a change in smoking behavior in response to a change in the nominal nicotine delivery of the cigarette that is being smoked.

Benowitz WD, 55:11-22; 56:22-23; Farone WD, 102:15-103:13 (emphasis added).

3638. Dr. Benowitz explained that "[c]ompensatory smoking behavior is a manifestation of nicotine addiction," and "occurs primarily due to nicotine." Dr. Benowitz provided "the consensus in the medical and scientific fields" regarding compensation, testifying: "The concept of smoking to obtain desired levels of nicotine and the concept of nicotine titration with associated compensation is widely accepted by the scientific and public health communities." Methods of smoker compensation include taking "bigger puffs," taking "more frequent puffs," "block[ing] the ventilation holes in the filter," and smoking more cigarettes. Dr. Farone testified

that, even for ultralow tar cigarettes, where a smoker switching down may not be able to compensate fully "on a per cigarette basis[,] [o]f course, that smoker could always smoke more cigarettes." Benowitz WD, 55:11-22; 56:22-23; 57:5-9; 57:23-1; Benowitz TT, 11/2/04, 4762:23-24; 4763:14-16; Farone WD, 103:18-104:1; accord Farone TT, 10/12/04, 2169:18-19 (testifying that "the requirement for nicotine" drives smoker compensation).

3639. Because each smoker smokes to obtain his or her own particular nicotine quota, smokers end up inhaling essentially the same amount of nicotine – and with it tar – from so-called "low tar and nicotine" cigarettes as they would inhale from regular, "full flavor" cigarettes. This is referred to as "complete" compensation. As Dr. Benowitz testified at trial in this case, both he and the National Cancer Institute (in Monograph 13) have concluded that "[f]or spontaneous brand switchers, **there appears to be complete compensation for nicotine delivery**, reflecting more intensive smoking of lower-yield cigarettes." Dr. Benowitz further testified that virtually all smokers, **over 95%, fully compensate for nicotine.** Benowitz WD, 59:6-17; 61:15-62:13 (emphasis added); Benowitz TT, 11/2/04, 4769:25-4770:4; Monograph 13 at 10 (U.S. 58700) (A); accord Burns WD, 1:10-15; 12:10-11; 43:19-45:2; Burns TT, 2/15/05, 13311:9-15; Burns TT, 2/16/05, 13537:6-9 (trial testimony of Dr. Burns that compensation is both "essentially complete" and permanent).

3640. Defendants do not presently dispute that compensation exists. They do, however, claim that, while compensation exists, it is not complete, contending that smokers of low tar cigarettes receive less than precisely 100% of the nicotine that they would receive from a regular, full flavor cigarette. However, the issue of whether compensation is exactly 100% is a red herring. As Drs. Burns, Benowitz and Samet testified, compensation is "essentially complete," and – as every major scientific body that has examined this issue has concluded – low tar

cigarettes have not reduced the risks of smoking relative to full-flavor cigarettes. Therefore, whether compensation is precisely 100% is immaterial; the bottom line is that **low tar cigarettes are no better for smokers' health**. See, e.g., US FF §§ III.D(4)(a)-(b), supra; TT, 9/22/04, 292:8-10 (counsel for Defendants in opening statement stating: "Now, does compensation occur? Absolutely. Absolutely.").

3641. Because the amount of nicotine that smokers need to sustain their nicotine addiction does not change over time, compensation for reduced deliveries is permanent, and occurs for as long as the smoker smokes a low tar product. Benowitz WD, 70:25-71:10; see generally DXA0310399-0650 at 0452-0476 (US 58700) (A) (Monograph 13) (indicating no evidence to warrant conclusion that there is reduction in compensation over time).

3642. Because compensation is essentially complete, low tar cigarette smokers unwittingly inhale essentially the same amount of tar and nicotine as they would from regular, full flavor cigarettes, thereby eliminating any health benefit from purportedly low tar cigarettes. Dr. Benowitz testified that "light and ultra-light cigarettes" do not, in actuality, "reduce the risks of smoking":

> Considering the overall exposure data for individuals selecting their own brand, there is little reason to expect that smokers of cigarettes with low machine measured yields will have a lower risk of disease than those who smoke higher yield cigarettes.

Benowitz WD, 72:9-14; U.S. 58700 at 60; see also Benowitz WD, 61:6-13 (explaining the conclusions of Chapter 3 of NCI Monograph 13).

3643. Dr. Benowitz added:

> Compensation explains why smoking of light cigarettes has not been associated with a reduction of smoking-induced disease risks. One would think, looking at the FTC yield data, that toxic exposures would be substantially reduced if one switches to light cigarettes; however, because of compensation, resulting toxic

exposures are similar for light and regular cigarettes.

Benowitz WD, 60:23-61:14.

3644. Indeed, despite the fact that tar deliveries, as measured by the FTC Method, decreased by more than two-thirds between 1954 and 1994, lung cancer in smokers actually **increased**. (US 58700) (A) (Monograph 13); (US 76212) (A) (1997 CDC MMWR article); see also (US 88626) (A) (1995 Thun et al. article).

3645. Smoker compensation, and Defendants' knowledge thereof, reveals the falsity of the central message communicated by Defendants in their marketing of low tar cigarettes – that they are safer, delivering less tar to smokers – because in the course of compensating to ensure adequate nicotine intake, smokers inhale substantially more tar and nicotine and, in the process, more toxins, than the FTC Method levels used by Defendants to market these cigarettes. As demonstrated in Section III.D(4)(a), supra, there is no meaningful reduction in disease risk in smoking low tar cigarettes as opposed to smoking regular cigarettes. See also US FF §§ III.D(3), supra, for a recitation of Defendants' false marketing and public statements.

3646. "[O]ne of the problems" Dr. Henningfield identified with "the claims of [defendants] that their cigarettes are 'light,' 'reduced,' or 'lower' in tar and nicotine" is that "[t]he various compensation mechanisms used by smokers to ensure they get enough nicotine . . . cause actual tar and nicotine delivery to smokers of most cigarettes advertised as 'light' to be well within the range of the cigarettes advertised as full flavor." He added: "**These conclusions are supported by individual government supported investigators as well as . . . health agencies in Massachusetts, Canada, England, and by the World Health Organization.**" Henningfield WD, 55:13-56:7 (emphasis added).

3647. Indeed, Dr. Whidby – scientist, former employee, and consultant for Philip Morris

USA – testified, consistent with Main Conclusion 5 of NCI Monograph 13, that "**the FTC tar and nicotine yields" do not "actually provide meaningful information to smokers about the amounts of tar and nicotine they will receive from a cigarette brand**." TT 13993:14-19 (emphasis added); DXA0310399-0650 at 0452-0476 at 0423 (US 58700) (A) ("Measurements of tar and nicotine yields using the FTC method do not offer smokers meaningful information on the amount of tar and nicotine they will receive from a cigarette . . . [or about] the relative amounts of tar and nicotine exposure likely to be received from smoking different brands of cigarettes.").

3648. Defendants have known since at least as early as the 1950s that the central component that drives the smoking habit is nicotine, an addictive substance. US FF § III.C(1), supra (Addiction). Accordingly, Defendants also have long been aware that the reason people smoke cigarettes is to attain a sufficient "dose" of nicotine to sustain their addiction. For example, James Morgan, Philip Morris USA President and CEO, testified in 1997 that, based on discussions with Philip Morris Research and Development scientists, he was aware that nicotine is the major component of cigarette satisfaction. 1003287880-7890 at 7884 (US 20163) (O); accord 500380562-0564 (US 20630) (O); 100515899-5910 (US 20230) (A); 1003285403-5416 (US 20159) (A); 500917468-7476 at 7474-76 (US 20660) (A); 105553905-3914 (US 34799) (A); Morgan PD, Minnesota, 9/4/97, 6:24-7:2; Morgan PD, Minnesota, 9/5/97, 286:22-288:9.

3649. The evidence shows that Defendants also have known since the 1960s and 1970s that, because smokers smoke to obtain the desired effects of nicotine, smokers of lower-yield cigarettes tend to adjust their smoking behavior to titrate (i.e., control) their intake of nicotine to achieve desired levels. In fact, the evidence shows that Defendants' internal understanding of it was decades ahead of that of employees and scientists of the Government and the scientific

community. Dr. William Farone, Philip Morris USA employee from 1976 to 1984, including as Director of Applied Research, and expert in "the chemistry and biochemistry of alkaloids and addictive drugs, the chemistry and physics of cigarette smoke, cigarette design and technology, and the chemistry and biochemistry of toxic substances and how they interact with living systems," testified that, during his employment at Philip Morris, Philip Morris had "a greater understanding of compensation than the outside scientific community," and that it is his expert opinion that "the same is true for the other tobacco company Defendants." He added that, in 1966, when the FTC was considering the FTC Method, Defendants knew "that smokers smoked for nicotine" and "that smokers alter their smoking behavior to get nicotine." Farone WD, 2:2-8; 2:15-19; 117:15-118:8; Farone TT, 10/12/04, 2169:18-22; 2170:5-11; 2171:25-2172:8; 2182:11-2190:7; Wigand WD, 8:11-17; 120:5-17.

3650. Dr. Farone testified that, when he was Director of Applied Research at Philip Morris, Philip Morris's own research found that "if we adjusted the design to reduce the nicotine delivery, or if people were given a cigarette of lower nicotine delivery than their usual brand, smokers would 'compensate' – change how they smoked – to get the amount of nicotine they need." Farone WD, 102:2-14; see also Farone WD, 104:7-15 (testifying that he knows Philip Morris was aware of compensation for nicotine "[f]rom conversations that I had with many of my colleagues at Philip Morris while I was working there, including people working under Dr. Dunn in his behavioral research group," and that this knowledge "is evident from the company's own documents").

3651. Dr. Jeffrey Wigand, B&W's Vice President of Research and Development from 1989 to 1993, testified that, during his employment at B&W, "[c]ertainly everyone in my research and development department was well aware of compensation," defined as "smokers

manipulating their smoking behavior to achieve their optimum nicotine reward," and that compensation "was a design consideration that played a central role in all of the cigarettes manufactured at B&W as well as the other BAT Cigarette Affiliated Companies." Wigand WD, 8:11-17; 120:5-17.

3652. Smoker Compensation and the FTC Method. In 1967, the FTC began testing all cigarettes sold in the United States for tar and nicotine yields using a single smoking machine, commonly referred to as the FTC Cigarette Test Method ("FTC Method"). As Dr. Burns testified, "[p]rior to 1967 [when the FTC Method was adopted], the different cigarette manufacturers were making claims about the tar deliveries of their cigarettes which could not be easily reconciled because they were based on numerous different testing methods," which "resulted in consumer confusion." Burns WD, 1:10-15; 12:10-11; 24:18-25:3; Burns TT, 2/15/05, 13311:9-15; Burns TT, 2/15/05, 13356:5-22; 13363:25-13364:6 (discussing the 1960 FTC prohibition of tar and nicotine claims in advertising because of the resulting consumer confusion, which lasted until adoption of the FTC Method).

3653. A consumer research report prepared for B&W explained how Defendants' deceptive marketing practices led the FTC to initially prohibit, and then later permit, the use of tar and nicotine figures in cigarette advertising once a standardized testing method (i.e., the FTC Method) had been implemented:

> In 1955, **the FTC, reacting to conflicting claims as to tar and filtration** . . . imposed 'Cigarette Advertising Guides' banning all mention of tar, nicotine and filtration 'when **not established by competent scientific proof**'. This put a stop to such claims in advertising. In July and August of 1957, the *Reader's Digest* published two articles with figures on tar and nicotine mentioning Kent by name. The August article, written with Kent's assistance was practically an ad for Kent. In 90 days, Kent's sales leaped from 300 million to 3 billion per month. This article broke the dike and set off the famous Tar Derby. Over the next 4 years, tar

> levels were drastically cut. Marlboro dropped from 34 mg. tar in 1957 to 25 mg. in 1958 and 19 mg. in 1961 . . . . In mid 1960, the FTC called off the Tar Derby, rigidly prohibiting tar and nicotine claims. Some of the new low tar brands disappeared. Soon thereafter, **the brands stopped reducing tar levels and, indeed, began to raise them**. Kent, for example, went from 14 mg. in 1961 to 16 mg. in 1963 and 19 mg. in 1966. The FTC prohibition ended March 25, 1966 initiating a new phase in Hi-Fi development.

670917650-7741 at 7664-7665 (US 87913) (A) (emphasis added).

3654. As Dr. Burns' testimony and the B&W report show, the FTC Method was intended to put a stop to Defendants' various conflicting and unsubstantiated claims and provide a standardized and representative approximation of the amount of tar and nicotine generated by Defendants' cigarettes when smoked under identical conditions. Dr. Burns explained that "the purpose of the testing was to allow consumers to select [from among] different brands that would deliver different amounts of tar to them," with the idea that it "would be a valid way for consumers to switch in a way that would reduce their exposure to tar and nicotine." Burns TT, 2/15/05, 13363:25-13364:6.

3655. The FTC Method is conducted by having a machine "smoke" the cigarettes for a designated puff volume at a designated interval. As the smoke is drawn into the machine, it passes over a filter known as a Cambridge pad, on which the particulate tar matter is collected. That accumulated matter is measured to calculate the tar and nicotine yields for the cigarette. The FTC Method was developed to provide consumers with a relative ranking of nicotine, tar, and carbon monoxide yields from various cigarettes. Henningfield WD, 47:11-48:2; Henningfield TT, 11/22/04, 6794:8-6796:6.

3656. Dr. Henningfield testified that, when the FTC first implemented the FTC Method, Defendants were "aware of the role of nicotine in influencing and maintaining smoking

behavior," but that he is "not aware of any evidence that the industry informed the FTC that a major reason that the method could yield misleading data was that nicotine addiction would drive smokers to achieve relatively stable nicotine intakes." Similarly, Dr. Henningfield testified that, to his knowledge, Defendants never informed the public directly that smokers' "physiological need to obtain nicotine substantially lessens the accuracy of the FTC ratings." Henningfield WD, 48:14-49:7.

3657. Dr. Farone testified that, to his knowledge, Defendants did not inform the FTC in 1966 "that smokers alter their smoking behavior to get nicotine." Nor did Defendants "tell consumers directly about the unreliability of the FTC machine as a measure of actual tar and nicotine intake" or "tell [smokers] directly that their smoking behavior was driven by the need to satisfy their nicotine addiction." Farone TT, 10/12/04, 2170:5-23.

3658. Dr. Henningfield elaborated concerning Defendants' response to the adoption of the FTC Method testing:

> Rather than work with the FTC toward procedures that would provide meaningful data, and provide data regarding the actual intake of nicotine from different cigarettes, the tobacco industry began to modify their cigarette designs so as to exploit the particular features of the standardized machine in a way that rendered the tar and nicotine ratings obtained from the machine unrealistically low and thereby defeat the testing method. In their own words, they designed their cigarettes to be more "flexible" dosing systems so that they could advertise that the cigarettes were lower in tar and nicotine delivery, but still deliver tar and nicotine at levels equal to those of "full flavor" products.

Henningfield WD, 54:7-15.

3659. While Defendants maintain that certain statements made by or related to tobacco companies in England indicated that nicotine is addictive and/or smokers compensate for nicotine, Dr. Henningfield explained that "[t]hose conclusions or statements were not being

offered by any major tobacco company in the United States to the public in the '70[s], 80s, [or] forward that I'm aware of, and certainly not in formal hearings." Henningfield TT, 12/1/04, 7540:18-7541:19.

3660. Individual Smoker Variation vs. Smoker Compensation. Defendants "initially resisted imposition of the [FTC] testing method and claimed it would be inaccurate." Defendants claimed that the FTC Method would be inaccurate because different smokers "smoke differently - and even smoke differently at different times." This is known as **smoker variation**, and there is not, and never has been, any real dispute as to this concept. What Defendants withheld from the FTC was their knowledge that smokers' addiction to nicotine would drive them to smoke the lower-delivery cigarettes, which purportedly would cause them to take in less nicotine and tar, more intensely, thereby defeating the stated purpose of the lower-delivery cigarettes. This is known as **smoker compensation**. As is explained more fully below, **smoker compensation**, which is a central element of Defendants' low tar fraud, is entirely separate and distinct from **smoker variation**. Henningfield WD, 48:3-50:12.

3661. Throughout this litigation, Defendants have attempted to conflate smoker compensation with the entirely distinct and separate topic of individual smoker variation. Defendants have claimed that they could not have engaged in fraud with respect to low tar cigarettes because it was known from the time the FTC Test was implemented in 1967 that, because different people smoke cigarettes differently and the FTC Test could not account for these individual variations in smoking behavior, the FTC Test could not indicate with precision the amount of tar and/or nicotine that any individual smoker would receive. For instance, an August 1, 1967 FTC press release described these variations in smoking behavior:

> No two human smokers smoke in the same way. No individual smoker always smokes in the same fashion. The speed at which

> one smokes varies both among smokers, and usually also varies with the same individual under different circumstances even within the same day. Some take long puffs (or draws); some take short puffs. That variation affects the tar and nicotine quantity in the smoke generated.
>
> Even with the same type of cigarette, individual smokers take a different number of puffs per cigarette depending upon the circumstances. When concentrating, or talking, the number of puffs is usually less. When listening, or required to listen to another person talking, the number of puffs per cigarette, as well as duration of each puff, usually increases. Smoking rates while reading a book may differ from smoking rates while viewing a television program. The number of puffs and puff duration (as well as butt length) will vary according to emotional state. Some smokers customarily put their cigarettes down in an ashtray where they burn between puffs; other smokers constantly hold cigarettes in their mouths; others hold them between their fingers.

FTC News Release at 2 (JD-040254) (A); 03573029-3030 at 3029 (US 22244) (A).

3662. While certain documents proffered by Defendants, such as this August 1, 1967 FTC press release, discuss individual smoker variation (i.e., that different people smoke differently from one another), **these documents do not discuss smoker compensation**. As Dr. Benowitz explained**, compensation behavior is entirely distinct and separate from "individual smoker variation"**:

> Individual smoker variation refers to the fact that one smoker may smoke cigarettes – either regular or low tar – differently than another smoker, and that the same person may smoke the same cigarette differently on different occasions. . . . Individual smoker variability relates to the fact that cigarettes are smoked differently by different individuals. **This type of variability is separate and distinct from the issue of compensation, which relates to the phenomenon of smokers smoking purportedly low-delivery cigarettes more intensely in order to achieve their particular desired level of nicotine intake.**

Therefore, Dr. Benowitz explained, a statement "that no two people smoke in the same way" is not a statement about smoker compensation. Benowitz WD, 56:6-23 (emphasis added).

3663. Early FTC documents, such as the FTC's August 1, 1967 press release, do not mention **nicotine** or **addiction**, and do not discuss the fact that nicotine addiction would lead smokers to obtain essentially the same amount of nicotine from so-called low tar cigarettes as they would from regular cigarettes. As such, they **do not discuss smoker compensation, but rather** the distinct and separate notion of **individual smoker variation**. (no bates) (JD-040254) (A); Farone TT, 10/12/04, 2170:5-23.

3664. Public service announcements of the Office on Smoking and Health from the early 1980s relating to the potential for compensation reflected a similarly incomplete and ultimately incorrect view of compensation. As Dr. Burns explained, they "implie[d] that the individual has within [his/her] ability automatically not to compensate; that is, that the compensation is not driven by the addictive process. That was the understanding we had in the early 1980s . . . . It was only after that [] that we understood with precision and specificity how the nicotine drives that smoking change." Burns TT, 2/16/05, 13565:8-13566:4.

3665. The evidence shows that, rather than sharing their knowledge of compensation, Defendants strove to keep it secret. Indeed, Dr. Farone testified that Defendants' superior knowledge of compensation "was closely held within Philip Morris and the tobacco industry." Dr. Farone further testified that there was an "effort on the part of [his] co-workers at Philip Morris, including [his] supervisors, to restrict any public acknowledgment on the part of Philip Morris of the phenomena of compensation." In particular, Dr. Farone testified that a paper on vent hole blocking that one of his colleagues, Max Hausermann, wanted to publish was denied publication several times by Philip Morris until it was changed so that it was "worded in such a way" that it seemed to have less significance. Farone WD, 112:23-113:10; 1005062776-2776 (US 35966) (A); see also US FF § III.D(4)(c)(i), infra. (discussing agreement between BATCo

and Philip Morris not to discuss publicly the issue of compensation with respect to Barclay cigarettes).

3666. Dr. Wigand testified that, during his employment, B&W never shared information on smoker compensation with the public, the FTC or the FDA; in fact, B&W concealed this information: "compensation was one of the controversial topics that we were instructed to treat very carefully when drafting documents." Wigand WD, 8:11-17; 124:14-125:5.

3667. Because smoker compensation is driven by nicotine addiction, the fact that Defendants kept secret their extensive knowledge of smoker compensation is made plainly apparent by the fact that, at present, the Cigarette Company Defendants (except for Liggett) refuse to publicly acknowledge that nicotine is addictive. US FF § III.C(1), supra (addiction).

3668. Defendants suggested an analogy between the FTC tar and nicotine yields and automobile gas mileage estimates, intimating that they are both useful, albeit imperfect. As Dr. Henningfield explained, this comparison is not appropriate:

> [W]e know through that [gas mileage] rating system that if you buy a car with a better gas mileage rating, virtually no matter how you drive it, you're going to get better mileage than a car with a worse rating. But in cigarettes, by just subtle changes in the way you smoke and things that most people don't even know about, the ventilation and the channels and the burn accelerants and all these different tricks, makes those two cigarettes look the same. Thus, for example, when humans smoke Marlboro cigarettes . . . Marlboro Lights can yield approximately twice as much nicotine as the Regulars are claimed to deliver by the standard FTC method. Marlboro Ultra Lights can deliver three times their advertised rating and most of the Carlton brands can deliver seven or more times their advertised rating.

Henningfield WD, 83:14-84:10.

3669. Dr. Henningfield added that "light" cigarette descriptors also "are totally different" than the information on food labels and drug labels, because "if you eat the listed serving size of

[foods], you will receive the amount of [the constituents] listed on the label. . . . By contrast, . . . the advertised FTC tar and nicotine ratings for cigarettes bear very little relation to the actual dose a smoker can and, in most instances, does receive from smoking that cigarette. The inaccuracy in the FTC ratings is especially pronounced for cigarettes sold as 'light' or 'low tar' by the tobacco companies. This discrepancy is especially serious because it is in the direction of more toxins than advertised." Henningfield WD, 84:11-85:3.

3670. Dr. Benowitz testified that the analysis in Monograph 13 studied several categories of evidence to reach its conclusion that compensation is essentially complete:

> [W]hen we did the analysis in Monograph 13 we didn't rely just on this study or this type of study, we tried to look at multiple studies and see, Well, does it look like there's a lot of compensation? And the bottom line was, yes. It's not a hundred percent, but it's substantial.

Benowitz TT, 11/2/04, 4769:25-4770:4.

3671. Dr. Benowitz's chapter of Monograph 13 on smoker compensation included an evaluation of each of the three "different kinds of studies that are generally used to conduct research on compensation": "[1] spontaneous brand switching studies, [2] cross-sectional studies, and [3] forced brand switching studies." Benowitz WD, 62:14-20.

3672. Spontaneous Brand Switching Studies. Dr. Benowitz explained that spontaneous brand switching studies "are more informative of smokers' exposure in the real world when switching from higher to lower yield cigarettes," because "the brand of cigarette has been selected by the smoker and not by the researchers." Dr. Benowitz added that "spontaneous brand switching studies generally show that there is no reduction in smoke intake [including nicotine and tar intake] per cigarette." Referencing his own spontaneous brand switching study, Dr. Benowitz testified:

> For smokers who switched to lower yield cigarettes, the analysis of cotinine concentration or carbon monoxide per cigarette showed no change despite the reduction in nominal machine measured yield. Therefore, these smokers obtained the same dose of nicotine and carbon monoxide from each cigarette even though the machine measured yield was lower.

As stated by Dr. Benowitz, his study demonstrated that: "**For spontaneous brand switchers, there is complete compensation for each cigarette smoked. As a result, for these smokers, switching from higher to lower yield cigarettes is not likely to reduce the risk of smoking.**" The evidence that there is no reduction **per cigarette** by switching to lower tar cigarettes is particularly compelling in light of Dr. Benowitz's testimony that "we do know that **on average people who are smoking lower-yield cigarettes smoke the same or even slightly more than higher-yield cigarettes**." Benowitz WD, 63:22-64:2; 64:14-65:6; 65:14-17; Benowitz TT, 11/2/04, 4762:23-24; 4763:14-16 (emphasis added); see also Benowitz WD, 63:5-10 (explaining that "[c]otinine is a major breakdown product of nicotine" that "is metabolized . . . by the liver" in humans, and therefore "has become the accepted marker for looking at nicotine exposure measurement from tobacco products").

3673. Dr. Benowitz also explained what spontaneous brand switching studies show regarding compensation per cigarette:

> The spontaneous brand switching studies show a high degree of compensation per cigarette. . . . In the studies that I was involved with, smokers took the same amount of nicotine per cigarette from lower yield and higher yield cigarettes. Another study showed that nicotine intake as estimated by measurement of nicotine in metabolites in the urine were no different in individuals who switched from higher to lower machine measured yield cigarettes compared to those who had not switched. . . . The per cigarette figure [is important because it] shows what an individual can take in from a particular cigarette. Thus, it provides information on the delivery characteristics of the product. . . . These studies support the concept of compensation and help explain why low yield cigarettes do not reduce the hazards of smoking.

Benowitz WD, 65:18-66:8.

3674. In the spontaneous brand switching study Dr. Benowitz conducted, "the people who decreased the FTC nicotine yields of their brands basically stayed about the same [as before switching] on a per cigarette basis." He added, "I basically said there was no difference in intake per cigarette" and, on that basis, concluded that compensation is complete. While counsel for Defendants suggested a different approach, Dr. Benowitz, a leading expert on compensation, explained that defense counsel was asking a different question than the Benowitz study was designed to answer:

> What we did in our analysis is say, well, if we look at people who [switched down to] low yield cigarettes . . ., what's the intake per cigarette? That's a different question than what you're asking. . . . [W]e asked the question what happens when you switched to a low yield cigarette, that was what we analyzed. . . . We just made the observation that per cigarette the intake of nicotine stayed the same. That's on the face of it valid. . . . Does a lower yield product deliver the same amount as higher yield product? This study says yes, it can deliver [] exactly the same amount.

Dr. Benowitz added that the approach suggested by defense counsel would have been appropriate for a randomized study, which was not the kind of study conducted by Dr. Benowitz. Benowitz TT, 11/2/04, 4763:19-4764:25; 4766:9-21; 4767:10-23; see also Benowitz TT, 11/2/04, 4768:19-4769:10 (disagreeing with defense counsel's suggested approach, stating "[w]ell, that's addressing a different question," and stating that "[i]f the question is people who switch product, does their exposure per cigarette change? Then you don't need a control group [,which defense counsel suggested including in the analysis]. You can say that it doesn't change. It depends on what question you're asking, and we were asking [that] question").

3675. Forced Brand Switching Studies. Explaining forced brand switching compensation studies, Dr. Benowitz testified that, although they do not customarily show 100%

compensation, this is likely due to the act of forcing participants to switch brands:

> [S]mokers are switched only for the purpose of the research. Motivation and cigarette acceptability differ from the natural situation of brand switching. . . . The forced brand switching studies show on average about eighty percent compensation. . . . **Presumably compensation is not complete because the smokers have been switched to cigarettes that were not of their own choosing**.

Benowitz WD, 68:6-21; 70:19-24 (emphasis added).

3676. Cross-Sectional Studies. Dr. Benowitz noted that cross-sectional studies also lead to the conclusion that compensation is essentially complete:

> Cross-sectional studies involve sampling smokers in the general population who are smoking their own chosen brand of cigarettes . . . . show that there is very little difference in tobacco smoke exposure in people smoking cigarettes with different machine-determined yields. . . . There have been many cross-sectional studies performed, and overall they demonstrate that while there are some differences in nicotine exposure when high- and low-yield cigarette brands are compared, these differences are quite small. . . . Cross-sectional studies show nearly 100 percent compensation.

Benowitz WD, 66:9-68:5.

3677. Both Drs. Burns and Benowitz testified that – in cross-sectional studies where the participants themselves choose the tar level of their cigarettes – there is a "very shallow slope" or "very tiny slope across the range of tar and nicotine" comparing the nicotine intake of smokers of various tar levels, demonstrating that smokers who smoke cigarettes of widely varied FTC tar levels are ingesting similar amounts of nicotine. This is an indicator that compensation is essentially complete. As Dr. Burns explained, the fact that lower tar smokers may show, on the whole, slightly lower levels of nicotine than higher tar smokers does not mean that the lower levels are the result of the type of cigarette, but instead indicates that the nicotine quota of smokers able to smoke lower tar cigarettes is customarily lower:

> The effect is one that one would expect to be present as a small slope, since one would expect that high yield smokers would be likely to have higher nicotine levels and that the very lowest yield cigarette smokers would be there because they don't need much nicotine. **That's independent of the brand of cigarettes they smoke. That's why they chose those brands. It's not an effect of the brand that they smoke**. And so **you would expect to see a small slope. The fact that the slope is as small as it is suggests that . . . there is full compensation on a population level when people in the natural setting move from one brand to another.**

Dr. Benowitz testified that his 1983 study, which showed this "very shallow slope," had been "replicated [in]numerable times by other scientists," and that "those studies show basically the same picture, that there's a very shallow slope between the machine yield and cotinine levels." Burns TT, 2/16/05, 13541:8-13542:14; Benowitz WD, 67:10-18 (discussing his 1983 cross-sectional study); Benowitz TT, 11/1/04, 4564:13-15; Benowitz TT, 11/2/04, 4826:13-4827:5; see also Burns TT, 2/16/05, 13547:7-11 (indicating that the Gori and Lynch compensation study "was presented and examined in [Monograph 13] by Dr. Benowitz and was part of the data that was examined in that chapter that reached the conclusion that compensation was essentially complete").

3678. Defendants failed to call a witness at trial qualified to challenge the testimony of Drs. Benowitz, Burns, Henningfield, and Farone regarding smoker compensation. Instead, Joint Defendants relied upon tobacco industry scientist Michael Dixon, PhD, an employee of BATCo, one of the Defendants in this case, to testify as an expert in "human smoking behavior." Dr. Dixon, however, lacks qualifications to be able to testify credibly about smoker compensation. Dr. Dixon is not a medical doctor or an epidemiologist, but rather holds a PhD in respiratory physiology. Dr. Dixon testified that he is "not an expert on whether or not there is a reduction in health risks by switching down to a lower FTC-rated cigarette." Furthermore, by his own admission, Dr. Dixon is not an expert in addiction, is not qualified to testify regarding the

addictive properties of nicotine, and has never been accepted in a court of law as an expert on addiction. Dr. Dixon further admitted that nowhere in his written direct examination did he even mention the subject of nicotine addiction. He has not published any articles on the subject of nicotine addiction, and there is nothing in the record to suggest that he has published a single peer-reviewed publication on any subject. Without any expertise in nicotine addiction, Dr. Dixon's testimony as to whether nicotine addiction drives smokers to compensate is not entitled to any weight. In fact, Dr. Dixon's opinion that smokers compensate for tar is contradicted by the testimony of Jeffrey Wigand, former B&W Vice President of Research and Development from 1989 to 1993, who testified that the notion that smokers compensate for tar was "not my understanding within the context of my work at Brown & Williamson." The education, training, and professional qualifications of Drs. Benowitz, Henningfield, and Burns are far superior to that of Dr. Dixon. They are more credible witnesses than Dr. Dixon. Dixon WD, 2:1-8; 3:1-9; Dixon TT, 3/9/05, 14917:5-9; 14960:16-14961:7; 14997:6-15001:11; Wigand TT, 1/31/05, 11646:24-116474.

3679. Dr. Dixon also appears to have both professional and financial motives for giving testimony favorable to Defendants. He has worked for various tobacco companies for nearly 25 years, currently is paid approximately $160,000 per year in salary and bonus by one of the Defendants in this case (BATCo), and owns roughly 1,600 shares of BATCo stock. As part of his employment, Dr. Dixon occasionally spends over half his time giving testimony and working with BATCo lawyers. Dr. Dixon further admitted that the fact that he had done "a very good job in testifying" had been mentioned in his performance appraisal. Dixon TT, 3/9/05, 14955:2-11; 14975:14-18; 14982:5-14; 14985:23-14986:18; 14987:22-14988:23; 14991:11-14992:22; 14995:1-17; accord 321155579-5580 at 5579 (US 46683) (A) (Hugh Honeycutt, former B&W

Director of Research Services and Analytical Research, describing Dr. Dixon on March 26, 1999 as a "full-time litigation witness").

3680. Defendants also called a statistician, William Wecker, who has "never been qualified by a Court as an expert on the issues of addiction or compensation," has never published a peer-reviewed article related to addiction or smoker compensation, and is not even aware of why smokers compensate. Dr. Wecker admitted that Dr. Neal Benowitz, on the other hand, "is a seminal researcher on the issue of compensation." Wecker TT, 3/15/05, 15649:22-23; 15651:7-11; Wecker TT, 3/16/05, 15725:9-12; 15725:4-6.

3681. Dr. Wecker offered opinions based on an **unpublished** statistical analysis he performed in which he examined **only select portions** of some of the cross-sectional studies analyzed in Chapter 3 of Monograph 13 on cigarettes in certain tar ranges corresponding to RJR cigarettes. Wecker TT, 3/16/05, 15728:6-15729:19; 15743:9-15746:17 (indicating his calculations included only portions of some of the cross-sectional studies analyzed in Monograph 13, because his analysis was prepared for another case confined to RJR cigarettes within a certain range of tar and nicotine delivery).

3682. Dr. Wecker's testimony on smoker compensation is not credible. As Dr. Benowitz explained, the 47% compensation figure arrived at by Dr. Wecker simply is not consistent with the numerous cross-sectional studies on compensation:

> **If there's [roughly] 50 percent compensation**, it would mean that the person at the low end would be taking more, but only half as much as if it was full compensation. So what we would be seeing instead of a shallow slope that has 15 or maybe – – even if it was 23 percent, as we talked about as a slope, **you would be seeing a slope that is quite substantial. . . . and that's just not been seen in any of the data. Not my data**. And I have to say that besides the Gori study, **there have been six or eight or ten other studies that have looked at the same question and they all show very similar shallow slope** or most of them do.

Benowitz TT, 11/2/04, 4824:13-4826:11; Wecker TT, 3/16/05, 15725:20-22 (discussing 47% figure).

3683. In addition, Dr. Wecker was largely unable to provide a satisfactory explanation for the numerous errors and discrepancies between the demonstrative of calculations Dr. Wecker provided to the Court and his underlying data for those calculations in arriving at the 47% figure. Wecker TT, 3/16/05, 15730:21-15731:12; 15733:13-15735:23; 15741:16-15743:8; (no bates) (US 93178) (A) ("Tab 20" – Dr. Wecker's underlying calculations).

3684. Defendants also sought to support their contention that compensation is not complete through the testimony of Joseph Mulholland, an FTC staff economist. Dr. Mulholland (noting specifically that the FTC, although it has looked at compensation, has not taken a position on the issue) testified that, in his personal view, he did not agree with the conclusions of Monograph 13 in regard to compensation and that compensation is not complete for a majority of smokers. Mulholland WD, 19:3-5, 10-11, 19:18-20:13, 21:5-14; Mulholland TT, 4/25/05, 19886:17-19887:8, 19887:18-19888:4, 19892:3-7, 19943:16-19945:1. While the Court acknowledges Dr. Mulholland's extensive knowledge and experience as a **staff economist** concerning certain smoking-related issues, for the reasons set forth in Section III.D(4)(a), Dr. Mulholland's testimony in this regard is marginally, if at all, relevant, and does not begin to overcome the overwhelming testimony presented by the United States, through its qualified and knowledgeable experts and Defendants' own documents, that smoker compensation has effectively nullified any possible health benefits arising from the sale of low tar cigarettes.

(i) Tobacco Institute

3685. When the FTC Method was adopted, the Tobacco Institute offered several criticisms in an August 1, 1967 press release, but none of the criticisms had to do with smoker

compensation. Instead, the Tobacco Institute criticized the number of cigarettes tested, the length of the cigarette smoked, and the lack of dissemination of tar yields per cigarette puff. The Tobacco Institute stated that "there is no valid scientific evidence to show that . . . ‘tar' and nicotine [] are responsible for any human illness" and then, in what now can be recognized as a classic diversionary move, went on to propose several changes to the FTC Method, most of which were based on claims that FTC tar and nicotine yields were **inaccurately high**. The Tobacco Institute argued that twice as many sample cigarettes should be tested to arrive at FTC yields, that the FTC Method should use a longer butt-length (which would have lowered FTC tar and nicotine yields by smoking less of the cigarette), and that tar and nicotine yields should be disclosed on a per-puff, as well as a per-cigarette, basis. In this context, the Tobacco Institute contended that the FTC Method "may be deceptive because a smoker may assume his cigarette is delivering the amount of ‘tar' and nicotine reported by the FTC **when in fact it will be delivering much less**, the way he smokes." TIMN0120846-0849 at 0847-0848 (US 87967) (O) (emphasis added).

3686. A January 8, 1981 Tobacco Institute document entitled "Health Effects of Smoking Low Tar, Low Nicotine Filter Tipped Cigarettes" summarized several meetings, most notably a June 1980 scientific meeting convened by "the Office of Smoking and Health of the Department of Health and Human Services" that was anticipated to "most likely be the backbone and meat of the Surgeon General's 1981 Report to Congress." Despite the document's indications that the meeting's participants' understanding of the potential for smoker compensation was incomplete and limited compared to that of Defendants (evidenced by Defendants' extensive documentation of compensation predating this meeting, described infra), the report's "Opinion and Recommendations" stated: "From the industry's point of view, there would appear to be no

need for any particular statement to be made, because the evidence is still coming in and it would be premature to make such a statement." Regarding discussion of compensation at the scientific meeting, the report stated merely that "there have been claims that smokers alter their smoking technique depending on the type of cigarette they choose to smoke" and that, "[w]hile much of the information on this issue is anecdotal and limited, questions and claims are likely to continue." TIMN 0133721-3734 at 3723, 3724, 3730, 3732 (US 85125) (A).

(ii) Philip Morris

3687. In a March 24, 1961 Philip Morris memorandum from Wakeham to Hugh Cullman , "Trends of Tar and Nicotine Deliveries over the last 5 Years," Wakeham stated: "As we know, all too often the smoker who switches to a hi-fi cigarette winds up smoking more units in order to provide himself with the delivery which he had before." Dr. Burns explained that this exhibit "indicated that the companies knew that smokers were smoking to derive a fixed amount of nicotine and would change their smoking behaviors (compensate) to preserve that intake of nicotine when cigarettes were modified to deliver a lower dose of nicotine under machine smoking protocols. 1000861953-1953 (US 35484) (A); Burns WD, 465:15-20; see also Farone WD, 104:16-105:9 ("[T]his research into and understanding of compensation influence[d] how Philip Morris designed cigarettes").

3688. As Philip Morris marketing researcher Myron E. Johnston noted in a June 1966 Philip Morris report entitled "Market Potential for a Health Cigarette": "[A]ny health cigarette must compromise between health implications on the one hand and flavor and nicotine on the other. It seems clear from the performance of existing health cigarette entries that flavor and nicotine are both necessary to sell a cigarette. **A cigarette that does not deliver nicotine cannot satisfy the habituated smoker and cannot lead to habituation, and would therefore almost**

certainly fail." 1001913853-3878 at 3860 (U.S. Ex. 20123) (A) (emphasis added).

3689. A July 28, 1967 Philip Morris USA memorandum from W.L. Dunn, Jr., then Associate Principal Scientist, to R.B. Seligman, Director of Development, admitted that cigarette ventilation holes (which are supposed to lower tar yields) were placed where they would be covered up by smokers (thus increasing tar delivery), but not by machine smoking methods such as the FTC Method:

> An earlier study (Memo of June 27, 1967) established that lip contact with the tipping paper extended to 9.96 mm from the outer end of the tipping paper for the average smokers. Since the air dilution holes are located in a band from 8.0 to 9.7 mm from the outer end of the tipping paper, it follows that some of these holes are likely to be occluded under normal smoking conditions, whereas no occlusion is likely to occur when the cigarettes are machine smoked for analysis.

The memorandum also documents Philip Morris USA's awareness of compensation for nicotine delivery, postulating that "[s]mokers adjust puff intake in order to maintain TPM and/or nicotine constancy." 1003295500-5502 at 5500, 5502 (US 88627) (O).

3690. An August 11, 1967 Philip Morris USA document from Helmut Wakeham, Director of Research and Development, to Paul D. Smith, Vice President and General Counsel, stated that human smokers increased their smoke intake when switching from non-filter to filter cigarettes, in the process receiving the same amount of tar and nicotine from filter cigarettes as from non-filter cigarettes and rendering machine-smoking tar and nicotine yields for low tar cigarettes "erroneous and misleading":

> Two tests conducted at Product Opinion Laboratories demonstrate that in smoking a dilution filter cigaret, the smoker adjusts his puff to receive about the same amount of ‘undiluted' smoke in each case. . . . In the smoking machine the puff volume is constant so that with dilution the quantity of ‘equivalent undiluted smoke' delivered to the Cambridge filter is reduced. Not so with the human smoker who appears to adjust to the diluted smoke by

> taking a **larger puff** so that he still gets about the same amount of equivalent undiluted smoke. . . . The smoker is, thus, apparently defeating the purpose of dilution to give him less ‘smoke' per puff. He is certainly not performing like the standard smoking machine; and to this extent the smoking machine data appear to be erroneous and misleading. It has probably always been so for diluted smoke cigarettes, whether dilution is obtained by porous paper or holes in the filter.

1000322554-2555 (US 35224) (A) (emphasis in original); see also Dr. Jerry Whidby WD, 17:16-19:11 (testifying that "Product Opinion Laboratories was a facility established by Philip Morris to evaluate smokers' reaction to the cigarette brands Philip Morris was selling, as well as to Philip Morris's prototype cigarettes," and that he is not "aware of any instance, at any time between when Dr. Wakeham wrote this document in 1967 and when [Dr. Whidby] left the company in 1998, in which Philip Morris informed the American public directly of Wakeham's conclusions that the FTC tar and nicotine yields are apparently 'erroneous and misleading,'" and "dilution filter cigarettes generated lower FTC yields than non-dilution cigarettes, but delivered about the same amount of smoke to smokers").

3691. Dr. Farone provided the following testimony about the significance of Wakeham's statements in this document:

> It shows that Philip Morris understood the puff compensation phenomenon. This document shows that by 1967, Philip Morris recognized that when you have dilution or ventilation, the mechanism for compensation is puff adjustment. . . . this document [also] shows that Philip Morris knew in 1967 that human smokers compensated by increasing their smoke intake when switching from non-filter to filter cigarettes, and in doing so, smokers received the same amount of tar and nicotine from their filter cigarettes as from non-filter cigarettes. **It also shows Wakeham's understanding that the FTC tar and nicotine yields for low tar cigarettes are erroneous and misleading**.

Farone WD, 111:5-112:15 (emphasis added).

3692. Dr. Whidby testified that, since roughly the mid-1970s, the "vast majority of the

low tar and ultra-low tar cigarettes sold by Philip Morris in the United States . . . are dilution cigarettes." Whidby WD, 19:16-18.

3693. In an August 25, 1967 Report on Project 1600, William Dunn, Senior Scientist, outlined an additional study performed by Philip Morris on puffing, with findings that "as dilution air puff volume is decreased by lip coverage, gross puff volume is correspondingly decreased." Dunn stated that the study added "further support to the postulate that **smokers adjust puff intake in order to maintain constant smoke intake**." 1003288337-8338 at 8337 (US 85049) (O) (emphasis added).

3694. A speech in Fall 1969 to the Board of Philip Morris reported: "It would appear that **smokers do modify their smoking habits in order to obtain a preferred [nicotine] intake level**." 1003287880-7890 at 7884 (US 20163) (O) (emphasis added).

3695. A November 26, 1969 internal industry paper by Helmut Wakeham, Philip Morris Vice President of Corporate Research and Development, entitled "Smoker Psychology Research" and presented to the Philip Morris Board of Directors stated: "This great variability among smokers results from the fact that a smoker tends to seek his own level of intake. Even while smoking a single cigaret, he adjusts the volume of his puff as he goes down to the rod, compensating for the change in the density of the available smoke. . . . A smoker's intake level is determined by the smoker himself, not by the manufacturers of the cigarettes." 1000273741-3771 at 3748 (US 26080) (A).

3696. A September 2, 1970 Philip Morris memorandum from Ray Fagan to Wakeham indicated confirmed that Philip Morris's understanding was that smokers compensated for lower deliveries by smoking more cigarettes:

> In the last 15 years particulates in cigarette smoke have declined by 33%; however, the number of cigarettes per smoker has increased.

> Furthermore, experimental studies have shown that a smoker will increase the number of cigarets he smokes if the cigaret he is offered contains less particulates and less nicotine.

This Philip Morris memorandum also stated that, while the FTC Method's implicit "assumption that 'tar' is 'tar' is 'tar'" superficially "seems like a reasonable assumption, there is little reason to validate it. As a matter of fact, much of the evidence available seems to point in the opposite direction." 2022244449-4450 at 4449-4450 (US 36855) (A); Farone WD, 110:6-14; 118:9-23.

3697. A November 1971 Philip Morris Special Research Report written by Tom Schori also addressed compensation by increasing the number of cigarettes smoked. As Dr. Farone explained, "[w]hen the smokers were switched between these various cigarettes, as tar delivery decreased from that to which the smokers were accustomed, cigarette consumption increased. This resulted in a tendency for the smokers' daily intake of tar to remain constant even though the tar deliveries of the cigarettes he smoked differed markedly." The last sentence of the abstract in this report stated: "These findings support the hypothesis that the smoker does have daily intake quotas for tar and/or nicotine and that he titrates his smoke intake to meet these quotas." 1000350158-0188 at 0161-0162 (US 20176) (A); Farone WD, 110:15-111:1.

3698. A January 1972 document from Philip Morris Research Center, written by Tom Schori and William Dunn, recounted Philip Morris's evidence indicating that smokers compensated when smoking brands supplying less nicotine in order to receive their "daily nicotine intake quota," stating:

> Cigarette consumption rate, i.e., number of cigarettes smoked per day, was found to vary as a function of the nicotine delivery of these cigarettes. Specifically, as nicotine increased, cigarette consumption decreased. **These findings support the notion that smokers develop a daily nicotine intake quota and that when smoking cigarettes differing in nicotine delivery from that which they are accustomed they tend to modify their consumption rate in order to maintain their normal quota. No**

> **support was found for the analogous notion of a daily tar intake quota, however.**

1003285403-5416 at 5403 (US 20159) (A) 2062951266-1279 at 1266 (US 39723) (A) (emphasis added); Farone WD, 111:1-4 (referring to US 20159); Henningfield WD, 94:14-21 (referring to US 39723 as a "significant in terms of Defendants' knowledge and understanding of the addictiveness of nicotine from the 1970s").

3699. A May 14, 1975 Philip Morris memorandum from William Dunn to Robert Seligman, Vice President for Tobacco Science and Research, stated:

> Underlying all of our work in this area is the conviction **what the smoker gets in the way of smoke is independent of smoke concentration levels as delivered within the range of commercially available cigarettes. He has a variety of regulatory maneuvers at his disposal for accommodating supply to a fairly constant need [for nicotine]**. To monitor all of these maneuvers simultaneously is a major objective of our behavioral research program.

1000024914-4920 at 4915 (US 26072) (A) (emphasis added).

3700. Human Smoker Simulator. An August 19, 1977 Special Report from the Philip Morris USA Research Center written by Barbro Goodman, a Research Scientist, and entitled "Summary of Human Smoker Simulator Program," described Philip Morris's "Human Smoker Simulator," a mechanism Philip Morris used to replicate human smoking behavior. The Simulator recorded how smokers smoked particular cigarettes by measuring their puffing behavior, then played back the recording into a smoking machine so the machine could replicate – and then measure – the amount of smoke constituents and the chemical composition obtained from a cigarette when smoked like the human had smoked it. The document states: "**The Smoker Simulator program has the instrumentation to measure those smoker variations that constitute a smoker's puffing profile and a programmable smoking machine to**

measure the resulting tar, nicotine, and water deliveries." 1003728025-8039 at 8027 (US 20179) (A) (emphasis added); Whidby WD, 21:19-28:9; Whidby TT, 2/22/05, 13989:19-13991:6; see also 1003293476-3493 at 3484 (US 85073) (A) ("The cassette tape impulses an electronic smoking machine which **duplicates exactly the smoking behavior of a given individual with a given cigarette**. Delivery of tar, nicotine, and other smoke components can then be determined at the same conditions.") (emphasis added).

3701. This report includes a number of statements reflecting Philip Morris's understanding of smoker compensation and how smoker compensation is affected by cigarette design parameters:

> That roughly 20% or less of smokers take puffs equal to or smaller to those taken by the FTC Method machine smoking protocol.
>
> "The varying puff sizes in turn also give increased deliveries above those of" the FTC Method.
>
> "Smoker profile characteristics have been found to be affected by the cigarette design parameters to varying degrees."
>
> "A cigarette **designed such that it causes the smoker to take larger puffs** than the compared model could easily be perceived as having more impact (desirable or undesirable as the case may be)"
>
> lists low resistance to draw and "high filter dilution" as the top two "physical cigarette designs that have the effect of increasing a smoker's puff volumes."
>
> "In conclusion, when a smoker is presented with a cigarette other than his normal brand, it is possible to estimate the maximum flow rate to a certain degree. The puff duration will increase with increasing RTD [resistance to draw] and/or filter dilution. Since the volume is based on both flow and duration, the puff volume will change accordingly."
>
> Test results showing that smokers of full-flavor, light and ultralight cigarettes all took larger puffs than in the FTC Method, and that the smokers' puffs were increasingly large for lower tar cigarettes, so that, **for full-flavor smokers, "average tar deliveries were**

> **45% higher than" the FTC yields, low tar smokers' "showed a higher rate of increase, 81%," and, for ultralight cigarettes, "[t]he average tar delivery" was "more than three times that of" the FTC yield.**

1003728025-8039 at 8027, 8028, 8032, 8034, 8036, 8037 (US 20179) (A) (emphasis added); Whidby WD, 22:18-23:9; 23:17-21; 24:6-13; 25:14-18; 26:21-27:5; 27:15-28:9; see also 2025986350-6401 at 6353, 6384 (US 87080) (A); Whidby WD, 53:10-54:21 ("Preliminary results suggest that **inhalation patterns are modified in response to changes in the available nicotine** in the cigarette smoked. . . . The results from studies which analyze blood plasma and urine nicotine concentrations . . . suggest that **nicotine compensation is fairly complete**.").

3702. A September 17, 1975 Philip Morris document from Goodman to Leo F. Meyer, Philip Morris Director of Research, that reflected results of Philip Morris's studies with its Human Smoker Simulator, reported that, due to compensation, smokers got as much tar and nicotine from Marlboro Lights as from full-flavor Marlboros:

> **Marlboro Lights cigarettes were not smoked like regular Marlboros**. There were differences in the size and frequency of the puffs, with larger volumes taken on Marlboro Lights by both regular Marlboro Smokers and Marlboro Lights smokers. . . . The panelists smoked the cigarettes according to physical properties; i.e., the dilution and the lower RTD of Marlboro Lights caused the smokers to take larger puffs on that cigarette than on Marlboro 85's. The larger puffs, in turn, increased the delivery of Marlboro lights proportionally. **In effect, the Marlboro 85 smokers in this study did not achieve any reduction in smoke intake by smoking a cigarette (Marlboro Lights) normally considered lower in delivery**.

The report's "Conclusions" section noted that "**[t]he smoker data collected in this study are in agreement with results found in other project studies**." 2021544486-4496 at 4486-4488 (US 20348) (A) (emphasis added); see also Farone WD, 113:11-20 (indicating that US 20348 "supports my point – shown in other documents as well – that where a 'light' version of a brand

varies in limited ways from its full flavor counterpart, compensation will cause the smoker to take in basically the same amount of toxins."); see also Whidby WD, 45:11-12 (noting, in the context of this exhibit, that "Marlboro 85's" refers to Marlboro Reds, a full-flavor cigarette brand).

3703. As Dr. Burns explained, "there are three things that are powerfully significant in this document":

> (1) It "very clearly demonstrates that, in contrast to what we believed six years later when we wrote the 1981 Surgeon General's Report, smokers who smoked brands of cigarettes on the market in 1975 were not getting different yields when they smoked those products. We [in the public health community] believed they were."
>
> (2) "[T]his is dated 1975, six years prior to the time the [1981] Surgeon General's Report reached its conclusion. And we did not have access to this information or comparable information."
>
> (3) "[T]his study was done on a machine that mimicked actual smoking behaviors, that actually matched the behavior of the individual when the machine smoked the cigarette. In 1981, one of the recommendations that we made . . . was that this type of machine should be developed so that we could develop a better understanding of the relationship between delivery of tar and nicotine of these cigarettes when they were actually smoked. So . . . six years prior to the time we were reviewing that evidence for the Surgeon General, this information was available to Philip Morris."

Burns WD, 52:15-53:12.

3704. Only two other Philip Morris Human Smoker Simulator reports compared the deliveries of the full flavor and light versions of brands Philip Morris was selling. These other studies compared the smoking behavior of smokers smoking Philip Morris's Marlboro Red (full-flavor) and Marlboro Lights brands. One was conducted on January 3, 1975, and did not measure tar and nicotine delivery through the Human Smoker Simulator. The other, dated

September 23, 1976, measured the smoking behavior – and resulting tar and nicotine deliveries – of 150 regular cigarette smokers for several years. This Human Smoker study's results revealed that, while Marlboro 100s are both full-flavor cigarettes and longer in length than Marlboro Lights, "the tar and nicotine yields for these two brands are basically identical." Whidby TT, 2/22/05, 14099:12-14106:6; 14106:15-14107:1; 1003727277-7298 at 7280, 7281, 7290 (JD-040539) (A).

3705. Seeking to downplay the significance of these reports, Dr. Whidby offered generalized testimony about the results of the September 17, 1975 and September 23, 1976 studies in conjunction with 13 other Philip Morris Human Smoker Simulator studies. From this set of studies, Dr. Whidby offered his lay opinion that cigarettes in general with increased filtration and dilution and increased resistance to draw are "associated with" reduced delivery to human smokers. However, when asked whether the 15 studies "are the[] only reported human smoker simulator studies by Philip Morris," Dr. Whidby replied, "I don't think they are, no." Moreover, Dr. Whidby also acknowledged that "a lot of [the other 13 studies] use[d] experimental cigarettes," as opposed to the cigarettes Philip Morris sells, including experimental cigarettes that "had different circumferences" and cigarettes with "added nicotine." In light of this, the Court finds that the studies measuring the relative deliveries of the full-flavor Marlboro and Marlboro Light cigarettes that Philip Morris sold in the United States are most probative, and these studies reveal that the Marlboro and Marlboro Lights brands had comparable yields as measured by the Human Smoker Simulator. Whidby TT, 2/22/05, 14075:8-14; 14076:16-23;14073:10-16; 14087:20-14088:18; 14089:23-14091:4; 14091:18-14092:2; 14099:1-11.

3706. Dr. Whidby testified that, in 1978, Philip Morris changed the filter on its Marlboro Lights cigarette to a filter with increased resistance to draw. However, while Philip

Morris conducted Human Smoker Simulator studies after this filter change until at least 1980, Philip Morris failed to introduce any Human Smoker Simulator studies or other evidence approximating the relative deliveries to smokers of Marlboro full-flavor and Marlboro Lights after the filter change. Philip Morris also failed to provide evidence of whether Philip Morris made other changes to Marlboro Lights in concurrence with or in addition to the changed filter. As a result, there is no evidence indicating that the delivery to human smokers of the Marlboro Light cigarette with a changed filter relative to the Marlboro full-flavor brands would be substantively different than that represented in the September 17, 1975 and September 23, 1976 studies depicted above. Whidby TT, 2/22/05, 14066:24-14067:19.

3707. A Philip Morris Report dated July 20, 1981 with the heading "Philip Morris USA Research Center," written by Frank Gullotta and J.A. Jones and sent to William Dunn and 40 others, including Dr. Whidby, described Philip Morris's Human Smoker Simulator program as "a system . . . which **permits relatively unobtrusive monitoring of a smoker's inhalation patterns outside the laboratory setting**," and indicated that "the **system's accuracy was highly satisfactory throughout the experiment**" and had "a mean accuracy reading of 96% . . . for 70 experimental sessions." The Report also indicated:

> A major barrier to investigations on smoke-laden inhalation patterns has been the lack of instrumentation which would accurately measure inhalation parameters, and yet be unobtrusive to the smoker. **The system we have acquired breaks this barrier by permitting accurate and relatively unobtrusive monitoring of inhalation patterns under natural smoking conditions.**

Dr. Whidby, a former long-time employee and current paid consultant for Philip Morris, contended that the Human Smoker Simulator was obtrusive and inaccurate or had other limitations, but the Court finds that Dr. Whidby's testimony is contradicted by the statements in this Philip Morris Report, which Dr. Whidby admitted "was written about the time that Philip

Morris shut down the human smoking simulator program." 2025986350-6401 at 6352-6353, 6382 (US 87080)(A) (emphasis added); Whidby TT, 2/22/05, 14001:3-25; 14060:10-14061:14; ;14107:2-21; 14107:25-14108:6.

3708. Dr. Whidby testified that, after 1981, roughly when Philip Morris stopped doing testing with the Human Smoker Simulator, Philip Morris did not use the Human Smoker Simulator or any other method to simulate how human smokers smoke. Since it discontinued the Human Smoker Simulator research, "Philip Morris hasn't developed any other machine testing method that is better than the FTC method at approximating human smoker intake." Whidby TT, 2/22/05,13991:15-13992:13.

3709. A May 1976 study prepared for Philip Morris by The Roper Organization, Inc., stated: "There is some evidence that two criticisms of low tar brands – fast burning and hard to draw on – translate into more smoking once someone has switched to a low tar brand. . . . Low tar smokers were much more inclined than smokers of other types to say they are smoking more." 2024921314-1612 at 1349 (US 20403) (A).

3710. A March 1, 1977 Philip Morris memorandum from Stanley Schachter to Thomas Osdene, Director of Research, shows that Philip Morris had a clear understanding of compensation for nicotine. Among the conclusions were: "Serious smokers smoke to prevent withdrawal. **Smokers regulate nicotine intake** . . . . The smoker who fails to regulate suffers withdrawal." 1000046626-6661 at 6654-6655 (US 35105) (O) (emphasis added).

3711. Philip Morris research in 1977 and 1979, using smoking machines puffing with parameters that simulate how humans puff their cigarettes, showed that the actual yield of tar and other tobacco constituents was substantially higher than that predicted by the FTC standard smoking machine method. The discrepancies were greater for cigarettes with low FTC tar

values, consistent with the concept of compensation. 1003728025-8039 (US 20179) (A).

3712. A January 1979 study prepared for Philip Morris by Goldstein/Krall Marketing Resources, Inc., stated:

> [R]espondents tended to say that they thought they were smoking a greater number of cigarettes. **This might be attributed to the presumed need to compensate for less taste and tar and nicotine** . . . . It should be pointed out that respondents also verbalized that they were ‘smoking less', but from the standpoint of less tar and nicotine, not frequency . . . [F]urthermore, many respondents feel they are smoking less in the sense that they are taking in less tar and nicotine as a result of smoking ultra low tar cigarettes. Also, there seemed to be some feeling that more cigarettes could be smoked with less harm because of significantly lower tar levels . . . the likelihood of ultra low tar smokers taking another step and stopping does not seem great. There appears to be a concept involved that might be called ‘limiting' . . . It could be hypothesized that a potential next step, if taken at all, would be to limit the number of cigarettes they smoke. But since they seem to feel somewhat safer and freer about smoking and in some respects, may be compensating for a lack of taste, they could actually be smoking a larger number of cigarettes per day.

2040066740-6766 at 6750-6751, 6754-6755 (US 20435) (O).

3713. An October 16, 1981 memorandum from Jan Jones to William Dunn entitled "Nicotine Retention Research Proposal" stated:

> Research on smoke-laden inhalation patterns, using the ambulatory monitoring instrumentation, has provided preliminary evidence that **inhalation behavior is modifiable, and is altered as a function of changes in the nicotine delivery of the cigarette**. We are observing changes in inhalation parameters in the direction which **would suggest compensation for increases or decreases in nicotine relative to the subject's usual brand**.

1000136372-6373 at 6372 (US 35162) (O) (emphasis added).

3714. In a March 2, 1992 Philip Morris memorandum, "Menthol Full Flavor Vs. Low Tar Qualitative Study," Shari Teitelbaum reported on the results of a study conducted to "understand the awareness, attitudes and perceptions that African-American full flavor menthol

smokers have toward low tar menthol cigarettes." Teitelbaum reported that "[t]hose who had tried a light menthol cigarette were dissatisfied with the taste. Many felt they would have to smoke more cigarettes to get similar satisfaction. Here, it is possible that economic concerns partially influence their choice of full flavor cigarettes (i.e., 'more bang for the buck')." Teitelbaum further reported that, among these consumers, "low tar menthol cigarettes were considered to be for women and people who want to quit." 2071376833-6834 at 6833 (US 27273) (O).

3715. In a November 29, 1982 report, "The Effect of Cigarette Nicotine Content on Smoker Puff Parameters and Deliveries," Philip Morris scientists reported the results of their study of "puff number, puff volumes, puff durations, flow rates and puff intervals," which showed smokers "generally tended to decrease puff duration, puff number and puff volume and increase puff interval as the nicotine level of the cigarette increased." 1000408760-8809 at 8762, 8764, 8771 (US 35272) (O).

3716. Carolyn Levy, a research scientist for Philip Morris in its Behavioral Research Group from 1975-1980, testified that she "worked on the issue of whether individuals regulated the amount of nicotine they obtained from smoke," and as part of that work she "monitored how smokers inhaled smoke from cigarettes with varying tar and nicotine deliveries." Levy further testified that, as a result of this research, she was able to "gather evidence that some people change their smoking behavior in response to cigarettes with differing tar and nicotine deliveries." Levy testified that, when she requested publication: "I was told not to publish or was not given approval to publish by the manuscript review board." Levy WD, 10:16-11:15.

3717. A July 29, 1987 Philip Morris document with a September 2, 1987 transmittal note from INBIFO, Philip Morris's research facility in Germany, from Wolf Reininghaus,

General Manager of Contract Research at INBIFO, to Walter Fink, Philip Morris researcher, concluded that reduction in tar levels would, at a certain point, deprive smokers of the necessary quantum of nicotine to satisfy an addicted smoker: "Any future reduction of tar levels will come into conflict with a twofold limit, as 1) a minimum amount of nicotine is needed for the smoker's satisfaction (ca. 0,8 mg/cig) and (2) there exists a maximum concentration of nicotine in smoke to let the taste of the latter unaffected [sic] (less than 10%)." 2023186690-6690A (US 20379) (O).

3718. A September 12, 1995 Philip Morris memorandum from Shelby Rafferty and Lauren Steen, "Menthol Launch Meeting Recap," discussed a meeting held regarding the anticipated launch of Parliament Menthol Lights cigarettes. Under the heading "Prototype Development Status," the memorandum stated: "While current analytics may target Newport menthol levels, **it was stressed that as cigarettes can be smoked subjectively higher or lower, consumer perception and subjectivity should drive product formulation, rather than numbers alone**." 2063726692-6694 at 6692 (US 27142) (O) (emphasis added).

3719. Discussion points in a January 13, 1997 document prepared for Denise Keane, Philip Morris General Counsel, to use in describing Philip Morris's opposition to changing the FTC test methodology stated, under the heading "Weakness in PM argument: Original methodology was an attempt to match then-current market – non-filter smokers. **Puff volume has probably increased as [FTC tar and nicotine yields of] products on market decreased**." 2074759497-9499 at 9497 (US 43525) (A) (emphasis added).

3720. A November 1999 presentation entitled "PM USA Discount Brands," given to Geoffrey Bible, Chairman of the Board and CEO of Philip Morris Companies, noted in a Product Comparison chart that Ultra Light products have a higher puff count than Full Flavor products.

2070662118-2389 at 2176 (US 87914*) (O).

(iii) RJ Reynolds

3721. In a March 28, 1972 memorandum marked "RJR SECRET" from Claude Teague to E.A. Vassallo and Murray Senkus, entitled "A Gap in Present Cigarette Product Lines and an Opportunity to Market a New Type of Product," Teague stated: "I believe that for the typical smoker nicotine satisfaction is the dominant desire, as opposed to flavor and other satisfactions." The document went on to state: "**Given a cigarette that delivers less nicotine than he desires, the smoker will subconsciously adjust his puff volume and frequency, and smoking frequency, so as to obtain and maintain his per hour and per day requirement for nicotine (or, more likely, will change to a brand delivering his desired per cigarette level of nicotine)**." Teague further stated:

> **[R]egardless of which cigarette the smoker chooses, in obtaining his daily nicotine requirement he will receive about the same daily amount of tar**. If, as claimed by some anti-tobacco critics, the alleged health hazard of smoking is directly related to the amount of tar to which the smoker is exposed per day, and the smoker bases his consumption on nicotine, then **a present 'low tar, low nicotine' cigarette offers zero advantage to the smoker over a regular filter cigarette**, but simply costs him more money **and exposes him to substantially increased amounts of allegedly harmful gas phase components in obtaining his desired daily amount of nicotine**.

The document ends with the statement that "**[t]he thoughts and philosophies expressed above come from many sources and certainly are not solely those of the writer**." 500790776-0784 at 0778, 0782-0784 (US 29473) (O) (emphasis added).

3722. A document entitled "Smoking Satisfaction" and labeled as a "[t]alk delivered to RJR Tobacco Company management, June 23, 1974 and RJR Tobacco International management, August 4, 1976" by Murray Senkus, Director of Scientific Affairs for RJR until

1979, stated

> [T]he amount of nicotine that one can get in the lungs from low tar cigarettes is much less. So **the smoker then resorts to other means to get the nicotine he needs in the blood** from low tar cigarettes by longer puffs, by bigger puffs, by more frequent puffs, and also by smoking more cigarettes each day. It has been observed that as one switches from a non-filter to a filter, one smokes more cigarettes per day. But eventually **one can change his style of smoking so one can get enough nicotine in the blood during the inhaling step** by changing the smoking style; i.e. longer puffs, bigger puffs, and more frequent puffs. Surveys have shown that in switching to lower tar cigarettes, smokers have not necessarily increased the number of cigarettes per day.

501525355-5366 at 5360-5361 (US 29531) (O) (emphasis added).

3723. Senkus, in a speech he gave at RJR in late 1976 and early 1977, "Some Effects of Smoking," demonstrated RJR's knowledge that smokers compensate for lower delivery cigarettes to obtain their required nicotine level, and confirmed that the other Defendants also knew this:

> **[T]here are ways to increase or decrease the amount of nicotine one can obtain by smoking a single cigarette**: One can take a deeper puff or shallower puff. . . . One can puff more frequently or less frequently. . . . One can take a deeper puff and hold the smoke in the lungs longer before exhaling to assure complete transfer of nicotine into the body fluids. **Without any question, the desire to smoke is based on the effect of nicotine on the body** . . . . [T]he amount of nicotine that one can get in the lungs from low tar cigarettes is much less. So the smoker then resorts to other means to get the nicotine he needs in the blood from low tar cigarettes, by longer puffs, by larger puffs, by more frequent puffs, and also by smoking more cigarettes each day. One can get enough nicotine into the blood during the inhaling step by changing the smoking style; i.e., longer puffs, bigger puffs, and more frequent puffs . . . . **It is worth noting that our competitors are aware of the significance of the quality and quantity attributes of nicotine**. Moreover, they are fully aware of the advisability of maintaining a low tar value and also maintaining the nicotine as high as possible [referring to Philip Morris's Marlboro and Merit, and Lorillard's True brand].

500251711-1722 at 1714,1718, 1720 (US 48076) (A) (emphasis added).

3724. In an April 5, 1982 RJR report from J.H. Robinson and J.H. Reynolds to Dr. D. Werner, the authors admitted that the nicotine delivered under human smoking conditions was "more than 200% higher" than advertised, stating that "**the smoker can adjust his puffing characteristics to obtain the same level of nicotine from different cigarettes. This represents the first concrete evidence that smokers compensate to obtain a consistent amount of nicotine**. Relevant to this, it should be noted that all cigarettes experienced a marked reduction in nicotine filter efficiency under human smoking conditions compared to the nicotine filter efficiencies obtained under standard FTC conditions." 508028982-8984 at 8983 (US 85053) (O) (emphasis added).

3725. A May 11, 1983 RJR R&D Project Outline drafted by J.H. Reynolds and entitled "Smoke Component Dose" stated:

> To properly assess the sensory, physiological or psychological responses of smokers to products it is necessary to accurately determine the doses of smoke/tobacco components to individuals. Since the dose to an individual is dependent on his or her smoking behavior (e.g., puff volume, frequency, duration, etc.), measurement and understanding of the effects of these behaviors on smoke delivery must be accomplished.

In the "Action Plan" section of the outline, Reynolds encouraged the development of an improved human-mimic smoking machine. 519192755-2756 at 2755 (US 80230) (O); 506047899-7900 at 7899 (US 85054) (O).

3726. A July 25, 1983 memorandum entitled "Critique of Smokers of Low-Yield Cigarettes do not Consume Less Nicotine" to Alan Rodgman from John Robinson, RJR's Principal Scientist in psychopharmacology – which critiqued an article written by Dr. Neal Benowitz showing that smokers compensate to obtain a stable nicotine dose in their bloodstream – stated:

> **The paper itself expresses what we, in behavioral, have 'felt' for quite some time. That is, smokers smoke differently than the FTC machine and may very well smoke to obtain a certain level of nicotine in their bloodstream**. If a given level of nicotine in the blood is the final goal of a smoker, one would predict that he would smoke an FFT and ULT cigarette differently. If the smoker could obtain the same nicotine in his bloodstream from an FFT and ULT cigarette by modifying his puffing/inhaling pattern, it would be expected that the blood cotinine level would be the same after smoking either cigarette on a regular basis . . . the data reported in this paper remind us of the HMSM experiment done with the German Camel and Marlboro cigarettes. While there were certain imperfections in this experiment, you may recall that the smokers apparently obtained almost exactly the same amount of nicotine no matter which of the four cigarettes they smoked. This was one of the first indications that smokers may, in fact, smoke to obtain a certain level of nicotine in their bloodstream. **Data like these made me feel that the data reported in this current publication are probably correct**.

502680871-0871 (US 49198) (A) (emphasis added); Henningfield WD, 53:6-54:6 (explaining that this exhibit shows that "[t]he Benowitz study [reviewed in this exhibit] confirmed what the industry already understood"); see also 508978013-8025 at 8014 (US 20819) (O) (acknowledging that smokers who switched to low-tar products typically "compensated," and indicating that a smoker "has his or her own nicotine requirement from each cigarette" and "adjusts [his/her] smoking maneuver" to obtain the desired level of nicotine").

3727. Although RJR's internal documents reveal the company's extensive knowledge of smoker compensation, RJR knew that consumers did not have similar knowledge. A December 16, 1988 RJR marketing presentation noted that inquiry of a focus group of Canadian smokers found that they had "no understanding of compensation." 650900829-0849 at 0840 (US 20951) (O).

(iv) Brown & Williamson

3728. Dr. Jeffrey Wigand, who was B&W's Vice President of Research and

Development from 1989 to 1993, testified that, during his employment at B&W, "[c]ertainly everyone in my research and development department was well aware of compensation. Indeed, it was a design consideration that played a central role in all of the cigarettes manufactured at B&W as well as the other BAT Cigarette Affiliated Companies." He explained that the term "compensation," as it was used at B&W, meant "smokers manipulating their smoking behavior **to achieve their optimum nicotine reward.**" Dr. Wigand added: "B&W was aware that smokers would typically modify their smoking behavior in order to obtain their desired level of nicotine." Wigand WD, 8:11-17; 120:5-17 (emphasis added).

3729. Dr. Wigand added that, while a BATCo document indicated that tar was a secondary factor in smoker compensation, it was "not [his] understanding within the context of [his] work at Brown & Williamson" that smokers compensate for tar, stating "the primary reason for compensation is for nicotine." Dr. Wigand added that "the belief of Brown & Williamson" during his employment was that "the reason people compensate is to meet their nicotine burden. . . . [B&W] believed that the way people compensated was to obtain their dose of nicotine. And that was our [referring to B&W] preoccupation was how to deliver nicotine." Wigand TT, 1/31/05, 11646:24-11647:23; 11651:25-11652:18; 11654:22-11655:17.

3730. Dr. Wigand also explained B&W's understanding that smokers compensate to satisfy a "nicotine burden," as opposed to compensating for tar:

> [Y]ou wouldn't compensate for tar, because tar gives you no benefit. You really, when you want to compensate is you have a **nicotine burden**, whether it's - - think about somebody who goes outside and they haven't had a cigarette for two hours and their nicotine is down and you watch the way they smoke that full flavored cigarette. And so they take a large puff **in order that they can bring their body's level of nicotine back, not their tar level back**. If you switched for health reasons from a high tar cigarette to a so-called light mild cigarette, you want to continue with that **nicotine burden**, not the tar burden. You want to

> continue to get that nicotine and you compensate to bring nicotine, but when you bring the nicotine in, compensation makes you not just breathe down this far in your lungs (indicating) but you breathe way way way down and that's where the risk . . . associated with compensation is.

Wigand TT, 1/31/05, 11651:3-18 (emphasis added).

3731. Dr. Wigand testified that B&W knew – as a result of compensation and cigarette design – both that the FTC method underestimated human smoker intake for all smokers, and that it disproportionally underestimated human intake for lower tar cigarettes:

> It was well known throughout all of the BAT Cigarette Affiliated Companies that the overwhelming number of smokers were obtaining significantly more tar and nicotine from cigarettes than was measured by the FTC [Method]. . . . [I]t was true for Brown & Williamson's cigarettes. Even for full flavored cigarettes the machine testing understated the amount of tar and nicotine obtained by most smokers. But, the degree of understatement substantially increased as you moved from full flavor to light cigarettes and on to ultra lights. . . . [This was] [b]ecause of compensation and cigarette design. Since most smokers have nicotine maintenance levels in a fairly tight band, as you moved to cigarettes of lower yield as tested by the machines, the smokers' compensation increased to obtain the nicotine dose they required.

Wigand WD, 122:18-123:11.

3732. Dr. Wigand also testified that the presence of "free nicotine" was a reason B&W understood that "the machine testing understated the amount of nicotine obtained by smokers":

> [S]ince the testing only picked up particulate nicotine, any increase in free nicotine in the gas phase of smoke would lead to higher nicotine yields to the smoker than what was recorded by the machine smoking.

Wigand WD, 8:11-17; 124:14-125:5.

3733. Dr. Wigand testified that, given B&W's and the other BAT companies' understanding of smoker compensation and design of their cigarettes for elasticity of delivery, B&W and the other affiliated BAT companies did not believe that "light" and "mild" brand

descriptors were accurate:

> First, everyone at Brown & Williamson, indeed throughout all of BAT, understood that the machine method for measuring nicotine and tar yield grossly understated the tar and nicotine actually ingested by the smoker. Second, again through out the BAT organization, we knew that smokers compensated to obtain more nicotine than was reported on the label and that compensation increased as a smoker moved from a full flavor to a light cigarette.

Wigand WD, 124:2-13.

3734. Minutes from a January 12-18, 1974 B&W/BATCo conference stated: "[W]hatever the characteristics of cigarettes as determined by smoking machines, **the smoker adjusts his pattern to deliver his own nicotine requirements**." 109882674-2679 at 2675 (US 21507) (A) (emphasis added); Kessler WD, 61:13-62:5 (testifying that this document "provide[s] evidence of an effort to try and manipulate nicotine deliveries to assure that smokers receive an adequate dose of nicotine").

3735. B&W's scientific research on compensation was confirmed by its consumer research on low tar cigarettes, in which smokers reported compensating for the reduced deliveries. For instance, a February 23, 1977 consumer research report, "Consumer Discussions of Low Delivery Cigarettes," authored by R.F. Brotzge and W.H. Deines, demonstrates B&W's awareness that low tar smokers were compensating by smoking more cigarettes, stating:

> Findings, in order of importance, to participants in the five focus groups were: 1. Health - Participants expressed general fears about cancer, emphysema, other lung diseases, etc. Despite these fears, they stated their determination to continue smoking . . . 5. **Compensation - Participants noted they smoked more low tar cigarettes and received less satisfaction**.

679009843-9867 at 9843 (US 85055) (O) (emphasis added).

3736. Similarly, a July 25, 1977 B&W Internal Marketing Study entitled "Low 'Tar' Satisfaction, Step 1 Identification of Perceived and Underperceived Consumer Needs," in

analyzing smokers' satisfaction with low tar cigarettes with regard to switching behavior, stated: "It was noted earlier that **new arrivals to the Hi-Fi category realize that they are smoking more cigarettes** [quoting a study participant]: 'You can also go down to the lower tar, but increase your smoking. So you're right back where you were.'" The study further noted that "Cigarette **consumption, as reported in a 1976 Consumption Study, increases as nicotine (satisfaction per cigarette) decreases**." 775036039-6067 at 6050 (US 21053) (A) (emphasis added).

3737. A report bearing the stamp "Brown & Williamson June 24, 1980 R&D Library" prepared by BATCo, "Compensation: A Review [of] the Relationship Between Compensation and Changes in Cigarette Design," prepared April 23, 1980, stated that studies indicated that compensation was a permanent phenomenon: "On the basis of the German studies, compensation would therefore be seen as a long-term tendency to permanently adjust towards some preferred (or minimum) level [of nicotine]." 650032329-2385 at 2356 (US 53429) (A); Ivey WD, 68:1-10.

3738. A July 1983 B&W report by W. Wiethaup and W. Schneider, "Filter effects on smoke and smoke effects," stated:

> One factor, which may be responsible for a relatively intensive 'strength' impression within a given tar segment, is the 'smoke elasticity.' **The smoke elasticity describes the potential of a cigarette, to provide the smoker with more smoke, if he draws harder. This becomes relevant at least for the first few puffs of a low tar cigarette, as all recent investigations show**.

512107109-7120 at 7110 (US 85056) (O) (emphasis added).

3739. Certain Senior B&W officials expressly advocated **against** informing consumers about the likelihood that they would inhale tar and nicotine levels much higher than reported FTC deliveries. A June 28, 1985 B&W memorandum from Dr. R. A. Sanford, Director of Research & Development, to Earl Kohnhorst, Vice President for the Research Department,

discussing research programs for the development of new products, stated:

> **Compensation: It exists; most smokers practice it, but we need to understand it better before advantage can be taken in the marketplace**. Here, I believe designing to the subconscious is preferred to requiring the smoker to make a conscious act.

The memorandum also acknowledged that low tar cigarettes were no less harmful, stating that "[b]iological assurance has not been realized despite the years and money spent." 512000002-0005 at 0002-0003 (US 20915) (O) (emphasis added).

3740. A December 7, 1989 report by Rob Ferris, a scientist who worked at the "BAT Fundamental Research Center at Southhampton," which was sent to Dr. Wigand, stated: "Manipulation of both effort and reward variables influenced smoking behavior, subjects compensating for both effort (mechanics) and reward (delivery)." Dr. Wigand testified that, "[t]o those of us receiving the report, it meant that Dr. Ferris had demonstrated that smokers compensate (that is, modify their smoking behavior) to receive the necessary 'delivery' of nicotine to sustain their addiction." The report also stated that "compensation can be conceptualized of as acting within an effort-reward relationship. Subjects compensate to gain the optimal reward by varying the effort they expend in terms of intensiveness of smoking behaviour." Dr. Wigand explained that "[t]his demonstrates the understanding within Brown & Williamson and BATCo that smokers modified their behavior to obtain the necessary maintenance level of nicotine regardless of whether they were smoking a full-flavor or a light cigarette." 600287960-7975 at 7963-7964 (US 30763) (A); Wigand WD, 120:18-121:20; see also Wigand TT, 1/31/05, 11652:11-11655:17 (testifying that, while this document indicates that tar may be a "partial factor" for compensation, Dr. Wigand's and B&W's belief during his employment was that "people compensated . . . to obtain their dose of nicotine," adding that "our preoccupation [at B&W] was how to deliver nicotine").

3741. A March 26, 1999 e-mail from Hugh Honeycutt to Mike Dixon and numerous other BATCo employees referenced B&W's "Atlanta Study," which was conducted by scientist Kelly St. Charles, to examine smoking behavior and puffing profiles for low tar cigarettes. Honeycutt's email expressed concern that "B&W had just made a big splash in the US touting Carlton as the '1' for you," – a marketing slogan indicating that Carlton delivered only one milligram of tar – in light of research finding that "smokers of ultra low tar brands like our Carlton 1 mg appeared to actually get 3 mg." of tar. This email demonstrates that B&W was aware that Carlton smokers were inhaling three times the amount of tar claimed in B&W's marketing, which based its delivery claims on the FTC machine-measured tar yield. 321155579-5580 at 5579 (US 46683) (A); 2073168412-8414 (US 22024) (A). Indeed, B&W now admits that smoker compensation causes Carlton 1 mg smokers, on average, to inhale 5 to 6 times the amount of tar that B&W has advertised. (US 88628) (A) (stating "a Carlton 1 mg. smoker will, on average, get 5 to 6 milligrams of tar").

(v) BATCo

3742. A BATCo document from the late 1970s, "Why do People Smoke?," reflects BATCo's understanding that designing a compensable cigarette to perpetuate smokers' nicotine addiction was a "key determinant of" smokers' choice of cigarette. It states that "[n]icotine sustains smoking behaviour," that "**smoking behaviour is highly responsive to cigarette design**," and that "[a] key determinant of product preference will be the design 'Effort-Reward Gradient,'" i.e., elasticity of delivery. The document added: "Increase in Cigarette Consumption [is] Related to Change in Nicotine Yields," noting that "[m]ost compensation must occur at the individual cigarette level." 403626692-6802 at 6729, 6731, 6734, 6762, 6768 (US 85018*) (A) (emphasis added).

3743. An undated BATCo document by Dr. S.J. Green, a Senior Scientist for BATCo Research and Development, entitled "Ranking Cigarette Brands on Smoke Deliveries," discussed compensation to equalize nicotine intake in several contexts, including smokers "increas[ing] puff volume to receive the same nicotine" when smoking a lower tar cigarette and smokers "adjust[ing] their smoking behaviour on the basis of nicotine intake." 110077247-7268, at 7247-7250 (US 88643) (A).

3744. A March 11, 1971 report authored by D. Creighton, BATCo R&D Research Scientist, and L.M. McGillivray entitled "The Effect of Changed Deliveries at Constant Pressure Drop on Human Smoking Pattern" stated:

> It was found that there is indeed a degree of compensation for the reduced delivery. **The panel as a whole took larger puffs from the lower delivery cigarette, inhaled the smoke more deeply and held the smoke in the lungs for a longer time**. The six individual panel members compensated for changed delivery in different ways, some by increased volumes, and others by increased number of puffs on the lower delivery cigarette.

The report also stated: "An increase in puff volume, but not puff duration, means that subjects must have drawn harder on the lower delivery cigarettes, and that the flow rate was greater during puffing. This implies that smokers are willing to work harder to achieve an optimum delivery from a lower delivery cigarette." The report further stated: "The fact that the panel compensated for the lower delivery by increasing the depth of inhalation, the depth of exhalation and the total time for which the smoke was held within the body is of particular interest in the light of the finding that more is retained from a puff of smoke that is inhaled deeper, and held within the lungs longer." 757001173-1185 at 1174, 1180 (US 85058) (A) (emphasis added).

3745. A November 3, 1971 BATCo research and development report summarized:

> A test has been devised using existing techniques to show whether a panel of smokers would compensate by their puffing and inhaling

> behaviour for reduced deliveries of TPM and nicotine. The test took the form of a comparison between two cigarettes of similar pressure drop but differing deliveries of TPM and nicotine. **It was found that there is indeed a degree of compensation for the reduced delivery**. The panel as a whole took larger puffs from the lower delivery cigarette, inhaled the smoke more deeply and held the smoke in the lungs for a longer time.

102793967-3980 at 3969 (US 34698) (A) (emphasis added).

3746. A June 17, 1975 BATCo document, "Compensation for Changed Delivery," sent to several BATCo employees, including David Geoff Felton, Senior Scientist for BATCo Ltd.'s Research and Development Department, acknowledged that smokers compensate to achieve a stable dose of nicotine:

> A number of experiments . . . have been interpreted as showing that compensation for changed delivery does occur. . . . Our own results showed that **when the [tar] to nicotine ratio was changed more smoke was taken from the lower delivery cigarette. . . . My own view is that compensation for changed delivery of nicotine does occur. . . . The weight of evidence at present available is for nicotine compensation** [referring to several studies].

105658168-8179, 8168, 8178 (US 85418) (A) (emphasis added).

3747. A June 1, 1976 BATCo report, also entitled "Compensation for Changed Delivery," authored by D. Creighton, R&D Research Scientist, concluded that "**the evidence is strongly in support of the hypothesis that many smokers do change the way they smoke in response to cigarette design changes that affect nicotine delivery . . . . The tendency amongst the majority of established smokers is to attempt to equalise nicotine delivery if the cigarette design allows them to do so**." The study further concluded that "[d]ue to the differences in the delivery of individual cigarettes from the same brand . . . and the differences between subjects and within a subject" "[e]qualisation [of nicotine levels] within the range + 20%" was expected. The report stated that "there are eight suggested methods by which a subject

may regulate his nicotine intake; any number of which may be used simultaneously or at different times," namely by varying puff volume, puff number, puff distribution, cigarette butt length, puff interval, puff profile, inhalation pattern, and number of cigarettes smoked. 650008449-8480 at 8470, 8460-8462, 8469, 8464 (US 76192) (O) (emphasis added).

3748. The report included a section entitled "Why Should a Smoker Compensate for Changed Delivery" that stated that "**the majority of smokers who actually buy cigarettes and smoke them regularly are directly or indirectly seeking the effect of the nicotine content of the smoke**." 650008449-8480 at 8470, 8460-8462, 8469, 8464 (US 76192) (O).

3749. A June 27, 1978 BATCo memorandum, also entitled "Compensation for Changed Delivery," authored by Creighton, confirmed BATCo's knowledge that compensation is not temporary, occurred as a result of a need for nicotine, and contradicted "the advice of Health Authorities" that smokers who would not or could not quit should switch to a lower delivery cigarette:

> It is difficult to ignore the advice of Health Authorities who advise smokers to give up smoking or change to a lower delivery brand but there is now sufficient evidence to challenge the advice to change to a lower delivery brand, at least in the short-term. Numerous experiments have been carried out in Hamburg, Montreal, and Southampton within the company as well as many other experiments by research workers in independent organizations, that show that generally smokers do change their smoking patterns in response to changes in the machine smoked deliveries of cigarettes. . . . Further findings from these results were that the modified smoking patterns used to smoke the changed delivery brands were maintained for the month during which they were smoked. This shows that there was no adaptation during that time . . . . **In general, a majority of habitual smokers compensate for changed delivery, if they change to a lower delivery brand than their usual brand . . . . If they choose lower delivery brand which has a higher tar to nicotine ratio than their usual brand (which is often the case with lower delivery products) the smokers will in fact increase the amounts of tar and gas phase that they take in, in order to take**

the same amount of nicotine.

105553905-3914 at 3905, 3907, 3913 (US 34799) (A) (emphasis added); Ivey WD, 69:14-70:1; Henningfield WD, 49:8-50:4 (indicating that exhibit is one of "many documents that show that the companies were aware of compensation, and that smoker compensation is driven by a smoker's need to obtain nicotine," and shows Defendants "understand that smokers' need for nicotine contributes to the inaccuracy of the FTC test ratings").

3750. A June 29, 1979 study authored by Creighton, "A Comparison of Smoking Surveys Separated by Four Years," compared the smoking behavior of a group of smokers in 1974 of a cigarette with 1.7 mg nicotine and 27 mg TPM to their behavior in 1978 when smoking a cigarette with a slight reduction in nicotine (by 17% to 1.4 mg) and virtually identical TPM delivery (26 mg). The study found that the group smoked the reduced nicotine cigarette "more intensely" (i.e., increased their puff volume), which likely "equalised" the nicotine delivery of the two cigarettes. The study concluded that "it is probable that as a result of the changes in smoking behaviour observed in this study, subjects took about the same amount of nicotine from the two different cigarettes but, because of changes in TPM to nicotine ratios, received more TPM from the [reduced nicotine cigarette]." The study further found that "**[t]he fact that smokers have changed their smoking patterns to take more smoke from a cigarette with lower nicotine delivery but similar TPM delivery adds support to the contention that nicotine is a major determinant of smoking behavior**, and that TPM, as long as it is delivered in sufficient quantity, plays a lesser role." 650008946-8960 at 8948, 8953-8955 (US 85059) (A) (emphasis added).

3751. An April 27, 1981 memorandum by Martin Oldman to L.C.F. Blackman, Director of Millbank, stated that "[s]ome people appear to smoke for nicotine, others don't . . . nicotine

dependent smokers. . . are more likely to compensate for nicotine than others." 105399692-9693 at 9693 (US 85060) (O).

3752. A July 9, 1984 document by Imperial Tobacco Limited, sister company to B&W, was distributed to various B&W and BATCo employees, including: Blackman; A.M. Heath, BATCo Executive Director of Marketing; Erhard Koehn, BATCo Manager of Product Development; Rainier Wernitz, BATCo Manager, Market Research; Tilford Riehl, B&W Division Head of Product Development; A. Mellman, B&W Director of Marketing Research; T. Wilson; Brennan; C.I. Ayers; and G.O. Brooks, BATCo scientist. It acknowledged that smokers who switch to low tar brands increase the number and intensity of puffs taken and number of cigarettes smoked to achieve a higher dose of nicotine: "BRANDS SWITCHING DOWN DELIVERY: increase in puffing parameters – increase in numbers of cigs. smoked – more puffs taken means to achieve a higher dose." 536000000-0090 at 0050 (US 22338) (A).

3753. A January 24, 1985 BATCo letter from Charles H. Keith to Lance Reynolds stated:

> [H]uman smokers, even though they ingest much more Nicotine and Tar than is indicated by the FTC values, get about the same amount of Tar and one and a half times the Nicotine from Barclay, Carlton and Cambridge. . . . [I]t is clearly apparent that the **human smokers are ingesting much more nicotine and tar than the nominal values obtained by FTC tests. The human levels are six to eight times higher than the normal values**.

621096298-6300 at 6298, 6300 (US 76191) (O) (emphasis added).

3754. A February 25, 1985 BATCo document, "The Burning Cigarette," authored by G.O. Brooks, Marketing Department, confirmed that "we can be seriously misled by assuming that the machine deliveries are those obtained by the smoker. The human smoker is a very variable, whimsical machine who most probably smokes different cigarettes in different ways,

even varying his puffing process down the cigarette in order to satisfy his/her requirements." 100575013-100575029 at 5021-5022 (US 85061) (A).

3755. A BATCo document dated October 12, 1987 sent by M.L. Reynolds to H.F. Dymond (researcher) and H. Ibig, under the heading "Easily Achieved Tar Deliveries from Low Tar Cigarettes," displays a chart depicting the increased tar deliveries of RJR's Now cigarette, and Philip Morris's Merit and Merit Ultra cigarettes, caused by the compensatory behaviors of vent hole blocking, taking more puffs, and taking bigger puffs. This chart shows that these behaviors in combination caused a thirteen-fold increase of tar inhaled for Now cigarettes, a nearly three-fold increase for Merit, and a four-fold increase for Merit Ultima. 400015695-5696 at 5696 (US 85063) (O).

3756. A December 21, 1987 BATCo document with subject heading "Notes on Meeting With Dr. Eicher" authored by "HFD" (H.F. Dymond, researcher), and sent to Nick Cannar and several B&W and BATCo personnel, stated: "BAT acknowledged the discussion on compensation and described how channel ventilation was an alternative form of ventilation, both systems could be manipulated by a consumer. Other companies were also beginning to acknowledge compensation, but they were reluctant to debate the issue in public." 400015634-5635 at 5634 (US 85064) (O).

3757. A May 6, 1992 BATCo report entitled "Topics In Smoking and Health 'Bible'" stated:

> [T]he expression of product smoke deliveries in the form of a league table, while understandable, can be misleading. **There can be no guarantee that a smoker who switches from one product to another delivering a lower 'tar' value will thereby reduce his intake of 'tar.'** He may well alter the way he smokes the second product in some subtle fashion and so adjust his intake of smoke to fit his needs. In this way, he may inadvertently increase his intake of other substances in the smoke. League tables and delivery data

> on products may, therefore, be misleading to the consumer, who will be unaware of the sub-conscious ways in which he manipulates his own behaviour . . . smokers of higher delivery cigarettes may find that they need to smoke more low delivery cigarettes to achieve the same satisfaction . . . . Increasingly smokers will accept the alleged harmfulness of smoking, and while wishing to continue will look for health reassurance brands . . . Smoking behaviour is also of importance. For example research into the effects of low tar and nicotine cigarettes on ease of quitting smoking will be undertaken.

500887584-7709 at 7606-7607, 7614, 7679, 7704 (US 20656) (A) (emphasis added).

3758. A BATCo document from 1998 or later, entitled "Perception of Lights" and based on BAT research in Hungary, notes that smokers who switch from higher to lower tar cigarettes compensate for the reduced delivery by smoking more: "The biggest disadvantage people saw to 'Lights' was that 'you need to smoke more of it.'" 321541609-1679 at 1645 (US 22052) (A); Ivey WD, 78:14-16.

3759. A March 4, 1998 internal BATCo draft report, "Lights Information Kit," which provided "a summary of British American Tobacco's understanding of Lights cigarettes" to assist BATCo in its attempt to "take an increasing share of this segment," noted that "[c]learly, the tar yield that a consumer actually gets will be highly dependent on the individual's smoking behaviour - how many puffs, how big each puff is, what butt length is left. Moreover, an individual smoker's behaviour will vary significantly from one cigarette to another." 321478980-8985 at 8983 (US 22049) (A).

3760. A May 19, 1998 BATCo draft document regarding talking points in response to "Allegations concerning nicotine control and manipulation," tellingly omitted any reference to BATCo's internal evidence that the smoker's need to get a sufficient delivery of nicotine is the cause for such variation. The document stated, under the heading "Compensation by smokers":

> It is well known that all cigarettes can yield different amounts of

> smoke depending on how people smoke. All cigarettes are inherently compensable relative to machine smoking yields determined according to standardised conditions. More frequent puffs and/or larger (*previously: more intense*) puffs, (*previously: or even more cigarettes)* can obviously increase the amount of smoke constituents that the smoker receives from each cigarette. Research has suggested that some smokers do tend to take larger puffs when they switch from a higher to a lower tar and nicotine yield cigarette during short-term experimental brand switching studies.

321087921-7932 at 7925 (US 22043) (A) (italics in original).

3761. A June 17, 1998 Market Research Summary Report bearing BAT and Oracle legends, contained in BAT Russia's 1999 Brand Plan, found, based on a consumer survey, that smokers of an ultralight Kent brand in Russia compensate for the reduced delivery of tar and nicotine by smoking more cigarettes:

760008596-8803 at 8760 (US 54588) (Confidential) (A).

(vi) American Tobacco

3762. A November 11, 1976 report prepared by Fay Ennis Creative Research Services for F. William Free & Company, an advertising agency used by American, demonstrates American's awareness that smokers of low tar cigarettes employed several different methods of smoker compensation. The report summarized focus group sessions relating to low tar cigarettes. When asked about Now and Carlton cigarettes, the panelists "concluded that **you would smoke twice as much of this type of cigarette in order to get any satisfaction**. One man said that he didn't like the draw on these cigarettes because he had to puff so hard, his throat tickled." When asked to define a low tar cigarette, some panelists stated: "You have to drag on the cigarette ‘real' hard to get any satisfaction out of it." ATC0137310-7324 at 7319-7320 (US 87916) (O)

(emphasis added).

(vii) Lorillard

3763. A July 16, 1976 Lorillard memorandum from M.S. Ireland to H.J. Minnemeyer on the subject of "Research Proposal – Development of Assay for Free Nicotine" revealed Lorillard's awareness of smoker compensation and the fact that it is driven by nicotine addiction:

> Cigarette sales are made for one reason. The customer is satisfied with the product either from the taste or the physiological satisfaction derived from the smoke. **The consensus of opinion derived from a review of the literature on the subject indicates the most probable reason for the addictive properties of the smoke is the nicotine. Indications are that the smoker adjusts his smoking habits to satisfy the desire for nicotine either by frequent or large puffs on the cigarette, or smoking a large number of cigarettes**.

00044522-4523 at 4522 (US 22012) (A); 94937037-7038 at 7037 (US 56775) (A) (emphasis added); see also Farone WD, 132:18-133:12 ("Clearly, these statements indicate an understanding of smoker compensation to achieve the needed nicotine level, and an interest in exploiting this knowledge."); Henningfield WD, 96:17-97:3 (referring to US 56775 as a "significant in terms of Defendants' knowledge and understanding of the addictiveness of nicotine from the 1970s").

3764. A December 10, 1976 document by H.S. Tong of Lorillard that included a review of the scientific literature reached several conclusions confirming Lorillard's awareness that smokers compensate to receive their desired level of nicotine – conclusions that Lorillard publicly denies to this day: "It seems that, within limits, **smokers can and do control their nicotine intake from smoke by varying their smoking techniques**. . . . Smokers were known to smoke more when offered low nicotine cigarettes. . . . It would seem desirable to have a low tar cigarette with a nicotine content between the threshold and optimum doses level." 00045061-

5071 at 5061-5063, 5068 (US 34210) (A) (emphasis added); see also Farone WD, 132:18-133:12 ("Clearly, these statements indicate an understanding of smoker compensation to achieve the needed nicotine level, and an interest in exploiting this knowledge.").

3765. A July 30, 1980 Lorillard memorandum, "A Review of Behavioral and Psychopharmacological Factors in Smoking," from S.T. Jones (Product Design), included conclusions by Lorillard personnel based on review of scientific articles in the literature. A notable conclusion – and one that Lorillard continues to deny more than 24 years later – was that smokers compensate to maintain their required nicotine intake, in the process rendering machine-generated tar and nicotine yields, such as those generated under the FTC Method, inaccurately low: "The evidence to date clearly indicates that smokers titrate or regulate their intake of nicotine, e.g. smokers of cigarettes which deliver large amounts of nicotine will adjust – when given low nicotine cigarettes – their smoking to get a larger nicotine dose than the machine determined values indicate." Lorillard also independently acknowledged that, in the 1980s, it knew that smokers of low tar/low nicotine cigarettes would compensate by altering their smoking habits in order to obtain a higher level of nicotine. 01105000-5021 at 5010 (US 20030) (O); Spears PD, State of Minnesota v. Philip Morris Inc., 9/23/97, 62:29-65:11.

3766. An August 21, 1984 Lorillard memorandum from E-Chung Wu to W.R. Deaton, reporting on a "puff profile study of 15 brand of cigarettes . . . with 5 smoking panel members" acknowledged smoker compensation: "The general trend shows that puff volume increases with the decrease of both CPM or nicotine. . . . Obviously, the higher dilution of smoke needs larger volume to compensate for the decrease of the flavor or nicotine." 89213491-3501 at 3491 (US 56466) (O).

3767. A November 11, 1999 Lorillard e-mail from Jack Reid to Larry Gains (copied to

Chris Coggins) related the following proposal, which acknowledged that smoker compensation rendered FTC Method tar yields unreliable: "Chris has made the following suggestion for a new project and even suggested that Ed Robinson would be the man. It could lead to not only publications, but an establishment of an industry wide standard and/or defense when issues of compensation are raised." Under this proposed new standard for measuring tar and nicotine of cigarettes:

> [O]ne could predict the nicotine delivered no matter how many of the holes were covered, and correct for differing inhalation volumes for each smoker . . . . The need for this is real, particularly in light of the last meeting Chris and I attended in Massachusetts. Texas is getting into the act as well and others are making rumblings about the issue of compensation. Something like this might be just the solution for providing concise, accurate data instead of some of the outrageous speculation that has been floating around.

96997728-7729 (US 74552) (O).

(viii) Liggett

3768. Despite the fact that Robert D. Bereman, Vice President for Chemical Research at Vector Research, Ltd. (a spinoff of Vector Tobacco, 100% owner of Liggett) is aware of the

and despite being aware of the concerns of the public health community regarding the safety of low tar cigarettes, Liggett continues sell cigarettes marketed as "light" and as delivering lowered tar and nicotine. Bereman PD, United States v. Philip Morris, 4/23/02, 52:24-54:12 (Category 1); Bernstein PD, United States v. Philip Morris, 6/25/02, 36:24-37:20 (Confidential).

(c) Defendants Deceptively Designed Their Low Tar Cigarettes to Facilitate Compensation

3769. As discussed in Section III.D(4)(b), supra, the evidence shows that Defendants have been aware for decades that smokers of low tar cigarettes compensate for the reduced deliveries to obtain enough nicotine to sustain their addiction. As Dr. Burns, who conducted a review of internal tobacco industry documents as part of the research underlying NCI Monograph 13, testified:

> The **internal tobacco industry documents demonstrate** the design characteristics, the design intent for developing these products, the testing that was done, the conditions under which they were tested, and the results of that testing demonstrate that what was happening was that **cigarettes were intentionally being designed to vary the yield when smoked differently, and that the reason for that design was to satisfy the nicotine ingestion required by individual smokers. So the product could produce a very low level when smoked by machine; but when smoked by the individual, the individual could derive from that cigarette as much nicotine as they needed to satisfy their addiction**.

Burns WD, 40:7-14; 48:18-20 (emphasis added).

3770. Dr. Burns testified that internal documents of Defendants:

> [D]emonstrate that the companies not only knew that low tar cigarettes did not deliver lower smoke exposure to the smoker, but also that these engineering changes in cigarettes were intended to take advantage of the known compensatory changes among smokers such that the cigarettes yielded very low levels of tar and nicotine when smoked by machine, but much higher levels of tar when smoked by smokers.

Burns WD, 45:19-46:6; see also Burns WD, 55:7-16 (Defendants' documents "confirm the conclusions in" NCI Monograph 13 and "demonstrate that the tobacco companies recognized that the smoking public was being misled by the tar values and by the use of terms such as low tar and light.").

3771. Dr. Henningfield elaborated on the effect of Defendants' superior knowledge of smoker compensation, relative to the scientific community in general, as follows:

> [W]hat is important to me is the internal reports that are being offered as conclusions that are helping guide the industry; whereas, outside of the industry, as the record shows, even in the 1980s we were still trying to figure out the nature and extent of compensation. So, my conclusion was that **the industry had already changed its behavior in cigarette design; whereas, we outside of the industry were still trying to understand the nature and extent of the compensation. And the record shows that**.

Henningfield TT, 11/29/04, 7264:7-15 (emphasis added).

3772. Dr. David Kessler, Commissioner of the Food and Drug Administration from 1990 to 1997, during which time he led an investigation of the tobacco industry, explained the revelation that Defendants' design of their cigarettes to manipulate the delivery of nicotine was based on Defendants' efforts to ensure that their cigarettes provided enough nicotine to sustain smokers' addiction:

> As I would later come to understand, the tobacco industry, for the last several decades, was confronted with a problem. They understood that smokers smoke primarily for nicotine. They also wanted to sell "light" cigarettes. The industry used a number of different techniques to produce "light" cigarettes. Smokers wanted to reduce the amount of chemicals that they inhaled when they smoked. The problem was that, as the industry made cigarettes "lighter," they would also be reducing the amount of nicotine that a smoker received. **The industry understood that, if smokers did not receive an adequate amount of nicotine, they would either switch cigarettes or quit smoking altogether. So what the industry was faced with was the need in "light" cigarettes to provide smokers with [an] adequate level of nicotine**.

Kessler WD, 1:10-17; 2:3-8; 19:19-20:7 (emphasis added).

3773. Dr. Kessler testified that, during the FDA's investigation, its drug laboratory in St. Louis conducted tests "measuring the level of nicotine in specific brands of cigarettes," revealing

that:

> [T]he nicotine concentration in the Merit brand family was 1.46 percent nicotine concentration . . . for Merit regular cigarettes, 1.67 percent nicotine concentration for Merit light cigarettes and 1.99 percent nicotine concentration for the lightest Merit brand, Ultima. Thus, the lightest variety had the highest concentration of nicotine.

As Dr. Kessler noted, "[t]his data shows that nicotine concentrations in this brand variety were highest in the ultra-low-tar–the 'lightest' versions of Merit cigarettes." Dr. Kessler added that this disparity "could not occur by accident," and "suggested that the **manufacturer intended to provide an adequate level of nicotine to** those **people who smoked that [low tar] brand**." Kessler WD, 1:10-17; 2:3-8; 20:16-22:6 (emphasis added); see also Kessler WD, 1:10-17; 2:3-8; 33:14-22 (testifying that "[t]he tobacco companies spent considerable time focusing on increasing the effectiveness of nicotine delivery in light cigarettes," including using additives to increase amount of "free" nicotine).

3774. The FDA Final Proposed Rule relating to regulation of tobacco products reached the following conclusion regarding Defendants' design of low tar cigarettes: "**The evidence in the record shows that the manufacturers have conducted extensive product research and development to find ways to maintain adequate nicotine levels in low tar cigarettes**." VXA124 2326-3211 at 2533 (U.S. 64323) (A) (emphasis added); Kessler WD, 60:15-61:5.

3775. Dr. Henningfield's "overall conclusion" about the effects of Defendants' cigarette design on smoking deliveries is that "conventional cigarettes are designed to dispense nicotine in addicting doses on the premise that cigarette smoke is a palatable and effective vehicle for nicotine delivery, albeit a highly toxic vehicle." Dr. Henningfield based this conclusion on the fact that "[d]ocuments show that nicotine dosing characteristics have been extensively studied and controlled by the tobacco industry" and the fact that "laboratory and real world studies,"

including his own extensive reviews of the published literature, "confirm that wide variations in presumed nicotine dose, as suggested by the FTC rating, produce remarkably small changes in actual nicotine intake." Henningfield WD, 41:18-42:6.

3776. Dr. Henningfield summarized some of the evidence leading to his conclusion that Defendants intentionally designed their cigarettes to machine-measured yields that were deceptively low relating to their actual delivery to smokers:

> Since [Defendants'] internal documents make clear that the companies have the ability to reduce or even eliminate all tar or nicotine from a cigarette, and that the Defendants' research showed that the cigarettes they designed had great elasticity of yield, I conclude that the tar and nicotine yields are the result of choices made by the companies. And what other researchers and I have noted is that a result of the cigarette design choices is that smokers of cigarettes from a wide range of FTC tar and nicotine ratings show very similar blood nicotine levels as a result of smoking their cigarettes.

Based on this evidence of the blood levels of nicotine, Dr. Henningfield concluded that "virtually all cigarettes – and certainly the brands and styles of cigarettes that comprise well over 90% of the market – are capable of delivering levels of nicotine to the smoker that can create and sustain addiction." Henningfield WD, 66:23-67:12.

3777. Deceptive Design Techniques. Dr. Henningfield testified that, "**for any given brand, the tobacco manufacturers have given the cigarette smoker a multitude of ways to obtain addicting doses of nicotine through the design of the cigarette**," adding that some of Defendants' "design choices, like the length of the filter overwrap and ventilation, increase the discrepancy between the FTC machine ratings and yields received by human smokers." Henningfield WD, 42:11-15; 68:1-4 (emphasis added).

3778. Dr. Henningfield explained that the differences between many of today's lower tar cigarettes and their full flavor counterparts are only design features that lower the FTC yields,

while enabling smokers to obtain much higher yields:

> [T]he actual amount of tobacco, the blend of the tobacco materials that make up the filter, the nicotine content, and the smoke-producing potential of a "light" cigarette and its corresponding "regular" or "full flavor" version are not necessarily different across some brands that differ widely in their machine-rated tar and nicotine deliveries. Thus, although tar and nicotine delivery can be controlled by variation of the amount and blend of tobacco, in practice, a major means by which the differences are achieved is through the use of physical design characteristics and ingredients that can be used to manipulate the amount of smoke delivered to a machine, while leaving the human smoker free to easily obtain substantially higher levels of tar and nicotine than advertised.

Henningfield WD, 65:22-66:8.

3779. Dr. Henningfield testified that "design features" that he has "studied for" their "capacity to affect the delivery of nicotine," include:

1) filtration

2) "perforations for increased ventilation";

3) "physical placement of ventilation holes"; and

4) "paper porosity and composition."

Henningfield WD, 45:23-46:3.

3780. Filters. Regarding the "role of cigarette filters, as used by the tobacco company Defendants, in the delivery of nicotine," Dr. Henningfield testified: "[Filters are] used to control tar and nicotine dose as well as the relative delivery of tar and nicotine. It is my opinion that tobacco manufacturers have engineered filters to allow smokers to increase or decrease the amount of nicotine that comes out of the cigarette and into the lung." Dr. Henningfield based his conclusion, in part, on Defendants' documents. Henningfield WD, 43:15-22.

3781. Dr. Henningfield added that "filters perform differently in the FTC test" than "when human smokers smoke a cigarette," because "[t]hey can perform differently as a function

of how hard you are drawing" on them. Henningfield TT, 11/22/04, 6802:24-6803:22.

3782. Dr. Henningfield testified that Defendants could have employed filters that "limit smokers' ability to compensate for nicotine," stating: "It's possible to cap the ceiling by the amount of nicotine that's in the product, and that's been done in research cigarettes that I've used, and even in a commercial line." An example of this type of filter developed by Defendants is provided in a November 17, 1969 RJR memorandum from John D. Woods and cc'd to Claude Teague and Anders Laurene: "**[RJR's] Multijet filter is unique since it delivers approximately the same amount of wet tar to the human smokers as the machine measured wet tar value**." 504210090-0092 at 0091 (US 29749) (A) (emphasis added); Henningfield TT, 12/1/04, 7537:7-7540:16.

3783. Ventilation Holes. Cigarettes with ventilation holes in the filter are extremely common, and their sale by Defendants in the United States is, and has long been, widespread. US FF §§ III.D(4)(c)(ii)-(viii), infra; Whidby TT, 2/22/05, 14041:9-13 (testifying that "Philip Morris USA has used laser perforations for filter ventilation since the 1970s," and that most of the cigarettes Philip Morris sells in the United States contain vent holes created by laser perforation); Henningfield TT, 12/1/04, 7553:17-25 (stipulation by Lorillard counsel that Lorillard sells cigarettes with ventilated filters).

3784. Ventilation holes – "one of the main techniques of the tobacco companies to achieve lower tar and nicotine levels by the FTC standardized smoking method" – "lower the tar and nicotine levels delivered to machines, but not necessarily to people." Henningfield WD, 47:7-10.

3785. As Dr. Henningfield explained, "ventilation holes contribute to the discrepancy between the FTC machine and human smoker intake levels," because:

> The FTC machine smoking test never blocks the vent holes, because the cigarette is not inserted in the machine far enough to be blocked. Human smokers, however, can block the vent holes with their lips or fingers, lowering the ventilation levels. The FTC test registers tar and nicotine yields lower than those that occur if the vent holes are partially or completely blocked. Whatever theoretical reduction in tar and nicotine obtained in machine tests will be negated by the extent to which vent hole blocking occurs during human smoking.

Dr. Henningfield added that "ventilation hole blocking happen[s] with actual smokers," and that, "for some smokers," vent "hole blocking [is] a significant part of compensation." He explained, however, that studies on vent blocking show varied results, stating "most studies appear more likely to under-report blocking than to over-measure it," adding that "vent hole blocking appears to increase with increased ventilation." Finally, Dr. Henningfield explained: "The point is that it happens and can happen without the smoker being aware of doing it or aware of the dire health consequence," namely "[t]he well-documented exposure to substantially higher levels of tar and nicotine than advertised." Henningfield WD, 57:11-58:12; 59:14-15.

3786. "[T]he major difference in design between the Marlboro and Marlboro Light that accounts for the differences in the advertised FTC tar and nicotine yields" is "the ventilation holes system." Dr. Henningfield clarified that "this extra row of vent holes [in Marlboro Lights] almost doubles the amount of fresh air that comes into the smoking machine, and that means if the smoker occludes any of it, [he/she] can get much more tobacco smoke than the machine and the extra holes mean that the smoke is cool, smoother in ways that smokers can actually feel and they tend to take bigger puffs. **So, even if they don't cover the holes, studies show that they take larger puffs from the cigarette**, and the point is there are several different ways that the smoker can get more tar and nicotine that are related to the design of the product." Henningfield TT, 11/22/04, 6801:2-7; 6806:7-6807:9 (emphasis added).

3787. Dr. Burns testified that ventilation holes, which Defendants use to lower the FTC tar delivery, facilitate compensation in two ways:

(1) "they **can be obstructed** by fingers or lips, thereby increasing the delivery of the product"; and

(2) "the size of the hole and the placement are such that," at the low level of puffs taken by machine testing, a lot of air comes through the vent holes, but **when humans smoke them more intensely**, "the pressure drop required to get a certain [air] flow through a [vent] hole is much greater and **much more [] of the flow that the person is getting . . . comes through the tobacco rod[,] increasing the delivery** of tar and nicotine."

Burns WD, 1:10-15; 12:10-11 (emphasis added); Burns TT, 2/15/05, 13366:9-13367:5; see also Samet WD, 148:14-149:11 (explaining that vent holes contribute to the disparity between machine-measured and human yields, because "the ventilation holes in the filter, which are not covered when the end of the cigarette is inserted into the machine, are generally covered by smokers as they hold the cigarette and puff").

3788. Dr. Burns testified that, when smokers smoke cigarettes with vent holes, they unconsciously "block those holes with their lips or they inhale faster and harder and deeper until they work the cigarette so that they can get from it the nicotine they need. When they do that, they . . . get a full dose of tar. They get the same dose of tar that they would get from a full-flavored, regular cigarette." Burns WD, 1:10-15; 42:2-16; Burns TT, 2/15/05, 13311:9-15.

3789. Dr. Henningfield added that – as demonstrated by "[i]nternal company documents" – the Cigarette Company Defendants are aware that "the ventilation holes can accentuate the difference between the FTC and human tar and nicotine deliveries, because the smoker, but not the machine, can block the ventilation holes." Henningfield WD, 61:1-6.

3790. Dr. Farone also testified that "it was acknowledged by [his] colleagues at Philip Morris that compensation was an unconscious act," and that smoker compensation issues "were

discussed among the management of the company . . . . several times a year," including "the senior management of the company." Farone WD, 115:4-18.

3791. For instance, an October 21, 1982 Philip Morris document written by Barbro Goodman, in the "Conclusions" section, states: "The decrease in dilution [i.e., ventilation] from covering a portion of the perforated area can result in an increased delivery to the smoker of highly diluted cigarettes even though the puff parameters decrease." Dr. Burns explained that this observation "demonstrates an understanding that ventilation holes placed in filter locations likely to be occluded [blocked] by the smoker's lips or fingers would lead to an increase in the tar delivery of the cigarette when smoked by smokers." 1003415278-5280 at 5280 (JE-40704) (A); Burns WD, 54:5-8.

3792. Dr. Henningfield testified that the Cigarette Company Defendants generally manufacture their cigarettes so that the ventilation holes are "on the filter beyond the point where they would be covered by the orifice of the smoking machine," thereby permitting unobstructed ventilation when the cigarettes are tested by FTC Method parameters. Dr. Henningfield added that "diluting the smoke with fresh air reduces the tar and nicotine concentration and hence the level that is measured by smoking machines, but can increase the free nicotine in the smoke by a process called 'off-gassing,'" thereby altering "the tar-to-nicotine ratio" of the smoke. Henningfield WD, 46:8-22.

3793. Conclusions of Chapter 2 of Monograph 13 that speak directly to the issue of vent blocking – with which Dr. Henningfield wholly agreed – are:

> 2. Many of the same design changes that have reduced machine-measured tar yields, **particularly placing ventilation holes in the cigarette filters**, also **create an elasticity of delivery** for the cigarette, allowing a wide range of tar and nicotine deliveries from the same cigarette when a smoker alters his or her smoking behavior.

> 3. Increasing puff volume and frequency, **covering the ventilation holes with fingers or lips**, and other changes in smoking behavior known to occur with use of low machine-measured-tar cigarettes **can dramatically increase the tar and nicotine delivery** of low- and ultralow-yield brands.
>
> 4. Variations in the tar and nicotine delivery that result from the known compensatory alterations in smoking behaviors **make the current U.S. cigarette tar and nicotine yields as measured by the FTC method not useful to the smoker either for understanding how much tar and nicotine he or she is likely to inhale from smoking a given cigarette or for comparing the tar and nicotine intake that is likely to result from smoking different brands of cigarettes**.

DXA0310399-0650 at 0447 (p.34) (US 58700) (A) (emphasis added); Henningfield TT, 12/1/04, 7556:2-7557:9.

3794. While Defendants attempted to portray some of the observations of Dr. Lynn Kozlowski, some which appear in Chapter 2 of NCI Monograph 13 in particular, as indicating that vent hole blocking does not increase deliveries to the smoker in any significant way, Dr. Henningfield explained that defense counsel was "cherrypicking" certain studies and ignoring others:

> [Kozlowski] and others have done studies that have shown that yield on a puff by puff basis is related to blockage. He's also looked at conditions under which it makes less of an impact. . . . [Kozlowski has] published studies under other conditions [ignored by defense counsel] in which [vent blocking] makes a considerable difference [in deliveries to smokers].

Dr. Henningfield was adamant that it was "**very misleading**" to look at only a few of Dr. Kozlowski's observations in isolation and ignore the conclusions of Chapter 2 of Monograph 13, provided above, which Dr. Henningfield stated "come back to the bottom line." Defense counsel conducted a similarly flawed examination of Dr. Samet on this issue. Henningfield TT, 11/30/04, 7302:1-7305:23; 7306:13-7307:1; 7554:7-7557:9 (emphasis added); Samet TT,

9/29/04, 1158:8-1159:12 (examining Dr. Samet on a few observations of Chapter 2, while omitting examination on the Chapter's conclusions).

3795. A November 7, 1997 article in the Centers for Disease Control and Prevention's Morbidity and Mortality Weekly Report ("MMWR"), entitled "Filter Ventilation Levels in Selected U.S. Cigarettes, 1997," discussed "the potential for smokers to knowingly or inadvertently block filter ventilation holes with their lips or fingers," and stated:

> Blocking even a portion of the filter vents can markedly increase a smoker's exposure to the harmful components of cigarette smoke . . . . [F]ilter vents often are invisible to the unaided eye and the filters do not include a marking . . . to indicate the presence of vents . . . . Many smokers who block filter vents probably are exposed to substantially higher levels of hazardous smoke than the FTC-rated levels for those brands . . . . An estimated two thirds of U.S. smokers either are unaware of the presence of vents on cigarettes or do not know that tar yields increase when vents are blocked.

The report concluded that more than half of persons who smoke cigarettes with an FTC rating of less than 4 mg of tar block vent holes, thereby increasing tar, nicotine, and carbon monoxide yields by well over 50%. Centers for Disease Control and Prevention, Filter Ventilation Levels in Selected U.S. Cigarettes, Morbidity and Mortality Weekly Report, Vol.46, No. 44 (Nov. 7, 1997) (US 76212) (A).

3796. Smokers' Lack of Awareness of Vent Holes. Dr. Benowitz, an expert on smoker compensation who has performed extensive compensation research and published extensive articles on the topic, testified that smokers compensating by blocking vent holes do so unconsciously:

> [M]ost smokers are not aware of the ventilation holes, but come to learn by trial and error that holding the cigarette in a certain way in their hands or in their mouth results in better smoke characteristics. Ventilation holes are not blocked, on the other hand, when a cigarette is smoked by a machine according to the FTC method.

Dr. Benowitz added that "[t]he fact that many smokers block ventilation holes has been demonstrated in published peer-review research," and smokers' unawareness of the existence of vent holes has been similarly documented in publications. Benowitz WD, 55:11-16; 58:1-9; 58:14-59:5 (referencing publications by Kozlowski, et al.).

3797. Dr. Henningfield testified that smokers block vent holes "[f]or various reasons, including nicotine addiction, product design, and **failure of the tobacco companies to provide smokers with information that would at least give them a choice**. . . . Product design makes it easy for the smokers to inadvertently cover some or all of the holes some or all of the time." Henningfield WD, 58:13-18 (emphasis added).

3798. Dr. Henningfield testified that "[s]mokers are not informed by the companies, the holes are generally not marked and in fact are concealed on most brands," and explained that this is significant "from a health standpoint," because "smokers who don't know about or see the vent holes will cover at least some of the holes at least some of the time, and end up getting more tar and nicotine. Failure to inform smokers about the existence, placement, and role of the ventilation holes is also important because smokers may not realize they are there, and [] even if they are aware of the holes they would have no basis for understanding the impact of partial or full coverage of the holes on their tar and nicotine intake." Henningfield WD, 58:19-59:9.

3799. Dr. Henningfield explained that "[t]here are several ways cigarette manufacturers could have designed their products to avoid ventilation problems, thereby preventing excess particles from getting to the smokers' lungs," including the following options, which could be used in concert:

> **[I]f ventilation holes exist for the purpose of reducing the delivery of tar and nicotine into the body, as tobacco manufacturers claim, then the ventilation holes should be visible so smokers can see them.** This could be easily done by

> placing stripes on the tobacco rod to indicate where the ventilation holes are placed. Indeed, many cigarette brands have stripes on the filter already, but those stripes do not highlight the vent holes. . . . **The smokers would probably also need motivation in the form of a clear warning[] that blocking vent holes will lead to higher levels of exposure to tar and nicotine and that this can increase risk**. A third way [to decrease vent blocking] would be for tobacco manufacturers to place the ventilation holes where the lips and hands are less likely to cover them up accidentally.

Henningfield WD, 59:11-60:20 (emphasis added).

3800. In this context, the Court notes that the onsert that Philip Morris sporadically appends to its low tar brands fails to inform consumers where the vent holes on its cigarettes are or how they can be blocked. JD-041096 (A); Keane WD, 61:18-62:6; Keane TT, 1/18/05, 10422:3-10423:3.

3801. As Dr. Henningfield explained, while dissecting a Marlboro Lights cigarette, the presence of "stripes" around the cigarette for decorative purposes demonstrates that Defendants "have the capacity, if they so chose, to illustrate the vent holes, and for that matter could even put signs, symbols, you know, circles with a slash through which you see on even medicines and small pills at times," to indicate the consequences of covering them. Henningfield TT, 11/22/04, 6804:9-6805:19.

3802. Dr. Henningfield testified that ventilation holes are "very difficult" to see with the naked eye. Dr. Whidby, too, acknowledged that vent holes are "basically invisible to the naked eye," and that "some smokers block vent holes with their lips, their fingers or both." Dr. Whidby also testified that, to his knowledge, there is no "technical or scientific reason why the ventilation holes [on Philip Morris's cigarettes] couldn't be clearly identified for smokers so that smokers wouldn't inadvertently block the holes." Henningfield TT, 11/22/04, 6801:2-7; 6806:7-6807:9; Whidby WD, 36:21-37:5-9; 37:14-16; Whidby TT, 2/22/05, 14041:9-13.

3803. Dr. Whidby offered his "belief" that vent-hole blocking does not **completely** "defeat[] the purpose" of filter ventilation. However, given Dr. Whidby's appearance as a lay fact witness, and for the other reasons discussed in the Court's general findings on Dr. Whidby's credibility in Section III.D(4)(a), this "belief" is not entitled to any weight. Whidby TT, 2/22/05, 14048:9-14.

3804. Porosity, Burn Rate, Reconstituted Tobacco and Filter Overwrap. Manipulation of the porosity of cigarette paper "is another means of controlling the composition and amount of smoke that is collected by smoking machines." Henningfield WD, 62:22-63:7; 63:19-64:2.

3805. Dr. Burns testified that Defendants engineer their cigarettes to provide "elasticity of delivery" by "getting the tobacco to burn at certain rates and getting the paper to burn at certain rates. That results in lower [machine-measured] tar yields, but enables the person to have higher deliveries because [he/she doesn't] have to wait the interval between puffs that the machine waits." Burns TT, 2/15/05, 13367:5-11.

3806. Dr. Henningfield also testified that the composition of the cigarette paper – independent of its porosity – also can influence the delivery of the cigarette by affecting its burn rate:

> Cigarette paper used on manufactured cigarettes is treated both with chemicals that can affect nicotine delivery and with burn accelerant chemicals that make the cigarettes burn hotter and faster so as to deliver less tar and nicotine to the FTC smoking machines – which puff much less frequently than most people – than they do to people.

Henningfield WD, 62:22-63:7; 63:19-64:2; accord Henningfield TT, 11/22/04, 6795:20-6796:6 ("[I]f you increase the burn rate of the cigarette, you increase the amount of tobacco that is burned between machine-collected puffs and it's never measured. The smoker[s], of course, could get some of that, depending on how fast they puff. And in the case of the cigarette

smoker[s], typically, they take anywhere from 50 to a hundred percent more puffs [than the smoking machine].").

3807. Dr. Burns testified that Defendants' use of certain characteristics of reconstituted tobacco facilitates elasticity of delivery by affecting the cigarette's burn rate: "Reconstituted tobacco allows you to burn the tobacco at certain pre described rates because you can chop it up to very specific specifications, to certain sizes of the reconstituted tobacco. That influences the burn rate of the tobacco rod." Burns TT, 2/15/05, 13367:12-13368:3.

3808. Dr. Kessler recounted Defendants' internal documentary evidence reciting "two ways to manipulate the nicotine content in what the industry called 'reconstituted tobacco'": adding nicotine to reconstituted tobacco and changing "to blend formulas that utilized higher nicotine tobaccos in the reconstituted sheet." Kessler WD, 62:12-63:1; MNAT00533225-3228 (US 85492) (A).

3809. Dr. Henningfield also testified that, due to the FTC Method convention of stopping machine smoking "3 mm beyond the [filter] overwrap," a longer filter overwrap can contribute to a bigger disparity between FTC yields and human smoke intake, as "the smoking machine does not burn all of the tobacco in the cigarette even though cigarette smokers can smoke all of the tobacco." As Dr. Henningfield explained, these last few puffs can significantly increase deliveries to smokers:

> First, these last puffs provide the smoker with more tar and nicotine laden puffs because with each successive puff on a cigarette, the remaining tobacco and the filter collect tar and nicotine which can, in turn, be released by continued puffing. Second, because the smoke becomes more concentrated in tar and nicotine with each successive puff, just a few extra puffs can mean a disproportionately large increase in tar and nicotine exposure.

He added that "**in the ten years after the FTC test started**, it was reported in the literature that

the overall length of the overwraps increased over ten years. . . . this is the amount of material that is not smoked by the machine; it's the amount of material that can be smoked by human cigarette smokers. . . . even one extra puff dramatically boosts the tar and nicotine that the smoker takes in." Henningfield WD, 64:19-65:21; Henningfield TT, 11/22/04, 6795:4-7; 6797:2-22 (emphasis added).

(i) Defendants' Deception Regarding Barclay

3810. The episode involving BATCo's Barclay cigarette illustrates Defendants' conspiracy to deceptively design low tar cigarettes and to keep their activities secret from the public. In September 1983, Philip Morris Holland ran an advertisement pointing out that BATCo's Barclay brand cigarettes generated FTC tar and nicotine yields that were drastically lower than the actual tar and nicotine delivered to smokers of Barclay cigarettes. The Philip Morris advertisement actually mirrored the statements of an anti-smoking group on the issue. BATCo Chairman Patrick Sheehy responded by sending a telex to George Wiseman of Philip Morris, stating: "I find it incomprehensible that Philip Morris would weigh so heavily the short-term commercial advantage from deprecating a competitor's brand while weighing so lightly the long-term adverse impact from an ongoing anti-smoking programme. . . . **In doing so, Philip Morris . . . makes a mockery of Industry co-operation on smoking and health issues**." 201080394-0395 at 0394 (US 78984) (A) (emphasis added); 104576621-6624 at 6624 (US 20236) (A); 104576617-6620 at 6618 (US 20235) (A).

3811. In an October 26, 1983 telephone conversation between Hugh Cullman, head of Philip Morris International operations, and E.A.A. Bruell, BATCo Chairman, Cullman agreed not to do anything further to inform the public that the Barclay cigarette produced FTC Method tar and nicotine measurements that were deceptively low when compared to what smokers

actually inhale from Barclay cigarettes. The notes of the telephone conversation stated, "**Essential Industry hang together**. Holland activity was not PM company policy. They must try to prevent this happening in the future." Cullman agreed, stating "PM to instruct its No 1's they must not use anti-smoking activities, statements or programmes for competitive gain." 301030943-0944 (US 46577) (A) (emphasis added).

3812. On September 1, 1986, Harry F. Dymond, BATCo researcher, sent a letter on BAT (U.K. and Export) Limited letterhead to D. Allman of Filtrona Instruments and Automation Limited, setting out Dymond's "opinions" regarding the potential changes to the ISO machine smoking method – a machine smoking test system nearly identical to the FTC Method – relating to Barclay cigarettes. Dymond defended the ISO method, and recommended that it be used to test B&W's Barclay cigarettes, notwithstanding that Barclay's channeled filter produced yields that could not possibly be achieved by human smoking: "Given the present 'state of the art' in the cigarette industry and our present knowledge I believe the Draft International Standards . . . represent the best possible methods available for the testing of all cigarettes. . . . Channel ventilated cigarettes [such as Barclay] should not be treated differently from other ventilated products." 400015923-5925 at 5923 (US 85079*) (O).

3813. Philip Morris's internal research also proved that Barclay cigarettes deliver to smokers significantly larger amounts of tar and nicotine than its advertised FTC tar and nicotine yields indicate. An October 1986 Philip Morris report by H.W. Gaisch of the Science & Technology Department in Neuchatel, Switzerland summarized product characteristics:

> **Due to the vulnerability of the periferic ventilation channels of the ACRON filter, the product performs differently in the field than when being tested under laboratory conditions** . . . . The results obtained by Fresenius, the US Testing Company, the University of Neuchatel, Dr. Neurath and Dr. Aubort complement each other, and as they are based on different principles of

> measurement, validate each other. All these studies together prove that BARCLAY yields more tar and nicotine when smoked by the smoker than can be expected from standard machine measurements . . . . For example, Barclay, as marketed in Switzerland, has a tar rating of 1 mg on the smoking machine when the channels are operational and 11 mg when the channels are closed.

506811986-2001 at 1988, 1990, 1992 (US 20766) (O) (emphasis in original).

3814. A BATCo Ltd. facsimile sent June 23, 1987 by Nick Cannar of BATCo to Harry Dymond, a BATCo researcher, stated:

> Essentially, Philip Morris's attack on BARCLAY involves the allegation that BARCLAY delivers more in human smoking than it does in machine smoking. **In our defense, we say that, in this respect, BARCLAY is no different from other low delivery ventilated cigarettes and that because of 'human compensation' all smokers tend to take in more tar and nicotine from low delivery products. It is this argument which concerns the rest of the Industry which is anxious to preserve the status quo of machine testing**.

400015840-5843 at 5841 (US 85080) (O) (emphasis added).

3815. Under the heading "Conciliation," the document described an attempt "to see whether the rest of the Industry would support some change to the method of reporting tar and nicotine deliveries which would have the effect of resolving the dispute over BARCLAY deliveries," stating: **"The basis of the approach could be that we are very concerned about the continuing dispute over BARCLAY which we believe will inevitably lead to a public debate about compensation and the misleading nature of machine figures for all ventilated cigarettes to the detriment of the Tobacco Industry as a whole**." Under the heading "Widening the Debate about Compensation," the document stated: "[A] 'fall-back' position . . . would be for us to bring the whole issue of compensation into the public arena . . . . As a first step, **we could highlight with national regulators our concern that consumers are being misled by literal reporting of machine figures**. Subsequently, we could seek to interest the

popular scientific and consumer press in the whole issue of human and machine smoking." 400015840-5843 at 5842 (US 85080) (O) (emphasis added).

3816. A June 26, 1987 document on BAT (U.K. and Export) Limited letterhead from Michael Leach (BAT (U.K. and Export) Public Affairs Manager) to Nick Cannar (BATCo attorney), H.F. Dymond (BATCo researcher), A.L. Heard, and M.L. Reynolds (B&W Director of Research/Product Development) described "a suggested approach for the Armageddon option" for responding to Philip Morris's attacks on the Barclay cigarette. The plan involved revealing to the public that ventilated cigarettes generated misleading tar and nicotine yield information under the ISO machine smoking method. The document stated:

> Promoting a new standard involves drawing international scientific scientific [sic] and public attention to the facts of smoker compensation . . . . The initiative is based on good science. It moves in the new direction of scientific opinion which recognises the gap between smoking machine data and true human uptake . . . . **Faced by [Philip Morris's public complaints regarding the inaccurately low machine yields generated by Barclay cigarettes], BAT is considering an option designed to: a) Bring about the adoption by ISO of cigarette test criteria which more honestly reflect human smoke uptake . . . . Rationale . . . . It appears inevitable that existing test methodology will be questioned because it is unrealistic**. More accurate methods will be demanded of ISO ["ISO" changed to "the industry" by marginalia on document] . . . . It is in BAT's interest to accelerate the trend towards new test methodologies based upon the realities of human uptake. A BAT initiative would be moving with the flow of scientific opinion. Testing based on realities is likely to be more acceptable to the consumer than current methods . . . . **The initiative foresees BAT going over the head of the rest of the industry and recommending directly to the community [modified to "regulators" by marginalia] that cigarette testing be seen in a completely new way and that outdated tests be replaced. The industry status quo would be broken . . . . 1. BAT seen as a rogue elephant by the industry. Isolation**. 2. BAT seen by the community ["community" changed to "regulators" by marginalia] as realistic and working to present the consumer with honest information . . . . 4. **The public perception of low, medium, high tar cigarettes is turned on its head . . . .**

> **5. Smoking and health issues are seen in a changed light as it becomes clear that smokers have greater control over tar/nic uptake than previously recognised** . . . . Launch First half 1988 . . . . **If ISO . . . is not prepared to accept [BATCo's proposed] labelling [sic] solution, BAT may be obliged to draw public attention to the unrealistic nature of league table figures provided for smokers** . . . . The debate should be concerned with the importance of consumers having accurate scientific dat[a] . . . . CONCLUSION 1. Channel ventilated cigarettes are important for the future of BAT's international business. 2. The company cannot sit on its hands if the rest of the industry, through ISO, insists on maintaining outmoded test criteria in order to shut out channel ventilated products. 3. . . . [T]he proposed programme would aim to bring about the adoption by ISO of more realistic, and non-discriminatory test standards. 4. BAT's views on compensation reflect a growing body of scientific opinion. There is an opportunity for the company to accelerate this movement. . . . 7. In pursuing this alternative, the company moves with the tide of scientific thinking.

400015831-5839 at 5831-5835, 5837-5839 (US 85081) (O) (emphasis added).

3817. Similarly, a BAT facsimile dated July 31, 1987 from Nick Cannar to several BAT employees discussed several options for combating Philip Morris's attempts to have B&W's Barclay cigarette excluded from the ISO measuring protocol. One such option was "to include a paragraph in the ISO standards saying that, at very low delivery levels, the figures may not be particularly relevant or meaningful to consumers." BATCo also described:

> [A] much more aggressive approach which would involve publically challenging the machine figures for our competitors' ventilated products. **As we know, human compensation occurs with all ventilated cigarettes, particularly low delivery ones**. One way of preventing ‘Barclay' from being dealt with in isolation is to generate a wide public discussion and interest in the higher deliveries obtained by humans from all ventilated cigarettes during human smoking. **This would be a very proactive approach which would involve, for example, drawing to the attention of national regulatory authorities and to other interested organisations and publications the discrepancies between actual human uptake and machine figures for a wide range of our competitors' products**.

400015806-5808 at 5807 (US 85082) (A) (emphasis added).

3818. An August 19, 1987 BATCo document authored by H.F. Dymond, BATCo researcher, and "CLA" on BAT (UK and Export) Limited letterhead stated: "ALL laboratory based data shows that BARCLAY delivers a comparatively higher quantity of smoke to the consumer than other 1mg cigarettes." The document went on to state that "the other members of the Industry claim that there is no evidence to show that conventional products distort the ranking derived from machine data when smoked by humans." Under the heading "Industry Reaction," the document stated: "PM do not openly concede that compensation occurs . . . . On balance the other Companies dislike the present situation intensely . . . . They are angry with BAT for raising an issue which they believe will bring the entire industry into disrepute. **They acknowledge the compensation argument, recognise the forces presently trying to debate it, believe that the industry should oppose any attempt by those outside the industry to raise the issue**." 400015791-5797 at 5793, 5796 (US 85083) (O) (emphasis added).

3819. A BATCo document entitled "Summary of a meeting on Barclay held in New York on 24th August 1987" (attended by E.A.A. Bruell, W.J. Dickson, R. Pritchard, Tom Sandefur, A.L. Heard, M.L. Reynolds, Nick B. Cannar, Ernest Pepples and H. Dymond (listed as "Testing Manager R&DC/BATCo representative on ISO/Coresta Committees)) dealt with the issue of Barclay and the deceptiveness of machine smoking yields for all ventilated cigarettes. The document revealed that BATCo and the other Defendants were aware that all ventilated low delivery cigarettes generated misleadingly low tar and nicotine yields by machine testing, and that BATCo's only consideration of informing consumers of "the true scientific position" that ventilated cigarettes generated misleadingly low machine-measured tar and nicotine yields was to use the "threat[]" of informing consumers of the truth to prevent the other cigarette companies

from exposing the misleadingly low nature of Barclay's tar and nicotine deliveries in relation to human smoking:

> Our scientific evidence is that smokers ‘compensate' with all low delivery products and obtain from these products significantly higher deliveries of tar and nicotine than is suggested by the machine figures. This phenomenum [sic] of ‘compensation' for low delivery cigarettes is becoming increasingly recognised by reputable independent scientists. . . . **We should say that unless attacks on Barclay cease or the Industry is prepared to support a modification of the ISO standard to show the average figure for all ventilated products, including Barclay, then we will take whatever action is appropriate to make known to consumers the fact that machine figures do not provide an accurate guide to human uptake from all ventilated products**. . . . **If the Industry permits the attack upon Barclay to continue or is not prepared to accept a revision of the ISO standard for all ventilated products, then we would propose to put these threats into operation and to publicise to consumers, consumer organisations and national regulators the true scientific position concerning the measurement of tar and nicotine deliveries of all ventilated products**.

Under the heading "Scientific Evidence" and the subheading "On the Negative Side," the document stated: "It is easy to demonstrate compensation with BARCLAY. Lay people find these demonstrations convincing." 400015688-5690 at 5688-5690 (US 85062) (A) (emphasis added).

3820. A December 1, 1987 document written by Thomas Sandefur, B&W President and CEO, to a scientist in Kuwait regarding tar and nicotine testing of B&W's Barclay cigarette via the ISO method (a machine test virtually identical to the FTC Method) stated: "We have also carefully considered your question about providing better consumer information concerning the deliveries from low tar cigarettes. In keeping with your interest [in] this matter, Brown & Williamson suggests placing an insert in Arabic and English with each packet of cigarettes stating that ‘Blocking ventilation may result in higher deliveries of tar and nicotine.'" The letter

also stated: "**[W]hen they block the ventilation holes the smokers of all low tar cigarette brands can get many times the amount of tar and nicotine predicted by the ISO method. We do not accept that the BARCLAY ventilation system is any more abused than any other air-dilution type filter**." 2500046199-6199 (US 27899) (O) (emphasis added); 506811986-2001 at 1988, 1990, 1992 (US 20766) (O); Bible PD, United States v. Philip Morris, 8/22/02, 123:12-126:6-9 (testifying that "the ISO method is another way of referring to the FTC method of measuring cigarettes").

3821. Philip Morris received a copy of the December 1, 1987 Sandefur letter and, aware of its possible implications for itself and other Defendants, responded aggressively, eventually getting BATCo to agree not to refer publicly to human smoking behavior or compensation. A September 8, 1988 memorandum to Geoffrey Bible, CEO of Philip Morris International, urged that, as part of any resolution of the dispute over the Barclay cigarette, "**BAT will cease all references and discussions relative to human smoking habits (compensation) regarding ventilated products**. In other words, **discussing who 'cheats' is a non-productive exercise for our business**." 2500046198-6198 (US 45836) (O); 2500046174-6175 at 6175 (US 20547) (O) (emphasis added); Bible PD, United States v. Philip Morris, 8/22/02, 131:3-135:9.

3822. On January 12, 1989, Steve Darrah, head of Philip Morris International Operations, wrote to Philip Morris International attorney Lee Pollak and Philip Morris International CEO Geoffrey Bible regarding an upcoming meeting with BATCo/B&W to resolve the dispute over the tar and nicotine rating of Barclay. The meeting included Martin Lance Reynolds from BATCo (a fact witness and formerly an expert for Defendants in this case). The memorandum stated: "Philip Morris' position will be the following . . . **BAT will not raise the issue of compensation and human smoking behavior in the future** . . . . As we have made a

major ‘concession' regarding retroactive litigation, **we will ask that BAT stop immediately all current efforts on their part to raise the issue of human smoking behavior** . . . ." 2500046145-6146 at 6146 (US 20544) (O) (emphasis added); Bible PD, United States v. Philip Morris, 8/22/02, 135:11-143:13.

3823. On January 19 and 20, 1989, Philip Morris and BAT representatives met to resolve their disagreement. The memorandum describing the meeting reported that "BAT had planned to help SASO to make a human smoking behavior study in Saudi Arabia to show the difference in tar delivery between human and machine smoking for low tar products. **These kinds of tests are extremely dangerous for the entire industry and BAT accept to cancel it**." 2500046147-6150 at 6149 (US 20545) (O) (emphasis added - bold type); 2023266337-6337 (US 85052) (O) (telex cover note with Bible's handwriting); 2023266338-6340 (US 26783) (A) (copy of 2500046147-6150); Bible PD, United States v. Philip Morris, 8/22/02, 138:16-144:3.

3824. Dr. Harris, economist and expert witness in this case, reached the following conclusions from the quoted portion of the document above and other evidence he reviewed on the Barclay issue:

> **For many years, Defendant cigarette manufacturers had an explicit agreement, going back to late 1953, not to make adverse health claims about each others' products.** As I testified earlier, the business environment was significantly altered with the widespread publication of tar and nicotine ratings in the late 1950's by such independent entities as Reader's Digest and Consumer Reports. **To preserve their cooperative arrangement in the face of a new business environment, manufacturers began to compete on "the numbers," but still sought jointly to avoid any explicit claims about the health significance of such ratings or any claims that competitors' brands were unhealthy**. When BAT and Brown & Williamson introduced Barclay as a 1mg cigarette, such an act, while apparently competing "on the numbers," nonetheless raised issues that threatened to destabilize the collusive arrangement. As we know from the Holland incident, Philip Morris first retaliated by making direct health-related attacks

> on Barclay, and BAT responded by withdrawing from INFOTAB. With Philip Morris continuing to press its case in Switzerland, **BAT threatened to publicize the unreliability of "the numbers" themselves, thus threatening the common interests of all the firms in the entire industry. The threat was apparently sufficient to induce Philip Morris ultimately to withdraw its complaints, and manufacturers continued to compete "on the numbers" while the collusive arrangement was maintained.** The episode attests to the enduring strength of the collusive arrangement in the face of serious destabilizing threats by participating firms.

Harris WD, 201:11-202:6 (emphasis added).

3825. On January 23, 1989, a Philip Morris memorandum with agreed-upon "official minutes" from the meeting with BATCo and B&W regarding the Barclay filter cigarette was sent to and reviewed by Geoffrey Bible and other Philip Morris executives. Despite the fact that correspondence between Philip Morris employees and B&W/BATCo employees, which detailed Philip Morris's actions to prevent B&W/BATCo from engaging in any further public discussion of compensation, **was received by Bible himself**, Mr. Bible denied under oath at his 2002 deposition in this case that Philip Morris took steps in 1988 to prevent B&W from discussing the phenomenon of compensation publicly in connection with Barclay cigarette. Compare Bible D, United States v. Philip Morris, 8/22/02, 130:19-130:24; with 250046174-6175 (US 20547) (O); 2500046145-6146 (US 20544) (O); 2500046147-6150 (US 20545) (O).

3826. As detailed below, the evidence shows that the Barclay saga was not an isolated event. Dr. William Farone, Philip Morris USA employee from 1976 to 1984 and former Director of Applied Research at Philip Morris USA, and expert in "the chemistry and biochemistry of alkaloids and addictive drugs, the chemistry and physics of cigarette smoke, cigarette design and technology, and the chemistry and biochemistry of toxic substances and how they interact with living systems," testified that "[t]he argument against Barclay also applies to Marlboro Lights and

other similar products – simply a different mechanism. Artificially low FTC ratings is an inherent characteristic that occurs in the design of cigarettes with low resistance to draw as manufactured by all the companies." Farone WD, 2:2-8; 2:15-19; 114:8-22; Farone TT, 10/12/04, 2171:25-2172:8; 2182:11-2190:7.

3827. Several of Defendants' documents reference a 1969 "Smoker Intake Study" that was jointly "performed by Philip Morris for Brown & Williamson, Reynolds, Philip Morris and Lorillard." The results of this study of "smoke intake patterns among filter smokers" were presented by W.L. Dunn, Senior Scientist at Philip Morris, to the lawyers and scientists from the Tobacco Institute, including employees and representatives from Philip Morris, RJR, B&W, Lorillard and Covington & Burling on February 5, 1969. One of the study's objectives was to determine "the validity of FTC tar values as an index to smoke exposure." The study noted that "[h]ow much smoke a smoker gets is a crucial variable in studying the relationship of smoking to health." The report stated: "There is some relationship between the amount of smoke taken into the mouth daily and the FTC tar value for the brand smoked; **the relationship [is] of such low order [or] magnitude among filter smokers, that, taken alone, ha[s] no practical value for predicting smoke intake**." The report also discussed the "independence of daily intake relative to FTC tar values for brands smoked," and observed that "about 20% of those smokers of the high delivery cigarettes had a lower daily intake than the average smoker of the lowest delivery cigarettes." 504208317-8360 at 8319, 8323, 8327, 8328 (US 85068) (A) (Philip Morris Smoking Behavior Study) (emphasis added); 1001818034-8034 (US 85069) (O) (February 7, 1969 letter from Helmut Wakeham, Philip Morris Vice President of Corporate Research and Development, to P.A. Eichorn, Manager in Philip Morris's Technology Planning and Information Development Department, & W.L. Dunn); 04227839-7844 at 7843 (US 20066) (O) (February 24, 1969 letter

from P.R. Grant, Lorillard attorney, to Lester Pollack, Lorillard attorney and executive, noting the study was "supported by all but American Tobacco" and illustrative of when "the Industry from time to time has joined together to support studies"); 00498812-8814 (US 29414) (A) (June 6, 1969 letter from Arthur Stevens, Lorillard attorney, to H. Thomas Austern, Tobacco Institute attorney (with law firm Covington & Burling) referencing "the smoker intake study performed by Philip Morris for Brown & Williamson, Reynolds, Philip Morris and Lorillard"); 1000869989-9989 (US 85071) (O) (September 5, 1968 letter from P.A. Eichorn to R.B. Seligman, Philip Morris executive); 1001880771-0772 (US 85072) (O) (September 10, 1968 letter from P.A. Eichorn to Helmut Wakeham).

(ii) Philip Morris

3828. The evidence shows that Philip Morris was more far more interested in developing cigarettes that would sell than they were with designing safer cigarettes. James Morgan, former Philip Morris CEO, testified that the marketing department often drove new product development at Philip Morris:

> I believe that I characterized the marketing R&D relationship as 70 to 80 percent marketing, saying to R&D here are the marketplace conditions, here are the issues from a cigarette standpoint that we see; what can you do. And then the balance 20 percent or 25 or 30 percent R&D saying, hey, here are some things we developed, what do you think you can do with these in the marketplace.

Morgan PD, Price, 6/5/02, 95:13-99:5.

3829. Dr. Farone testified:

> **Philip Morris, including during my time there, exploited its knowledge of [the] compensation phenomenon in its design and manufacture of cigarettes**. . . . Philip Morris exploited knowledge of [the] compensation phenomenon by designing low tar cigarettes to register low tar and nicotine yield values under the FTC method testing protocol, while at the same time enabling smokers to compensate. **When I was there, it was a key**

consideration in every product development.

Farone WD, 2:2-8; 2:15-19; 114:2-7 (emphasis added); Farone TT, 10/12/04, 2171:25-2172:8; 2182:11-2190:7 (emphasis added).

3830. Dr. Farone testified that: "In the case of Marlboro Lights, that cigarette was designed – before I got to Philip Morris – **such that it could score one level on the FTC machine while simultaneously delivering the needed dose of nicotine for the smoker**." Farone WD, 126:9-16 (emphasis added).

3831. Dr. Farone further testified:

> We [at Philip Morris] knew how to make cigarettes with filters that essentially prevented compensation or made it very obvious to the smoker that they were compensating . . . . However, **Philip Morris intentionally avoided including those features in some of their major lights and lower tar cigarettes, to ensure that smokers could compensate**.

Farone WD, 124:4-20 (emphasis added).

3832. Dr. Farone added that cigarette design to facilitate compensation "continues today," and that "Marlboro Lights, Virginia Slims Lights, and Winston Lights, just to name a few, are all cigarettes that are designed to facilitate compensation." Farone WD, 115:19-116:2; accord Farone TT, 10/7/04, 1852:9-16 (testifying that "if you compare a full delivery cigarette to" a light (as opposed to ultralight) cigarette, "the amount of nicotine [smokers] derive will be essentially the same" from either).

3833. A February 18, 1964 Philip Morris Research Center report to Philip Morris management prepared by Helmut Wakeham, then Director of Research, proposed that Philip Morris influence the testing procedure to be used by the government and the FTC, specifically to measure the harmfulness of cigarettes, and exploit the governmental testing methodology as a vehicle for marketing:

> [T]he following recommendations are offered to Philip Morris management: . . . . Move promptly and effectively toward establishment of suitable biological approval specifications for all new smoking products. It may be expected that in time the Government will force the adoption of such specifications, in which case Philip Morris would be able to influence the setting of the ‘uniform and reliable testing procedure' (proposed FTC Rule 3) consistent with our own methodology. Apart from possible legal requirements, **such a policy would enhance advertising opportunities**.

1003884292-4302 at 4298-99 (US 20180) (O) (emphasis added).

3834. A June 1966 Philip Morris report prepared by Philip Morris marketing researcher Myron E. Johnston, Jr. – whom Dr. Farone testified "was generally acknowledged to be the guru on market analysis within the R&D Department" at Philip Morris and whose "research and recommendations shaped [the] views and decisions" of Philip Morris executives – for Helmut Wakeham and others illustrates that, as of 1966, Philip Morris was continuing with this plan by developing cigarettes that would generate low tar and nicotine numbers on the FTC machines, but deliver much higher levels when smoked by humans:

> In the event of . . . the passage of legislation requiring a statement of ‘tar' and nicotine content on the pack, the delayed dilution cigarette could be a formidable entry as a full tobacco flavored cigarette. It could compare favorably with any health cigarette currently on the market yet deliver full flavor throughout the crucial first 40mm of the rod. I am of the opinion that we should press development of this concept.

Dr. Farone, who reviewed this document as part of his duties while a Philip Morris employee, testified that Mr. "Johnson wrote this memo in anticipation of the introduction of the FTC testing method," and that the "paragraph shows that Philip Morris was planning to develop cigarettes that would generate low tar and nicotine numbers on the FTC machines, but the cigarettes would actually deliver much higher levels when smoked by humans." The document further stated: "**The illusion of filtration is as important as the fact of filtration**. Therefore any entry should

be by a radically different method of filtration but need not be any more effective . . . . Several studies have shown that a large proportion of smokers believe that any filter reduces the health hazard . . . ." Dr. Farone testified that this statement "shows that Philip Morris's product development was not genuinely aimed at making products that meaningful testing showed likely to be less hazardous, but rather products that would imply safety but didn't actually offer any advantage." 1001913853-3878 at 3857-3858, 3862, 3870 (US 20123) (A); 1000338644-8671 at 8649, 8654, 8662 (US 21487) (A) (emphasis added); Farone WD, 108:8-110:5.

3835. Dr. Farone added that this document is one of many on the topic, and that the views expressed in it were known and of interested to the highest level executives at Philip Morris:

> Some of the most senior executives would always come to the monthly Richmond meetings when any presentation was given by Mr Johnson or Mr. Dunn relative to this topic because there was a general recognition within Philip Morris that what we were doing was selling a nicotine delivery device. People smoke for the nicotine. So topics like how much nicotine smokers need, how much they want, how much they can tolerate, how little they can accept, were all topics that were discussed frequently. This is one of probably several dozen documents on this same subject that I have seen.

Farone WD, 107:4-19.

3836. A 1969 Philip Morris report of the findings of a Philip Morris study of filter smokers' intake patterns stated that the FTC Method has "**no practical value for predicting smoke intake**." 1003287490-7557 at 7494 (US 20161) (O) (emphasis added).

3837. A March 1, 1974 Philip Morris document by Wakeham stated under the heading "SUMMARY": "People do not smoke like the machine [referring to the FTC Method] . . . **Generally people smoke in such a way that they get much more than predicted by machine. This is especially true for dilution cigarettes**." After acknowledging that people get much

more tar than indicated by the FTC testing methodology, the document stated in the "CONCLUSION" section: "**The FTC standardized test should be retained: 1) It gives low numbers**." 1003293476-3493 at 3476, 3492-3493 (US 85073) (A) (emphasis added); see also Whidby TT, 2/22/05, 13983:2-22 (acknowledging that first reason Wakeham lists for retaining FTC Method is: "it gives low numbers").

3838. This document also displays a chart and states: "A study of 1,235 smokers in 1968 and again in 1972 showed them to have increased the daily number of cigarettes they smoke . . . ." The chart shows that, for 70% of the brands depicted, when the tar level went down, the number of cigarettes smoked per day went up. 1003293476-3493 at 3480 (US 85073)(A); Whidby TT, 2/22/05, 13978:4-14; 13979:4-13980:17; 13980:22-13981:19; 13978:23.

3839. Dr. Farone testified that this document, which he "was aware of at the time" he was a Philip Morris employee, has to do with . . . designing the cigarette so that the FTC tar number is lower, but the amount of nicotine that can be extracted by the smoker relatively easily by changing their habits would be equal to the one of higher tar delivery." Farone WD, 116:15-117:8.

3840. A March 7, 1974 Philip Morris interoffice memorandum from Raymond Fagan to Wakeham, entitled "Moral issue on FTC Tar," stated:

> Some concern has been expressed concerning the moral obligation of Philip Morris (and perhaps the tobacco industry) to **reveal to the FTC the fact that some cigarette smokers may be getting more tar than the FTC rating of that cigarette**. You mentioned in your presentation at the Center on Tuesday, March 5, that such concern was voiced in N.Y. at your talk there. And it was expressed again by some individuals who heard you in Richmond. **I believe that there need be no such concern, at least from a position of morality**.

1000211075-1076 at 1075 (US 35179) (A) (internal numbering omitted).

3841. "[F]rom the 1970s until today, Philip Morris has [] used computer models to predict the FTC tar and nicotine delivery based on" a given cigarette's design, but Philip Morris has never used or input data into these computer models to predict the tar and nicotine delivered to human smokers based on a given cigarette's design. In fact Dr. Whidby testified that "[t]he computer does not deal at all with what people who smoke Philip Morris cigarettes actually get." Whidby WD, 16:13-17:6.

3842. Dr. Whidby also testified that Philip Morris research found "that many smokers take bigger puff volumes than the machine does in the FTC method." Whidby WD, 17:10-15.

3843. An Annual Report of the Philip Morris U.S.A. Research Center dated June 17, 1981, written by Barbro Goodman and entitled "Development Smoke Studies," which lists Dr. Whidby as a recipient, stated that the average panelist in the subject smoke studies took bigger and longer puffs than the FTC Method. The Report continued: "The cigarettes with the lowest RTD [resistance to draw] and dilution levels were smoked with the largest puff volumes, which means that lower delivery cigarettes generally are smoked with larger puffs than higher delivery controls. This was true in all sets of cigarettes that were tested." As Dr. Whidby acknowledged, the Report went on to describe Philip Morris's "capability to lower the number of puffs of a cigarette taken under the FTC Method – thereby decreasing its reported FTC tar yield – by making the cigarette burn faster." Dr. Whidby also acknowledged that, unlike the machine, a human smoker "can just take puffs of [the] cigarette more often and ingest just as much tar and nicotine from the cigarette as [the smoker] could before the cigarette was designed to burn faster." This Philip Morris Report also recounted several lines of "evidence that physical parameters, particularly RTD [resistance to draw] and dilution, are the primary determinants of average smoker parameters." 1000392398-2423 at 2403, 2407, 2411 (US 34636) (A); Whidby

WD, 48:19-49:11.

3844. Dr. Whidby testified that, "from 1971, when Marlboro Lights was introduced, until 1978 or 1979, the resistance to draw ("RTD") of Marlboro Lights was lower than the RTD of Marlboro Red, which made it easier for a smoker to take bigger puffs on a Marlboro Light than on a Marlboro Red." Whidby WD, 43:1-12.

3845. A Philip Morris document with the heading "Tentative Agenda Richmond Meeting – August 2, 1983 Product With Most Desirable Smoke Characteristics Future Product Trends," which lists Dr. Whidby as a scheduled presenter, set out – under the heading "Low tar high (or med) nicotine" – a plan to develop a cigarette that reduced delivery "under actual smoking cond[itions]" by increasing nicotine delivery relative to tar. This demonstrates that Philip Morris's other "low tar" cigarettes at the time were **not** designed to actually deliver lower tar to smokers: "[C]an show using PREP technique how to balance nicotine level **to achieve a real low delivery cigt. under actual smoking cond.** Use smoking simulator in conj. – w/PREP if nec. Make a series of cigts. w/low tar & varying nic." 1003177954-7957 at 7957 (US 35661)(A) (emphasis added); Whidby WD, 64:1-18.

3846. Victor DeNoble, a former Philip Morris research scientist, stated on the January 3, 1995 PBS television program "Frontline" that Philip Morris was aware that smokers were blocking cigarette ventilation holes and that "[i]n fact, there was a project in which a psychology group at Philip Morris actually filmed people smoking to determine where filter[] and dilution holes should be placed, so that the fingers would cover them up." 2046562514-2533 at 2531 (US 85085) (O).

3847. A facsimile sent from Philip Morris's Richmond legal office on January 21, 2000, to familiarize new employees with Philip Morris's cigarettes confirmed that the ventilation holes

in cigarettes are not readily apparent; it instructed new employees to "[o]bserve the ventilation holes in the tipping paper by holding up to the light or by using the magnifying glass." 2074112963-2968 at 2965 (US 85086) (A); see also Whidby WD, 38:1-22; 39:12-17 (testifying that "this Philip Morris document instructs the person giving the presentation that, even after the tipping paper is removed from around the filter, in order to see the ventilation holes, he or she needs to hold the tipping paper 'up to the light' or use 'the magnifying glass," and acknowledging that "Philip Morris could just put a visible line around the part of the filter that contains the vent holes" to alert consumers to their presence, "[b]ut Philip Morris has never done that.").

(iii) RJ Reynolds

3848. In February 1965, when the testing procedures to be used by the FTC were under development, Alan Rodgman, a RJR senior scientist, told senior management: "The conclusion is . . . inescapable that **labeling the amount of 'tar and nicotine' on a cigarette package cannot give to the smoker meaningful information as to the amount or composition of the total solids and nicotine he receives from the cigarettes he smokes. He is more likely to be misled than informed**." 521184948-4965 at 4950 (US 22134*) (A) (emphasis added); 501013225-3239 at 3227 (US 22227) (O); 2025002829-2846 at 2831 (US 22166) (O).

3849. A document circa 1971, apparently written by Anders H. Laurene, then Manager of the Chemical Division of RJR (and Director for RJR from 1977 to 1980) shows that, as early as 1971, RJR had internal data in a "Puff Profile Paper" that was "well-organized, professionally written, and describe[d] highly competent work" concluding that FTC tar and nicotine yields for low tar cigarettes were inaccurately low due to smoker compensation:

> It is indicated by these data that smokers compensate for low "tar" deliveries by taking larger puffs. This could be interpreted by adversary forces to mean that the industry is failing in actuality in its present approach toward reduced 'tar' delivery to smokers. Our

> own approach – higher filtration and/or air dilution – is made to seem self-defeating by these data. . . . Puffs taken by humans smokers are depicted as being much larger in volume than the generally recognized "FTC puff volume." . . . [T]he results of this study may be interpreted by adversary forces to mean that smokers receive much more "tar" than FTC numbers indicate. Such interpretation would be damaging to our already besieged industry . . . . As it now stands, we do not have any means of disproving or challenging such interpretation.

The document added: "**There is nothing wrong with this paper** as concerns work quality, scientific merit, or written preparation." This same document evidences RJR's commitment, on behalf of the entire industry, to prevent publication in 1971 of accurate scientific data showing compensation for low delivery cigarettes. **RJR deferred publication** of the paper **solely because its "contents can be interpreted to be contrary to Corporation interests**" and "**might raise further controversy on the issue of 'tar' delivery to smokers."** 500286135-6136 (US 85074) (O) (emphasis added).

3850. A September 18, 1975 handwritten report by John H. Reynolds, an RJR scientist, revealed that RJR was designing cigarettes to test low by FTC puff volumes (35 ml), but achieve much higher tar/nicotine deliveries when bigger puffs were taken by actual human smokers:

> Several LTC cigarette prototypes were tested in an **attempt to improve the tar delivery capability at high puff volumes, while retaining a nominal 2mg tar delivery at the 35ml puff volume**. The effects of the location and number of tipping perforations, tow item, cigarette wrapper and mouthend configuration ("TC" or plain) were examined to a limited extent. The results of these tests were passed on to TPD [tobacco product development] for their use. An interesting finding was that when other factors were equal, the plain tip versions always gave a greater increase in tar delivery on increasing from 35cc to 64cc puffs than did the "TC" tip versions.

502833940-3940 (US 85075) (O) (emphasis added).

(iv) Brown & Williamson

3851. Dr. Wigand, who was B&W's Vice President of Research and Development from 1989 to 1993, explained how compensation was "a design consideration" at B&W:

> Brown & Williamson designed their cigarettes purposefully to deliver varying amounts of nicotine, dependent upon the different ways in which individuals smoked cigarettes. This design feature allowed each individual smoker to satisfy their maintenance level of nicotine despite variations in the amount of nicotine each smoker required to maintain addiction. In short, Brown & Williamson consciously designed its cigarettes with elasticity of nicotine delivery in mind.

Wigand WD, 8:11-17; 121:21-122:2.

3852. Dr. Wigand also explained the significance of B&W's design of its cigarettes for "elasticity of nicotine delivery":

> [W]e knew at Brown & Williamson that smokers had varied nicotine burdens, which means the amount of nicotine required to sustain addiction varied from smoker to smoker. Thus, we knew that if light cigarettes were capable of only delivering the machine measured amount of nicotine that most smokers of light cigarettes would not get the required amount of nicotine necessary to maintain addiction. Thus, it was necessary to design the cigarette to be elastic in terms of the amount of nicotine delivered. Essentially allowing each smoker to obtain from the cigarette – regardless of whether it was a light or a full-flavor cigarette – the dose of nicotine that was necessary to meet their individual nicotine burden.

Dr. Wigand testified that, when he was the head of B&W's research and development, "all brand styles of cigarettes – full-flavor, lights and ultralights" manufactured by B&W were "designed to be elastic." Wigand WD, 122:3-14; 123:21-124:1; see also Wigand WD, 123:16-20 ("Elasticity is the cigarette design feature that allows the human to be successful in getting the amount of nicotine they need out of a cigarette, even though that amount will differ from one smoker to another.").

3853. A March 4, 1982 interoffice memorandum discussing the highly deceptive nature

of the design of B&W's Barclay cigarette and others like it, sent from J.H. Reynolds, A.B. Norman, and J.H. Robinson to R.E. Morse (all RJR employees) stated:

> The next generation of "Barclay competitors" will be spawned (indeed has already been spawned) in the minds of R & D and marketing people throughout the industry and its suppliers. **This generation of products, or the next, could easily be products which will deliver NO "tar" or nicotine when smoked by the FTC method, and yet when smoked by humans essentially be unfiltered cigarettes**. Such products could (and would) be advertized as 'tar-free,' 'zero milligrams FTC tar', or 'the ultimate low-tar cigarette', while actually delivering 20-, 30-, 40-mg or more "tar" when used by a human smoker! **They will be extremely easy to design and produce**. If there is any doubt that such products could be made, we will be happy to provide design sketches or prototypes of new or existing designs which will substantially accomplish the feat. **Such cigarettes, while deceptive in the extreme, would be very difficult for the consumer to resist, since they would provide everything that we presently believe makes for desirable products; taste, "punch", ease of draw and "low FTC tar."**

503670658-0659 at 0658 (US 20721) (A) (emphasis added).

3854. A June 9, 1982 B&W memorandum by Ernest Pepples, Vice President and General Counsel, entitled "Low-'Tar' Cigarette Advertising and the FTC Cigarette Testing Program: A Time for Re-Examination," stated:

> It has been theorized by some that smokers of low-'tar' cigarettes may automatically compensate for the reduced delivery of 'tar' and nicotine by oversmoking, e.g., by puffing more often or more deeply, by smoking each cigarette closer to the filter, or by smoking more cigarettes . . . . **FTC's present system further contributes to consumer deception because it allows some cigarette companies to promote heavily a "box" brand, without adequately distinguishing it from the soft pack of the same brand name, which delivers considerably more "tar". In fact, however, the companies produce such a small volume of the box brand as to make it a phantom brand that is rarely found in the marketplace**. On the other hand, the soft-pack version bearing the identical brand name and package design but testing at a considerably higher "tar" level, is the version readily available to the consumer . . . an EPA-type disclaimer might be

> adopted to warn that the FTC figures are standardized measurements derived by laboratory tests; any smoker may get more or less depending on the way he or she smokes the brand in question.

Despite this knowledge, B&W took no step toward informing consumers of the true meaning of the FTC yield numbers. 690025487-5491 at 5488-5491 (US 21042) (A) (emphasis added).

3855. In a March 19, 1984 letter, Pepples told Howard Liebengood of the Tobacco Institute that "the industry opposes and will resist any 'compromise' [with FTC] that includes requirement relating to 'tar' and nicotine ratings" because such ratings "may be misleading to consumers" and FTC tests bear no relation to actual consumer intake. 521060910-0912 at 0912, 0910 (US 20892) (O) (emphasis in original).

3856. A February 14, 2002 B&W document entitled "Low Delivery Products and 'Lights' Descriptors" acknowledged:

324534461-4481 at 4463 (US 20594) (Confidential) (O).

3857. At his deposition in this case, Hugh Honeycutt, Director of Research Services and Analytical Research for B&W and former Director of Product Development and Leaf, testified that ultra-low tar smokers actually inhale more tar than is shown by the FTC Method. Honeycutt PD, United States v. Philip Morris, 4/23/02, 130:23-131:10.

(v) BATCo

3858. In an internal document, BATCo acknowledged that, unless lower tar cigarettes were specifically designed to allow compensation, thus offering deceptively low machine measured tar and nicotine yields and much higher actual yields to human smokers, they often were not popular with smokers: "Nearly every BAT company has products in the low tar segment of its markets, but they do not generally command a major position in sales . . . . In the extremely low delivery range, **unless they are specifically designed, they offer poor 'reward**

for effort' . . ." 100515899-5910 at 5909 (US 20230) (A) (emphasis added). Explaining the significance of Grieg's statements, Dr. Burns testified: "Clearly a tobacco industry goal was to develop products that could be promoted as delivering lower yields, but when smoked would deliver a full dose of nicotine in order to satisfy the smoker." Burns WD, 51:16-19.

3859. A 1980s memorandum from BATCo's research and development group recommended that BATCo design cigarettes that would make it easier for smokers to compensate: "**Irrespective of the ethics involved, we should develop alternative designs (that do not invite obvious criticism) which allow the smoker to obtain significant enhanced deliveries should he so wish**." 109869437-9440 at 9437 (US 21707) (A) (emphasis added); Henningfield WD, 54:16-55:2 ("This course was followed despite the fact that an alternative course was possible – namely, to design cigarettes that would make it more difficult to obtain tar and nicotine levels above the FTC test levels").

3860. A January 10, 1977 BATCo report by D.E. Creighton reported nearly-identical conclusions to those of a January 17, 1977 memorandum. The report added:

> There were some observed abuses of the cigarette design . . . . It was observed that at least one subject learned that by placing the cigarette further into the mouth, the ventilation holes could be covered up and smoke deliveries increased. It was also noted that the fingers used to hold the cigarette could be conveniently placed to cover up some of the ventilation holes. One subject was seen to cover the ventilation holes with clear adhesive tape . . . . The puff durations were longer from both the low delivery cigarettes and the volumes of the individual puffs were, on average, higher when compared with the usual brand or with machine smoking . . . . The pressures used to draw the puffs were, however, less than those recorded when usual brands were smoked. This reduction in the draw resistance is due to the ventilation and higher paper porosity of the low delivery brands. In general it may be summarised that the subjects smoked the low delivery brands more intensely than the usual brands, presumably in an attempt to draw more smoke and nicotine . . . . Since the data from the two tests are comparable it may be interpreted that cigarettes with nicotine deliveries of less

> than 1.0 mg and highly ventilated filters were smoked at maximum intensity by these smokers . . . . these findings may be relevant to the design of low delivery cigarettes.

105456335-6363, at 6335, 6337-6339, 6341, 6343-6347, 6357, 6359, 6363 (US 85087*) (A).

3861. A January 19, 1977 internal BATCo memorandum sent to C. Ian Ayres, BATCo Research Manager, D.J. Wood, BATCo Researcher, and others explained how compensation makes published smoke deliveries misleading:

> Two cigarette brands, 'Now' (U.S.A.) and "Reemtsma No. 1', with very low deliveries of TPM and nicotine, have been smoked by subjects whose manner of smoking was monitored. The subjects smoked these two brands with greater intensity than they smoked cigarettes of more normal delivery, taking larger puffs at more frequent intervals. From each brand, the subjects on average took more than twice the volume of smoke that was taken by a standard smoking machine. **This emphasises the misleading nature of published smoke deliveries when dealing with cigarettes of this type**.

109869437-9440 at 9437 (US 21707) (A) (emphasis added).

3862. A June 28, 1977 memorandum from D.J. Wood, a researcher for BATCo, entitled "The Design of Low Delivery Cigarettes (With Regard to Smoker Compensation)," recommended producing a cigarette that would deliver up to twice the machine-measured amount of nicotine. The paper warned that "[a]lthough marketing considerations will influence the lower limits towards which deliveries will be reduced," a "minimum nicotine intake must be achieved" before "some of the effects of smoking . . . [which] appear to be due to nicotine itself" occur. The paper noted that, although the "**minimum effective nicotine level**" would vary from individual to individual, **BATCo "should aim at a cigarette delivering at least 0.5 mg of nicotine. With appropriate design, including moderately low drag resistance, smokers will be able to obtain up to 1 mg nicotine from such a cigarette**." 110074887-4890 at 4890 (US 21829) (A) (emphasis added).

3863. Minutes from a July 1, 1977 meeting of BATCo employees, under the heading "Compensation," state: "Mr. Wood's note on low delivery cigarettes was considered by the meeting. Mr. Sheehy, BATCo's Chairman, asked whether, from our knowledge of the compensatory responses of smokers, cigarette designs could be postulated which took advantage of this information. For example, could a 9 mg. cigarette be designed which would make the desired adjustment of smoking pattern easy to the smoker." 110074875-4883 at 4881 (US 85094) (A).

3864. In a memorandum dated August 26, 1977, S. J. Green, Scientist, Manager, and Director of BATCo Research & Development from 1961-1979, posed the following questions to be discussed at a Chairman's Advisory Conference with Mr. Sheehy, then Chairman of BATCo:

> Should we market cigarettes intended to reassure the smoker that they are safer without assuring ourselves that indeed they are so, or are not less safe? For example should we 'cheat' smokers by 'cheating' League Tables? If we are prepared to accept that government has created league tables to encourage lower delivery cigarette smoking and further if we make league table claims as implied health claims – or allow health claims to be so implied – **should we use our superior knowledge of our products to design them so that they give low league table positions but higher deliveries on human smoking? Are smokers entitled to expect that cigarettes shown as lower delivery in league tables will in fact deliver less to their lungs than cigarettes shown higher**?

110069804-9804 (JE 26360) (A) (emphasis added).

3865. A September 21, 1977 letter from F. Haslam to P.L. Short, Manager of BATCo's Marketing Department, stated:

> I have been concerned that the discussions on compensation and cigarette design should be taken a step further . . . . **[i]t should now be possible to design a number of cigarettes which would have the same smoking machine delivery but different deliveries to the compensating smoker**. Broadly speaking, this could be achieved by developing cigarettes with a knowledge of the

> smoker's response to such factors as pressure drop, ventilation, irritation, impact, nicotine delivery, etc.

100236543-6543 (US 21412) (A) (emphasis added).

3866. A May 19, 1981 BATCo document entitled "Products/Consumer Interaction," by M. Oldman, referencing a discussion about "machine v/s human smoking," stated: "It was agreed that **effort should not be spent on designing a cigarette which, through its construction, denied the smoker the opportunity to compensate or oversmoke to any significant degree**." 109883262-3265 at 3263 (US 21579) (A) (emphasis added); Henningfield WD, 54:16-55:5 (testifying that this document illustrates that "an alternative course" to Defendants' design of their cigarettes to facilitate compensation, i.e., designs with less elasticity of delivery, "was possible").

3867. A December 1981 BATCo memorandum to BATCo counsel providing a critical analysis of legal and scientific problems raised by a presentation of L.C.F. Blackman, BATCo Research Director, on the safety of low yield cigarettes warned against misrepresenting the opinions of the Surgeon General in statements to the public:

> B. Assurances of Safety. If Dr. Blackman quotes or refers to the Surgeon General in support of an argument that low tar cigarettes are safer, he must be very careful to include the **Surgeon General's provision that this may be true only if smoking patterns do not change. Otherwise, the industry might be accused of misleading the consumer regarding the Surgeon General's opinions**. In effect, Dr. Blackman might be creating a duty to instruct the consumer regarding use of the product. Negligent failure to instruct is a basis for liability, as is negligent failure to warn . . . . 3. Compensation. Dr. Blackman mentions that consumers should be made aware of the scientific opinion supportive of a less hazardous cigarette. If the industry points this out, it follows logically that it must also point out the great concern that switchers to lower yield cigarettes compensate by inhaling more or smoking more cigarettes. The question arises of whether this concern should be brought to the attention of the consumer by the industry in the form of a warning.

2501022952-2969 (US 27925) (A) (emphasis added).

3868. A report from a BATCo research conference held August 22-26, 1983 in Rio de Janeiro, Brazil, and attended by top BATCo scientists, discussed BATCo's planned response to any proposed changes to the FTC Method. The document stated that "[c]ompensation is now attracting the interest of Government and medical authorities in many parts of the world" and that "[a] direct consequence of this growing interest in compensation is the possibility that the FTC, and other authorities, may call for a change in the standard smoking machine test procedure" by either "a modification to the existing standard procedure (increased puff volume, duration or interval)" or "a more extreme possibility. . . an entirely new test. . . e.g. a biological index or a Herzfeld-type multiple delivery index." The report then stated:

> Either move would weaken the concept of low tar and would both confuse and concern the smoker. **Operating companies around the Group should, therefore, do everything possible to defend and maintain the present standard test procedure. If, however, the FTC or any other authority takes action to change the procedure the strategy should then be to stretch out any discussions** (both with the authorities and later with the ISO) until exhaustive studies have established that an alternative procedure is in fact more relevant.

110074746-4769 at 4754 (US 85076) (A) (emphasis added).

3869. A BATCo document entitled "Proceedings of the Smoking Behaviour-Marketing Conference July 9th-12th, 1984" revealed not only that BATCo designed its cigarettes with planned FTC tar and nicotine yields and separate, higher yields intended to be achieved by human smokers through compensation, but also that BATCo concealed its design of cigarettes to facilitate compensation by utilizing degrees of "elasticity" that were "less obvious":

> From a research and product development viewpoint the proposition of designing a cigarette, of high taste to tar ratio, which responds positively to human smoking behaviour [referring to compensation] has been agreed to be acceptable. . . . The marketing policy concerning this type of product . . . will depend largely on the degree of elasticity in the design and how overtly

> this elasticity is achieved. The **consensus is that small improvements in elasticity which are less obvious, visually or otherwise is likely to be an acceptable route**. . . . Large changes in delivery are not credible (i.e. 1 mg machine delivery giving 10 mg through the consumer compensation). Better to have a 9 mg product giving 15 mg.

B12910303-0501, 0305-0307 (US 85449) (A) (emphasis added); Kessler WD, 61:13-62:5 (testifying that document "provide[s] evidence of an effort to try and manipulate nicotine deliveries to assure that smokers receive an adequate dose of nicotine"). In stark contrast to BATCo's internal plans, a January 21, 1983 document entitled "Notes for BAT Co Conference," appended to "Minutes of the BATCo Chairman's Advisory Conference" (held in March 1983), explains that BATCo's plan was to counter arguments that smoker compensation reduced or eliminated any health benefit to low tar cigarettes by claiming that BATCo designed cigarettes to **prevent** compensation:

> One line of attack [on the claimed health benefits low tar cigarettes] will be that smokers compensate for the reduced delivery by alternating their smoking habits. We should admit that this can occur but **emphasise that our superior knowledge of smoker behaviour has permitted the development of products giving smoking experiences . . . mitigating against compensation.**

109877063-7124, 7118 (US 87917*) (A) (emphasis added).

3870. An April 8, 1987 B&W memorandum from M.L. Reynolds, Director of Research, to Claude Joigny of SEITA in France demonstrates Mr. Reynolds' awareness that FTC tar numbers were misleading and that a banding system, in which low tar cigarettes are identified as delivering a range of mg of tar, as opposed to a single tar number, would be more accurate, stating: "I myself explained that Brown & Williamson would support a tar banding system of the type used in the U.K. as a more relevant consumer message." 400015868-5868 (US 85078) (O).

3871. BATCo also understood "elasticity," i.e., making cigarettes (such as "Barclay")

that would deliver low yields of tar and nicotine when smoked by the FTC Method machine, but would easily allow smokers to compensate and greatly increase their actual intake of tar and nicotine. Two documents from Colin C. Greig, BATCo Research & Development, identified means to design cigarettes with "elasticity": "'Structured creativity group' – Thoughts by C.C. Greig – R&D, Southhampton – Marketing Scenario" and "Specific Proposal." "Specific Proposal," stated: "**What would seem very much more sensible[] is to produce a cigarette which can be machine smoked at a certain tar band, but which, in human hands, can exceed this tar banding. Such is the case with Barclay. . . . Barclay is an extreme example of this 'elasticity' of delivery . . . . There are . . . ways to obtain moderate 'elasticity through non-obvious cigarette design features. One particular way is to use a recent R&D development . . . rather obvious to the expert but <u>not</u>, necessarily, the customer**." The document proposed several cigarette designs that enable compensation, including "a nicely 'elastic' product which has good smoking mechanics" and "'[a] medium delivery compensable product.'" 100515899-5910 (US 20230) (A) (emphasis added – bold type).

3872. The document entitled "'Structured creativity group'" stated:

> If one looks, cursorily, at the human behaviour records in GR&DC over the last fifteen years, the immediate conclusion is that puff volumes have risen as inexorably as machine deliveries have declined. Given **the design parameters of the cigarettes, it is possible to speculate that human compensation has, for a significant part of the smoking population, negated attempts to reduce tar deliveries**.

In that document, Greig dismissed as "rubbish" the argument that low tar smokers do not compensate. He further wrote, under the heading "What satisfies his requirement," that smokers:

> may smoke a low delivery cigarette - but in times of tension or altered mood we want a stronger one. What happens? Either we smoke one more intensely (remember there is no single dose for a cigarette) - or we smoke two in rapid succession. A dilemma

> appears - do we design a compensatable cigarette and sell one - or the non (or minimally) compensatable cigarette - to sell two? Given the unit cost, it is very probable that the second option is not viable - so we have, perhaps, to do the first.

Grieg concluded the memorandum with: "**Let us provide the exquisiteness, and hope that they, our customers, continue to remain unsatisfied**. **All we would want then is a larger bag to carry the money to the bank**." 100515899-5910 at 5902, 5907-5908 (US 20230) (A) (emphasis added).

3873. A 1999 BATCo document, "Lightning – Extreme Smoking Regimes Testing Results and Implications for IT and The Light-Mild Issue," shows that, using smoking machine parameters different than the FTC that more closely approximate human smoking (parameters that block ventilation holes, for example) with BATCo's du Maurier brand of light cigarettes, "[d]eliveries (tar and nicotine) [were] considerably higher than competitor brands under high smoking regime. . . . Deliveries for our major trademarks (Player's and du Maurier) appear higher than the competitor brands[.] Could this become a consumer issue? How can we best adjust the lineups of families (if required) while minimizing perception of change by current smokers." 321989110-9124 at 9116 (US 85077) (A).

(vi) American Tobacco

3874. A circa 1994 American Tobacco document admitted American's use of vent hole position to "regulate 'tar' delivery":

> The American Tobacco Company utilizes ventilation holes in the filter tip of cigarettes to provide a means for ingress of air to dilute the smoke and regulate ‘tar' delivery. The size and/or number of ventilation holes are factors in the design of air-diluted filter cigarettes. Generally, lower ‘tar' deliveries are achieved by increasing the size and/or number of ventilation holes. The American Tobacco Company positions the ventilation holes in a relatively narrow band about mid-way of the filter tip length for all air-diluted brands, i.e., full flavor, low ‘tar,' and ultra low ‘tar.'

However, the document inexplicably denied that American utilized the position of vent holes to obtain low FTC tar deliveries: "Hole position is therefore not utilized as a criteria in obtaining low FTC smoke deliveries in cigarettes. Ventilation holes for all brands are positioned a minimum of 12 mm from the mouth end of the cigarette." 980215835-5838 at 5835 (US 85096) (O).

(vii) Lorillard

3875. A memorandum recounting Lorillard scientist Vello Norman's visit to the American Health Foundation on November 18, 1980 demonstrates that Lorillard was aware that its cigarette designs brought about deceptive tar and nicotine yields when tested by the FTC Method. In a parenthetical note in the memo, Norman wrote:

> Note: actually what he needs is a pressure drop sensitive smoking machine which could take large puffs from cigarettes that are easy to draw through and would have a hard time puffing on very tight cigarettes. **This would simulate human behaviour but, I did not dare to mention anything like that because it would be detrimental to our types of brands**.

00265808-5810 at 5809 (US 20023) (A) (emphasis added).

3876. A February 6, 1985 memorandum from M.A. Sudholt to M.S. Ireland (Lorillard scientists) confirmed Lorillard's desire to design low tar cigarettes that actually delivered enough nicotine (referred to as "impact") to sustain smokers' addiction. The document stated: "The major impact of the nicotine project has been to **increase the physiological impact** . . . in ultra low tar cigarettes. Ultra low tar cigarettes generally have little taste or **impact** and high pressure drop." The memorandum proposed "Future Work" intended to "**produce an increased impact in ultra low tar cigarettes**." 80642659-2661 at 2659-2660 (US 21996) (O) (emphasis added).

3877. Stephen Jones, a Lorillard chemist who had participated in the design of nearly all Lorillard cigarette brands, including Newport, Kent Golden Lights, Kent III, Triumph, Maverick,

Style, Old Gold, and Max, testified that the Lorillard marketing department, and not the product development department, determined tar and nicotine parameters for new cigarette brands. Jones PD, Reed v. Philip Morris, 4/22/97, 7:18-7:21, 43:14-44:12, 45:3-45:9.

(viii) Liggett

3878. Minutes of an October 22, 1975 Liggett meeting on tar and nicotine reduction, attended by more than a dozen Liggett scientists, evidenced Liggett's aim to produce filter cigarettes that would achieve low FTC tar yields with ventilation holes positioned so that a smoker would cover them up when smoking. Under the heading "Long-Range Planning to Reduce Tar of All Brands to 15mg," the minutes stated: "With respect to filter perforations, **it was suggested that they could be positioned farther than normal from the smoker's mouth, thereby causing him to partially cover the holes while smoked**." LWDOJ9165648-5650 at 5649-5650 (US 21216) (O) (emphasis added).

(d) Defendants Continue to Make Misleading Statements Regarding Compensation and the FTC Method

3879. Despite the evidence spanning multiple decades showing Defendants' extensive knowledge of compensation, Defendants concealed their knowledge of compensation and disseminated false and misleading statements to downplay its existence and prevalence. As part of their fraudulent scheme to portray low tar cigarettes as less harmful, Defendants publicly championed the validity of the FTC Method and its usefulness to consumers well into the 1990s. US FF §§ III.D(1), (3)(c) and (4)(b)-(d), supra; Henningfield WD, 48:14-49:7; 54:7-15; 55:6-12; 2041186475-6517 at 6475, 6486-95, 6498-04 (US 22181*) (A) (1994 – B&W, American Tobacco, Lorillard and Liggett defending the validity and usefulness of the FTC Method to consumers); 2048381972-2310 at 1975 (US 22190) (O); 521321297-1301 at 1297 (US 22137) (O); 520011445-1480 at 1445, 1457-58 (US 22101) (O) (1994 – various public statements by

RJR employees defending the validity of the FTC Method); 2505597781-7998B at 7968-87 (US 23028*) (A) (1996 – Defendants' statements defending the utility to consumers of the FTC Method).

3880. As Defendants knew, the smoking regimen used in the FTC Method was designed to approximate smoking behavior in the 1930s, when cigarettes were relatively simple devices: few had filters, and perforated filter ventilation cigarettes were not in production. Henningfield WD, 47:11-21.

3881. It was understood, when the FTC Method was adopted, that, while it was intended to provide a useful measure of the amount of tar and nicotine that particular brands generate when smoked in a uniform fashion, the standardized FTC Method – or any standardized testing procedure for that matter – would not **exactly** represent the amount of tar and nicotine that **any particular smoker** would ingest. 03531981-1986 (US 22243) (A); JD-040254 (A); JD-048746 (A).

3882. Thus, as noted in Section III.D(4)(b), supra, while the FTC contemplated that numerous potential variations among individuals in everyday smoking behavior could have some effect on tar and nicotine yields, **the FTC did not have an understanding of smoker compensation – that smokers' addiction to nicotine would cause them to smoke low tar cigarettes more aggressively to satisfy their nicotine addiction, and thereby inhale amounts of tar and nicotine comparable to those inhaled by smokers of full flavor cigarettes**. Defendants withheld their knowledge that the reason that the FTC Method could yield misleading data was that nicotine addiction would drive smokers to obtain relatively stable nicotine intakes through smoker compensation. Henningfield WD, 48:3-49:7.

3883. While it was understood that the FTC Method (and any standardized method)

would be an imperfect measure of the amount of tar and nicotine that a particular smoker would inhale from any particular cigarette, the FTC Method nonetheless was intended to reflect a representative approximation of the amount of tar and nicotine generated by cigarettes when smoked under identical conditions, thereby providing a useful comparison of the tar and nicotine smokers would receive. For example, the FTC in stated in 1983: "I**f consumers avoid blocking ventilation holes, cigarettes smoked in the same fashion will yield 'tar', nicotine, and carbon monoxide in general accordance with their relative FTC rankings**." 03573029-3030 at 3029 (US 22244) (A); 48 F.R. 15,953 at 15,954 (Commission Determination Re Barclay Cigarettes; Amendment of Report of "Tar," Nicotine, and Carbon Monoxide Content of 208 Varieties of Cigarettes; Request for Comment on Possible Testing Modifications) (emphasis added).

3884. In a November 29, **1994** written statement submitted for the December 5-6, 1994 NCI Conference on the FTC Cigarette Test Method, B&W, American Tobacco, Lorillard, and Liggett defended the FTC Method, stating that the FTC Method "Provides Useful and Reliable Information About the Relative 'Tar' and Nicotine Yields of Cigarettes," and contending that FTC yields are a **"useful predictor" of the amount of tar and nicotine smokers will inhale**. 2041186475-6517 at 6475, 6486-95, 6498-6504 (US 22181*) (A) (emphasis added).

3885. Similarly, at the NCI Conference on the FTC Cigarette Test Method on December 5, 1994, David Townsend and Donald de Bethizy, RJR employees, maintained in both their written and oral statements that the FTC Method was a valid and accurate test method that approximates human smoking. 2048381972-2310 at 1975 (US 22190) (O).

3886. In his written statement, Townsend asserted that the FTC Method "provides accurate and reliable information" that "is a key factor for consumers to make objective choices

in the marketplace" and stated that "implementation of the FTC testing for ‘tar' and nicotine . . . was an important step in providing data for the consumer to use to make an informed decision in the marketplace." 521321297-1301 at 1297 (US 22137) (O). Townsend further stated that "it is clear from the information, I believe, that the FTC test method does provide accurate and reliable information for the consumer to use in the marketplace; that is, to compare yields of various brands and make objective choices. The consumer makes choices based on the FTC information, or the rankings derived from that information . . . . The FTC method was established to provide accurate and reliable comparative smoke yield information, and has been very successful in doing that." 2048381972-2310 at 2252, 2256 (US 22190) (O).

3887. De Bethizy maintained: "The FTC method provides an accurate and meaningful ranking of cigarettes. . . . **On average, smokers absorb approximately the yield of nicotine predicted by the FTC method**, and smokers of lower yielding products absorb less nicotine . . . ." 520011445-1480 at 1445, 1457-58 (US 22101) (O) (emphasis added). He also stated: "The FTC method provides an accurate and meaningful ranking of cigarettes. . . . [T]he compensation phenomenon does not undermine the FTC method." 2048381972-2310 at 2264, 2267 (US 22190) (O).

3888. In their 1996 comments on the FDA's proposed tobacco rule, Defendants continued to maintain that there is a meaningful relationship between the FTC ratings and smoker tar and nicotine exposure. 2505597781-7998B at 7968-87 (US 23028*) (A).

3889. While defending the FTC Method and resisting proposed changes to it, Defendants have made repeated public assertions that they have substantially reduced the tar and nicotine deliveries of cigarettes, citing the FTC ratings as their primary support for this assertion. 2505597781-7998B at 7987-88 (US 23028*) (A) (1996 Comments of B&W, Liggett, Lorillard,

Philip Morris, Inc., RJR & Tobacco Institute before the U.S. FDA, Vol. III) (claiming that "over the years, the average yield of cigarettes generally has declined markedly . . . . The fact is that from 1950 to the present, U.S. cigarette manufacturers have reduced ‘tar' and nicotine yields by more than 60 percent"); 2046932308-2363 at 2314-2315 (US 85067) (O) (Philip Morris 1994 submission to NCI regarding the FTC Method, asserting "an overall decrease in the ‘tar' and nicotine intake of smokers" as a result of reduced FTC yields); 521321297-1301 at 1299 (US 22137) (O) (1994 RJR employee's statement that "all cigarettes are substantially lower in 'tar' yields than they were in past years" and his claim that "[c]igarette design changes have resulted in an overall major reduction in smoke yields.").

3890. A February 7, 1996 Covington & Burling memorandum from Tobacco Institute attorney David H. Remes to Defendants' attorneys and senior employees, including Denise Keane, Philip Morris General Counsel, Ernest Pepples, B&W Senior Vice President and General Counsel, Kendrick Wells, B&W Assistant General Counsel, and attorneys from the law firms of Arnold & Porter and Collier Shannon, recounted a meeting earlier that day between Remes and C. Lee Peeler of the FTC. In keeping with Defendants' scheme to promote low tar cigarettes as safer while also keeping secret their knowledge of smoker compensation and that low tar cigarettes are no safer than regular cigarettes, Remes relayed to Peeler at this meeting the industry's claim that low tar cigarettes actually do deliver less tar and nicotine to smokers, and that consumers need not be informed about changes in smoking behavior related to smoker compensation. Remes communicated his "observation that in many cases low-yield brands contain so much less tobacco than higher-yield brands that **any compensation could not begin to erase the difference**." Remes also said that he had made a "suggestion that smokers do not need to have it explained to them that smoking a lot of low-yield cigarettes will result in greater

T&N deliveries, just as people do not need to be told that eating a lot of low-fat cookies can make them fat," and noted that Mr. Peeler "responded that the analogy does not hold because we know how much fat is ‘delivered' in each cookie but not how much T&N is delivered by each cigarette." 92613896-3899 (US 87919) (A) (emphasis added); Wells WD, 63:1-64:16.

3891. There have been discussions in the scientific community about revising the FTC Method to make it a more accurate measure of the tar and nicotine that human smokers actually ingest. Defendants have opposed changing the FTC Method, arguing that it provides a way for consumers to choose cigarettes and order them from light to strong that is meaningful in terms of the tar and nicotine exposure from smoking. Although Defendants were aware that puff frequency, puff volume, and puff duration for smokers of filtered cigarettes varies greatly, they opposed any change to the regimen that would yield higher tar and nicotine results for their "light" cigarettes. Henningfield WD, 55:6-12.

3892. For instance, in September 1997, the FTC solicited public comment on a proposal to replace the existing FTC test method with a methodology that would "provide information on the tar, nicotine, and carbon monoxide yields obtained under two different smoking conditions" to provide "a range of yields for individual cigarettes smoked under less intensive and more intensive smoking conditions" and convey to smokers that "a cigarette's yield depends on how it is smoked." FTC Cigarette Testing; Request for Public Comment, 62 Fed. Reg. 48,158, 48,159 (Sept. 12, 1997) (US 88618) (A). In response, Philip Morris, RJR, B&W, and Lorillard submitted joint comments to the FTC defending the current FTC Method and opposing the proposed change, stating: "The manufacturers believe that the current test method should continue to be used. They are not convinced that it should be supplemented with a second test method." Comments of Philip Morris Inc., RJ Reynolds Tobacco Co., Brown & Williamson

Tobacco Corp., and Lorillard Tobacco Co. on the Proposal Entitled FTC Cigarette Testing Methodology Request for Public Comment (62 Fed. Reg. 48,158) at 2-3 ("Joint Comments") (US 88618) (A).

3893. The comments further stated: "**Smokers are familiar with the ratings produced by the current test method**, and continued use of the current test method assures historical continuity of the data. For these reasons, testing under the current FTC test method should continue." Joint Comments at 4 (US 88618) (A) (emphasis added). The comments referred to compensation as a "hypothesized" and "weakly documented phenomenon" and stated: "The testing protocol should not be modified to reflect 'compensatory' smoking, in part because "current knowledge about these behaviors is too sparse to be usable for modeling purposes." Joint Comments at 43 (US 88618) (A).

3894. Defendants' comments argued that "[t]he protocol should not be modified to incorporate a vent-blocking condition." In response to the FTC's question: "What kinds of consumer education messages should be created to inform smokers of the presence of filter vents and the importance of not blocking them with their fingers or lips?" **Defendants' 1998 comments stated: "The manufacturers are not convinced that vent-blocking is a sufficiently common or documented phenomenon that smokers should be alerted to the presence of filter vents and instructed not to block the vents**." Joint Comments at 60, 82 (US 88618) (A) (emphasis added).

3895. In response to the FTC's question: "If the effect of compensatory smoking behavior is not incorporated in the tar and nicotine ratings, should a disclosure warning smokers about compensatory smoking behavior be required in all advertisements?" **Defendants' 1998 comments stated: "The manufacturers are not convinced that compensatory smoking**

behavior is a sufficiently common or documented phenomenon that consumers should be alerted to its existence. . . ." Joint Comments at 89 (US 88618) (A) (emphasis added).

3896. As illustrated below, internal company documents and statements further confirm Defendants' concerted campaign to provide health reassurance in the form of reduced tar and nicotine claims based on the FTC Method, while deceiving the public regarding smoker compensation, which allows smokers to ingest much higher levels of tar than registered on the FTC Method.

(i) Tobacco Institute

3897. In anticipation of the 1981 Surgeon General's Report, the Scientific Affairs Division of the Tobacco Institute drafted a December 15, 1980 memorandum to Horace Kornegay, President of the Tobacco Institute, warning that, among other issues, the Report was expected to include a discussion of smoker compensation. Rather than recommending provision of full and complete information on the subject to the public, the "Response" section of the memorandum stated:

> [I]t is suggested that the TI take the following position on the report and that on receipt of any queries from the press, staff be instructed to respond as follows: "The results of research in the past are so mixed that it is impossible to reach and support a firm conclusion at the present time. All one has to do is be aware of and appreciate the call for more research to realize that the Surgeon General's Office cannot objectively have a strong position supported by research. The office is looking for more money in order to support the current campaign against the tobacco industry."

TIMN0073798-3799 at 3799 (US 85127) (O).

(ii) Philip Morris

3898. In a June 29, 1988 "Statement of Philip Morris, U.S.A." to Congress, Philip Morris made statements equating machine measured tar and nicotine deliveries with actual

smoker intake, without disclosing its knowledge that nicotine-driven smoker compensation substantially increases the amount of tar and nicotine inhaled by smokers above those recorded by the FTC Method:

> From the 1940s to today, Philip Morris has similarly spent millions on its own research program to modify its cigarettes. As a result, the 'tar' and nicotine yields of today's cigarettes – the principal concern of the scientists who believe cigarettes pose health risks – have been reduced as much as 95% from the 1957 averages. . . . [I]t was Philip Morris scientists who perfected the instrument that was used for many years by the Federal Trade Commission and other groups around the world for the measurement of 'tar' and nicotine yielded by cigarettes. . . . [filter] ventilation techniques also contributed to an overall reduction in 'tar' and nicotine levels. . . . As a result of these advances in filtration and ventilation, Philip Morris and the other cigarette companies were able to reduce 'tar' and nicotine levels substantially in the late 1950s. . . . As a result of these dramatic reductions in the 'tar' and nicotine levels of the leading brands, as well as the introduction of entirely new low-delivery cigarettes, the overall intake of 'tar' and nicotine by American smokers decreased dramatically even before the Surgeon General's Report against smoking in 1964. . . . As a result of all this research, **Philip Morris succeeded in reducing 'tar' and nicotine levels even more in the years following the 1964 Surgeon General's Report**.

TI0170431-0458 at 0433, 0439, 0441-0443, 0451 (US 85065) (A) (emphasis added).

3899. In his April 14, 1994 written Statement before the U.S. Congress' Subcommittee on Health and the Environment, William Campbell, President and CEO of Philip Morris USA, stated, contrary to extensive information developed by and known to Philip Morris USA, that "consumers are not misled by the published nicotine deliveries as measured by the FTC method." Campbell also claimed, without qualification or reference to the FTC Method, that "tar **and nicotine** levels have decreased dramatically over the past 40 years. Today, the market is populated with a number of 'ultra low' brands which deliver less than 5% of the tar **and nicotine** of popular brands 20 years ago." In a statement carefully worded to refer only to the number of

cigarettes smoked, ignoring all other methods of smoker compensation, Campbell both misrepresented the evidence about whether downswitchers smoke more cigarettes per day and denied that smoker compensation rendered the FTC tar and nicotine yields misleading:

> Commissioner [David] Kessler suggested that the FTC figures were misleading because smokers might "compensate" for lower tar and lower nicotine brands by smoking those cigarettes differently. In fact, the data indicates that, despite the dramatic reductions in tar and nicotine levels over the past decades, the **number of cigarettes smoked** by an individual has remained constant, and even declined slightly. More importantly, the data shows no difference in the **number of cigarettes smoked** by those who favor higher and lower yield brands.

ATC2746877-6887 at 6877, 6878, 6887 (US 59009) (A) (emphasis added); compare with 1000861953-1953 (US 35484) (A) (Wakeham 3/24/61) ("**As we know, all too often the smoker who switches to a hi-fi cigarette winds up smoking more units in order to provide himself with the delivery which he had before**.") (emphasis added).

3900. A circa October 1994 document that Philip Morris submitted to the United States National Cancer Institute entitled "Submission of Philip Morris Incorporated to the National Cancer Institute Consensus Conference on the FTC Cigarette Testing Methodology and Rating System" continued to deny and/or minimize the effects of smoker compensation and advocate for the continued use of the FTC Method, which Defendants know gives deceptively low tar numbers:

> A number of the FTC's questions . . . relate to ‘compensation,' a term used to suggest that some smokers of lower yield cigarettes may sometimes alter their smoking behavior in ways that may tend to reduce the differences in yields among brands and styles implied by their relative FTC method ratings. While there is a fair amount of recent literature on compensation, few studies have been performed that provide reliable data to establish the occurrence of this suggested phenomenon. We appreciate the interest people have in possible compensation. But there can be no real dispute that, to date, the scientific literature on compensation is limited and

> inconclusive. . . . [W]hatever conclusions may be reached about compensation, **the FTC method remains an appropriate standard for measuring cigarette properties. The reporting of FTC method yields . . . remains a useful source of information to consumers choosing among cigarette brands and styles**.

2046932308-2363 at 2312, 2362-2363 (US 85067) (O) (emphasis added).

3901. A document entitled "Philip Morris Management Corp., Worldwide Regulatory Affairs Department, 1996 Core Issues Plan," under what was categorized as "Core Issue #2 Federal Trade Commission," revealed Philip Morris's objectives in response to a NCI Conference recommendation to change the FTC Method and to provide more information to consumers: "**Preserv[ing] our ability to . . . advertise low tar/light and ultra low tar/ultra light cigarettes as such; avoid changes in the FTC method for as long as possible; [and] minimize changes in the FTC method to the extent possible**. . . ." 2046266224-6268 at 6234 (US 23936) (A) (emphasis added).

(iii) RJ Reynolds

3902. In a July 2, 1984 letter to the FTC from Samuel B. Witt III, RJR Vice President, General Counsel, and Secretary, Witt stated:

> [T]he Commission has also asked for comment on broad questions concerning 'smoker compensation.' . . . In their submissions [in response,] health organizations take the position (which is not correct) that the average smoker will get the same amount of 'tar' and nicotine from higher and lower 'tar' cigarettes, therefore making the Commission's numbers irrelevant to the consumer. **RJRT, on the other hand, maintains that the average smoker will get less 'tar' from smoking a low 'tar' cigarette than he or she will receive from smoking a higher 'tar' product, and that the average smoker of low 'tar' cigarettes does not smoke more cigarettes than the average smoker of higher 'tar' cigarettes.**

2025045756-5761 at 5760 (US 22247) (A) (emphasis added).

3903. In an April 14, 1994 statement to the House of Representatives Subcommittee on

Health and the Environment of the House Energy and Commerce Committee regarding the potential regulation of cigarettes by the FDA, RJR stated:

> Since the 1950s, Reynolds tobacco has pursued . . . development of new technologies to reduce yields of 'tar' and nicotine generally . . . [this] line of research has been remarkably successful. . . . The important point is that in spite of broad variations in how individual smokers may smoke any given cigarette, the fact remains that the lower the yield by FTC numbers, the lower the yield will be to any given smoker. The yield for any given smoker will probably be different from the FTC yield; for some smokers it will be higher, for some it will be lower, but **overall, the FTC yields are generally predictive of the yield to smokers as a group. The statement, however, that "in reality" low yield cigarettes do not yield low 'tar' and nicotine, is not true**.

516962199-2227 at 2203-2204 (US 85128) (O) (emphasis added).

3904. Despite substantial evidence showing RJR's extensive knowledge of smoker compensation – and consistent with Defendants' conspiracy to keep their knowledge of compensation secret – F. Ross Johnson, CEO and President of RJR Nabisco from 1985 to 1989, claimed in a 1997 deposition to have never heard of smoker compensation. Johnson PD, State of Minnesota v. Philip Morris Inc., 9/11/97, 77:21-79:20.

(iv) Brown & Williamson

3905. In the mid-1990s, Tommy Sandefur, B&W CEO, submitted a written statement to Congress defending the FTC Method: "We also vigorously dispute the suggestion of [David] Kessler and [John] Slade that the 'tar' and nicotine ratings produced using the FTC test method are meaningless or misleading." Yet, more than ten years earlier, on March 19, 1984, Ernest Pepples, B&W Senior Vice President and General Counsel, wrote a letter to Howard Liebengood of the Tobacco Institute acknowledging that FTC tar and nicotine ratings "may be misleading to consumers" and bear no relation to actual consumer intake. Compare 682637627-7629 at 7629 (US 22946) (O); with 521060910-0912 (US 20892) (O).

3906. B&W's conduct regarding its Advance cigarette demonstrates the lengths to which it has gone to prevent smokers from discovering that the FTC tar and nicotine yields for low tar cigarettes are very likely unrealistically low. In 1996, B&W entered into an agreement with a small, independent tobacco company, Star Tobacco, Inc. ("Star"), to develop Advance. Star began test-marketing Advance in October 2000 in Lexington, Kentucky, and Richmond, Virginia. In addition to the federally mandated warnings, Star added additional information about compensation and nicotine addiction on the package and in an "onsert" attached to the package. Ivey WD, 55:4-7.

3907. In contrast to Star, when B&W began to test market Advance in Indianapolis, Indiana in November 2001, B&W used its own, redesigned packaging and onsert which deliberately avoided making the clear disclosures Star Tobacco had made:

- B&W omitted Star's onsert statement that "ALL SMOKED TOBACCO PRODUCTS ARE ADDICTIVE AND POSE SERIOUS HEALTH HAZARDS";
- B&W omitted Star's statement: "Because many smokers smoke to get nicotine, they tend to smoke more intensely when smoking "lights" or "ultra lights," and that because of such nicotine-driven compensation "lights" and "ultra-lights" are NOT NOW viewed by health scientists as reliably less hazardous." Instead, B&W stated in small type that smokers "can increase or decrease the amount of smoke that they take in depending on how they smoke their cigarettes" and thus actual delivery may differ from the FTC test measurements; and
- B&W omitted statements on the package that "Smoking related diseases can KILL you," "Smoking can take YEARS off your life," and "It is much safer for you to QUIT than to switch or smoke."

Compare Star Packaging, 524942388-2389 (US 52963) (A) & 524942390-2391 (US 88038*) (O) to Onsert to B&W's Advance Packaging (US 87216) (A); Blackie WD, 181:18-182:3; 182:9-20; 183:20-184:13; Wessel PD (30(b)(6), United States v. Philip Morris, 3/19/03, 19:3-23:9.

3908. A circa 2000 or later draft Q&A on Brown &Williamson's Advance cigarettes confirmed B&W's plan to continue disseminating information contending that low tar cigarettes

are less hazardous. The proposed response to this hypothetical question: "Couldn't these [Advance] cigarettes have the same effect on consumers as the 'light' cigarettes, leading them to a false sense of safety?" suggested that low tar cigarettes are or may be less harmful: "[*S*]*cientific evidence* suggests that smokers of 'lights' products on average take in less tar than smokers of full flavor products . . . . [W]e believe that the move to low tar represented a valid step in the attempt to reduce the health risks associated with smoking. Further reducing specific toxins, as we have done with Advance, represents a further step in the right direction." On the next line is the statement, "What evidence? Can you tell me the names [sic] these studies?" No such evidence is ever identified. 271099136-9142 at 9139 (US 22114) (O) (emphasis in original).

3909. Although Susan Ivey admitted at trial that B&W "has been aware for many years" that some smokers compensate when smoking low tar cigarettes, on its website, B&W misrepresents that there is an open controversy regarding smoker compensation, stating that "[t]he question of why compensation occurs is still the subject of scientific research, and the relative importance of tar versus nicotine in determining compensation is unclear" and that "how much smokers alter their behavior when they switch to lower tar products, and for how long, is still unclear." The website further states that "our studies show that, **as actually smoked by consumers, lower tar cigarettes will generally deliver less tar and nicotine than higher tar cigarettes**, and cigarette deliveries generally align with the ranges associated with the descriptors: ultra lights, lights, and full flavor." Ivey WD, 67:19-21; TLT1040050-0055 at 0052-0054 (US 88620) (A) (emphasis added); Ivey WD, 64:1-67:11.

(v) BATCo

3910. Despite substantial evidence showing BATCo's extensive knowledge of smoker compensation – demonstrated in Section III.D(4)(b)(v), supra – and consistent with Defendants'

conspiracy to keep their knowledge of smoker compensation secret – in an October 1999 Memorandum by British American Tobacco to the U.K. House of Commons Health Committee, entitled "The Tobacco Industry and the Health Risks of Smoking," BATCo attempted to downplay compensation's significance:

> It is clear that compensation does occur, but that . . . **despite compensation, smokers receive less tar on average when switching to a lower tar cigarette**. . . . The evidence suggests that increasing the number of cigarettes consumed, blocking of ventilation holes and increasing inhalation depth, **are not common compensation mechanisms** . . . . The limited evidence of which we are aware, suggests that switched smokers either revert gradually to their former, non-compensatory behaviour (which results in lower overall intake of smoke), or change again to a brand which they prefer and which does not require the extra 'effort' of taking larger puffs (which may or may not result in lower intake).

322017057-7142 at 7108-09 (US 22068) (A) (emphasis added); Ivey WD, 69:4-13.

(vi) American Tobacco

3911. Eric Gesell, designated representative of American, testified at a 1997 deposition that, throughout the entire time he worked for American, he did not know about smoker compensation. Gesell also testified that the company did not believe that smokers smoke for a certain level of nicotine and adjust their level of smoking when switching between different types of cigarettes to ensure that they get the same amount of nicotine. Gesell PD, Minnesota, 9/18/97, 5:8-25; 6:10-17; 98:21-100:6.

3912. Gesell also testified on behalf of American that the FTC Method tar and nicotine yield data "is meaningful, and it was meaningful, and probably still is today." Gesell PD, Minnesota, 9/18/97, 5:8-25; 6:10-17; 107:7-108:6.

(vii) Lorillard

3913. Consistent with Defendants' conspiracy to keep their knowledge of smoker

compensation secret, Alexander Spears, CEO of Lorillard, testified in 1997 that he believed that the FTC tar and nicotine numbers did not need to be explained to smokers because it was "very obvious" that they were meaningless due to smoker compensation. Spears PD, Minnesota, 9/23/97, 70:2-72:2.

E. Defendants Intentionally Market to Youth

(1) Introduction

3914. While Defendants undertook coordinated, fraudulent activity to deny and distort the health consequences of smoking in order to maximize their profits, they simultaneously engaged in coordinated, fraudulent activity in order to protect their ability to recruit new, youth smokers through cigarette marketing, often utilizing the same joint organizations that were initially created to carry out deceptive public relations campaigns related to disease risks. In order to protect each company's ability to continue to market to the youth market that was of such vital importance to their continued survival, Defendants continually promised the public, both through the Tobacco Institute and individually, that they did not market to youth, that their marketing was only aimed at adult smokers, and that their marketing had no impact on youth smoking. These public statements were false and misleading.

3915. From 1954 to the present day, Defendants have intentionally marketed cigarettes to youth, including to children, to teenagers, and to young people under age twenty-one, while publicly denying they do so. Dolan WD, 24:3-16; Krugman WD, 17:2-19:1; Chaloupka WD, 30:8-32:20; Biglan WD, 100-379.

3916. Defendants falsely claim that all of their cigarette marketing serves the primary purpose of retaining loyal customers ("brand loyalty"), and the secondary purpose of encouraging smokers to switch brands. They deny that any of their marketing efforts are aimed at encouraging young people to initiate smoking or to continue smoking. Defendants further claim that cigarettes are a "mature product category" for which advertising and marketing expenditures "cannot and do not affect primary demand." Dolan WD, 61:6-16.

3917. In fact, overwhelming evidence introduced at trial – both Defendants' internal

documents and testimony from experts called by the United States – prove that, historically and currently, Cigarette Company Defendants market to young people, including those under twenty-one and those under 18. Cigarette Company Defendants' marketing activities are intended to bring new smokers into the market. Cigarette Company Defendants conducted research into young people's vulnerabilities to cigarette marketing, as set forth below, and knew that youth were highly susceptible to marketing, would underestimate the health risks of smoking, and were price sensitive. Cigarette Company Defendants used their knowledge of young people's vulnerabilities gained in their research in order to create marketing campaigns that would and did appeal to youth, in order to induce youth smoking initiation and ensure that young smokers would choose their brands. Dolan WD, 24:3-16; Krugman WD, 84:1-99:23. Chaloupka WD, 30:8-32:20; Biglan WD, 100-379.

3918. On this issue, the United States called a number of leading experts from diverse fields, who not only applied their technical expertise but also reviewed thousands of Defendants' internal marketing documents. Each of the United States' experts concluded that Defendants market to youth. These experts were:

- Dr. Robert Dolan, the Dean of the University of Michigan School of Business, former Harvard Business School Professor, and renowned expert in marketing
- Dr. Frank Chaloupka, the world's leading expert on the effect of price on smoking behavior, author of literally hundreds of peer reviewed articles on the topics of price, tobacco control, and economics, and contributor to several Reports of the Surgeon General on the topic
- Dr. Dean Krugman, expert in marketing communication and mass communication, respected expert on advertising and frequently published in the field
- Dr. Anthony Biglan, expert in psychology with particular expertise in adolescence, often-published expert in youth smoking prevention

(US 18218) (referenced only).

3919. In contrast, Defendants called a **single** expert on the topic of marketing, Dr. Richard Semenik. Dr. Semenik offered the incredible opinion that cigarette advertising is a weak force, and that the cigarette market is a mature market, comparing cigarettes to laundry detergent and gum. Dr. Semenik admitted on cross-examination that he did not review any internal company documents for this case. Moreover, he cited only one **single** tobacco company marketing document in his direct testimony, and that was a document cited by Dr. Dolan. Dr. Semenik "didn't review the deposition testimony of any tobacco company employees at all in this case" and he "did not review the written direct testimony filed in this case or any trial testimony of any of the tobacco companies' witnesses." He also did not review any tobacco company point-of-sale marketing pieces; any direct mail pieces; or any of the tobacco companies' direct mail marketing databases. He provided no testimony about the reach of any of Defendants' marketing efforts, whether through television, on billboards, in magazines or at retail. Dr. Semenik testified that he failed to review any of these materials because he is of the view that Defendants' internal marketing documents are "irrelevant" to his expert opinions. Semenik TT, 4/4/05, 17644:9-12; 17738:7-25; 17669:4-6; 17667:9-14; 17666: 20-23; 17666:24-17667:2; 17674:11-25; 17680:15-25.

3920. Dr. Semenik failed to cite a single article to support his mature market theory. Semenik TT, 4/4/05, 17690:21-24. In contrast, Dr. Krugman cited to two peer reviewed articles that support his opinion that the market is not "mature," meaning that new smokers are entering the market every day as a result of Defendants' marketing practices. Krugman WD, 154:32-155:12, 156:16-158:5.

3921. Additionally, Dr. Semenik admitted that he had "never published a scholarly article in a peer reviewed journal on the subject of cigarette marketing or adolescent tobacco

use"; had no expertise in adolescent development; had "never performed an econometric analysis nor" was he "qualified to do so"; had never testified to Congress on tobacco-related issues; and had never contributed to a Report of the Surgeon General. Semenik TT, 4/4/05, 17648:10-12, 17652:18-20, 17652:21-24, 17653:6-10.

3922. Defendants continue to publicly deny that their cigarette brand marketing has any effect on youth smoking behavior. The United States called Dr. Eriksen, the former Director of the Office on Smoking and Health, and foremost expert in public health, particularly tobacco use, on the topic of the effect of Defendants' marketing on youth cigarette smoking behavior. In his testimony before the Court, Dr. Eriksen testified that he had relied upon "the weight of the evidence," including numerous scientific studies, Reports of the Surgeon General and other reliable publications and reports, to conclude that Defendants' cigarette marketing is a substantial contributing factor to youth smoking initiation and continuation. Eriksen WD, 1/17/05, 55:4-8.

3923. Dr. Eriksen further testified that, as he had explained in his first deposition in this case on August 22, 2002, he had used the term "substantial contributing factor" to mean "one cause among many." Eriksen TT, 2/02/05, 11892:7-15, 11893:18-25, 11894:3-19. Dr. Eriksen provided extensive and clear testimony on this point:

Q. And was that exact question posed to you on page 92 of that [2002] deposition? . .
A. Yes, it was.
Q. And the question there is, "Is there any difference in your mind between saying that advertising is a substantial contributing factor to the decision to smoke and saying that advertising is the cause of the decision to smoke?" . . .
A. Yes.
[Objection made and overruled]
Q. Dr. Eriksen, your testimony at lines 20 of page 92 through line 5 of 93, was "That the language that I've used in my depositions and testimony and statement that **there will be consistency between using the term contributing factor and a cause implying -- as long as it's understood it's not being said to be the only cause, but it's one factor among many or one cause among many. I would generally be comfortable with that being used interchangeably**." And is that consistent with the testimony that you were providing today?

A. It certainly was my intent to be consistent with that. . . . I'm comfortable with using cause if it's one cause of many. It's in my written testimony to that effect, and that's how I believed I was answering the question in the context of cause. If it's meant the only cause, I don't agree that's the only cause. But if it's one cause of many I'm comfortable with using the term cause.

Q. **So by choosing the term "substantial contributing factor," you meant to indicate that marketing was one cause among many**?
[Objection made and overruled]

A. **Yes, I meant it to mean a cause, but not the cause.**

Eriksen TT, 2/02/05, 11892:7-15, 11893:18-25, 11894:3-19 (emphasis added). Since Dr. Eriksen's first deposition in this case in 2002, his opinion has been clear and consistent: the term "contributing factor" is interchangeable with "one cause among many."

3924. Dr. Biglan's testimony was consistent with that provided by Dr. Eriksen. When asked if marketing was the "cause" of smoking initiation, Dr. Biglan testified regarding the word "cause": "That word is not used much in the behavioral sciences any more. The term 'influences' come to be used largely because it better connotes the fact that **behavior is multiply determined** and so no single variable cause is -- of behavior. Behavior is influenced by a set of variables." Biglan TT, 1/11/05, 9681:3-8 (emphasis added).

3925. To counter the testimony of Drs. Eriksen and Biglan, Defendants called Dr. Heckman, an economist affiliated with Lexecon, to testify about the issue of causation. Dr. Heckman testified that the appropriate scientific criteria that should be applied to assess causality were as the Surgeon General said, consistency, specificity, temporality and other criteria. It is undisputed that these are exactly the criteria that Dr. Eriksen applied. Eriksen WD, 5/05, 11:1-12.

3926. Moreover, Dr. Heckman's testimony is subject to serious limitations. First, although there is no doubt as to his recognized credentials in the field of economics, Dr. Heckman does not have the same expertise as Dr. Eriksen who is the longest serving prior

Director of the Office on Smoking and Health, and one of this country's foremost experts in public health and tobacco specifically. Second, Dr. Heckman focused on only four of the studies that Dr. Eriksen discussed in his testimony and provided some technical critiques of the methods of those four studies. And, without his handwritten notes that he had to carry to the witness stand, Dr. Heckman was not familiar with even just these four studies which Dr. Eriksen was questioned about extensively and discussed in great detail, from recollection. In addition, in his testimony, Dr. Eriksen analyzed many more than four studies. Heckman TT, 4/13/05 at 18921:13-25. Third, Dr. Heckman was critical of the four studies he did discuss because they used "proxies" like "receptivity" to marketing, rather than measuring the direct exposure of children to marketing. However, as Dr. Eriksen explained, it is both infeasible and unethical to perform an experimental study that would directly measure children's exposure to cigarette marketing and see if they started smoking or smoked more. As a result of the serious harm of cigarette smoking, proxies are necessary to use in lieu of experimental studies on human subjects. Heckman TT, 4/13/05, 18798:19-24, 18808:15-17; Heckman TT, 4/14/05, 18936:11-18937:13; Eriksen WD, 56:26-57:4. Defendants' own expert, Dr. Wittes, admitted that she would not be involved in a controlled randomized study to see if exposure to cigarette advertising causes youth to smoke. Wittes TT, 6/1/05, 22537:16-22538:10.

3927. Additionally, Dr. Heckman testified about the possibility of conducting an econometric study which uses direct measures of expenditure data. But Dr. Heckman admitted that, in order for such an econometric study to be performed, one would need disaggregated marketing data, which, as he admitted, is not available to researchers because Defendants hold it confidential. In fact, Dr. Heckman testified that Defendants refused to provide such data even to him, their own expert in this case. Heckman TT, 4/14/05, 18942:5-15. The Court can draw an

inference that the evidence Defendants refused to provide even their own expert would further support the conclusion that cigarette marketing is a causal factor in youth smoking.

3928. The Court observed the demeanor of these witnesses live at trial. Drs. Dolan, Biglan, Krugman, and Chaloupka's opinions are entitled to greater weight than those of Dr. Semenik, and Dr. Eriksen's opinions are entitled to greater weight than those of Dr. Heckman.

3929. Cigarette Company Defendants spent billions of dollars every year on their marketing activities which have both the intent and the effect of encouraging trial and continuing purchase of their cigarette products by young people. Over the decades, Defendants have used the full range of marketing tools available to them, including: advertising on television, radio, and billboards, and in magazines and newspapers; sponsoring events, such as sporting events, bar promotions, festivals, concerts, and contests; coupons, price reductions, and free packs with purchase; gifts with purchase (known as "continuity items") such as t-shirts, mugs, and sporting goods; direct-mail marketing through which they send magazines, birthday cards, and other materials directly to individuals' homes; distribution of free cigarette samples at retail stores, public events, bars, or other locations; and retail store (known as "point of sale") advertising and promotions. Krugman WD, 43:14-2; Dolan WD, 48:6-3.

3930. Cigarette Company Defendants' expenditures on cigarette advertising and promotion have increased dramatically over the past decades, and remain high both on an absolute basis and relative to other industries. In the nine-year period from 1991-1999, domestic cigarette advertising and promotional expenditures totaled $51.4 billion dollars (unadjusted for inflation). In 1999 alone, domestic cigarette advertising and promotion totaled $8.2 billion, an increase of 22% over 1998, and a six-fold increase over 1963, after adjusting for inflation. For example, Philip Morris spent in

Krugman WD, 23:10-24:4; LeVan PD, United States v. Philip Morris, 6/25/02, 47:23-78:19 (Confidential); 2085298135-8136 (US 25253) (O).

3931. It is immaterial to Defendants' liability whether they actually succeeded in their efforts to market to youth. Nevertheless, the evidence shows that Defendants' marketing efforts have been a success: 88% of youth smokers buy the three most heavily advertised brands – Marlboro, Camel, and Newport. Fewer than half of smokers over the age of 25 purchase these brands. Marlboro, the most heavily marketed brand, currently holds 55% of the 12 to 17 year old market but only 36% of smokers over age 25. Defendants are well aware of this phenomenon; in many internal documents cited below, Philip Morris refers to Marlboro, Camel, and Newport as the "herd brands" because teenagers flock to these brands in "herds." Eriksen WD, 52:17-54:10; (US 17684A) (A).

3932. Independent scientific studies performed by reputable independent scientists, and published in reputable scientific journals and in official government reports, have confirmed Defendants' knowledge, as set out in their internal documents, that their marketing contributes to the primary demand for and continuing use of cigarettes. Over the past ten years, there have been a number of comprehensive reviews of the scientific evidence concerning the effects of cigarette marketing, including advertising and promotion, on smoking decisions by young people. From these reviews it is clear that the weight of all available evidence, including survey data, scientific studies and experiments, behavioral studies, and econometric studies, supports the conclusion that cigarette marketing is a substantial contributing factor in the smoking behavior of young people, including smoking initiation and continuation. Eriksen 1/17/05 WD, 55:4-20.

3933. Most children and adolescents select a regular brand of cigarettes to smoke before

the age of 18. As Michael Eriksen, a public health expert who formerly headed the CDC's Office on Smoking and Health, testified: "When adolescents begin to smoke, they generally smoke one of three brands, Marlboro, Newport, and Camel, and they remain loyal to those brands. Adolescents, like cigarette smokers, generally, are extremely brand loyal. Once a brand of cigarettes is selected, smokers continue to smoke this brand. Cigarette companies are aware of smoker's brand loyalty and also that most smokers start to smoke and choose a brand as adolescents." Id., 49:7-13.

3934. Defendants' internal documents, detailed below, show that they have long understood that they could not survive absent acquiring youth smokers to replace smokers who have quit or died. In these documents, Cigarette Company Defendants expressed the view that stimulating youth smoking initiation and retaining and increasing their share of the youth market is crucial to the success of their businesses. These documents show that, for many years, Cigarette Company Defendants conducted market research on youth smokers under age twenty-one and knew that the majority of smokers began smoking as youth, developed brand loyalty as youth, and that persons who began smoking when they were teenagers were very likely to remain lifetime smokers. Recent internal documents show that youth smoking initiation continues to be vitally important to Cigarette Company Defendants. 2041518797-8956 at 8819-8820 (US 23907) (O).

3935. Contrary to Defendants' assertions that cigarettes are a "mature product," cigarette marketing both creates and grows demand. Defendants' claims that they market only to loyal customers or to attract brand switchers are false. As Defendants are well aware, and as their internal documents plainly show, smokers are highly loyal, and the number of smokers who switch brands is very small. As Dr. Krugman, an expert in advertising and marketing

communication called by the United States, testified after reviewing Defendants' internal documents, only about 9% of adult smokers switch among Cigarette Company Defendants' brands, and therefore brand switching alone could not possibly justify $12 billion in annual advertising and promotion expenditures. Krugman WD, 154:31-158:5.

3936. This independent expenditure analysis is confirmed by Cigarette Company Defendants' internal documents. A November 28, 1994 email from Josh Slavitt, Senior Issues Manager, Corporate Affairs Department, recognized that Philip Morris's frequently repeated public argument that its marketing was directed purely at attracting brand switchers and not new smokers was based upon faulty research. Slavitt wrote: "Our counter argument was – until this morning – that we advertise to maintain brand loyalty and promote brand switching because each market share point of the tobacco industry is worth $400 million. We defended this position by showing that a specific number – 15-20% – of smokers 'switch' brands every year." However, according to the email written by Ed Gee, Philip Morris Consumer Research Director, to which Slavitt was responding, "the industry switching rate is more like 10%." 2045165002-5014 (US 38402) (A).

3937. As Defendants know, the decision to begin smoking or continue smoking is motivated by what preeminent expert Dr. Paul Slovic described in his testimony as "affect" (a conglomeration of positive and negative emotions) rather than the analysis of quantitative statistical logic (fact/rationality). Individuals respond to ubiquitous and appealing cigarette advertising imagery and seek quick satisfaction, bypassing logical analysis. The prospective consumer of cigarettes does not go through several hierarchical stages of information processing (awareness, knowledge, liking, conviction and purchase) that are associated with the purchase of some other products. Cigarette marketing, including advertising and promotion, is designed to

play a key role in this impulsive process by exposing young people to massive amounts of imagery associating positive qualities with cigarette smoking. Research in psychology and cognitive neuroscience demonstrates how powerful such imagery can be in suppressing perception of risk and manipulating behavior. Cigarette Company Defendants' internal marketing research and public marketing practices reveal that they were well aware of this power and exploited it in their marketing campaigns. Slovic WD, 53:22-63:11.

3938. Young people are particularly vulnerable to the types of affective advertising and promotion that associate positive imagery with smoking. Young people overestimate smoking prevalence and underestimate smoking risk, in part as a result of these types of marketing campaigns. Id., 38:14-39:7, 53:4-21.

3939. Many people, and particularly young people, do not adequately understand and appreciate the cumulative risk that smoking entails. Most smokers only begin to think of risk after they have started to smoke regularly and become addicted. At that point, more than 80% of smokers wish they had never begun to smoke. Id., 29:4-30:2.

3940. Many young smokers tend to believe that smoking the "very next cigarette" poses little or no risk to their health. Because the most serious harmful consequences of smoking are cumulative, occurring in the distant future, and because teenagers lack an understanding of the addictive properties of cigarettes, it is unlikely that concerns about harmful consequences influence the decisions by teenagers to initiate smoking. Id., 11:18-12:3.

3941. Initiation of smoking as a youth is particularly harmful because, the earlier one begins smoking, the more likely one will develop a smoking-related disease. VXA0130158-0484 at 0203-0207 (US 64693) (A) (Preventing Tobacco Use Among Young People: A Report of the Surgeon General, 1994) ("1994 Surgeon General Report")).

3942. Cigarette smoking, particularly that begun by young people, continues to be the leading cause of preventable disease and premature mortality in the United States. Of children and adolescents who are regular smokers, one out of three will die of smoking-related disease. Eriksen WD, 3:10-19

3943. In fact, the proportionate impeding effects of childhood smoking on lung growth exceeds the loss of lung function associated with smoking during adulthood. Lung cancer risk rises exponentially as a function of the duration of smoking, so that the risk at age 50 for a person who began smoking regularly at age 13 is 35% greater than that for a 50-year-old who started smoking at age 23. VXA0130158-0484 at 0203-0204 (US 64693) (A) (1994 Surgeon General Report).

3944. Initiation of smoking as a youth is also harmful because, the earlier one begins smoking, the more likely one will become addicted. VXA0130158-0484 at 0203-0207 (US 64693) (A) (1994 Surgeon General Report).

3945. Recent studies indicate that the earlier onset of cigarette smoking is associated with heavier smoking. Heavier smokers are not only more likely to experience tobacco-related health problems, but they also are the least likely to quit smoking. The level of dependence on nicotine in adults has been found to be inversely related to the age of initiation of smoking. As Dr. Neal Benowitz, a physician and leading expert on nicotine addiction, testified, "The earlier a person starts smoking cigarettes, the more highly dependent they will be as an adult, and the more difficult it will be for them to quit. In addition, the earlier someone starts smoking, the higher that person's smoking rate is later on in life." Benowitz WD, 40:8-11; VXA0130158-0484 at 0256-0260 (US 64693) (A) (1994 Surgeon General Report, Tables 20 and 22).

3946. The smoking of as few as one to five cigarettes a day is also a predictor of

continued smoking and dependence. The risk of dependence (addiction) increases sharply and significantly when the quantity of cigarettes smoked increases from less than one cigarette per day to one to five cigarettes per day, or from one to five cigarettes to half a pack (10 cigarettes) per day. Adolescents, who smoke significantly fewer cigarettes per day than adults, experience significantly higher rates of dependence than adults at the same level of use. Benowitz WD, 51:19-54:16; VXA0130158-0484 at 0259-0260 (US 64693) (A) (1994 Surgeon General Report, Tables 20 and 22).

(2) Defendants Have Made False and Misleading Public Statements Denying That They Market To Youth and Asserting That Their Marketing Has No Effect On Youth Smoking Behavior

3947. As set forth below, Defendants falsely denied that Cigarette Company Defendants intentionally designed their marketing efforts to entice young people to begin smoking and to continue smoking. Defendants falsely claim that all of their marketing is aimed only at encouraging the brand loyalty of adult smokers. Defendants also falsely state that marketing has no effect on youth initiation and smoking behavior. The following are representative examples of such false and misleading public statements introduced into the record during trial.

(a) False and Misleading Statements of The Tobacco Institute

3948. The Tobacco Institute was created in 1958 by American, Liggett, Lorillard, Philip Morris, RJR, The American Snuff Company, Larus & Brother Co. and Stephano Brothers. Although membership fluctuated during the existence of the Tobacco Institute, all Defendants (except BATCo and the Council for Tobacco Research) created, agreed to fund, and/or over the years did jointly fund and direct the activities of the Tobacco Institute (discussed at US FF § I, supra). The Tobacco Institute, since its founding, made numerous fraudulent public statements about youth marketing. These statements included that Defendants believed that smoking is a

custom or choice for informed adults, and not youth; and that cigarette marketing is only aimed at – and only affects – adult brand switchers, not youth, as shown below.

3949. On November 20, 1962, Hill & Knowlton, on behalf of Philip Morris, RJR, B&W, Liggett, Lorillard, and American, through the Tobacco Institute, in response to a comment made by LeRoy Collins, President of the National Association of Broadcasters, that "cigarette advertising is designed primarily to influence high school children," issued a press release entitled "Tobacco Institute Head Calls N.A.B. President's Charges Incorrect." In the press release, George V. Allen, President of the Tobacco Institute, stated "the president of the National Association of Broadcasters, in a statement focused on high school age children, is incorrect when he suggests that cigarette advertising is designed primarily to influence them." The press release also stated that "[t]he tobacco industry regards smoking as an adult custom, and the decision to smoke or not to smoke should be made at the age of mature judgment." MNAT00280070-0070 (US 21724) (O).

3950. On or about July 9, 1963, the Tobacco Institute, through its agent Hill & Knowlton, issued a press release stating that it was: "the tobacco industry's position that smoking is a custom for adults and that it is not the intent of the industry to promote or encourage smoking among youth." It further stated: "[t]he industry wants to make it demonstrably clear that it does not wish to promote or encourage smoking among youth." TIMN0098597-8598 at 8597 (US 21270) (A); TIFL0522044-2045 at 2045 (US 21313) (A).

3951. On July 22, 1969, Joseph F. Cullman III, Chairman of the Executive Committee of the Tobacco Institute and Chairman of the Board of Philip Morris, testified to the Consumer Subcommittee of the Senate Committee on Commerce that "it is the intention of the cigarette manufacturers to continue to avoid advertising directed at young persons." Cullman further

testified that the cigarette industry would submit to a broadcast ban that banned all cigarette advertising from television and radio because:

> [y]oung people are exposed to broadcast advertising differently than they are to print advertising. It is well-known that young people spend a great deal of time viewing television and listening to radio; it takes an affirmative act on the part of the viewer or listener to avoid broadcast advertising. By contrast, much less time is spent by young people in reading newspapers and magazines and an affirmative act is required by the reader to see and comprehend such advertising. Objections to cigarette advertising on the broadcast media based on appeal to youth do not apply to cigarette advertising in newspapers and magazines.

680263421-3422 (US 22345) (A).

3952. In or about September 1975, the Tobacco Institute, through its agent Hill & Knowlton, issued a press release entitled "Cigarette Industry Advertising Standards," communicating that the Tobacco Institute had issued statements as early as 1963 denying that the cigarette industry marketed to youth smokers. The press release also repeated Cullman's July 22, 1969 testimony that "it is the intention of the cigarette manufacturers to continue to avoid advertising directed at young persons." 680263421-3422 (US 22345) (A).

3953. On February 15, 1978, Horace Kornegay, President of the Tobacco Institute, testified before the House of Representatives Subcommittee on Health and the Environment of the House Energy and Commerce Committee: "I do not believe, as some have suggested, that cigarette advertising induces young people to smoke, and I am supported on that statement by several studies that have been done. I do believe that it is peer influence." (JD-011816) (A). In a letter dated March 6, 1978, in response to a congressional request during his testimony to provide documentation of any recent studies targeting young women by the Tobacco Institute's constituent companies, Kornegay stated the following: "I am writing to confirm that I am unaware of any consumer study conducted by any of our member companies with regard to

children nor any cigarette advertising campaigns directed at children, whether male or female. I have communicated with each of our cigarette manufacturing members and advised them of the Subcommittee's request for such material, should any exist." (no bates) (JD-011816) (A).

3954. A 1979 Tobacco Institute brochure entitled "Fact or Fancy?" declared that cigarette advertisements create new smokers "[n]o more than advertising a specific brand of toothpaste causes more people to use toothpaste. Cigarette advertising is brand advertising, aimed at interesting smokers in switching brands and in creating brand loyalty. . . . The tobacco industry does not try to persuade anyone to smoke. Nor does it discourage anyone who makes up his or her mind to quit." TIMN0133740-3798 at 3760, 3786 (US 21280) (A).

3955. A May 24, 1979 letter from Kornegay to Joseph A. Califano, Jr., Secretary of the Department of Health, Education and Welfare, was written in response to Califano's statements to the Interagency Council on Smoking and Health on April 26, 1979. Kornegay's letter stated that Califano's "statements . . . reflect the erroneous view that brand advertising has an effect on the decision to begin smoking." TI05031337-1339 (US 21245) (A), (US 78792) (A).

3956. An August 1, 1979 document created by the Tobacco Institute stated that smoking is an "adult custom, one to be decided on by mature, informed persons" and that laws prohibiting sale of cigarettes to "youngsters. . . . should be vigorously enforced." The document further stated that "the great majority of youngsters have not rushed to judgment about smoking. The majority is the best example for the minority – a lesson the latter need from people who make and sell cigarettes." TIMN0032423-2424 (US 65594) (O).

3957. On August 31, 1979, the Tobacco Institute issued a press release articulating Defendants' "policy" on youth smoking: "Kids shouldn't smoke! Smoking is an adult custom. Until a person is mature enough to make the decision in light of all the available information and

on the basis of individual freedom of choice, that decision should be deferred." TIMN0157538-7538 (US 85136) (O).

3958. On or about May 13, 1981, the Tobacco Institute issued a press release announcing the adoption of a "Code of Cigarette Sampling Practices" that promised to cease their prior distribution of cigarette samples to persons under 21, and limiting the distribution of cigarette samples to "persons 21 years of age of older." The press release included a statement that members of the Tobacco Institute had a "long-standing policy of discouraging smoking by children," and that "the thrust of the new code is further to discourage smoking by children." The code supposedly established that sample distribution would not occur within two blocks of any "center of youth activities, such as playgrounds, schools, college campuses, or fraternity or sorority houses." TIOK0000817-0818 (US 22346) (O); TIMN0123794-3795 at 3794 (US 85138) (O); TIMN0123589-3590 at 3589 (US 21279) (O); TIMN0102493-2494 at 2493 (US 21271) (O).

3959. In a 1983 document entitled "Voluntary Initiatives of a Responsible Industry In Advertising," the Tobacco Institute stated that "smoking is an adult custom to be considered only by those mature enough to make an informed decision." ATX040294056-4056 (US 58599) (A); TIMN333363-3363 (US 62907) (O).

3960. A 1983 Tobacco Institute advertisement stated in bold letters: "We don't think our kids should smoke, either." The advertisement further stated that: "As with many of life's pleasures, smoking, drinking, and driving a car require a knowledge of oneself and a sense of moderation that come only with age. When our children acquire this sense of moderation and this knowledge of themselves – and are, therefore, no longer children – they can make their own decisions. Until then, we'll try to help them learn what every human being . . . has always had to

learn. When we confuse the pleasures of growing up with the satisfactions of being grown up, we miss a great deal of both." TIOK0001287-1288 (US 78789) (O).

3961. In September 1983, the Tobacco Institute circulated a card entitled "Cigarette Industry Advertising Standards." The card emphasized the "industry's longstanding policy against youth smoking," that "[t]he industry's position has always been that smoking is an adult custom." TIMN292908-2908 (US 62894) (O).

3962. On the nationally televised ABC program *20/20*, broadcast on October 20, 1983, Ann Browder, a Tobacco Institute spokesperson, speaking on behalf of Philip Morris, RJR, B&W, Liggett, and Lorillard, stated: "We feel very strongly that cigarette smoking is an adult custom that one should not even consider until they've reached the age of maturity" and that the "age of maturity is 21." Browder also stated that "Cigarette manufacturers are not interested in obtaining new business from teenagers. . . . We've been in business very well, thank you, for sometime now without attempting to hook kids. We do everything possible to discourage teenage smoking." 680286673-6686 at 6675-6676 (US 20999) (A); 690149518-9531 at 9520-9521 (US 21046) (A).

3963. On April 1, 1984, the Tobacco Institute initiated a project with the National Association of State Boards of Education ("NASBE") to publish a pamphlet entitled "Helping Youth Decide" which advised parents on how to communicate with their children and how to assist them in making decisions on issues such as tobacco and alcohol use, drug use, and sexual activity. In an April 12, 1984 memorandum from Tom Humber, Chairman, Tobacco Institute Communications Committee, to the members of the Tobacco Institute's Executive Committee, Humber explained one of the advantages of working with NASBE: "NASBE will provide us with an established, clear link to all levels of government: federal, state and local." 04210444-0455 at

0445 (US 74879) (A). On September 25, 1984, the Tobacco Institute's Vice President Walker Merryman stated in a speech pertaining to the "Helping Youth Decide" pamphlet: "[w]e do not want youngsters smoking cigarettes. That has been our policy for many years and it is a policy which has guided and will continue to guide our industry's marketing, promotion and advertising practices." TIMN0053189-3191 at 3189 (US 77043) (A).

3964. On September 21, 1984, Curtis Judge, Lorillard President and Chairman of the Tobacco Institute's Executive Committee, stated in a press release that cigarette manufacturers feel "that smoking is among many behaviors that should be left to adults, like driving, voting, raising a family, and knowing enough to make an informed decision about all sorts of adult activities." He also stated: "The cigarette manufacturers of America do not want youngsters to smoke." TIMN0013806-3806 (US 85140) (O).

3965. In a booklet entitled "In the Public Interest: Three Decades of Initiatives by a Responsible Cigarette Industry," published in 1991, the Tobacco Institute stated: "For the past thirty years – and for the future – this industry has maintained responsible positions in five policy areas of concern to all Americans . . . : youth smoking, scientific research, fire safety, truthful advertising, and workplace smoking." This booklet further stated that "Cigarette manufacturers have always believed that the decision to smoke or not is a choice to be made by informed adults" and discussed the adoption of the Code of Cigarette Sampling and the provision of a "free parental guidebook, 'Helping Youth Decide'" as examples of the Defendants' commitment to reduce youth smoking. The booklet also stated: "It has always been the policy of cigarette manufacturers that smoking or not smoking is a choice to be made by informed adults. In keeping with that policy, the industry has recently launched five new initiatives designed to support and strengthen its commitment that youth should not smoke." TI10200492-0501 (US

62273) (O).

3966. In 1989, the Tobacco Institute issued a brochure entitled "Smoking and Young People – Where the Tobacco Industry Stands" which stated that the "tobacco industry has long taken the position that smoking is an adult practice to be considered solely by mature, informed persons." The Tobacco Institute further stated that "no other industry in America has taken such direct – and voluntary – action to steer its product away from young people." The Tobacco Institute denied that advertising encourages people to begin smoking, stating that "[m]any [studies] have concluded that peer pressure and parental influence are the chief factors in an adolescent's decision" to smoke and that "[a]ccording to many behavioral experts, the answer is an unequivocal no – there is no significant connection between advertising and the decision to start smoking." 2025861325-1334 at 1327, 1330, 1332 (US 23049) (A).

3967. In a January 11, 1989 interview on *CBS This Morning*, the host asked Brennan Dawson, Vice President of the Tobacco Institute, whether cigarette brand advertisements, such as ones featuring "Joe Camel," were directed toward teenagers. Dawson responded: "No. In fact, like all tobacco advertisements, they're directed at smokers, people who are already smokers, to give them education about how much and how many different brands there are, and things like that." TIMN389505-9507 at 9505 (US 85141) (A).

3968. In 1990, the Tobacco Institute revised and republished "In the Public Interest: Three Decades of Initiatives by a Responsible Cigarette Industry," originally published in 1986. It stated, under the heading "Our Commitments": "for the past thirty years – and for the future – this industry has maintained responsible positions in four policy areas of concern to all Americans, smokers and nonsmokers alike: Youth Smoking, Scientific Research, Truthful Advertising, and Workplace Smoking." The discussion on youth smoking alleged that "Cigarette

manufacturers have always believed that the decision to smoke or not is a choice to be made by informed adults," and outlined various industry initiatives. TIMN0194781-4787 at 4782, 4783 (US 21397) (A).

3969. In 1990, the Tobacco Institute issued a multi-page advertisement captioned "Cigarette Industry Initiatives Against Youth Smoking" which provided supposed examples of Cigarette Company Defendants' efforts to keep youth from smoking, including the Code of Cigarette Sampling and the ceasing of product placement in movies. TI1630033-0034 (JE-062448) (A).

3970. Also in 1990, the Tobacco Institute issued a series of press releases entitled ". . . On Youth Smoking." The releases pronounced Defendants' public position on various youth smoking issues. A release entitled ". . . On Youth Smoking Tobacco Advertising . . . And Why Kids Smoke" stated: "cigarette advertising has no significant effect on the prevalence of smoking by young people." TIFL0303295-3368 at 3305 (JD-080072) (O). Another release, entitled ". . . On Youth Smoking Reducing Access" stated: "[i]n the past – and for the future – the tobacco industry has maintained responsible positions on the issue of smoking by young people. The longstanding policy of cigarette manufacturers is that the choice to smoke or not to smoke is to be made by informed adults." TIFL0303295-3368 at 3308 (JD-080072) (O). A release entitled ". . . On Youth Smoking Tobacco Industry Initiatives" stated: "[t]he tobacco industry has long taken the position that smoking is an adult practice to be considered solely by mature, informed persons." TIMN0015624–5625 at 5624 (US 65589) (A). A release entitled ". . . On Youth Smoking Tobacco Industry Guidelines" stated: "Long holding the view that smoking is for adults who choose to smoke – and an activity that should not be engaged in by youth – the tobacco industry has taken measures to address public concerns about youth smoking." TIMN0057161-

7161 (US 62818) (A).

3971. On February 20, 1990, the Tobacco Institute issued a press release stating that Charles Whitley, Tobacco Institute Legislative Consultant, had appeared before the Senate Committee on Labor and Human Resources on behalf of the Tobacco Institute and had testified that "the cigarette industry does not want young people to smoke." TIMN341503-1504 (US 85377) (O).

3972. In a February 22, 1990 interview on *Larry King Live*, Brennan Dawson, Vice President of the Tobacco Institute, stated: "the industry does not target kids. In fact, you'll only find tobacco ads in publications that are primarily geared towards older people; adults, in fact." TIMN341405-1422 (US 21363) (A).

3973. On *CBS News Nightwatch*, broadcast on February 27, 1990, Brennan Dawson stated: "advertising doesn't cause smokers . . . . And advertising in that mature market doesn't create the urge to run out and buy a pack of cigarettes." Dawson further stated: "The industry does not target children. We don't want kids smoking. We have taken a number of very proactive steps over a long period of time to make that demonstration very clear." CORTI1731-1738 at 1734, 1737 (US 87735) (A).

3974. In March 1990, the Tobacco Institute issued a supposed report on youth smoking stating, "Tobacco manufacturers have always believed that the decision to smoke or not is a choice to be made by informed adults." TIMN215242-2425 (US 85149) (A).

3975. On the CNN program *Crossfire* broadcast on April 11, 1990, Brennan Dawson, stated: "There is no one in the tobacco industry that wants children and underaged youth to smoke. That has been a longstanding policy of the tobacco industry." CORTI1828 -1841 at 1837 (US 85150) (A).

3976. On May 24, 1990, the Tobacco Institute issued a press release entitled "Discouraging Youth Smoking, Tax Burden On Smokers And Other Issues Discussed in Testimony" concerning the testimony offered by the Tobacco Institute's Charles O. Whitley before the Senate Committee on Finance. The press release quoted Whitley as testifying: "I know of no other industry in America that has taken such direct, voluntary action to steer its products away from young people." The press release also stated that Whitley "outlined many of the steps that the tobacco industry has taken to help discourage youth smoking." The press release further stated that "Whitley also disputed claims that raising cigarette taxes would discourage youth smoking." MNAT00600156-0157 (US 22349) (A).

3977. In a July 1990 Tobacco Institute document entitled "Youth Guidelines," the Tobacco Institute issued new industry guidelines regarding sampling and product placement, supposedly updating its advertising code. The document stated:

> The cigarette industry has long held the view that smoking is for adults who choose to smoke – an activity that should not be engaged in by youth. In fact, the industry already has taken measures to address public concerns about youth smoking. To date cigarette manufacturers: do not advertise in publications directed primarily to persons under 21; do not use models in ads who are or appear to be under 25; do not distribute cigarette samples to persons under age 21; do not distribute cigarette samples within two blocks of any centers of youth activities, such as playgrounds and schools.

The report also announced new additional industry guidelines regarding sampling and product placement. TIMN0038804-8804 (US 85151) (A).

3978. On October 11, 1990, the Tobacco Institute issued a press release entitled "Major New Initiatives to Discourage Youth Smoking Announced" which stated that Defendants had a "longstanding commitment" of discouraging and preventing smoking by youth and announced "five new initiatives that expand and reaffirm the industry's longstanding commitment and

positive actions against youth smoking." The press release included a quote from Brennan Dawson, Vice President of the Tobacco Institute, stating that "[w]e also were determined to address substantively concerns about cigarette marketing. And so we reviewed our practices to find what more we could do." The press release further quoted Dawson as saying: "since it is widely recognized that young people smoke primarily because of peer pressure, we are addressing this directly with a major program to assist parents in reducing that peer pressure." TIOK0000978-0980 (US 21714) (A).

3979. On December 12, 1990, Dawson told news reporters: "If a child never picks up another cigarette it would be fine with the tobacco industry." TIMN0131524-1525 (US 85153) (A).

3980. On the nationally televised ABC program *Good Morning America*, broadcast on December 12, 1990, Dawson, speaking on behalf of Philip Morris, RJR, B&W, Liggett, and Lorillard, stated that the tobacco "industry has a long-standing history going back for decades of positive actions to discourage youth smoking." TIMN0041988-1911 at 1989 (US 62806) (A).

3981. In 1991, the Tobacco Institute distributed to the public a booklet entitled "Smoking and Young People – Where the Tobacco Industry Stands," which stated that, in 1990, the industry "launched a set of bold, new initiatives designed to ensure that smoking remains an adult custom." In the booklet, the Tobacco Institute also stated that "[a]ccording to many behavioral experts, the answer is an unequivocal no – there is no significant connection between advertising and the decision to start smoking." TIMN0133916-3922 at 3917, 3919 (US 22206) (A).

3982. In a 1991 statement to the New York State Association of Tobacco and Candy Distributors, Samuel Chilcote Jr., President of the Tobacco Institute, said: "the tobacco industry

has long believed that smoking is an adult choice. Over the years we have taken many voluntary steps to make that clear." TIMN0031560-1560 (US 85161) (A).

3983. On December 11, 1991, the Tobacco Institute issued a press release criticizing a study published in the *Journal of the American Medical Association* ("*JAMA*") on youth smoking and accusing the authors of "glaring omissions and distortions." The press release stated: "Youth smoking is not on the rise in the U.S., contrary to the impression given in a study in today's Journal of the American Medical Association. . . . Contrary to the assertion of [the study's] authors, studies suggest that the majority of U.S. smokers are of legal age when they begin to smoke." The press release further stated: "cigarette ads have no significant effect on the prevalence of smoking by young people." The press release also contained the statement that "The tobacco industry has long taken steps to discourage youth smoking and to address concerns about tobacco marketing." In addition, the press release contained statements falsely suggesting that the majority of smokers in the United States are of legal age when they begin smoking and that Defendants had discouraged youth smoking. TIMN0024039-4040 (US 21266) (A) (emphasis in original).

3984. In an effort to head off expected criticisms triggered by the 1994 Surgeon General's Report on smoking and youth, the Tobacco Institute circulated background fact sheets to the media. A cover letter attached to the four fact sheets summarized them as follows:

> **Cigarette Advertising and Youth Smoking**, citing numerous studies and country experiences demonstrating that cigarette advertising does not influence young people to smoke;
>
> **Why Young People Begin Smoking**, outlining several U.S. and international studies reporting that family and peers are the primary influences of youth smoking;
>
> **Incidence of Youth Smoking**, highlights information on youth smoking data from federal studies; and

> **Tobacco Industry Initiatives Against Youth Smoking**, providing a look at some of the steps the industry has taken to address these issues.

TI16300337-0345 at 0337 (US 62447) (emphasis in original) (A).

(b) False and Misleading Statements of Philip Morris

(i) False and Misleading Public Statements

3985. As the following examples demonstrate, Philip Morris has also made numerous false and misleading statements about youth smoking and marketing. Philip Morris prepared a brochure intended to publicly promote its "thirty years of responsible marketing practices" dating from 1963 to 1993. The brochure stated: "Philip Morris Cigarette Ads are Directed to Adults Only . . . Philip Morris advertises to promote brand loyalty among adults who already smoke." 2078842782-2814 at 2809 (US 25040) (A).

3986. In 1989, Philip Morris initiated a program called "It's The Law" as part of its publicly-declared intention to reduce underage smoking. In a document regarding this program, Philip Morris denied that advertising leads children to smoke, stating: "All that cigarette advertising does is help smokers select a brand; it does not encourage nonsmokers or kids to smoke." 2046573757-3759 at 3757 (US 20472) (A).

3987. Doreen Baker, Manager of Marlboro Accounts at Philip Morris, sent a letter dated November 22, 1989 to Don Miller, Vice President and General Manager, Motorsports International, which stated that Philip Morris's "policy [is] to market to the 21 and above aged consumer." 2048513994-3994 (US 20483) (A).

3988. In 1991, Philip Morris placed advertisements which stated that "Philip Morris U.S.A. does not market cigarettes to children because smoking is an adult choice," and that "smoking is an adult decision." 2022881505-1505 (US 20366) (A); 2022881503-1503 (US

20365) (A).

3989. A June 27, 1995, Philip Morris press release announced a program – Action Against Access – which was described as a "new initiative to attack the problem of youth smoking." It further stated that "Philip Morris U.S.A. will fund a major retail compliance training program called 'Ask First/It's the Law' on how to ask for and verify proof of age for the purchase of cigarettes." The press release hailed these initiatives as "the best way to keep kids away from cigarettes." 2500050140-0141 (US 21804) (A); 511407678-7680 at 7678 (US 22928) (A).

3990. Responding to a letter from school children at Fairmont Public School in Fairmont, North Dakota, in a February 24, 1995 letter to the Principal, Ellen Merlo, Senior Vice President at Philip Morris, wrote: "Let me start by assuring you that Philip Morris agrees with your students, in that we do not want minors to smoke. We believe that while smoking is a legitimate life-style choice for adults, it is completely inappropriate for children. For more than three decades we have taken great care to ensure that our cigarette products are marketed to adults only. We never advertise in publications geared toward youth and have not done so since the early 1960s." 2070038936-8938 at 8936 (US 24506) (A); see also 2077070349-0354 (US 22091) (O); 2048370622-0641 (US 22094) (A).

3991. At a 1997 Philip Morris shareholders meeting, in response to a shareholder inquiry regarding youth smoking, the Altria Board of Directors stated that "[t]he Company has a long-standing policy against the sale of cigarettes to minors and in favor of responsible marketing. Consistent with this policy, which is applicable worldwide, the Company is committed to leading and supporting initiatives to address the problem of youth smoking." Philip Morris 1997 Proxy Statement, Proposal 1 (US 87736) (A).

3992. At a 1998 Philip Morris shareholders meeting, in response to a shareholder inquiry regarding youth smoking, the Altria Board of Directors stated that "the Company shares the proponents' desire to prevent youth smoking and is committed to taking action to prevent the sale of cigarettes to minors." Philip Morris 1998 Proxy Statement, Proposal 1 (US 87737) (O).

3993. At a 1999 Philip Morris shareholders meeting, in response to a shareholder inquiry regarding youth smoking, the Altria Board of Directors stated that "[b]oth Philip Morris U.S.A. . . . and Philip Morris International . . . have programs in place, and are subject to legal restrictions, that require that marketing and advertising activities be directed only to adults who choose to smoke." Claiming that Philip Morris goes "above and beyond" legal requirements, the Board further stated that "Philip Morris U.S.A. has a long-standing commitment to direct its advertising only to adults who choose to smoke. . . ." Philip Morris 1999 Proxy Statement, Proposal 1 (US 87738) (A).

3994. Philip Morris's internet website www.philipmorrisusa.com, launched on October 13, 1999, stated in part as follows: "Our goal is to be the most responsible, effective, and respected developer, manufacturer and marketer of consumer products made for adults." The website further stated that "Philip Morris is committed to acting responsibly in marketing its tobacco products to adults who choose to smoke. We demonstrate this commitment by implementing all of our marketing programs in compliance with both the letter and the spirit of the laws, rules, policies and restrictions that govern our business practices." TLT0450351-0360 (US 65080) (O) (www.philipmorrisusa.com).

3995. At a 2000 Philip Morris shareholders meeting, in response to a shareholder inquiry regarding youth smoking, the Altria Board of Directors stated, "[b]oth Philip Morris U.S.A. . . . and Philip Morris International . . . have programs and policies in place, and are

subject to legal restrictions, that help ensure that marketing and advertising activities be directed only to adults that choose to smoke. . . . Philip Morris U.S.A. has a long-standing commitment to direct its advertising only at adults who choose to smoke [and] complies with an industry code and company policy that help ensure that its marketing efforts are directed only to adults who choose to smoke." Philip Morris 2000 Proxy Statement, Proposal 4 (US 87739) (O).

3996. At a 2001 shareholders meeting, in response to a shareholder inquiry regarding youth smoking, the Philip Morris Board of Directors asserted that "Philip Morris U.S.A. has a long-standing commitment to help ensure that its marketing efforts are directed only at adults who choose to smoke . . . ." Philip Morris Companies Inc., 2001 Proxy Statement Pursuant to Section 14(a) of the Securities Act of 1935, Proposal 2 - A Proposal to Ensure that Tobacco Ads Are Not Youth-Friendly (US 87740) (A).

3997. On or about June 2001, Philip Morris posted on its Internet website a document entitled "U.S.A. Marketing Policies," which represented that "All of our brand advertising and promotions are intended for adults who choose to smoke. They serve to enhance brand awareness, recognition and loyalty among adult smokers." 2078296160-6161 (US 20534) (O).

3998. As of January 13, 2002, a section of Philip Morris's Internet website www.philipmorrisusa.com entitled "Responsible Marketing" stated in part that "we demonstrate our commitment to responsibly marketing our products to adult smokers by developing and implementing programs that comply with both the letter and the spirit of the laws, rules, policies and agreements that govern our business practices. . . . [including] PM USA's Marketing Practices. . . . Our marketing programs are designed to enhance brand awareness, recognition and loyalty among adult smokers, while honoring the Company's commitment to responsible marketing." ARU6432619-2620 (US 78280) (O) ("Responsible Marketing" on

www.philipmorrisusa.com).

3999. Philip Morris continues to disseminate false and misleading statements regarding its marketing to youth on its own website at the present time. Under a section entitled, "Responsible Marketing," Philip Morris states, "At Philip Morris USA, we demonstrate our commitment to responsibly marketing our products to adult smokers by developing and implementing programs that comply with both the letter and the spirit of the laws, rules, policies and agreements that govern our business practices." In describing its "marketing practices," Philip Morris states, "Philip Morris USA does not direct its advertising to underage smokers or to non-smokers." With regard to its obligations under the MSA, Philip Morris states, "Although the agreement restricts participation in promotional programs to "Adults" (defined as 18 years of age and older), PM USA voluntarily restricts such programs to adult smokers age 21 or older." ARU6432619-2620 (US 78280) (O) (http://www.pmusa.com/ responsible_marketing/ default.asp); ARU6432621-2624 (US 78281) (O).

4000. Philip Morris has, on numerous occasions, prepared internal memoranda or "talking points" intended for Philip Morris spokespersons to use when speaking to the public. These memoranda repeat the very same false and misleading public statements cited directly above. For example, talking points produced from the files of Joshua Slavitt, Director of Policy & Programs for Tobacco, Philip Morris Management Corporation, dating to or after 1990, stated: "Philip Morris directs its marketing efforts to existing adult smokers 21 years of age and older." 2078842251-2253 at 2251 (US 25034) (A).

4001. According to "Message Points" intended for public dissemination dating to or after 1992, produced from the files of Norma Suter, currently the Vice President of Marketing, Discount Brands: "Philip Morris does not market its products to minors and we do not want

minors to smoke because smoking in [sic] an adult custom. . . . Minors do not start smoking because of cigarette advertising, promotions or sponsorship. 2048826863-6864 at 6863 (US 23992) (A).

4002. In 1994, Philip Morris created message points intended to publicly respond to the 1994 Surgeon General Report's conclusion that cigarette advertisements contributed to youth smoking. The Philip Morris message points stated: "No study has ever been able to draw the conclusion that advertising can cause anyone – particularly kids – to smoke. All that cigarette advertising does is help smokers select a brand; it does not encourage nonsmokers or kids to smoke. Brand recognition does not equate to smoking." 2062341135-1136 (US 20511) (O).

4003. Similarly, a draft article intended to appear in an issue of *PMGLOBE* published close in time to the publication of the 1994 Surgeon General's Report stated that: "Philip Morris U.S.A. does not market its cigarette products to children and underage teenagers." 2078842765-2766 at 2766 (US 25039) (O); 2078842371-2376 at 2371 (US 25037) (O).

4004. In another example, a June 6, 1995 draft of Questions and Answers regarding sporting events signage, produced from the files of Joshua Slavitt, stated, "Any television pick-up that our advertisements may have received was and is purely incidental." 2078842259-2277 at 2274 (US 25035) (O); see also 2048216551-1559 (US 26990) (O); 2500121308-1353 at 1318-1320 (US 20553) (O).

(ii) False and Misleading Testimony

4005. On March 4, 1998, Geoffrey Bible, then Chairman and CEO of Philip Morris Companies, testified in Minnesota that "We do not market cigarettes to teen-agers." Bible TT, Minnesota v. Philip Morris, 3/4/98, 6167: 9-10.

4006. Suzanne LeVan, Vice President of Marlboro and former Vice President of Philip

Morris Premium Brands, has been a Philip Morris employee since December 1991. At her June 25, 2002 deposition in this case, LeVan testified that "Philip Morris markets its brand to adults who choose to smoke" and that "Philip Morris doesn't direct any of its marketing efforts to non-smokers." In response to the question: "Does Philip Morris do anything to recruit non-smokers to begin smoking?" LeVan testified, "No, sir, they do not." And in response to the question "What percentage of Philip Morris' marketing efforts are spent trying to convince minors to smoke Philip Morris brands?" LeVan testified, "None. Philip Morris doesn't market to minors" and testified that that was "a true statement for all of [her] years at Philip Morris." LeVan PD, United States v. Philip Morris, 6/25/02, 268-270; 2063683072-3077 (US 21870) (O).

(c) False and Misleading Statements of Liggett

4007. As the following examples demonstrate, Liggett has also made numerous false and misleading statements about youth smoking and marketing. On May 18, 1979, Raymond J. Mulligan, then President of Liggett, sent a letter to Joseph A. Califano, Jr., Secretary of the Department of Health, Education and Welfare, in response to a April 26, 1979 letter sent by Califano, which stated that millions of children are regular cigarette smokers and urged Liggett to dedicate a percentage of its advertising budget to youth smoking prevention programs. Mulligan stated that:

> [T]his Company does not promote or advertise its cigarette products to children or young people under twenty-one years of age, nor are our promotional activities and advertising aimed at encouraging such children and young people to begin smoking or even continue smoking. Cigarette smoking is an adult pleasure and custom, and our promotional activities and advertising are directed at attaining loyalty to our cigarette brands among adult smokers only.

TI03972545-2546 (US 22358) (A). Mulligan's letter also cited self-imposed restrictions against sampling and advertising on college campuses, using models under 25 years of age, television

and broadcast advertising, and "many other programs and policies not herein specified which by the industry's free will are directed at limiting the pleasure of smoking to adults." In response to Califano's suggestion of an anti-youth smoking campaign, Mulligan stated, "I believe there is sufficient evidence to show that government intrusion only encourages and fosters an attitude among many of our young people to oppose such intrusion by doing the very opposite of that which the government advocates." Id.

4008. On July 13, 1999, Ronald S. Fulford, Chief Executive Officer of Liggett, sent an internal memorandum to all employees which stated that "[i]t is Liggett's policy to scrupulously avoid any and all advertising or marketing which would appeal to children or adolescents." LDOJ2233261-3261 (US 21184) (O).

(d) False and Misleading Statements of Lorillard

(i) False and Misleading Public Statements

4009. As the following examples demonstrate, Lorillard has also made numerous false and misleading statements about youth smoking and marketing. In a January 6, 1970 letter to Michael Pertschuk, General Counsel for the United States Senate Commerce Committee, Arthur Stevens, Lorillard General Counsel, responded to a *Consumer Reports* story which discussed a 1969 or 1970 letter written by Philip Gaberman, creative director for Robert Brian Associates, regarding a new package design for Lorillard Kicks cigarettes. Stevens' letter stated: "[i]t is Lorillard's policy and practice to avoid directing its advertising or promotions toward young people. Therefore, we sincerely regret any misunderstanding which may have arisen in this regard as a result of the actions referred to in the 'Consumer Reports' story, and trust that the information we have supplied will demonstrate that we are continuing to avoid any such appeals and will continue to avoid them in the future." 00486108-6109 (US 20026) (A).

4010. On March 25, 1992, Stevens sent a memorandum to Gary W. Garson, Loews Vice President, Deputy General Counsel and Assistant Secretary, entitled "Loews 1992 Annual Meeting Shareholder Proposals 5 and 6." Loews is the parent company of Lorillard. In the memorandum, Stevens stated that "[t]he WSJ article of 3/13/92 reported the RJR response to this survey, viz, that teenagers are influenced in both their decision to smoke, and their brand selection, by the practices of their peers and families, rather than by advertising. Our MRD [Marketing Research Department] people agree with that conclusion." 91763206-3206 (US 21112) (O).

4011. In response to a shareholder inquiry regarding youth smoking at a shareholder meeting in 1996, the Lorillard Board of Directors stated that "[f]or over 30 years, Lorillard and other cigarette manufacturers have opposed smoking by minors. The voluntary code of the cigarette industry, to which Lorillard fully subscribes, contains a variety of provisions designed to discourage youth smoking . . . and a variety of restrictions strictly limiting the distribution of product samples. These efforts have been supplemented and enhanced over the years." 91762567-2592 at 2585-2586 (US 22080) (A) (Loews Corporation, 1996 Proxy Statement Pursuant to Section 14(a) of the Securities Act of 1935, Proposal No. 8 - Shareholder Proposal Relating to Smoking by Youth).

4012. In response to a shareholder proposal regarding youth smoking at a shareholder meeting in 1997, the Lorillard Board of Directors stated that: "Lorillard and other cigarette manufacturers have opposed smoking by children and underage adults for over thirty years. In an effort to deal with this and other matters, the cigarette industry has adopted a voluntary code, to which Lorillard has always fully subscribed, containing a variety of provisions designed to discourage youth smoking." TLT1022214-2235 at 2231 (US 87742) (A) (Loews Corporation,

1997 Proxy Statement Pursuant to Section 14(a) of the Securities Act of 1935, Proposal No. 5 - Shareholder Proposal Relating to Smoking by Youth).

4013. At trial, Lorillard CEO Martin Orlowsky admitted that he authored a statement in a document dated June 30, 1999 entitled "Corporate Principles of Marketing, Promotion and Youth Smoking" that: "[f]or many years, Lorillard, as a matter of corporate policy, has voluntarily and scrupulously followed the tobacco industry Cigarette Advertising and Promotion Code. . . . This Code was and is consistent with Lorillard's long-standing policy and practice that smoking is an adult custom and that children should not smoke." Orlowsky further stated:

> Lorillard does not and will not design or implement any marketing or promotional program intended to encourage youth to smoke cigarettes, and will continue to utilize only those advertising, promotional and marketing materials that do not, directly or indirectly, target youth. . . . Lorillard does not and will not advertise its products in publications directed primarily to persons under 21 years of age, including school, college or university media (such as athletic, theatrical or other programs), comic books or comic supplements. . . . Lorillard's advertising does not and will not depict as a smoker anyone who is or has been well known as an athlete, nor does it or will it show any smoker participating in, or obviously just having participated in, a physical activity requiring stamina or athletic conditioning beyond that of normal recreation. .. . and Lorillard does not and will not take any action the primary purpose of which is to initiate, maintain, or increase the incidence of youth smoking.

Orlowsky WD, 8:23-9:11; 82225801-5805 at 5803-5805 (US 55455) (A). Orlowsky also confirmed that he made this statement after the effective date of the MSA. Id., 9:12-14.

4014. At trial, Orlowsky testified that Lorillard's website indicates, as part of its corporate principles on marketing and promotion, that Lorillard:

> does not and will not target its marketing or promotions directly or indirectly to persons under 21 years of age....does not and will not conduct market research for its products involving persons under 21 years of age....does not and will not use any model in the advertising of its products who is, or appears to be, under 25 years

> of age....[will not] show any smoker participating in, or obviously just having participated in, a physical activity requiring stamina or athletic conditioning beyond that of normal recreation. . . . Lorillard advertising does not and will not suggest that smoking is essential to social prominence, distinction, success or sexual attraction[.]

Orlowsky WD, 16:20-18:8. Orlowsky also admitted that these are the same representations made in the Advertising Code and reiterated by Lorillard over the past 40 years. Id.; TLT0370590-0592 (US 76628) (O) (http://www.lorillard.com/index.php?id=29); MNAT00608606-8614 (US 21228) (A).

4015. In response to a shareholder proposal regarding youth smoking at a shareholder meeting in 1999, the Lorillard Board of Directors stated that:

> the MSA . . . is designed to provide a comprehensive framework to resolve many of the issues affecting the United States tobacco industry. This framework prohibits Lorillard . . . from targeting youth in its advertising and marketing. It also provides for the establishment of a foundation designed to . . . research, identify and implement effective means of reducing underage smoking, to be funded by approximately $1.45 billion supplied by the participating companies, including Lorillard. . . . The MSA requires corporate culture commitments in relation to full compliance with the MSA, including furthering its goal of preventing underage tobacco use. . . . As a consequence, Lorillard has advised the Company that all current and future promotional, marketing and/or advertising campaigns will be closely reviewed by Lorillard with the aim of complying with both the MSA, and Lorillard's commitment to reduce youth smoking.

TLT1022236-2258 (US 87743) (A) (Loews Corporation, 1999 Proxy Statement Pursuant to Section 14(a) of the Securities Act of 1935, Proposal No. 5 - Shareholder Proposal Relating to Executive Compensation and Teen Smoking).

4016. In a May 6, 1999 speech at the Tobacco Merchants Association 84th Annual Meeting and Dinner in New York City, Alexander Spears, then CEO of Lorillard, stated: "We are committed to reducing underage access and consumption of cigarettes. . . ." 98427298-7301 at

7301 (US 25830) (O).

4017. In June 2001, Lorillard posted on its Internet website a statement entitled "Marketing and Promotion" which promised that "Lorillard does not and will not design or implement any marketing or promotional program intended to encourage youth to smoke cigarettes, and will continue to utilize only those advertising, promotional and marketing materials that do not, directly or indirectly, target youth." VXA0104165-4166 (US 72746) (O) (www.lorillard. net/corp.html).

4018. Lorillard states on its current website:

> As clearly set forth in the Tobacco industry's Cigarette Advertising and Promotion Code (the 'Code'), to which Lorillard has adhered for many years, Lorillard believes that cigarette smoking is an adult custom and that children should not smoke. Accordingly, Lorillard advertises and promotes its cigarettes only to adult smokers . . . . Lorillard does not and will not take any action the primary purpose of which is to initiate, maintain, or increase the incidence of youth smoking.

TLT0370590-0592 (US 76628) (O) (http://www.lorillard. com/index.php?id=29); ARU6432609-2612 (US 78277) (O).

(ii) False and Misleading Testimony

4019. In his April 2, 2002 deposition in this case, Steven C. Watson, Lorillard Vice President, External Affairs, testified that he caused to be issued a press release in 2001 stating that "Lorillard Tobacco Company has never marketed or sold its products to youth" which was transmitted electronically by e-mail from North Carolina to P.R. Newswire in New York, and distributed from there by wire to various news agencies, to be published in newspapers, magazines or similar publications. Watson PD, United States v. Philip Morris, 4/2/02, 190:5-191:6.

4020. George Telford, Vice President of Brand Marketing for Lorillard since 1990 with

responsibility for developing Lorillard's annual strategic marketing plans, testified at his June 26, 2002 deposition in this case that the purpose of Lorillard's marketing and promotion efforts was to retain current smokers of Lorillard products and to convince competitive smokers to switch to Lorillard products. Telford also testified that Lorillard has set the target market for Newport as 21 to 34 year-olds since 1994. Telford PD, United States v. Philip Morris, 6/26/02, 39:17-42:10, 61:9-62:2, 62:9-17, 62:22-63:14, 63:20-64:3.

(e) False and Misleading Statements of American Tobacco, BATCo and B&W

(i) False and Misleading Public Statements

4021. As the following examples demonstrate, American Tobacco, BATCo, and B&W has also made numerous false and misleading statements about youth smoking and marketing. On September 19, 1962, Paul Hahn, President of American Tobacco, sent a telegram to Frank Stanton, President of Columbia Broadcasting System in response the CBS television program "The Teen-Age Smoker." Hahn stated that "it has always been the position of the American Tobacco Company that smoking is a form of pleasure for adults." ATC2622571-2571 (US 64815) (O).

4022. In response to a suggestion at a 1961 stockholder meeting that American Tobacco consider a campaign against children smoking to "build good will," a 1965 statement by American Tobacco Company on public relations advertising asserted that: "We will continue to make clear our position that smoking is a form of pleasure for adults." ATC2662876-2877 (US 64817) (O).

4023. On May 4, 1979, B&W Chairman and Chief Executive Officer Charles I. McCarty sent a letter to Joseph A. Califano, Jr., Secretary of the Department of Health, Education and Welfare, McCarty stated that B&W had a "policy against advertising or in any way promoting the

sale of cigarettes to persons under 21," and stated that B&W "does not have at hand the research data and other information necessary to a responsible analysis of the suggestion made in [Califano's April 26 letter]." 521038912-8912 (US 20890) (A).

4024. On June 1, 1979, McCarty sent a second letter to Califano further responding to Califano's April 26, 1979 letter. In this letter, McCarty stated: "We maintain a strict policy against promoting cigarettes to persons under 21 years of age." McCarty further stated: "We do not want children to smoke not because we agree with your oft-repeated slogan that smoking is 'slow-motion suicide' but because the decision whether to smoke, we think, is a decision which should be made by adults, not children. . . . I have serious doubts about the effectiveness of any campaign directed toward children advising them to postpone making the decision to smoke until they are adults. Such a campaign could backfire. Children might elect to smoke as a rebellion against authority or in an attempt to show adult behavior." 660008960-8961 (US 21524) (A).

4025. In a document entitled "Statement of Business Conduct" dated December 21, 1993, BATCo stated that "[t]obacco advertising and marketing programmes are used to cause existing adult consumers to switch from one brand to another and are not used to encourage young people to start smoking." This "Statement" indicated that it applied to "all directors, officers, and employees" at BATCo and at "every company within the B.A.T. Industries Group of companies." 503074962-4985 at 4965, 4978 (US 21869) (A). This "Statement," while internal, reaffirms BATCo's similar public statements.

4026. On August 25, 1997, the B&W Board of Directors (N.G. Brookes, R.L. Bexon, J.N. Jewell, M.J. McGraw, and C.L. Schoenbachler, Jr.) adopted a resolution that stated that B&W does not market to youth and that advertising and promotion were not major determinants of tobacco use by youths:

> B&W does not agree that its actions encourage young people to use tobacco products. B&W believes that minors should not use or have access to tobacco products, and **B&W does not market or advertise its products to minors**. B&W does not believe that tobacco advertising or promotion are major determinants of tobacco use by minors. B&W therefore does not agree that "sweeping new restrictions" on the marketing and sale of tobacco products are necessary. Enforcement of existing laws prohibiting youth access to tobacco would be the single most effective means of reducing youth tobacco use.

321963884-3886 at 3884 (US 85173) (A) (emphasis added).

4027. On February 24, 1998, Nicholas G. Brookes testified to the United States Senate Commerce Committee that B&W had "a policy that we do not promote our products to kids or underage smokers, and that would be a terminable offense. We would terminate somebody who clearly evaded that policy and, indeed, I think we have historically terminated contractors who have done so." 178200001-0132 at 0095 (US 35023) (A).

4028. In 1998, B&W's Internet website included a statement entitled "Marketing & Consumer Principles and Practices" which promised that: "we conduct our business in a principled manner to assure that our cigarettes are marketed responsibly, and that our advertising, promotion and sponsorship programs are not directed toward youth. Although state law permits individuals under the age of twenty-one to purchase tobacco products, the intended audience for all B&W marketing programs is adults twenty-one and over. Hence, the purpose of B&W's marketing programs is to encourage smokers twenty-one and over to select B&W brands rather than competitive brands." TLT0160001-0007 (US 65077) (A) (http://www.brownandwilliamson .com).

4029. During 1999 and through June 2001, B&W's website included a document entitled "Hot Topics: Corporate Responsibility." The section of the document entitled "Marketing Principles and Practices: Advertising" stated: "All elements of marketing programs,

including content, theme, imagery and choice of medium are to be directed at adults 21 years of age or older, not at youth." "Hot Topics: Corporate Responsibility," "Marketing Principles and Practices: Advertising." 106004419-4422 (US 76629) (A) (http://www.brownandwilliamson.com).

4030. In a July 7, 2000 interview with Charles Gibson of ABC News, Claudia Newton, B&W Vice President of Corporate Responsibility and Youth Smoking Prevention until 2001, stated that B&W was "making very sure that our marketing programs are aimed at the audience that we want to smoke our products, and that's people who are 21 years of age and up." 520526702-6705 at 6703 (US 22111) (O); 106004533-4534 at 4533 (US 87751) (O).

4031. In a press release issued on August 15, 2001, B&W stated that it had asked "the New York Times to issue an official apology and correction for its page one story today incorrectly stating that the company is advertising its products in magazines with significant numbers of young readers. [B&W] provided . . . information that shows the company does not advertise in youth-oriented publications." The release further stated: "Beginning shortly, B&W ads will be carried only in those publications that are mailed to adults 21 years of age and older. The magazines match names on their subscriber lists against databases that confirm the recipient is at least 21 years old. B&W ads will not appear in newsstand editions of those publications." 525022464-2464 (US 20918) (A).

4032. The "British American Tobacco Social Report 2001/2002," available on the British American Tobacco website, in response to the question of whether BATCo used advertising to encourage people to begin smoking, stated: "Our companies take care to ensure that their advertising does not encourage people to start smoking, to smoke more or not to quit. Our companies' advertising aims to inform adult smokers about British American Tobacco

brands so that they will switch from competitor brands to ours, or if they are already a smoker of our brands will remain so." TLT0231830-1910 at 1859 (US 76316) (O) (www.bat.com).

4033. B&W's most recent website contained a section entitled "Marketing & Consumer Communication Principles and Practices." There, B&W asserts, "B&W has long taken the position that mass media advertising should be directed to *adults* 21 and over, despite the fact that 18 is the age at which most states permit the purchase of tobacco products. . . . Although we carefully screen our publications to ensure they are directed toward *adults*, we recognize that some readers may not be *adults*. Thus, when we do not know the age of a publication recipient, we restrict the content of our advertising as well as the publications in which we place advertising, using the age of 21 as our threshold rather than legal age." B&W further stated, "[t]oday, our primary focus is on consumer relationship marketing, that is, marketing to specific individuals who have confirmed that they are both *adults* and smokers." VXB3840037-0041 (US 78678) (A) (emphasis in original) (http://www.brownandwilliamson.com/ BWT/ Index.cfm?ID=269& Sect=3).

4034. In discussing its "Corporate Responsibility" on its most recent website, B&W asserts: "Brown &Williamson invests in advertising to generate interest in our brands among competitive brand smokers and to discourage smokers of our brands from switching to other cigarette brands. . . . In addition, we do not target children or teenagers in our advertising or other marketing programs." TLT0770001-0065 at 0024 (US 72407) (A) (http://www.brownand williamson.com/BWT/ Index_.cfm?ID=30&Sect=4).

4035. A March 18, 2004 B&W press release appearing on the company's website included the following statement by Ludo Cremers, Divisional Vice President, Brand Marketing: "B&W is a responsible company that only markets its products to adults who chose to smoke and

strongly believes that anyone underage should not smoke cigarettes under any circumstances." TLT0962005-2006 (US 87745) (A) (http://www.bw.com/Index_sub2.cfm?ID=11).

(ii) False and Misleading Testimony

4036. In her April 17, 2002 deposition in this case, Claudia Newton, B&W Vice President of Corporate Responsibility and Youth Smoking Prevention until 2001, testified that advertising and marketing influences brand choice, not smoking initiation. Newton testified that she had reached that conclusion based on the results of surveys in which smokers were asked the open-ended question, "Why did you start smoking?" Newton PD, United States v. Philip Morris, 4/17/02, 150:15-20, 157:7-22, 158:17-159:4, 160:11-16.

4037. At trial, Susan Ivey, former President and Chief Executive Officer of B&W and now head of Reynolds American, testified that "B&W's policy . . . with respect to mass media advertising and market research" has been and remains "against advertising or in any way promoting the sale of cigarettes to persons under 21." Ivey WD, 4:7-16.

4038. Nicholas Brookes, Chairman and Chief Executive Officer of B&W from 1995 until 2000, testified at his March 31, 2003 deposition that B&W "researched attitudes of people over the age of 21 who were smokers and principally those who were smokers of our competitive brands to seek to encourage those current smokers to try our products." Brookes PD, United States v. Philip Morris, 3/31/03, 51:1-52:4.

4039. Paul Wessel, B&W Divisional Vice President, testified that it is the policy of B&W not to market to youth. Wessel also testified that B&W limited its sampling activities to adult only establishments. Wessel PD, United States v. Philip Morris, 3/19/03, 57:20-58:18.

(f) False and Misleading Statements of RJR

(i) False and Misleading Public Statements

4040. As the following statements demonstrate, RJR has also made numerous false and misleading statements. An April 7, 1972 letter written by T. K. Cahill, an employee in RJR's Public Relations Department, responded to a letter from Santa Monica, California fifth-grade teacher Kenneth Bersinger's class regarding a Winston ad in the *Los Angeles Times*. Cahill's response stated that "[n]one of our cigarette advertising, either in its content or in the media used, is directed to youth." 500671015-1015 (US 66308) (O).

4041. In a May 29, 1979 letter from William D. Hobbs, then Chairman and Chief Executive Officer of RJR, to Joseph A. Califano, Jr., Secretary of the Department of Health, Education and Welfare, Hobbs stated on behalf of RJR that, "we sincerely believe cigarette advertising plays no part in the process which causes teenagers to take up smoking and feel your suggestion that our Company participate in a massive campaign aimed at teenagers is misplaced." TI03972552-2554 at 2554 (US 21242) (O).

4042. In a press release drafted on January 13, 1984, intended for release on January 30, 1984, David B. Fishel, Vice President of Public Relations for RJR, stated that "our long-standing position has been that smoking is an adult custom, and we do not believe young people should smoke." 504638054-8056 at 8055 (US 20733) (O).

4043. A January 17, 1984 RJR document entitled "Questions and Answers" stated, "We do not target our advertising to minors . . . . We do not develop marketing plans against young people, we do not advertise to young people, we do not conduct consumer surveys among young people, and we have no intention of ever making any efforts to bring them into our market." 502276627-6637 at 6633 (US 20698) (A).

4044. In or about April 1984, RJR placed in numerous publications nationwide, including the weekly magazine *U.S. News and World Report* on April 19, 1984, an advertisement entitled "We don't advertise to children." This advertisement stated that "we're running ads aimed specifically at young people advising them that we think smoking is strictly for adults." It further stated that "research shows that among all the factors that can influence a young person to start smoking, advertising is insignificant. Kids just don't pay attention to cigarette ads . . . . [A]ll of our cigarette ads are what we call 'brand advertising.' Its purpose is to get smokers of competitive products to switch to one of our brands, and to build the loyalty of those who already smoke one of our brands. . . . Getting smokers to switch is virtually the only way a cigarette brand can meaningfully increase its business." 500638176-8176 (US 20644) (O).

4045. A draft Marketing Assistant Training Manual dated May 14, 1986, created by the RJR Law Department, stated: "The company does not market its products to youth. We believe that smoking is an adult custom; therefore, we do not market our products to persons under 18 years of age, nor do we research persons under that age. The Code of Cigarette Sampling . . . to which we subscribe, states that sample cigarettes shall not be distributed in public places to persons under 21 years of age -- we abide by this code." The manual further stated that "The Company has no interest in getting non-smokers to smoke. For this reason, neither our research nor our advertising concerns itself with non-smokers." Additionally, the manual instructed that "We use [the term 'young adult smokers'] to refer to smokers who are at the lower end of the adult spectrum, i.e. 18 and above. To avoid any misconception about our intention to reach only adult smokers, we use the phrase 'younger adult smoker', and never 'youth', 'kids', 'young people', etc." 515787126-7129 at 7126-7128 (US 20868) (A).

4046. RJR talking points were apparently prepared for public dissemination in 1989 to

respond to a statement made by Congressman T. Lukens regarding RJR's Supercross (stadium motorcycle racing event) contract. The talking points stated that RJR's signs placed at sports events were intended only to impact attendees and not television viewers, and denied that RJR's cigarette advertising signs were placed for maximum television exposure. 507416662-6669 (US 20776) (O).

4047. James W. Johnston, then Chairman and Chief Executive Officer of RJR, sent a letter dated March 5, 1990, to Mark Green, New York City Commissioner of Consumer Affairs, in response to a letter sent by Green to Louis V. Gerstner, President of RJR. In his letter, Green had raised questions concerning the "Joe Camel" advertising campaign. Johnston stated that it "has long been an RJR policy not to induce youth to smoke . . . we have published full-page statements in national publications urging youths not to smoke." Johnston further stated that, as CEO of RJR, "I have reinforced this policy," and "I see no basis to conclude that R.J. Reynolds has conducted itself in an unethical, illegal or misleading manner." 507603767-3767 (US 20780) (O); 507721148-1153 (US 20783) (O). In a May 3, 1990 letter addressed to "All Sales Reps.," J.P. McMahon, RJR Division Manager, stated: "It has always been . . . [RJR's] policy that we do not promote or sell our cigarette products to anyone under the age of 21." 682817262-7262 (US 21031) (A).

4048. On September 18, 1990, Joan F. Cockerham of RJR's Public Relations Department, sent a letter to private citizen Joanna Brown in response to a letter from Brown expressing concern that the Joe Camel "Camel Smooth Character" appealed to youth. Cockerham stated: "Our intention with this campaign, as with all of our advertising, is to appeal only to adult smokers. We would not have launched the current Camel campaign if we thought its appeal was to anyone other than this group . . . [O]ur advertising is directed to adult smokers

and not younger people." Cockerham also stated that "research shows that among all the factors that might influence a young person to start smoking, advertising is insignificant." 507706384-6384 (US 20782) (O).

4049. On January 28, 1992, Yancey W. Ford, Jr., Executive Vice President for Sales of RJR, sent a letter to James Harrison, President of the Vermont Retail Grocers Association, regarding the request by certain public health groups that the Association's members remove Camel advertising from their stores. Ford stated that "R.J. Reynolds Tobacco Co. does not want youth to smoke. We do not believe that smoking should be a part of growing up." Ford further stated that "R.J. Reynolds Tobacco Co. and the tobacco industry have long been on record against youth smoking" and that the Joe Camel advertising campaign was directed at adult smokers. Ford also discredited a study on youth smoking that had recently been published in the *JAMA*, that found that Camel had 33 percent of smokers 12-18 year olds, and cited Joe Camel as being widely recognized by this group. TIMN0165921-5923 (US 22354) (O).

4050. RJR sent an August 28, 1992 letter addressed to Dr. Francis A. Neelon, Editor of the *North Carolina Medical Journal*, purporting to be from Dr. Robert G. Fletcher, Medical Director of RJR. The letter bore a handwritten notation on the copy retained by RJR stating that it was "written by SWM for Dr. Fletcher." SWM are the initials for Seth W. Moskowitz, an RJR employee responsible for media relations. The letter criticized Dr. Adam Goldstein's "Health Watch" article entitled "Youth and Tobacco: Addiction and Death" that appeared in the August 1992 volume of the *North Carolina Medical Journal*. The letter stated: "[Dr. Goldstein] claims the tobacco industry spends huge sums of money promoting its products to youth. This is blatantly false. None of Reynolds Tobacco's product advertising or promotions are directed toward anyone under the legal age to smoke" and "I strongly share Dr. Goldstein's belief that

children should not smoke, as does my company." The letter further stated that "peer pressure is the main influence prompting children to start smoking." 512024008-4011 at 4008-4009 (US 22994) (O), (US 76095) (O).

4051. An August 1994 RJR draft statement, intended for delivery to the United States House of Representatives Committee on Energy and Commerce, Subcommittee on Health and Environment stated: "radio and television exposure is not a motivating consideration for Reynolds in deciding whether to sponsor an event or a vehicle participating in an event." 509321275-1290 at 1276 (US 21993) (O).

4052. At a 1995 RJR shareholder meeting, in response to a shareholder inquiry regarding youth smoking, the RJR Board of Directors stated that "RJRT does not direct its cigarette advertising and/or promotions towards minors." 520807416-7418 at 7417 (US 22239) (O).

4053. At a 1996 RJR shareholder meeting, in response to a shareholder inquiry regarding youth smoking, the RJR Board of Directors stated that RJR holds a "firm and longstanding belief that 'Kids should not smoke' . . . [and] has effective programs offered throughout the United States to combat youth smoking." RJR 1996 Proxy Statement, Item 4 (US 88005*) (2048767992-8039 at 8023-8024) (O).

4054. In a press release issued on April 21, 1998, RJR claimed, "We do not want children to smoke, nor do we market this adult product to minors." ARU6432634-2635 (US 78284) (O) (http://www.rjrt.com/ NR/NRreleases_rjrtview.asp?DocId=127).

4055. An RJR Media Contact Record indicated that on May 6, 1998, Cliff Pennell, head of RJR Sports Marketing Enterprises, was interviewed by Liz Clark, a sportswriter for the *Washington Post*. The Contact Record revealed that Pennell stated in his introductory comments,

"We don't want youth to smoke. . . . RJR brands are only interested in communicating with adult smokers 21 and over." 700033868-3869 at 3868 (US 54421) (A).

4056. At a 1999 RJR shareholder meeting, in response to a shareholder inquiry regarding youth smoking, the RJR Board of Directors claimed that "Reynolds has policies and practices in place to assure that its advertising is responsible, and directed to adult and not underage smokers. Reynolds's policy prohibits any advertising research involving subjects under the age of 21. In their research about proposed new advertising, consistent with good qualitative research practices, Reynolds's researchers ask study participants whether the proposed ads are perceived as being for persons younger or older than or about the same age as the study participants. If an ad is thought to have particular interest to persons younger than 21, it is not used." 519439239-9268 at 9262 (US 87748) (O) (RJR 1999 Proxy Statement, Item 3).

4057. As of June 2001, the RJR internet website contained a document entitled "Marketing Philosophy," that stated that "Reynolds Tobacco is not interested in, and does nothing aimed at, trying to persuade any nonsmokers to begin smoking." LIGS-C2507550-7554 at 7550 (US 65063) (O) (www.rjrt.com).

4058. As of March 18, 2005, the RJR website stated regarding the company's position on youth smoking that: "We don't want children to smoke. . . . As a responsible manufacturer and marketer of adult products, we make every effort to ensure that all of our actions are guided by this basic belief." (no bates) (JD-068012) (A) (http://www.rmrt.com/home.asp).

4059. RJR also asserts on its website that RJR, "[does] not encourage nonsmokers to start smoking." ARU6432639-2640 (US 78286) (O) (http://www.rjrt.com/TI/tobacco_cover.asp).

(ii) False and Misleading Testimony

4060. At trial, RJR President and Chief Executive Officer Andrew Schindler testified that RJR adopted a policy in 1992 regarding "marketing plans or campaigns," that RJR does not "interact with" or "talk to" 18, 19, and 20 year olds, but rather "conducts its interactive marketing practices only with those 21 and older." Schindler testified that when he assumed in 1994 his position as RJR President and CEO, he continued RJR' policy to "limit [RJR'] advertising and marketing efforts to smokers 21 years of age and older" in part "to create a buffer between adult smokers and minor smokers" as a defense against charges that RJR "market[s] to teenagers." Further, Schindler testified that RJR "absolutely does not want to develop a cigarette that appeals to children." Finally, Schindler testified that "Reynolds Tobacco is not interested in trying to persuade any nonsmokers to begin smoking or in persuading any smokers not to quit." Schindler WD, 76:17-77:1; 170:16-171:18; 208:16-18.

4061. At trial, Lynn Beasley, President and Chief Operating Officer at RJR, testified that, prior to merging with B&W, "Reynolds only permitted those 21 and older to participate in many of our marketing programs." She further testified that, after the merger with B&W, "now we allow legal age adult smokers to participate in our direct mail, sampling and promotional program." Beasley WD, 118:7-17. At trial, Beasley confirmed that Reynolds has publicly stated that the company does not market to youth for her entire tenure there. Beasley TT, 17351:19-23.

(3) Defendants Have Never Followed Their Advertising Code That They Claim Prevents Them From Marketing To Youth

(a) Defendants' Adoption of An Advertising Code

4062. In 1964, Cigarette Company Defendants, through the Tobacco Institute, under public pressure and threat of federal regulation, adopted a voluntary industry-wide Advertising and Promotion Code ("Advertising Code" or "Code") which the industry claimed would

thereinafter prevent them from marketing to underage smokers. 2025345360-5362 (US 20414) (A).

4063. Defendants' adoption of the Code and subsequent public statements regarding the Code were in fact a public relations gambit designed to assuage the public's concerns about Defendants' cigarette marketing to youth. Although Defendants made numerous public statements that the Code prevented them from marketing to youth, Defendants knew that these statements were in fact false and misleading. Defendants wrote the Code with loopholes that would permit them to continue to market to youth. Moreover, after adopting the Code, Defendants did not follow many of the Code's provisions and continue not to follow them. By stating publicly that the Code prevented them from marketing to youth, Defendants used the Code to mislead the American public.

4064. On January 25, 1964, the Federal Trade Commission ("FTC") published a proposed Trade Regulation Rule for the prevention of unfair or deceptive advertising and labeling of cigarettes in relation to the health hazards of smoking and gave notice of a proceeding for the promulgation of the Rule. 03573546-3751 (US 75032) (A) (29 CFR § 530-32).

4065. Under public pressure regarding their marketing practices, and to avoid regulation by the FTC, Cigarette Company Defendants adopted the Cigarette Advertising and Promotion Code in April 1964. From 1964 to the present, Cigarette Company Defendants claim that they have obeyed and continue to obey the 1964 Code, which was last revised in December 1990. Key aspects of the Code include provisions prohibiting: (1) advertising that appears in magazines "primarily directed to" persons under 21 years of age; (2) advertising that represents cigarette smoking as essential to social prominence, distinction, success, or sexual attraction; (3) advertising using models or other characterizations who appear to be under 25 years of age; (4)

advertising suggesting that healthy looking models derive their attractiveness from smoking or that good health is due to smoking; (5) advertising depicting a smoker as any person participating in, or obviously having just participated in, a physical activity requiring stamina or athletic conditioning beyond normal recreation; (6) advertising making health claims; (7) using sports celebrities that have special appeal to persons under 21 years of age; and (8) sampling to persons under 21. Krugman WD, 163:1-182:23; 2025345360-5362 (US 20414) (A); 2070557699-7702 (US 20519) (A); MNAT00608606-8614 (US 21228) (A); TIMN0102493-2494 (US 21271) (O); TIMN0015615-5617 (US 21265) (A); 2022976326-6335 (US 20370) (O); ATX040294056-4056 (US 58599) (A).

4066. Defendants made public their adoption of the Code in an attempt to gain positive publicity and to persuade the public that they did not market to youth. 2025345360-5362 (US 20519) (A); 2070557699-7702 (US 21228) (A); MNAT00608606-8614 (US 78779) (A); TIMN0102493-2494 (US 21271) (O); TIMN0015615-5617 (US 21265) (A); 2022976326-6335 (US 20370) (O); ATX040294056-4056 (US 58599) (A).

4067. For example, on April 27, 1964, Philip Morris, B&W, Lorillard, Liggett, RJR, and American Tobacco, through the Tobacco Institute, issued a press release entitled "Cigarette Manufacturers Announce Advertising Code" to announce their adoption of the Cigarette Advertising Code supposedly establishing "uniform standards for cigarette advertising." 2065081133-1135 at 1133 (US 20517) (O).

4068. Authority to enforce the Code was vested in a Code Administrator. The Code stated that the Administrator was to be an independent person who would, among other duties, evaluate Cigarette Company Defendants' marketing efforts to ensure that they did not target young people. The Code vested in the Administrator the power to reject marketing that

inappropriately appealed to youth and to assess damages of up to $100,000 for violations. The first and only Administrator serving from 1964 to 1970 was former Governor Robert B. Meyner of New Jersey. MNAT00608606-8614 (US 21228) (A).

4069. On March 25, 1966, Manuel Yellen, Lorillard's Chief Executive Officer, wrote to Governor Meyner withdrawing his company's participation for his supervision. Yellen stated: "The Code was essentially the cigarette industry's response to a recognized need for industry self-regulation during a time of uncertainty over the course of future legislative and regulatory action. It is our belief that the circumstances which led to the establishment of the Code administration have now significantly changed. . . . Accordingly, we now wish to advise you of our resignation. . . . We shall also continue to adhere to those principles underlying the provisions of Article IV, Section 1, of the Cigarette Advertising Code dealing with limitations on advertising to youth." 03595414-5415 (US 21385) (O).

4070. By 1970, all of the companies had abandoned the office of the Code Administrator. As a result, the Advertising Code provisions that required approval of the Code Administrator lost all force, and the Advertising Code has had no enforcement mechanism since 1970. Langenfeld TT, 3/10/05, 15192:12-15193:17.

4071. Defendants promulgated a separate Code of Cigarette Sampling Practices in 1981 that prohibited the distribution of free cigarette samples to non-smokers or those under 21, or near schools or any other center of youth activity. Like the Advertising Code, however, the Sampling Code lacked any meaningful enforcement mechanism. Defendants are left to police their own sampling personnel, a requirement in direct conflict with the companies' goal of increasing the smoking market. TW0040-0401 (US 21271) (O).

4072. Despite the withdrawal of all Cigarette Company Defendants from the supervision

of the Code Administrator twenty years earlier, the Tobacco Institute, on behalf of Cigarette Company Defendants, issued a multi-page advertisement in 1990 captioned "Cigarette Industry Initiatives Against Youth Smoking" emphasizing the cigarette manufacturers' opposition to youth smoking and stating that Cigarette Company Defendants continued to obey the marketing provisions in the Code. 6300337-0345 (JE-62448) (A).

4073. Defendants have cited the Code as preventing them from marketing to young people. For example, the Tobacco Institute, on behalf of the Cigarette Company Defendants, publicly stated that the 1964 Code prohibited "advertising, marketing and sampling directed at young people." ATX040294056-4056 (US 58599) (A).

4074. Similarly, a December 1990 pamphlet published by the Tobacco Institute, entitled "Cigarette Advertising and Promotion Code," stated: "The cigarette manufacturers advertise and promote their products only to adult smokers . . . [and] have adopted the following Code to emphasize their policy that smoking is solely for adults." Camisa PD, United States v. Philip Morris, 6/28/02, 24-26; 2021183859-3862 at 3859 (US 36717) (A).

4075. Defendants' internal documents show that they intended to use the Code to communicate to the public that they would not market to anyone under the age of 21. A November 20, 1990 memorandum from Ronald S. Goldbrenner to James R. Cherry, both Lorillard in-house counsel, regarding the "Youth Action Plan & the 1990 Marketing Mangers Meeting" stated: "[T]he industry has adopted a new Youth Action Plan designed . . . to demonstrate its commitment to avoid advertising or promoting to children. In this context 'children' means anyone under twenty-one. For those of you who have or have had teen-agers at home, you know this is an imperfect definition, but it is the one we are using. This Plan will go into effect on Dec. 11, 1990 and will be announced with much fanfare and P.R. In fact, we are

advised that some of the companies are already implementing the Plan." 91384746-4749 at 4747 (US 57030) (A).

4076. Defendants promised that the Code would stop them from advertising to youth. A draft article intended to appear in an issue of the internal Philip Morris newsletter, *PMGLOBE*, published close in time to the publication of the 1994 Surgeon General's Report stated that the Advertising Code: "proscribes youth ads. . . . Inside the company, rigorous standards are observed in the marketing of cigarette products to ensure that cigarette advertisements are directed only at adults who have already made the informed decision to smoke." 2078842765-2766 at 2765 (US 25039) (O).

4077. Similarly, in a May 18, 2000 letter to the Honorable Christine O. Gregoire, then Attorney General of Washington, Michael Szymanczyk, Philip Morris President and CEO, stated, "As we have explained to you, the Tobacco Enforcement Committee and other Attorneys General and AG staffs on several occasions, Philip Morris uses a rigorous process to satisfy ourselves that we place our print advertising only in publications that are directed primarily toward adults, the standard of our Advertising Code." 2085589698-9702 at 9698 (JD-048190) (O).

4078. Philip Morris, B&W, Lorillard, and RJR continue to state to the public on their websites and in other public fora that they have adopted the industry's voluntary Code, and that they follow this Code in planning and executing cigarette marketing. These statements are knowingly false, deceptive, and misleading. 2021183859-3862 (US 36717) (A); TLT0450351-0360 (US 65080) (O) (www.philipmorrisusa.com); TLT0370590-0592 (US 76628) (O) (http://www.lorillard. com/index.php?id=29); TLT0770001-0065 (US 72407) (A) (http://www.bw.com/ Index_sub2.cfm?ID=12); LIGSC2507550-LIGSC2507554 (US 65063) (O)

(www.rjrt.com).

(b) Defendants Do Not Follow Their Advertising Code

4079. As early as 1967, the FTC Report to Congress criticized loopholes in the Advertising Code, specifically the provision which stated that "Cigarette advertising shall not appear – (a) in publications directed primarily to persons under 21 years of age . . . . Cigarette advertising shall not depict as a smoker any persons participating in, or obviously just having participated in, physical activity requiring stamina or athletic conditioning beyond that of normal recreation." 2070557699-7702 (US 20519) (A). The FTC Report criticized cigarette advertising for exploiting these loopholes by appearing during television shows with an audience of at least 45% of its viewers under 21; for portraying physical activity as long as the smoker is not a participant; and for implying that smoking contributes to success, even if it is not essential to it. 85872480-2503 (US 22148) (A) (1967 FTC Report, at 24-27).

4080. Cigarette Company Defendants did not, and have not to this day, changed the language of their Advertising Code to remove these voluntary loopholes. Their updated versions of the Code contain the identical language criticized by the FTC Report thirty-eight years ago. 2022976326-6335 (US 20370) (O).

4081. Despite provisions in the Code forbidding marketing directed at young people, and their public statements that the Code itself prohibited such marketing, Cigarette Company Defendants continued to market to young people through advertising in television and radio broadcasts, movie placements, sampling, and by using sports heroes and other celebrities to sell their products. Many more examples of Cigarette Company Defendants' marketing to youth follow infra, US FF § III.E(4), organized by Defendant. Krugman WD, 100:1-139:23.

4082. In addition to routinely violating the Code by marketing to persons under 21, the

Cigarette Company Defendants also violated the Code provision that specifically prohibits advertising depicting a smoker as any person participating in, or obviously having just participated in, a physical activity requiring stamina or athletic conditioning beyond normal recreation. United States Expert Dr. Dean Krugman testified that Defendants had violated the Advertising Code provision prohibiting showing "any smoker participating in or obviously just having participated in a physical activity requiring stamina or athletic conditioning that go beyond normal recreation." Specifically, Dr. Krugman testified that:

> One of the more blatant examples is RJR's use of downhill ski racers, kayakers, windsurfers and other individuals participating in scenes of athletic achievement in its Vantage cigarette advertisements. Also, Philip Morris's advertisements depict the Marlboro Man demonstrating athletic prowess through fast horseback riding and cattle roping. Philip Morris documents confirm that Philip Morris's approach is to show the Marlboro Man in physical action beyond normal recreation. These internal documents describe the Marlboro Man as extraordinary, the Marlboro Man is "hard-working, fearless, and skillful." For example, a document entitled "1999 Marlboro Mainline Print Pool Research" states: "The Marlboro Man demonstrate[es] his expertise and skill, as no one else could." The document also indicates, "Shoot a Variety of Action Shots: The Marlboro Man demonstrating his expertise and skill, as no one else could." The page also illustrates the kind of pictures that can demonstrate the special skills and expertise.

In cigarette advertising and promotions related to sports sponsorships, cigarette smoking was also associated with physical power and endurance, violating the prohibitions of the Code. Krugman WD, 182:8-23; LB20300182-0210 at 0205-0206 (US 33744*) (A).

4083. Victor Lindsley, Lorillard's Senior Brand Manager, admitted at trial that many Newport advertisements depict individuals engaged in athletic activities, including ice hockey, rock climbing, skiing, snow boarding, football, kayaking, and wind surfing. However, Lindsley testified that none of these advertisements violate the voluntary Advertising Code prohibition

against showing people "participating in or obviously having just participated in physical activity requiring stamina or athletic conditioning beyond that of normal recreation." Lindsley TT, 3/30/05, 17226:24-17230:7. When the Court asked Lindsley if he had ever been rock climbing, he testified that he had never been rock climbing and had no idea how much physical strength and stamina was required. Lindsley TT, 3/30/05, 17257:15-19.

4084. Cigarette Company Defendants also violated the Code provision that specifically prohibits advertising that depicts cigarettes as essential to social prominence, distinction or success. Such violations include Vantage advertisements using the slogan "Taste of Success" and similar advertising. These advertisements, and many others discussed below, exploited the loophole which Defendants intentionally created in the Code allowing an inference that smoking contributes to success, as long as the advertisement does not explicitly state that smoking is "essential" to success. Krugman WD, 163:1-182:23.

4085. Cigarette Company Defendants also violated the Code provision that specifically prohibits advertising that depicts cigarettes as essential to sexual attraction. Such violations include Newport's "Alive with Pleasure" campaign showing young people in sexually suggestive situations. These advertisements, and many others, exploited the loophole which Defendants intentionally created in the Code allowing an inference that smoking contributes to sexual attraction, as long as the advertisement does not explicitly state that smoking is "essential" to sexual attraction. Id.

4086. Cigarette Company Defendants also violated the Code provision that states "[n]o one depicted in cigarette advertising shall be or appear to be under 25 years of age." For example, B&W's "B Kool" advertising campaign uses a model whose age cannot be determined because only his torso, arm, leg, and hand holding a pack of Kools are visible. Biglan WD, 260-

270.

4087. Philip Morris continues to state, as shown through the testimony in this case of Richard Camisa, Philip Morris Director of Media since 1998, that it has adhered to the 1990 revised Advertising Code in determining the placement of cigarette media, including the Code provision that reads: "Advertising: Cigarette advertising shall not appear in publications directed primarily to those under 21 years of age, including school, college or university media, such as athletic, theatrical, other programs, comic books or comic supplements." Philip Morris has violated this section of the Code. See US FF § III.E(7)(d)(i), infra. Camisa PD, United States v. Philip Morris, 6/28/02, 24-26.

4088. As recently as March 10, 2002, Altria's Board of Directors cited the Advertising Code as a reason for recommending a vote against a shareholder proposal that would have provided for independent review of all marketing activities to eliminate activities that appealed to young people between the ages of 12 to 17 years old. Altria stated that adoption of this shareholder proposal was unnecessary because "Philip Morris U.S.A. has a long-standing commitment to direct its advertising only to adults who choose to smoke; complies with an industry code and company policy that help ensure that its marketing efforts are directed only at adults who choose to smoke; is subject to comprehensive advertising restrictions and monitoring provisions of the master settlement agreement that prohibit the targeting of youth in the advertising, promotion or marketing of tobacco products; and has launched its own comprehensive youth smoking prevention effort, including advertising specifically designed to help prevent youth smoking." 2078016400-6453 at 6435-6436 (US 20531*) (A).

4089. Despite its claims to have adhered to the Code, Philip Morris's senior marketing executives are unfamiliar with the Code's provisions. For example, Robert L. Mikulay, a Senior

Vice President for Marketing at Philip Morris, testified in this case that Philip Morris did not, from at least 1985, follow the provision of the Advertising Code requiring an impartial administrator to review advertising as there was no Administrator. Mikulay PD, United States v. Philip Morris, 7/1/02, 55:16-56:11.

4090. Richard Camisa, who has been the Director of Media at Philip Morris since April 1998, a former Marlboro brand manager, and a Philip Morris employee since 1979, testified when shown a copy of the Advertising Code then still in place: (1) that he did not recognize the Advertising Code of 1964; (2) did not recognize the term "Code Administrator"; (3) did not know how Philip Morris interpreted the term "Code Administrator"; and (4) did not know whether the company had a Code Administrator as the term is used in the Code. Camisa PD, United States v. Philip Morris, 6/28/02, 24-26, 35-39.

4091. With respect to the provision of the Code that states, "Cigarette advertising shall not suggest that smoking is essential to social prominence, distinction, success or sexual attraction, nor shall it picture a person smoking in an exaggerated manner," Camisa testified that: (1) he could not explain its meaning and stated that it "could mean different things to different people" within Philip Morris; (2) he could not provide a single example of an advertisement that might improperly suggest that smoking is essential to sexual attraction; (3) no one at Philip Morris ever provided him with a list of objective standards or characteristics to determine whether an advertisement violated this provision; and (4) he was not "trained" to determine whether an advertisement suggests that a person's attractiveness and good health is due to cigarette smoking. Id., 41-49.

4092. With respect to the same provision of the Advertising Code, Nancy Brennan Lund, the Senior Vice President for Marketing at Philip Morris, testified that the Code prohibits

only advertisements that literally and explicitly attribute sexual attractiveness or social success to smoking: "it means that we are not able to say that, because you smoke a cigarette, you will more likely be socially prominent or successful or attractive sexually." Lund PD, United States v. Philip Morris, 6/27/02, 171:22-172:8. When asked whether the Advertising Code's prohibition on advertising in school, college or university media also prohibited research into the smoking habits and brand preferences of college students, Lund was unable to answer, and testified that, while Philip Morris has a nominal policy to research "only adult smokers," she was not sure whether Philip Morris made a provision beyond that. Id., 171:12-21.

4093. Robert L. Mikulay, a former Senior Vice President for Marketing at Philip Morris, testified in this case that although he was the head of Philip Morris's marketing department and ultimately responsible for ensuring compliance with the Advertising Code: (1) he could not recall the existence of a formal policy with respect to training new employees about the provisions of the Code; (2) he could neither confirm nor deny that new employees received a copy of the Advertising Code; (3) he was not aware of an independent entity that had the responsibility of ensuring that Philip Morris and Leo Burnett, Philip Morris's primary advertising agency, complied with the provisions of the Code; (4) he was not aware of the provision of the Code that states that advertising shall not represent that cigarette smoking is essential to social prominence, distinction, success or sexual attraction; (5) he had "never thought about . . . or had occasion to think about" how a cigarette advertisement could violate this provision; and (6) the only example he offered of how Philip Morris would violate the provision would be to run "a print ad that would say just that: 'Reach social prominence by smoking a cigarette.'" Mikulay PD, United States v. Philip Morris, 7/1/02, 86:6-91:10, 99:5-103:18, 74:11-78:16.

4094. At his deposition in this case, Victor D. Lindsley of Lorillard testified that

Lorillard has no specific guidelines for determining, as required by the Advertising Code: (1) whether a model in an advertisement appears to be under 25; (2) whether an advertisement depicts smoking in an "exaggerated manner"; and (3) whether an advertisement depicts an individual participating or just having participated in "a physical activity requiring stamina or athletic conditioning beyond that of normal recreation." Lindsley testified that these decisions are "judgment calls" made by attorneys. Lindsley PD, United States v. Philip Morris, 5/16/02, 34:19-38:7.

4095. Despite the proscription in the Advertising Code that prevents Cigarette Company Defendants from employing advertising themes associating above normal athletic ability with smoking, RJR until very recently continued to sponsor and advertise the Winston Cup Series. RJR admitted that the Winston Cup drivers have "above average athletic ability," but takes the position that the advertisements featuring the drivers do not violate the Code because they do not show race car drivers actually engaged in the act of smoking. Leary PD, United States v. Philip Morris, 5/2/02, 64:18-65:21.

4096. Claudia Newton, Vice President, Corporate Responsibility and Youth Smoking Prevention at B&W, testified in this case that there is no mechanism at B&W for punishing any employees for violations of the marketing code. Newton PD, United States v. Philip Morris, 4/17/02, 11:10-20, 12:1-3, 61:5-12, 62:20-64:7; Newton PD, United States v. Philip Morris, 5/15/02, 42:16-22, 43:11-13, 73:6-11; 106004533-4534 (US 87751) (O).

4097. The fact that Cigarette Company Defendants' senior marketing executives are unaware of the Code's provisions, knew of no procedures in place to train their employees about the Code, or have contradictory interpretations of how the Code should be interpreted and applied, and that none could provide a single example of implementation of the Code leading to

rejection of advertisements or other marketing, shows the falsity of Defendants' statements that they continue to obey the Code and that the Code prevents them from marketing to youth.

4098. Finally, Defendants' internal candidly documents admit that they do not comply with the Code and make clear that the Code was adopted so as to minimize external pressure and to maximize profits. An April 1991 RJR's executive summary entitled "Operating in a Restricted Environment" stated plainly that RJR was not following the Code at that time, but would consider actually implementing compliance if Defendants were threatened by external restrictions on marketing. "At some future point, RJR and the industry may be forced to consider extreme and radical forms of self-regulation if deemed necessary and effective to avoid extraordinary restrictions or an outright advertising ban. [I]n the most extreme instance, re-institution of the Code with a Code Administrator. It is acknowledged that in [this] instance, RJR will be forced to change some marketing practices for such self-regulation to be viewed as a credible step." 507755082-5094 at 5093 (US 20787) (O).

4099. Similarly, a Philip Morris memorandum dated July 9, 1994 from Colin L. Goddard, Philip Morris Regional Manager, reveals that Philip Morris's motive for falsely stating that it adheres to an industry-wide Advertising Code is to avoid external, real regulation of marketing, that would decrease smoking incidence and thus decrease profits, in that it recommends that Philip Morris apply the same approach internationally: "An industry code will be written [for Pakistan]. . . so that it can be used as both a lobbying lever and an argument against not introducing formal legislation." 2504024765-4767 (US 21992) (O). The memorandum stated: "The immediate implication [of advertising restrictions] for our business is clear: If our consumers have fewer opportunities to enjoy our products, they will use them less frequently and the result will be an adverse impact on our bottom line." 2041183751-3790, 3752

(US 37924) (A).

(4) Defendants Intentionally Marketed To Youth Contrary To Their Public Statements

(a) Introduction

4100. The Cigarette Company Defendants' representations that their marketing efforts were and are only directed toward shifting current smokers from one brand to another, not toward attracting new smokers or youth, and not toward keeping smokers from quitting, are untrue and fraudulent. Defendants' marketing activities brought new smokers into the market and retained existing smokers in the market. Dolan WD, 24:3-16

4101. Defendants' claims that they market only to adult brand switchers are false. Since at the most 9% of smokers switch between cigarette brands, brand switching does not justify Defendants' $12 billion in annual advertising and promotion expenditures. Krugman WD, 154:31-158:5.

4102. This is confirmed by Cigarette Company Defendants' internal documents. A November 28, 1994 email from Josh Slavitt, Senior Issues Manager, Corporate Affairs Department, recognized that Philip Morris's frequently repeated public argument that its marketing was directed purely at attracting brand switchers and not new smokers was based upon faulty research. Slavitt wrote: "Our counter argument was – until this morning – that we advertise to maintain brand loyalty and promote brand switching because each market share point of the tobacco industry is worth $400 million. We defended this position by showing that a specific number – 15-20% – of smokers 'switch' brands every year." However, according to the email written by Ed Gee, Philip Morris Consumer Research Director, to which Slavitt was responding, "the industry switching rate is more like 10%." 2045165002-5014 (US 38402) (A).

4103. Defendants' own employees admit that brand switching rates are low and falling.

David Beran, Executive Vice President of Strategy, Communications and Consumer Contact for Philip Morris, testified that Beran TT, 4/18/05, 19395:15-17 (Confidential) (closed court); (JD-053375) (O) (Confidential). Beran testified that the brand switching rate for 2002 was 6.3 percent. Beran TT, 4/18/05, 19322:16-25; (JDEM 040331) (O).

(JD-053375) (A) (Confidential); Beran TT, 4/18/05, 19394:25-19395:3.

4104. Defendants know that their cigarette businesses could not survive absent acquiring youth smokers to replace those smokers who had quit or died. In internal documents, Cigarette Company Defendants express the view that stimulating youth smoking initiation and retaining and increasing their share of the youth market is crucial to the success of their businesses. Defendants know that marketing their cigarettes to teenagers was essential to each company's success and longevity and Defendants create marketing campaigns designed to increase youth consumption. As United States expert Dr. Robert Dolan testified:

> The trend in tobacco companies' spending on marketing has continued to increase dramatically. Tobacco industry spending of $2 billion on advertising and promotion in 1980 reached $4 billion in 1988 and then $6 billion in 1994. After four years around the $6 billion mark, spending shot up $11.2 billion by 2001. In 2002, the last year for which data is available, the tobacco companies spent $12.47 billion, an increase of 11.61% over 2001. The fundamental dynamic of the industry has not changed though. The tobacco companies knew that brand loyalty is a key phenomenon and if someone doesn't start smoking as a teenager, he or she is unlikely to start. . . . Defendants still represent that the only objective of marketing is impacting brand choice while they implement marketing programs which increase the value potential customers see in smoking – attracting people including teenagers to the market and deterring others from quitting.

Dolan WD, 147:10-148:18; 2070802707-2770 at 2728 (US 89172) (A).

4105. As cited by United States Expert Dr. Dean Krugman, advertising executive

Emerson Foote, the former CEO of McCann-Erickson, which has handled millions of dollars in tobacco industry accounts, stated on April 24, 1986: "[T]he cigarette industry has been artfully maintaining that cigarette advertising has nothing to do with total sales. . . . [T]his is complete and utter nonsense. The industry knows it is nonsense. . . . I am always amused by the suggestion that advertising, a function that has been shown to increase consumption of virtually every other product, somehow miraculously fails to work for tobacco products." Krugman WD, 52:3-18; TIMN277252-7253 at 7253 (US 77086) (A).

4106. Notwithstanding Defendants' repeated denials of marketing cigarettes to young people, Cigarette Company Defendants allocated substantial resources to research the habits and preferences of the youth market. From their extensive market research on youth smokers, on people under twenty-one, and on people under eighteen, Cigarette Company Defendants knew that the majority of smokers begin smoking as youth, develop brand loyalty as youth, and that persons who begin smoking when they were teenagers were very likely to remain lifetime smokers. From Cigarette Company Defendants' research into young people's vulnerabilities to cigarette marketing, Defendants knew that youth were highly susceptible to the appealing imagery Defendants chose to use in their marketing, that youth would underestimate the health risks of smoking, and that youth were price sensitive. Chaloupka WD, 30:8-32:20; Biglan WD, 100-379; Krugman WD, 50:1-83:23.

4107. Knowing that advertising and promotion stimulated the demand for cigarettes, the Cigarette Company Defendants used their knowledge of young people's vulnerabilities gained in this research in order to create marketing campaigns (including advertising, promotion, and couponing) that would and did appeal to youth, in order to foster youth smoking initiation and ensure that young smokers would choose their brands. Dolan WD, 24:3-16, 65:7-74:23;

Chaloupka WD, 30:8-32:20; Biglan WD, 100-379; Krugman WD, 50:1-149:23.

(i) Defendants' Marketing Is A Substantial Contributing Factor To Youth Smoking Initiation and Continued Consumption

4108. Independent scientific studies performed by reputable independent scientists, and published in reputable scientific journals and in official government reports, have confirmed Defendants' knowledge, as set out in their internal documents, that their marketing contributes to the primary demand for and continuing use of cigarettes. Over the past ten years, there have been a number of comprehensive reviews of the scientific evidence concerning the effects of cigarette marketing, including advertising and promotion, on smoking decisions by young people. From these reviews it is clear that the weight of all available evidence, including survey data, scientific studies and experiments, behavioral studies and econometric studies, supports the conclusion that cigarette marketing is a substantial contributing factor in the smoking behavior of young people, including the decision to begin smoking and the decision to continue smoking. Eriksen WD, 1:20-3:19.

4109. Despite Defendants' frequent public assertions that cigarette marketing only affects brand switching and brand loyalty, marketing has been and continues to be quite effective in influencing young people to smoke. This is shown by the fact that: (a) young people who are more familiar with the advertising are more likely to begin smoking; (b) increased expenditures on cigarette marketing campaigns have been associated with increases in the incidence of smoking among adolescents; (c) adolescents who are exposed to more cigarette advertising are more likely to begin smoking; and (d) the brands that are most popular with young people are the ones where advertisements are designed to appeal to their needs and the most money has been spent on advertising and promotional activities. Biglan WD, 36-95; Dolan WD, 147:10-148:18; Krugman WD, 84-149.

4110. Recent studies, performed by reputable scientists and published in reputable journals and other fora, confirm that smoking initiation is caused by Cigarette Company Defendants' marketing activities. One such study measured progression to smoking in 1996 among young persons who reported being confirmed "never smokers" in 1993 (ages 12-17), but who had a favorite cigarette advertisement, or who owned or were willing to own a cigarette brand promotion item, and concluded that 34% of all experimentation with cigarettes in California between 1993 and 1996 (ages 15-20) was attributable to tobacco marketing activities. Similar research using Massachusetts surveys, conducted in 1997-98 and published in 2000, replicated this result, finding that, among persons who reported smoking less than one cigarette in their lifetime in 1993 (ages 12-15), but who had a favorite cigarette advertisement or who owned a cigarette brand promotion item, 46% progressed to established smoking (ages 16-19). Eriksen WD, 76:16-77:13 (citing Pierce JP, Choi WS, Gilpin EA, Farkas AJ & Berry CC., "Tobacco industry promotion of cigarettes and adolescent smoking," *JAMA* 279 (7): 511-515 (1998) and Biener AL & Siegel M., "Tobacco marketing and adolescent smoking: more support for a causal inference," *American Journal of Public Health* 90(3):407-411 (2000)).

4111. Cigarette Company Defendants intentionally exploit adolescents' vulnerability to imagery by creating advertising that utilizes the themes of independence, liberation, attractiveness, adventurousness, sophistication, glamour, athleticism, social inclusion, sexual attractiveness, thinness, popularity, rebelliousness, and being "cool." Cigarette Company Defendants place this advertising in magazines, on billboards, at point of sale (or "POS," meaning marketing materials placed in retail locations such as convenience stores), and in other venues that historically and currently reach millions of teens. Krugman WD, 100-139.

4112. Independent academic studies have concluded that, historically and currently,

cigarette advertising has appealed to children and adolescents. The messages, images, and merchandise used in cigarette advertising have corresponded precisely to adolescent aspirations. Teens smoke the most heavily advertised brands: Marlboro, Camel, and Newport. Biglan WD, 36-95.

(ii) Defendants Place Their Marketing To Reach the Maximum Number of Young People

4113. Not only do Cigarette Company Defendants choose marketing techniques that are particularly effective with children and adolescents, but currently and historically they place their marketing where it is most likely to be viewed by young people. Over the decades, they have consistently chosen to place their advertisements in media that reach millions of young people: on radio and television, on billboards, and currently in magazines and at retail. The ubiquity of Defendants' marketing increases young peoples' perceptions of the prevalence of smoking, normalizes smoking, and connects positive imagery with smoking, all of which encourage youth smoking initiation and continued consumption. Krugman WD, 100:1-139:23.

4114. Defendants have consistently spent vast sums of money on advertising and promotion, ensuring that their brand imagery would be repeated frequently and in as many different media as possible to ensure that its message is received by the maximum number of customers. Krugman WD, 21:1-31:23.

4115. Between 1952 and 1962, the leading six cigarette manufacturers spent approximately $1.2 billion for television, newspaper, and general magazine advertising. Their total expenditures for all media in this time period may have been as high as $2 billion. Between 1963 and 1970, they spent over $1.5 billion on television advertising, and over $180 million on radio. With television alone, during a single evening in this time period, it was estimated that cigarette advertising reached 46% of 13 to 17 year olds, 38% of the United States population 18

years old and over, and 26% of the population ages 2 to 12. 03573546-3751 (US 75032) (A) (FTC, Trade Regulation Rule, at 44, Table 10, Sept. 1964); FTCDOCS00491753-1821 (JD-003567) (O) (FTC, Report to Congress, at Table 7).

4116. The broadcast ban ended cigarette broadcasting of advertisements on television at midnight on January 1, 1971. On January 1, 1971 alone, Cigarette Company Defendants spent over $2 million on television advertising, three times as much as spent on an average day in 1970. Id., Table 7.

4117. Following the broadcast ban that removed their advertisements from television, Cigarette Company Defendants turned to billboard advertising, newspapers, and magazines as a means to reach massive numbers of young people. Defendants' spending on newspapers and magazines increased almost threefold after the ban, from over $64 million in 1970 to nearly $160 million in 1971, and spending on outdoor advertising (mostly billboards) increased five-fold from under $12 million in 1970 to over $60 million in 1971. Id., Table 7 & Table 8. Billboard advertising also had an advantage for Defendants over television and radio: it did not result in the invocation of the Federal Communication Commission's Fairness Doctrine which had required that broadcasters provide time for public health, anti-smoking messages.

4118. Despite Joseph F. Cullman III's testimony (cited in US FF § III.E(2)(a), supra) in the hearings leading up to the 1971 broadcast ban that the industry would submit to the ban in order to rectify the over-exposure of children to cigarette advertising on television and radio, and his promise that advertising would be placed in "newspapers and magazines" because "an affirmative act is required by the reader to see and comprehend such advertising," Cigarette Company Defendants instead undertook a massive billboard campaign which indiscriminately exposed children to cigarette advertising. As a May 1981 FTC Staff Report stated, by 1979,

"[almost half of all billboards in the United States advertise cigarettes." The report stated: "In 1979, cigarettes also continued to be the product most heavily advertised in newspapers. . . . The tobacco industry dominated outdoor advertising even more than it does magazines and newspapers. The top five outdoor advertisers in 1979 were the five largest cigarette companies." (no bates) (JD-004744) (A) (FTC, Staff Report, ch. 2 at 2-5).

4119. As James J. Morgan, a Marlboro Brand Manager in the 1960s and 1970s and later the President of Philip Morris, testified on April 22, 1998 about Defendants' use of billboards as a mass reach marketing tool:

> Television had huge reach. Television reached 10, 12, 14 million people at a time, and we were losing that. And so I and a couple of associates came up with the idea that outdoor [billboards] could replace television as a reach medium, and that you could in fact reach large numbers of people with outdoor. But we had not done a lot of outdoor. . . . We found in Louisiana, Opalesce, a printer who could print on paper big enough that you could get what looked like a printed ad in a magazine on huge paper . . . . [W]ell before the rest of the industry caught up and [the rest of the industry] was still putting up stuff that was hand painted . . . [in] the early 70s, Marlboro outdoor started looking like Marlboro magazines, had the same quality, and it gave you the flexibility to basically run the same things on outdoor that you ran in magazines. That, then, not only built brand equity, but it added to the consistency, because people would see on the highways . . . what they saw in magazines. So the whole story of the broadcast ban is not the story of the broadcast ban, it is the story of the creation of the Marlboro outdoor effort, which has been recognized up and down the line as one of the best outdoor programs in the history of the outdoor industry in the United States.

Morgan PT, Minnesota v. Philip Morris, 4/22/98, 13455-56.

4120. Cigarette Company Defendants were also able to circumvent the broadcast ban and continue to promote their cigarette brands on television by sponsoring public entertainment events that enjoyed prominent television and/or radio coverage during which cigarette brand names and images were featured, including "cigarette brand-sponsored events such as the

Virginia Slims professional women's tennis tournament, Virginia Slims 'Fashion Spree,' Benson & Hedges Blues Festival, Marlboro Music Tour, Marlboro 'Mini Grand Prix,' and Marlboro professional racing events were covered on television." Krugman WD, 103:9-19.

(iii) Numerous Public Health Bodies and Consensus Scientific Reports Concluded That Cigarette Marketing Encourages Youth Smoking

4121. In the 1994 Surgeon General's Report, *Youth and Tobacco: Preventing Tobacco Use Among Young People*, the Surgeon General stated that: "A substantial and growing body of scientific literature has reported on young people's awareness of, and attitudes about, cigarette advertising and promotional activities. Research has also focused on the effects of these activities on the psychosocial risk factors for beginning to smoke. Considered together, these studies offer a compelling argument for the mediated relationship of cigarette advertising and adolescent smoking." UXA013058-0484 at 0362 (US 64693) (A).

4122. In the same report, the Surgeon General explicitly addressed and rejected Defendants' claims that their marketing activities are directed only toward adult brand-shifters: "Even though the tobacco industry asserts that the sole purpose of advertising and promotional activities is to maintain and potentially increase market shares of adult consumers, it appears that some young people are recruited to smoking by brand advertising. Two sources of epidemiologic data support his assertion. Adolescents consistently smoke the most advertised brands of cigarettes. . . . Moreover, following the introduction of advertisements that appeal to young people, the prevalence of the use of those brands – or even the prevalence of smoking altogether – increases." UXA013058-0484 at 0368 (US 64693) (A).

4123. The Surgeon General further stated in the 1994 Report that: "Current research suggests that pervasive tobacco promotion has two major effects: it creates the perception that

more people smoke than actually do, and it provides a conduit between actual self-image and ideal self-image – in other words, smoking is made to look cool. Whether causal or not, these effects foster the uptake of smoking, initiating for many a dismal and relentless chain of events." UXA013058-0484 at 0167 (US 64693) (A).

4124. In the 1998 Surgeon General's Report, *Tobacco Use Among U.S. Racial/Ethnic Minority Groups*, the Surgeon General stated that: "Advertising is an important influence on tobacco use initiation and maintenance. . . . Cigarette advertising and promotion may stimulate cigarette consumption by. . .encouraging children and adolescents to experiment with and initiate regular use of cigarettes. . . . In addition, cigarette advertising appears to influence the perceptions of youths and adults about the pervasiveness of cigarette smoking and the images they hold of smokers." This 1998 Report also affirmed that: "Available data indicate that young people smoke the brands that are most heavily advertised. In 1993, the three most heavily advertised brands of cigarettes, Marlboro, Camel, and Newport, were the most commonly purchased brands among adolescent smokers." HHA0430685-1029 at 0914 (US 64831) (A).

4125. In the 2000 Surgeon General's Report*, Reducing Tobacco Use*, the Surgeon General stated that "[i]ntensive review of the available data . . . suggests a positive correlation between level of advertising and overall tobacco consumption – that is, as advertising funds increase, the amount of tobacco products purchased by consumers also increases." Moreover, "[I]ndirect evidence of the importance of advertising and promotion to the tobacco industry is provided by surveys that suggest that most adolescents can recall certain tobacco advertisements, logos, or brand insignia; these surveys correlate such recall with smoking intent, initiation, or level of consumption." VXA1240104-0567 at 0272 (US 64316) (A).

4126. Contrary to Defendants' assertions that their main purpose in advertising is to

maintain brand loyalty and increase market share among current smokers, in the 2000 report the Surgeon General found that "[c]onsiderable evidence" supported the hypothesis that "advertising and promotion recruit new smokers." The Surgeon General stated: "Attempts to regulate advertising and promotion of tobacco products were initiated in the United States almost immediately after the appearance of the 1964 report to the Surgeon General on the health consequences of smoking. Underlying these attempts is the hypothesis that advertising and promotion recruit new smokers and retain current ones, thereby perpetuating a great risk to public health. The tobacco industry asserts that the purpose of marketing is to maintain brand loyalty. Considerable evidence has accumulated showing that advertising and promotion are perhaps the main motivators for adopting and maintaining tobacco use." Id., 0129.

4127. Regarding the Joe Camel campaign, the Surgeon General found in the 2000 Report: "The role of advertising is perhaps best epitomized by R.J. Reynolds Tobacco Company's Camel brand campaign (initiated in 1988) using the cartoon character 'Joe Camel.' Considerable research has demonstrated the appeal of this character to young people and the influence that the advertising campaign had on minors' understanding of tobacco use and on their decision to smoke." Moreover, "an increase in smoking initiation among adolescents during 1985-1989 has been ecologically associated with considerable increases in promotion expenditures [by the tobacco industry], as exemplified by the Joe Camel campaign." Id., 0130, 0272.

4128. Other reputable experts have concurred with the conclusions drawn by the Surgeon General. *Monograph 14: Changing Adolescent Smoking Prevalence*, a 2001 National Cancer Institute publication, found: "Tobacco advertising and promotional activities are an important catalyst in the smoking initiation process. A review of the existing evidence on the relationship between exposure to advertising or having a tobacco promotional item and smoking

behavior . . . suggests that there is a causal relationship between tobacco marketing and smoking initiation." CXA0240054-0325 at 0079 (US 72977) (A).

4129. Regarding the numerous studies which examine the role of tobacco advertising and promotion in smoking initiation, *Monograph 14* found that these studies:

> comprise an impressive body of evidence that tobacco advertising and promotional activities are important catalysts in the smoking initiation process. . . . When [these studies are] viewed as a group, . . . the conclusion that there is a causal relationship between tobacco marketing and smoking initiation seems unassailable. . . . [T]obacco advertisements are particularly attractive to adolescents who, for one reason or another, are looking for an identity that the images are carefully designed to offer.

CXA0240054-0325 at 0277 (US 72977) (A).

4130. The Institute of Medicine, which was chartered in 1970 by the National Academy of Sciences to enlist distinguished members of the appropriate professions in the examination of policy matters pertaining to the health of the public, earlier reached a similar conclusion. The 1994 Institute of Medicine publication "Growing Up Tobacco Free, Preventing Nicotine Addiction in Children and Youths" concluded: "The images typically associated with advertising and promotion convey the message that tobacco use is a desirable, socially approved, safe and healthful, and widely practiced behavior among adults, whom children and young people want to emulate. As a result, tobacco advertising and promotion undoubtedly contribute to multiple and convergent psychological influences that lead children and youths to begin using these products and to become addicted to them." HHA2242048-2211 at 2122 (US 33038) (A).

4131. The 1992 United Kingdom Department of Health, Economics and Operational Research Division publication "The Effect of Tobacco Advertising on Tobacco Consumption: A Discussion Document Reviewing the Evidence" concluded that:

> the great majority of the results [of aggregate statistical studies]

> point in the same direction - towards positive impact [on tobacco consumption]. **The balance of evidence thus supports the conclusion that advertising does have a positive impact on consumption.**

0212977-3036 at 0243 (US 34282) (A) (emphasis added). The Department of Health further concluded, regarding studies of advertising bans in other countries, that "[i]n each case the banning of advertising was followed by a fall in smoking on a scale which cannot reasonably be attributed to other factors [other than the advertising ban]." Id.

(b) Defendants Use Euphemisms To Refer To The Youth Market

4132. As the documents that follow show, open discussion of the youth market and use of words such as "starters," "beginners," "teenagers," and explicit references to smokers even as young as 8, were frequent in Cigarette Company Defendants' early research and marketing documents. In the 1970s and 1980s, however, due to external social pressure and litigation concerns, Cigarette Company Defendants became more cautious about using such terms in their internal documents. As a result, Defendants' marketing documents were, and continue to be today, systematically expunged of terminology that explicitly referred to young smokers. Indeed, the Cigarette Company Defendants have been advised by their legal counsel to stop making explicit references to young people in such documents, as can be seen in the documents below, dating to the 1980s and later.

4133. Instead, Cigarette Company Defendants have sterilized their documents by using euphemisms such as FUBYA (First Usual Brand Young Adult), YAS (Young Adult Smoker), YAUS (Young Adult Urban Smoker), YAMS (Young Adult Male Smoker), and YAFS (Young Adult Female Smoker); ASU 30 (adult smoker under 30); ASU 25 (adult smoker under 25); MASU 30 or MASU 25 (male adult smoker under 30/under 25); and FASU 30 or FASU 25 (female adult smoker under 30/under 25). This shift in terminology was undertaken to ensure

that, should any marketing documents become public, the public would interpret Cigarette Company Defendants' marketing to be directed only at adults, when, in fact, their marketing practices were still aimed at youth. The following documents demonstrate Defendants' conscious change in terminology from explicit to euphemistic.

4134. A Philip Morris document entitled "Writing Tips" listed prohibited words and suggested substitutions. The word "target" is listed as prohibited because it connotes "Youth/Female/Minority" and either "specific" or "select" are suggested substitutions. Additionally, the word "targeted" is listed as prohibited for the same reason and either "intended" or "designed" are suggested substitutions. 2072944560-4560 (US 42095) (A).

4135. On January 24, 1975, Robert A. Pittman, Senior Vice President of Marketing at B&W, wrote to Martin Broughton, Chairman of BATCo; John Anders of American Tobacco; J.W. Groome, Director of Advertising & Brand Management at B&W; G.H. Lee; Donald S. Johnston, President and Chief Executive Officer of American Tobacco; J.K. Madsen, Director of Transportation; and Corny S. Muije, Manager of Market Research, requesting that they cease using terms such as "young smokers," "young market," and "youth market." Pittman wrote: "In the future when describing the low-age end of the cigarette business please use the term 'young adult smoker' or 'young adult smoking market.' Please advise all members of your department that these terms should be used in all written materials in the future." 670192436-2436 (US 20966) (A).

4136. A handwritten memorandum dated June 7, 1979 stated that "a brand geared to a **younger age bracket** may be beneficial in bringing **new, young smokers** into the Lorillard market." Handwritten edits changed the sentence to read "a brand geared to a **young adult age bracket** may be beneficial in bringing **new smokers** into the Lorillard market." The

memorandum was produced from the files of Lorillard. 00046175-6182 at 6175, 6182 (US 20021) (A) (emphasis added).

4137. On September 11, 1980, Lawrence W. Hall, Jr., Director of Marketing Development at RJR, wrote a memorandum stamped CONFIDENTIAL to numerous RJR employee, including Ernest J. Fakelman, Vice President for Business Information and Analysis; Ellen N. Monahan, Marketing Development Department; Jerry R. Moore, Marketing Development Department; and Herbert E. Osmon, Staff Vice President for External Affairs, copied to Gerald H. Long, Executive Vice President, and blind copied to Nicholas W. Glover, Vice President of Brand Marketing. The memorandum stated:

> Young Adult Smokers – Terminology[:] As you all know, the objectives of RJR's marketing activities are to convince existing smokers to select our brands rather than competition's [sic]. More to the point, it is <u>not</u> our business to motivate people to start smoking, particularly minors. . . . Given this policy, it is important that we do not do anything that would leave the false impression that our real intentions are otherwise. The risk area here is in the references we make in our written communications regarding younger adult smoker market. [PRIVILEGED MATERIAL REDACTED] As an additional thought, I would suggest that we all begin using this terminology in our oral communication, both formal and informal. By doing so, we'll develop a good habit that will reflect itself in our written communications. Please discuss this with your people and assure that they understand this new terminology, the rationale behind it, and that they put it into practice immediately.

504075896-5896 (US 20006) (A) (emphasis in original).

4138. On September 12, 1980, Ellen N. Monahan, RJR Marketing Development Department, wrote to other RJR employees, attaching Hall's memorandum, and stated:

> Larry has asked that we adopt a strict terminology of referring to 18-34 year olds as younger adult smokers. This terminology is to ensure that our marketing efforts are strictly interpreted to be aimed at the appropriate target group. Would you please take steps to carry out this direction. For example, in proofing work, please

> be cognizant of Larry's request and make any appropriate changes. In drafting reports, please avoid short-cuts which may be misinterpreted by your secretary such that the inappropriate term is typed. Once we get into the habit, I'm sure it will become natural; but until then, let's be sensitive to the issue and give it our full attention.

503536932-6932 (US 20005) (A).

4139. In January 1980, RJR's Legal Orientation Manual, signed by Tom Rucker, Associate Counsel, stated, "All written material, whether internal or external, confidential or nonconfidential, should be drafted as if it might be printed the next day on the front page of a nationally known newspaper. We would also suggest that much of your business can be communicated orally." 513389267-9274 at 9273 (US 20853) (A).

4140. On September 12, 1980, RJR Executive Vice President Gerald H. Long wrote to RJR marketing employees that "I believe that we should state the age of smokers as beginning at 18 years of age for legal purposes and certainly not go below the 18 age bracket. This should be self-explanatory." 503747121-7122 at 7122 (US 20723) (A).

4141. In a document dated September 27, 1981, RJR in-house counsel provided written comments in response to a *Washington Post* September 18, 1981 newspaper column discussing an internal B&W marketing plan that included explicit comments about smokers' perception of cigarette smoking as dangerous to their health. The RJR counsel's comments indicate that "this article is a good example of why Law [RJR legal department] does, and should continue to, review our annual brand marketing plans. The 1975 Winston (I believe) plan, contains statements almost as incriminating against our smokers. **Fortunately, later plans have been 'sterilized' through our review**." The comments point to specific "stmts [sic] like this I try to expunge" from marketing plans. 504100354-0354(US 20727) (A) (emphasis added).

4142. An RJR Law Department Draft Marketing Assistant Training Manual dated May

14, 1986 stated: "We use [the term 'young adult smokers'] to refer to smokers who are at the lower end of the adult spectrum, i.e. 18 and above. To avoid any misconception about our intention to reach only adult smokers, we use the phrase 'younger adult smoker,' and never 'youth', 'kids', 'young people', etc." 515787126-7129 at 7128 (US 20868) (A).

4143. An internal 1990 B&W document entitled "Resolve Brand Marketing Strategies" used the terms "starters," "switchers-in," and "young smokers" interchangeably. 528000268-0279 at 0269 (US 20924) (A).

4144. In a March 30, 1990 letter, L.L. Bender, an employee of RJR stated: "we must operate with the knowledge that anything we write, say, or do can become 'public knowledge' overnight." He also wrote that "'Target' definitions should be broad and refer only to competitive brands. Proposals/recommendations that are not accepted should be discarded immediately." 507511965-1967 (US 20777) (O) (emphasis in original).

4145. Shari Teitelbaum, Director of Marketing and Sales Decision Support for Philip Morris, testified in this case that she did not include explicit references to respondents who were under 21 and non-smokers in an October 18, 1993 marketing survey report, choosing instead to call these respondents "others," due to concerns of the Philip Morris legal department. Teitelbaum PD, United States v. Philip Morris, 4/16/02, 57:16-60:24, 61:4-13; 2048972933-2993A (US 20518) (O).

4146. A Philip Morris document entitled "Document Creation Outline" dated March 11, 1996, stated: "Purpose: To Make all Employees Aware of the Need for Clarity in their Documents." The document cautioned, "These days, little need to remind that documents end up on the front page of papers, on the internet, on television, as well as in lawsuits, congressional hearings, government investigations." It provided examples of how to compose notes, letters, or

emails so as to avoid having to "explain later (to your supervisor, the legal dep't, or a lawyer on the other side)" and suggested that employees "give thought to whether communication is necessary." This document was produced in this case from the files of Paula Desel, Philip Morris in-house counsel. 2069615662-5668 at 5662, 5663, 5667 (US 21929) (O).

4147. A June 27, 1997 email sent by Terry Malkin, a BATCo employee, on behalf of Paul Bingham, Manager of Marketing, Planning and Intelligence for BATCo, to various B&W employees in Louisville informed them that the Tobacco Management Board at BATCo had "decided that all future references to young adult smokers will be changed to ASU 30-Adult Smokers Under 30 Years." According to Paul Wessel, Head of United States Managed Brands at B&W,

Wessel PD, United States v. Philip Morris , 3/19/03, 84:12-84:16 (Confidential); Smith WD, 9:9-23; 800146660-6660 (US 85181) (A).

4148. As of December 2003, Philip Morris continuously tracked the smoking habits of young people of beginning at 18 years of age in most states (and 19 years of age in Utah, Alabama and Massachusetts). In a report entitled

Philip Morris refers to this 18 to 24 year old age group as PM3002956620-6692 at 6624-6628, 6635 (US 88650) (O) (Confidential).

4149. At trial, RJR CEO Andrew Schindler, who spent years at the company, admitted that RJR has referred to smokers between the age of 14-17 as "young adult smokers." Schindler TT, 1/25/05, 10911:8-13.

(c) Philip Morris Intentionally Marketed To Youth Contrary To Its Public Statements

4150. In August 1953, "A Study of People's Cigarette Smoking Habits and Attitudes,"

conducted by Elmo Roper for Philip Morris studied the smoking habits of a "cross section of men and women 15 years of age and over." Questions included: "How old were you when you started smoking?" and "What was your first regular brand?" The document indicated that Philip Morris had "very great strength among young people -- particularly under 20." 2022239148-9333 at 9149-9153, 9155, 9163 (US 20358) (O).

4151. An October 7, 1953 letter from George Weissman, Vice President of Philip Morris, discussed the August 1953 Roper report, and stated that "industry figures indicate that 47% of the population, 15 years and older, smokes cigarettes" and that "we have our greatest strength in the 15-24 age group." Weissman stated: "An interesting aspect of the market is that in the age grouping, Lucky Strike is twice as popular among the 15-17 year olds as the next leading brand, and therefore, has the potential basis to reverse its present trend in a few years. Encouragingly enough, we have our greatest strength in the 15-24 age group, as against Camel and Chesterfield, which are proportionally stronger among older age groups." 2022239142-9147 at 9142, 9144 (US 22931) (A).

4152. In 1961, Philip Morris began running a nationwide advertising campaign, "Marlboro Country," on radio and television broadcasts, and in newspapers. This campaign featured Western scenery and cowboys; Philip Morris has continued to run this campaign to the present day, using over the years billboards, magazines, retail displays and direct mail. ADV0121731-1731 (US 3567) (A).

4153. A document entitled "Teen-Age Cigarette Purchasing and Smoking Habits in the U.S.A. 1963," produced from Philip Morris's files, discussed a nationwide study of teenagers aged 13 to 18 years old which examined the extent of teenage smoking, the volume of cigarettes smoked by teenagers, where teenagers obtained cigarettes, the extent to which minors purchased

cigarettes from vending machines, and possible factors motivating teenagers to smoke. Although this was purportedly an independent study, it was conducted at the request of Lewis J. Risman of the National Automatic Merchandising Association ("NAMA"), who corresponded around the same time with Philip Morris executives regarding youth research. 1005040495-0515 (US 20193) (O). On September 4, 1997, James J. Morgan, President and Chief Executive Officer of Philip Morris USA, testified that in 1963, "Philip Morris would have participated in . . . NAMA conventions, and would have tried to cultivate relationships with the association and its membership as important customers." Morgan PD, Minnesota v. Philip Morris, 9/4/97, 133:10-14.

4154. James J. Morgan, former President and Chief Executive Officer of Philip Morris USA, during his April 24, 1998 testimony agreed that, since 1968, Marlboro's share of the youngest demographic group has always been substantially higher than Marlboro's overall market share. Morgan PT, Minnesota v. Philip Morris, 4/24/98, 13907:12-19.

4155. In 1968, Philip Morris began a nationwide Virginia Slims newspaper and magazine advertising campaign. The advertisements often depicted slim, independent, well-dressed attractive women smoking cigarettes. ADV0281229-1231 (US 10511) (A).

4156. The "1969 Survey of Cigarette Smoking Behavior and Attitudes" performed by Eastman Chemical Products for Philip Morris contained detailed analysis of beginning smokers, including interviews with 12-14 year olds. This report stated that 16-20 is a critical age group for smoking initiation and explained that "at age 14, 60% of the boys who were to become smokers had smoked their first cigarette." The report included information on why these teenagers smoked their first cigarette and whether they liked their first cigarette. 81560431-0496 at 0454 (US 85200) (A).

4157. In a May 23, 1969 internal memorandum, Myron E. Johnston, Senior Economist for Research and Development at Philip Morris, wrote to Robert S. Seligman, Vice President for Tobacco Science and Research, regarding "Marlboro Market Penetration by Age and Sex." Attached to the memorandum was a chart showing, "by sex and individual years of age, the percent of . . . smokers . . . who smoke Marlboro," which included data on 15 year olds. 1000306237-6239 at 6237, 6238 (US 20091) (A).

4158. Helmut Wakeham, Vice President for Corporate Research and Development at Philip Morris, made a November 26, 1969 presentation to the Philip Morris Board of Directors entitled "Smoker Psychology Research." His report stated that, although "the primary motivation for smoking is to obtain the pharmacological affects of nicotine," it is psycho-social motivations and not nicotine that are responsible for smoking initiation: "We are not suggesting that the effect of nicotine is responsible for the initiation of the habit. To the contrary, the first cigarette is noxious experience to the novitiate. To account for the fact that the beginning smoker will tolerate the unpleasantness we must invoke a psycho-social motive. Smoking a cigarette for the beginner is a symbolic act . . . a symbolic declaration of personal identity." The report further stated: "The 16 to 20 year-old begins smoking for psychosocial reasons. The act of smoking is symbolic; it signifies adulthood, he smokes to enhance his image in the eyes of his peers." The document concluded: "As the force from the psycho-social symbolism subsides, the pharmacological effect takes over to sustain the habit, augmented by the secondary gratifications." 1000273741-3771 at 3749 (US 26080) (A); 1003287880-7890 (US 20163) (O); 1003287836-7848 at 7836, 7838-39 (US 22848) (A).

4159. In a June 12, 1970 memorandum, "Suggestions for Research to Answer Questions Raised on Philip Morris Benchmark Study," Steve Fountaine, a Philip Morris

employee, discussed the discrepancy between the reported results on a market share survey and Marlboro's actual sales share. Fountaine stated that this discrepancy was "due to the fact that Marlboro has such a high percentage of its smokers among the types of young people our survey misses of necessity (on campus college students, those in the military and those under 18 years of age.)" This memorandum set forth a detailed proposal for research into the smoking habits of young people aged 14 to 17: "To get a reading on the smoker percentage and Marlboro share among teenagers not covered in the Benchmark study we recommend interviewing young people at summer recreation centers (at beaches public pools, lakes, etc.). . . . In our opinion, this suggested approach will provide a good reading on the Marlboro share among very young smokers, as well as adding information on college student smoking habits." 2026234664-4669 at 4664, 4665-4667 (US 20424) (O).

4160. In the July 15, 1970 Philip Morris "R&D Strategic Plan: 1971-1975," Helmut Wakeham, Vice President for Corporate Research and Development, stated: "Without an effective counter-effort by cigaret [sic] makers, there is likely to be an erosion of the social acceptability of smoking. Whereas **smoking has traditionally been viewed by adolescents and young adults as sophisticated adult behavior to be emulated**, it is in danger of being regarded generally as undesirable behavior to be avoided." 1000837808-7813 at 7809 (US 20110) (A) (emphasis added).

4161. In an August 17, 1970 internal memorandum to Wakeham from William L. Dunn, Senior Scientist at Philip Morris, entitled "Considerations Pertinent to the Proposed FTC Requirement of Published Numbers," Dunn argued that Philip Morris did not need to attempt to block FTC regulations requiring disclosure of tar and nicotine levels in all cigarette advertising, because a survey of 12-18 year olds indicated that youth smoking initiation would not be

influenced by such FTC action. Dunn stated: "We have . . . evidence that the will to smoke is remarkably impervious to concerted, dissuasive pressures: a) Horn's recent survey data of teenagers revealing a higher percentage of smokers among 12-18 year olds in the USA than ever before recorded." 1002375102-5107 at 5102 (US 20135) (O).

4162. The September 24, 1971 "R&D Strategic Plan: 1972-1976" prepared by Harry G. Daniel, Planning Coordinator at Philip Morris, stated that "whereas smoking has traditionally been viewed by adolescents and young adults as sophisticated adult behavior to be emulated, the growing youth market may be in danger due to changing value systems and attitudes." 2022163543-3555 at 3544 (US 20353) (A).

4163. A "Marketing Planning Guide" written in approximately 1972 to provide a template to Philip Morris employees for creating yearly marketing plans, included a section entitled "Industry Trends," which stated: "Although the total population will increase by 3.4% during the 1973-1978 period, the 15-19 year old age group from which many new smokers are gained, will only increase by 1.9%, while undergoing actual decreases in 1977 and 1978." The document included smoking incidence figures for 12 to 17 year olds, as well as population numbers for smokers "under 15 years"of age. 2041400206-0236 at 0223 (US 20439) (A).

4164. Numerous documents in the record show that Philip Morris closely monitored the smoking behavior of teenagers. For example, a June 27, 1972 inter-office memorandum written by R.M. Jones of Philip Morris to Raymond Fagan, Principal Scientist at Philip Morris, entitled "Fifteen Year Cigarette Smoking Trends: 1955-1970" analyzed percentages of smokers and non-smokers by sex beginning at age 17, and concluded that there was a decrease in the number of current smokers and an increase in the number of former smokers. 1002647352-7365 at 7352-7353 (US 20141) (O).

4165. A May 18, 1973 memorandum entitled "Incidence of Smoking Cigarettes," sent by Neil Holbert, Philip Morris Marketing Research Department, to numerous Philip Morris employees, discussed findings from a survey conducted by the Opinion Research Corporation of smoking incidence among 452 12 to 17 year olds and those aged 18 and over. Holbert stated that the survey found that 13% of the 12 to 17 year olds polled smoked at least a pack a week. 2041761791-1801 at 1791, 1795 (US 21493) (A). According to James J. Morgan, former President and Chief Executive Officer of Philip Morris, copies of this memorandum summarizing the results of this proprietary study of teen smoking were received by, among others: Ross Millhiser, President of Philip Morris; James Morgan, then-Director of Brand Management; Bob Fritzmaurice, Marlboro Brand Manager; Bob Cremin, head of sales; Max Berkowitz, assistant head of marketing and sales; Claude Beck, advertising buyer; Ellen Merlo, brand group manager; and brand managers Dick Gumz, John Granville, Allen Levine, and Tom Keim. Morgan PD, Minnesota v. Philip Morris, 9/4/97, 145:9-146:18.

4166. Philip Morris's "U.S.A. Tobacco Marketing Five Year Plan" dated June 1973 discussed the concern that a decline in "the 15-19 year old age group from which many new smokers are gained" would cause a loss of cigarette volume:

> the new-smoker age group (15-19) will increase only 1.9% over the total period and will actually decline in 1977 and 1978. A decline of 7.8% for this period in the under 15 age group indicates that this trend will continue in the following years. . . . However, more than offsetting the loss of cigarette volume from the declining trend in the 'new-smoker' age group (15-19), are substantial increases in those two population segments which have the highest smoking incidences, the 20-29 year olds (+14.8%) and the 30-39 year olds (+19.1%). . . . In summary, then, the total industry volume will increase at an average annual rate of about 1.9% through 1976 on the strength of increases in the three key population segments - the 15-19 group which represents the primary source of new smokers, and the 20-29 and 30-39 groups which are characterized by high smoking incidences.

1005159031-9168 at 9034, 9043-9044 (US 26207) (A).

4167. A July 1974 Philip Morris Marketing Research memorandum entitled "The New Competition for Marlboro's Franchise Smokers" stated, "for the past year, Marlboro's growth in share of market has slowed down considerably. . . . [T]his problem is especially clear among the most important segment of the Marlboro franchise, smokers aged 18 to 24." In response to this trend, the memorandum reported that the "Roper Organization was commissioned to undertake [a] study. . . . with the intention of probing the dynamics of the market among smokers below the age of 24. (This was not the 'usual' sample of age 18-24; **in this study, no lower age limit was set.**)" Roper conducted 1050 interviews for this study. Comparing Roper's results and Philip Morris's own National Tracking Study, the document reported that the results were not significantly different, but "[t]he somewhat larger share for Marlboro smokers found in the Roper Study (33% Vs. 27% found in Tracking) may be accounted for by the **popularity of this brand among those under age 18** who are not interviewed in Tracking," but who were interviewed by Roper. The Roper study determined that "Marlboro is still the most frequent '**first regular brand**'" and stated, "The ideal situation would be to have lots of people choosing our brand as their first (which we do)." According to the Roper study, "The most important reason these young smokers give for settling on their first regular brand is what we might call peer pressure. . . . This tendency to 'go with the leader' feeds on itself. As a brand increases in popularity, it is more likely to be adopted as 'the' brand to smoke." 2022245802-5823 at 5803, 5804, 5807, 5808, 5809 (US 26748) (A) (emphasis added).

4168. The study referenced above prepared by the Roper Organization in July 1974 for Philip Morris was entitled "A Study of Smoking Habits Among Young Smokers," and found that "Marlboro is the starting brand for young whites, and Kool is the starting brand for young

blacks." The study questionnaire asked respondents when they started smoking and included a category for 14 and under. The study's findings included: "Marlboro N/M [non-menthol] appears to be attracting fewer new smokers than some of the other brands . . . [and] appears to have become static" and "Marlboro is the starting brand for young whites." The study report also stated: "**We are not sure that anything can be done to halt a major exodus if one gets going among the young. This group follows the crowd, and we don't pretend to know what gets them going for one thing or another. Certainly [Philip] Morris should continue efforts for Marlboro in the youth market**." 1002646151-6185 at 6152, 6154-6157 (US 20140) (A) (emphasis added). This document, like many others discussed supra, supports Dr. Krugman's testimony that Defendants harnessed peer appeals in marketing to teenagers. Krugman WD, 85:1-93:23.

4169. A July 25, 1974 Philip Morris Marketing Research Department memorandum entitled "Highlights of Special Roper Study on Young Smokers" discussed the implications of "new trends in the marketplace, particularly among young smokers." This Roper study, commissioned by Philip Morris, detailed Marlboro's slowing growth in share of market. The memorandum stated: "[T]his problem is especially clear among the most important segment of the Marlboro franchise, smokers aged 18 to 24 and that, while this softness was notable for Marlboro, menthols, and especially Kool, were showing growth among these young smokers." 1000730691-0713 at 0691, 0693 (US 20104) (A).

4170. A Philip Morris March 3, 1975 internal document entitled "Economic Forecast 1975-1980" written by Myron E. Johnston, Senior Economist for Research and Development, stated, "The most recent surveys have shown an increase in the proportion of teenagers (particularly girls) who are beginning to smoke cigarettes. Thus, even though there will be a

decline in the absolute number of teenagers from 1975 to 1980, the number of teenage smokers will remain constant. From 1969 to 1974, by contrast, the number of teenage smokers increased at an average rate of 2.2%. . . . During the last ten years Marlboro has benefitted from the rapid increase in the number of people 15 to 19 years old, the ages at which most smokers begin smoking." Johnston also predicted that, because of the declining number of 15-19 year olds, "Marlboro will be deprived of one source of its growth and, increasingly, will have to rely for growth more on switchers from other brands and on maintaining the brand loyalty of Marlboro smokers. Because of this decline in the number of 15-19 year olds, Marlboro sales will increase at a decreasing rate." 1000739883-9907 at 9903, 9905, 9907 (US 21601) (A).

4171. Johnston sent an inter-office memorandum dated May 21, 1975 to Robert B. Seligman, Director of Commercial Development, Tobacco Products, with the subject "The Decline in the Rate of Growth of Marlboro Red." Johnston discussed four factors contributing to the Marlboro Red growth slowdown: slower growth in the number of 15 to 19 year olds, the recession, increasing cigarette prices, and the "changing brand preferences of younger smokers." Johnston stated: "It has been well established . . . [by studies] that Marlboro has for many years had its highest market penetration among younger smokers. Most of these studies have been restricted to 18 and over, but my own data, which includes younger teenagers, shows even higher Marlboro market penetration among 15-17 year olds." 1003285497-5502 at 5497 (US 20160) (A).

4172. An April 8, 1976 Philip Morris inter-office memorandum from Myron Johnston and Frank Ryan, Senior Associate Scientist for Philip Morris, to William Dunn, Senior Scientist, entitled "Teenage Smoking," reported on the "upsurge" of smoking among young teenage girls, and hypothesized that the increase in teenage girls' smoking may be connected to the teenage

boys' smoking habits and the fact that "teenage boys typically date girls who are their own age or a year or two younger." This document included information on males age 12 to 17 and females age 10 to 15, and observed that the 13 year old age group "shows the most dramatic increase proportion of smokers." 1000743958-3959 at 3958 (US 20105) (O).

4173. A May 1976 study prepared for Philip Morris by the Roper Organization entitled "A Study of Smokers' Habits and Attitudes With Special Emphasis on Low Tar Cigarettes" stated that "[a]s usual, in the studies we conduct for Philip Morris, we undermeasure Marlboro's share since we do not interview people under the age of 18, and Marlboro is strong with teen-age smokers. Marlboro continues to be a young smoker's brand, with one-quarter of those 18 to twenty-one reporting they smoke Marlboro Red most often." 2024921314-1612 at 1374 (US 20403) (A).

4174. A June 2, 1976 Philip Morris memorandum from Alfred Udow of the Philip Morris Consumer Research Department to James Morgan entitled "Why People Start To Smoke" stated: "most smokers appear to have begun smoking between the ages of 10 and 18." The memorandum identified the "factors involved in the initiation of smoking," explaining: "In general, the studies suggest that youngsters' beginning to smoke is related to: a) curiosity about smoking; b) conformity pressures among adolescents; c) need for status among peers, including self-perceived failure to achieve peer-group status of satisfaction; d) the need for self-assurance; and e) striving for adult status." With respect to high school students, the memorandum stated: "The smoking pattern is established relatively early. Before 12 years of age, less than 5% of boys and 1% of girls smoke, but soon thereafter a steady increase begins. In the 12th grade, from 40-to-55% of children are smokers, and by the age of 25 years about 60% of men and 36% of women have acquired the habit." Udow indicated that he consulted both external, independent

research and internal Philip Morris research on youth smoking: "Information on the motivation that leads to a continuation of smoking comes from a special study done for Philip Morris (Brand, 1971)." 1000744089-4096 at 4089, 4092, 4095-4096 (US 20106) (A).

4175. Neil Holbert, Philip Morris Marketing Research Department employee, sent an inter-office memorandum dated October 13, 1976 about "Teen-Age Smoking" to Jon N. Zoler, Director of Marketing Research for Philip Morris. Holbert stated that "[w]e have an operational decision to make on what age to use as a low-end in working out incidence, consumption, and brand usage." Holbert also wrote that the "data suggest that we use Age 15 as a base." 1005085359-5359 (US 20207) (O).

4176. A November 10, 1977 memorandum from Neil Holbert to Jon N. Zoler entitled "Incidence of Smoking" stated: "We are often asked about incidence of smoking." The memorandum described an updating of a "compilation" of "studies and releases" discussing "Teen-age incidence data." A table attached to the memorandum included data obtained from sources, such as Opinion Research Corporation on the incidence of smoking in the United States from 1968-1977 among 12 to 18 year olds. 2041761868-1868 (US 20440) (O); 2041761869-1871 at 1871 (US 88801) (O). Opinion Research Corporation performed proprietary research for Philip Morris. Morgan PD, Minnesota v. Philip Morris, 9/4/97, 193:16-194:4.

4177. In a 1978 document entitled "The Assets," Philip Morris reported that "the percentage of smokers in the 17-24 year old age group is up, and the amount smoked per day per young smoker is also up." 1003058994-9017 at 8999 (US 20151) (O).

4178. In a July 1978 document entitled "Estimated Number of US Smokers," Philip Morris tracked smoking incidence among the population starting at age 12. 2042521997-2001 at 1997, 2001 (US 20445) (O).

4179. A March 1979 study prepared by the Roper Organization for Philip Morris entitled "A Study of Smokers' Habits and Attitudes With Special Emphasis on Low Tar and Menthol Cigarettes" stated: "While we do not interview below age 18, we would guess the trend towards doing almost everything at a younger age applies to cigarette smoking as well, and is a further factor in enlarging the market." 2049455309-5318 at 5313 (US 22218) (A).

4180. A March 29, 1979 memorandum on Philip Morris USA letterhead entitled "Marlboro" stated: "Marlboro dominates in the 17 and younger age category, capturing over 50% of this market" and itemized various special promotions, including "summer sampling" and the Marlboro Cup. 20483828174-8176 at 8174-8175 (US 21517) (A).

4181. An October 18, 1979 unsigned confirmation letter memorialized the agreement between Philip Morris Europe S.A. and Pinewood Studios, England to feature the Marlboro brand name in the film "Superman II" in return for £20,000 (approximately $42,500). 2046788819-8821 (US 20478) (O).

4182. An October 24, 1980 internal Philip Morris memorandum from Neil Holbert to Jerry Choyke, an employee of Philip Morris, regarding "Number of Smokers" discussed smoking incidence for the 1960s, 1970s, and projected for 1981, and included information from a Roper study conducted by the Tobacco Institute which surveyed 17 year olds. 2042329572-9572 (US 20444) (O).

4183. A March 31, 1981 report conducted by the Philip Morris Research Center entitled "Young Smokers Prevalence, Trends, Implications, and Related Demographic Trends" stated that "**Today's teenager is tomorrow's potential regular customer**, **and the overwhelming majority of smokers first begin to smoke while still in their teens**. . . . The smoking patterns of teenagers are particularly important to Philip Morris: Of the eleven packing of which the

median age of smokers is under age 30, seven are Philip Morris packings. . . . [I]t is during the teenage years that the initial brand choice is made." The report indicated Philip Morris's concern over demographic and social trends that were creating a downturn in teenage smoking rate: "Because of our high share of the market among the youngest smokers, Philip Morris will suffer more than other companies from the decline in the number of teenage smokers." 1000390803-0855 at 0808-0809 (US 22334) (A) (emphasis added).

4184. In a document dated May 7, 1981, Myron Johnston, Senior Economist for Research and Development at Philip Morris, stated that 33.2%, 32.6% and 32.2% of people 17 and over were current regular smokers for the years 1978, 1979, and 1980, respectively. 1000792013-2013 (US 20108) (O).

4185. In inter-office correspondence regarding "Smoking Prevalence by Age, Race, and Sex" dated July 29, 1982, from Johnston to Ralph Brown, another Philip Morris employee, Johnston discussed interview samples from age groups ranging from 17 and older. 1003285379-5384 at 5379, 5381-5384 (US 20158) (O).

4186. In a January 19, 1983 inter-office memorandum to Jon Zoler entitled "The Ages at Which People Start Smoking," Myron Johnston set out the smoking initiation ages for demographic groups, finding that the largest percentage (20 to 35%) began smoking before age 18, some (18 to 20%) began between the ages of 18 and 21, and a few (5 to 10%) began between the ages of 21 and 25. He asserted: "Conventional Wisdom has long held that anyone who has not started smoking by age 18 is unlikely to become a smoker. . . . Clearly, Conventional Wisdom has to be rephrased to read: 'Anyone who has not become a smoker by age 25 is unlikely to become a smoker.' It is interesting to note that the younger cohorts of white females, but not males, are beginning to smoke at progressively younger ages." 1003478157-8159 at 8157 (US

35772) (O) (emphasis in original).

4187. In inter-office correspondence dated February 18, 1983, from Johnston to Alfred Udow, Philip Morris Consumer Research and Marketing Department, entitled "Still More on Trends in Cigarette Smoking Prevalence," Johnston discussed "the encouraging upward trend in smoking prevalence among 18-29 year-olds – encouraging because of the importance of these younger smokers to Philip Morris." 1003285174-5178 at 5174 (US 20157) (O).

4188. A Philip Morris document entitled "Magic: Finding the Right Twist to Individual Smoking" discussed 1983 data that included a 16-24 age group. The document proposed the creation of "the first American blend cigarette with variable taste" called "Magic." Since, as the document stated, most older smokers do not switch brands, "Magic should try and attract a younger smokership - people who are more flexible in terms of choice." The target group, described as the "Artari [sic] Generation" were the "age group between 16-34 years old (46% of all smokers are in this age bracket.) Magic is made for people who work hard to be able to play hard. They are young, active people full of vitality and determined to enjoy their lives." Atari were video game players popular with children and teenagers. 2073690712-0724 at 0714, 0716, 0717 (US 24678) (O).

4189. An internal document entitled "Product Testing Short Course," dated January 23, 1984, prepared by the Philip Morris Research and Development Department, explained how Marlboro succeeded by attracting new teen smokers: "Marlboro floundered for 8 years and then hit a responsive chord among the post-war baby-boom teenagers with the theme from the 'Magnificent Seven' and an image uncalculatedly right for the wave of teenagers coming of smoking age." Explaining the importance of teenage smoking initiation, the document stated: "Of the two important demographic influences in the last 35 years – women and teenagers – one

has peaked and the other is working against us. Other demographic groups probably don't hold much promise since they are already smokers." 2028817401-7576 at 7504, 7508 (US 20016) (A).

4190. Metacorp, a marketing development corporation, prepared a March 1984 document entitled "1984 Marlboro Spring Resort Field Marketing Opportunities" for Philip Morris. Metacorp outlined various venues and events occurring during Spring Break, among them the 2nd Annual New Music Showcase, featuring Duran Duran, a band popular with teenagers. 2044390059-0073 at 0061, 0064 (US 20453) (O).

4191. In a March 16, 1984 memorandum to Leo Meyer, a Philip Morris scientist, discussing smoking prevalence and smokers' educational attainment, Myron Johnston stated, "Not much can be said of the 17-24 year olds because most of them are still in school." 2040280991-1022 at 0993 (US 21780) (O).

4192. A March 20, 1984 Philip Morris document entitled "The Cigarette Consumer" stated that "[p]eople begin smoking 1) [because of] peer pressure, 2) to rebel/assert independence, 3) to appear grown up, [and] 4) to experiment," and that "products targeted to younger end of spectrum [are] most viable." 2500002189-2207 at 2203, 2205 (US 21460) (A).

4193. EPSY, a Swiss-based survey company, in 1984 conducted for Philip Morris surveys of "juvenile smokers" in order to characterize " [t]he regular Marlboro smoker," "[t]he new Marlboro smoker," "[t]he Marlboro switcher to Camel," and the counterparts for "juvenile smokers" of Camel. The study found that “[t]he **new Marlboro smoker** still lives strongly in the world of illusions (**due to his young age**) and is attached to the Marlboro cliché to a much greater degree than the regular smoker.” The study concluded that "Marlboro has become vulnerable . . . because of discrepancies between brand psychology and the changing life attitude

of the **juvenile target group**" and because "[a]ttraction for juvenile smokers has decreased." The study recommended "more emphasis on motivational promotions" and "[t]arget-oriented promotions, i.e, Marlboro Challenge, Marlboro Music Promotions." 2040261475-1479 at 1475, 1479 (US 26920) (O) (emphasis added).

[This space is intentionally blank, as a result of substituting ¶4193 (above), submitted with The United States' Notice of Errata to United States' Proposed Findings of Fact," filed on August 16, 2005, to remove references to Bates page numbers 2040261472-1474 in US 26920.]

4194. A July 9, 1984 Philip Morris memorandum drafted by Myron Johnston to Leo Meyer on the subject of "The Changing Geography of Menthol and the Threat Posed by Newport" recognized the success of Lorillard's Newport brand and stated: "The fact that Newport smokers are very young gives further indication that Newport's growth is disproportionately at the expense of Marlboro. (Their median age as derived from the Tracking Study data is 23.2, and that does not take into consideration those under the age of 18.)" Johnston further stated: "Lorillard has clearly recognized that menthol smokers are disproportionately black and disproportionately young – groups that have relatively low newspaper and magazine readership and that tend to be pack buyers rather than carton buyers. Hence Newport relies heavily on point-of-purchase and outdoor advertising-63 percent of Newport's 1983 advertising expenditures were for outdoor." 2040280951-0977 at 0954-0955 (US 37496) (A).

4195. A November 1, 1984 Philip Morris USA inter-office correspondence from Myron Johnston to Tom Goodale, Director of Operations and Sales, and copied to the Central File and twenty-two employees, including Carolyn Levy and Bob Mikulay, both of whom would later head Philip Morris's Marketing Department, acknowledged the impact that smokers under the

age of 18 had on the median age of smokers of the Virginia Slims brand. In the memorandum, Johnston addressed his "serious reservations about the advisability of introducing a Virginia Slims 120," a line extension with an older demographic that he thought might damage Virginia Slims's younger demographics (including teenagers). Johnston wrote:

> The most serious reservation is demographic. Will the natural constituency for 120s (females with a median age of 38 for the menthols and 48 for the nonmenthols), be attracted by the carefully nurtured image created for Virginia Slims, where the median ages are 30 for the menthols and 35 for the nonmenthols? (Since these median ages are based only on smokers aged 18 and over, the actual median ages are probably several years younger.) . . . I'm not sure that it should be done, for fear of damaging the youthful image of Slims that has contributed so much to its success.

2001255708-5710 at 5708, 5709 (US 85182) (O).

4196. A December 12, 1984 Philip Morris special report entitled "Cigarette Market History and Interpretation" prepared by John E. Tindall, Senior Scientist at Philip Morris, and broadly distributed within Philip Morris, traced the history of the cigarette market from 1938 to 1984 and analyzed brand shares and relative performance in terms of the demographics of the smoking population and the turnover in the smoking population. The report explained the rise of Marlboro, Kool, and Newport: "New smokers entering the market were disproportionately attracted to those brands." The report stated: "**[I]f the domestic cigarette market is to survive long-term, it must have a constant influx of new smokers.** In the past, the psychology of brand choice for new smokers has been an area to which we have had to give little attention since our brands have been among the major beneficiaries of new smokers' brand choices. There are reasons to believe we may not be so fortunate in the future." The report further stated that "**Marlboro's growth and, presumably, its position as the brand of choice among new smokers, coincided with the Marlboro Country campaign. That was certainly a**

remarkable campaign and one that probably did appeal to young people, but not one that marketers would have been likely to have composed to attract young people in the 1960s." 2001265000-5045 at 5012, 5030 (US 20299) (A) (emphasis added).

4197. An August 15, 1985 report entitled "Trends in Smoking Among High School Seniors," authored by Johnston and addressed to Jon Zoler, stated that "about half of all people, in all age cohorts, who ever smoked have been smokers at age 18. Thus by studying trends in smoking among 18-year-olds we might gain some insight as to what to expect in the future." The report provided extensive data on the smoking habits of high school seniors. Zoler commented that this study was "the most comprehensive study I've seen on the subject." 2040282066-2092 at 2066 (US 20437) (O).

4198. A September 18, 1985 Philip Morris inter-office memorandum by Johnston to Tom Goodale, entitled "The Implication of Those Strange Happenings in the Menthol Market," surveyed menthol smokers by race, age, and gender in order to explore a drop in the 18-24 year old menthol smoker market. The memorandum identified menthol as an "entry brand," and asked the question, "Why are the young abandoning menthols?" Johnston concluded that women who begin smoking before age 18 were less likely to choose menthol, whereas those who begin smoking after age 17 were more likely to choose menthol. 2056267569-7584 at 7569, 7570, 7572-7573 (US 20497) (O).

4199. A document apparently drafted after 1986 entitled "Impact of Marlboro Sponsorship in CART Racing: Are We on Track?" discussed Marlboro car racing promotions. The document stated that 14% of 18-24 year olds were racing fans and that racing was perceived as "[m]asculine" and "dangerous" because racing "is like grabbing Death by the gonzos and saying 'Ha!'" 2040750492-0510 at 0495, 0496 (US 20438) (O).

4200. Philip Morris sent an advertising contract dated January 14, 1986 to the Los Angeles Dodgers Advertising and Novelty Department for the purpose of placing Marlboro advertising in the 1986 Dodgers scorecard and magazine available at Dodgers major league baseball games. 2041595387-5387 (US 38212) (O).

4201. The November 6, 1986 "Marlboro Review" included the following as part of the Philip Morris overall "Five Year Challenge": "**Increase share of new smokers**," "Retain current smokers," and "Develop targeted marketing tactics." The review recommended that Philip Morris "[e]xpand [the] Marlboro franchise into the mainstream menthol category" with a "target audience" of the "**new smoker**." To accomplish these goals, the review recommended: "[d]iagnostic consumer research to further assess positioning/advertising . . . [and] [i]nterviews with young smokers to determine potential appeal." 2045409872-9911 at 9890, 9906, 9908 (US 26949) (O) (emphasis added).

[This space is intentionally blank, as a result of substituting ¶4201 (above), submitted with The United States' Notice of Errata to United States' Proposed Findings of Fact," filed on August 16, 2005, to remove references to Bates page numbers 2045409912-9920 in US 26949.]

4202. A 1987 Philip Morris document entitled "Parliament Brand Plan Executive Summary" recommended a shift of focus to a younger demographic target because "strategically, if Parliament is to stabilize and grow over the long term, we must pick up younger smokers. Fortunately, we have reason to be optimistic about our ability to appeal to younger smokers. . . .

To target the 18-24 males and females, our retail focus will be on pack outlets (52% of smokers in this age group buy the pack compared to 30% of all smokers) and will be trial/conversion oriented. This younger age group is more likely to make decisions based on peer pressure. To convey the idea that everyone is smoking Parliament, the brand should have continuous high levels of visibility in as many pack outlets as possible." One question for research was: "Who are the 18-24 year old male and female Parliament smokers? Why do they smoke Parliament (taste, filter, advertising, peer pressure)?" 2045287048-7092 at 7061, 7063, 7064 (US 38407) (A).

4203. An August 1987 Philip Morris document stated that Marlboro, Benson & Hedges, and Virginia Slims events, like Marlboro Auto Racing, had been "highly successful in creating brand awareness and generating positive publicity." 2044732959-2963 at 2959 (US 21754) (O).

4204. An August 19, 1987 inter-office memorandum from Nancy E. Brennan (now Lund), current Senior Vice President for Marketing at Philip Morris, to David E.R. Dangoor, Executive Vice President at Philip Morris, summarized "Key Marlboro Issues." According to Brennan, "**The life blood of the Red franchise is new, young (male) smokers**. In this regard, several demographic and industry factors are working against us: 1) a shrinking population of young adults, 2) a lower incidence of smoking among young adults and, 3) an increasing percentage of new smokers entering the market with a low tar cigarette." In order to maximize share, Marlboro should "**[s]eek ways to display Marlboro continually in the convenience stores to fully capitalize on new smoker trial** and reduce temporary 'defection' . . . . **For Marlboro, the most critical retail visibility is displayed product. Currently, the Brand does not have continuous leadership display presence in pack or carton outlets. This should be our first priority. We are missing trial opportunities**." 2045305938-5942 at 5938, 5939, 5941 (US 26948) (O) (emphasis added). As is demonstrated by many documents cited supra,

Philip Morris increasingly emphasized visibility at the point of sale in the 1990s, an emphasis that has continued through the present day.

4205. Roy Anise, a manager in the Philip Morris Market Research Department, drafted a February 1, 1988 report addressed to Jon Zoler which noted that Philip Morris had reviewed the decreasing smoking incidence among high school seniors to determine if it was a cause of declining smoking rates of military personnel. Anise's report cited Myron E. Johnston's 1985 report entitled "Source Trends in Smoking Among High School Seniors" which stated that "[h]istorically about half of all people . . . who ever smoked have been smokers by the age of 18." 2042078401-8405 at 8404 (US 20442) (O); 2022214369-4395 at 4369 (US 20357) (O).

4206. A March 1988 Industry Review for Philip Morris included a section entitled "Smoking Among High School Seniors," which contained charts tracking, among other things, total cigarettes smoked by high school seniors and the race and gender of those seniors who smoked. The review did not distinguish between those high school seniors aged 18 and those 17 or younger. 2073001682-1738 at 1695-1700 (US 24647*) (O).

4207. Myron Johnston authored a March 17, 1988 memorandum addressed to Jon Zoler entitled "Smoking Among High School Seniors" in which he stated that, "I am even more confident than before that we can use the data on high school seniors to predict trends in smoking among young adults." 2042329558-9566 at 9561 (US 20443) (O).

4208. An April 5, 1988 letter from Elizabeth H. Reiman, Leo Burnett employee, addressed to Nancy Brennan Lund, now Senior Vice President for Marketing at Philip Morris, provided "details regarding the upcoming Camel qualitative study" and stated that "[r]ecent strong Camel performance, especially among the young male target, has resulted in an effort to explain that success and determine the potential threat to Marlboro." The letter indicated that

respondents for this study were to be "recruited among 18-24 year old smokers." 2045471014-1015 at 1014 (US 20461) (O).

4209. A June 20, 1988 memorandum on Philip Morris USA letterhead from consumer researcher Jan Jones to Ed Gee, Director of Consumer Research at Philip Morris, entitled "Statement of Position on the Social Pressures Construct" stated: "**We already have Marlboro as the brand of choice for young smokers entering the market**." 2050801835-1853 at 1845 (US 38763) (A) (emphasis added).

4210. A September 26, 1988 inter-office memorandum written by Carolyn Levy, then Philip Morris Assistant Director of Consumer Research, and sent to David Dangoor, Executive Vice President, outlined issues to research in 1989, including: "**Can we gain a better understanding of young smokers? What are their personality traits, beliefs, values, lifestyles? What are the marketing implications of these findings?**" 2080009511-9515 at 9511 (US 20535) (A) (emphasis added); see also 20080009516-9522 (US 88155) (A); 20080009523-9529 (US 88156) (A).

4211. A Philip Morris report entitled "Starter Profile and Their Regular Brands" provided data from 1989 to 1991 for "starters" who were "under 25." The report stated that in 1989, 82% of total "starters" were under the age of 25. 2504018410-8423 at 8411 (US 27965) (O); 2504018424-8429 (US 27966) (O).

4212. Philip Morris's 1989 Proposed Budget earmarked $80,000 to "Understand the Group Dynamics of Smoking Behavior and Brand Choice" including "entry brand choice." 2060393130-3189 at 3145 (US 20504) (O).

4213. A "Schedule of Product Placement 1987-1989," apparently drafted in 1989, listed a number of movies in which Philip Morris cigarettes and other products, such as neon cigarette

advertising signs, were supplied to movie studios for product placement in fil This list included such movies as "Disorderlies," "Robocop," "Tapeheads," "K-9," "Crocodile Dundee," and "Who Framed Roger Rabbit." 2025863632-3635 (US 20420) (O).

4214. On February 24, 1989, John A. Kochevar, Vice President Corporate Affairs at Philip Morris wrote to Representative Thomas A. Luken, detailing the product placement of Philip Morris cigarettes and marketing materials in movies from 1979 to 1989. Kochevar wrote: "During the preceding 10 years, when approached by filmmakers, Philip Morris U.S.A. has occasionally provided free cigarettes and promotional materials such as brand name signs, and in a few instances, apparel promoting the film. On such occasions, the script for the film in question has provided for one or more scenes in which smoking or related products were to be depicted." According to Kochevar, during that ten year period, Philip Morris "employ[ed] independent film industry consultants to review scripts submitted by movie producers and script writers and to advise us" and "provided signage and cigarettes for an average of 17 films per year," as well as making a $5,000 contribution to the Sylvester Stallone Fund for Autism. 2025863700-3702 at 3700-3701 (US 87790) (O).

4215. In a May 18, 1989 letter to Representative Luken, Kochevar admitted that Philip Morris had provided cigarettes and period cigarette advertising signs for "Who Framed Roger Rabbit" in 1988, and had provided cigarettes for "Crocodile Dundee" in 1986. 2023326334-6340 at 6339-6340 (US 20387) (O).

4216. A May 12, 1989 Philip Morris document entitled "Marlboro Brand Review" contained a discussion of Marlboro issues, performance, and strategy: "Major strategic shifts are not recommended for Marlboro. Our plans, in fact, have become even more focused on appealing to the core young adult male user and reinforcing our strong male, full flavor brand

image. Further, Marlboro's position against competitive threats will be offensive not defensive." Regarding the threat of Camel, the document stated: "Camel has perhaps the strongest flavor, most male image of any cigarette in the industry. This equity is being effectively leveraged with the bold, young 'smokin' Joe' advertising and promotion effort, an effort which taps directly into the young male headset – have fun, get wild, and be macho. **The campaign limitation may be that it can't support the franchise as it ages because the message is so young**." To meet Camel's threat, the document discussed a potential new advertising campaign, in addition to the traditional Marlboro advertisements, which would be "designed to appeal specifically to the young, adult male; ads which are strong in subject and tonality thereby reinforcing our core position." 2025871433-1506 at 1434, 1438, 1440 (US 22054) (O) (emphasis added).

4217. Leo Burnett prepared a September 22, 1989 report for Philip Morris entitled "Young Adult Smoker Target: An In-Depth Look" which examined the values and goals of the 18-24 year old age group who are "now key to PM (Philip Morris) target," and described the "young adult smoker" as a "**moving target in transition from adolescence to young adulthood**." 2048677983-8044 at 7984-85, 7987, 7994, 8037 (US 22336) (A) (emphasis added). Although Michael Mahan, Vice President for Marketing and Sales of the Asia Pacific Region for Philip Morris, testified he assumed, based upon the terminology "young adult smokers," that this document only meant 18 to 24 year olds, Mahan admitted that "adolescents" are 13, 15, 16, and 17 year-olds. Mahan PD, United States v. Philip Morris, 5/31/02, 89-91.

4218. In internal Philip Morris correspondence dated October 25, 1989 from Cathy Lieber, Philip Morris Manager of Promotions, to David Dangoor, Executive Vice President, Lieber wrote: "[W]e are naturally more interested to learn how you plan to target the emerging young adult female smokers rather than the older female smokers." 2504034812-4813 at 4812

(US 20570) (O).

4219. The "Philip Morris USA R&D Strategic Plan, 1991-1995," written in 1990, stated: "A review of Marlboro demographics is also a review of the 18-25 year old age group. . . . [I]n 1989, Marlboro's share of that smoker group was in excess of 60%. The brand's strength since 1977 has been in that age group. . . . **[T]he continued success of this brand depends on keeping its age profile young. This fact then would say that we do not want Marlboro or the Marlboro image to be old. Its success through the years have been its ability to attract the entry smoker.**" 2026230097-0713 at 0211 (US 20423) (A) (emphasis added).

4220. A Philip Morris presentation entitled "Reasons for Considering Camel as a Serious Competitor," apparently drafted in 1990 or 1991, stated that "Camel is becoming younger." The presentation cited market share statistics showing "in the past three years, Camel's share of adult college smokers almost doubled" and named Camel's growth among youth as the key reason Camel had to be taken seriously. 2043982154-2167 at 2155, 2159 (US 20452*) (O).

4221. A report dated August 7, 1990 entitled "New Brand Opportunities in the Cigarette Industry" was written for Philip Morris by Gibbons, Voyer & Associates. The report found that 17-19 year olds comprise 18.9% of smokers. It stated "Marlboro dominates young adult smoker market: initial exposure, peer pressure, meets image wants." It recommended that any marketing approach "insure that Philip [Morris] has a brand entry to meet the various wants of young adult smokers: image, product, price." 2049397333-7369 at 7343, 7348, 7350 (US 20486) (A).

4222. Jeanne Bonhomme, Manager of Consumer Research at Philip Morris, and Karen Eisen, a marketing researcher at Philip Morris, wrote a February 6, 1991 memorandum to James Taylor, Brand Manager, New Products at Philip Morris, entitled "Marlboro/Camel Consumer Research" which discussed research comparing the advertising and images of Camel and

Marlboro among 18 to 24 year old male Marlboro and Camel smokers. Respondents were asked whether various descriptive statements fit the Marlboro Man and Joe Camel, including whether these characters were "[r]ugged and [m]acho," "independent," "rebellious," "cool/hip," and whether they were someone that "I'd be friends with." When asked what the Marlboro slogan "Come to Marlboro Country" means, most respondents responded that it meant to "smoke/try/switch" to Marlboro. 2045732054-2074 at 2054, 2057-2058 (US 20465) (A).

4223. An April 29, 1991 speech given by Carolyn Levy, then Director of Philip Morris Consumer Research, discussed the marketing research conducted on Marlboro Medium, a Marlboro extension created in order to compete with the market success of Camel. 2044957040-7047 (US 85183) (A).

4224. Handwritten notes taken by Levy dated May 2, 1991 related to a Philip Morris project researching consumers' thoughts about cigarettes. Levy's notes stated: "Smoking is a social ritual which enables us to express and reaffirm our self-image by reactivating the **initiation into adulthood**. This taboo is for you, Playing with fire, Forbidden fruit, U.B.U., Badge of honor, It hurts so good, Dare to be me, The rite to be me." 2062145828-5833 at 5828, 5833 (US 85184) (A) (emphasis added). In her testimony at trial regarding this document, Levy acknowledged that "Philip Morris knows that cigarettes are one of the things that adolescents use in their transition from childhood to adulthood," based both on this research and on published literature. Levy WD, 50:2-51:21.

4225. The "Philip Morris Draft Marketing Plan (1992-1996)" stated: "To sustain growth during the plan, Marlboro must maintain its strength among young adult smokers." 2021508238-8284 at 8239 (US 20347) (A).

4226. During a 1992 presentation to analysts regarding Philip Morris's 1993 plans,

Michael Szymanczyk, then Senior Vice President of Sales at Philip Morris, stated: "To protect our premium volume we plan to continue focusing our marketing and retail sales efforts on Marlboro. Its younger smoker base and ability to retain its smokers mean that its profit stream has a longer time horizon than any other brand in the industry." Szymanczyk also stated that, "The average age of adults who smoke our brands is seven years younger than the average age of our competitors' smokers." 2046569094-9117 at 9105, 9115 (US 20470*) (O).

4227. "The Viability of the Marlboro Man Among the 18-24 Segment" dated March 1992, prepared by Bruce Eckman, Inc. for Philip Morris, made recommendations for Marlboro advertising in light of Camel's success. Eckman recommended that "to reduce the effectiveness of the Camel advertising with the 18-24 segment, Marlboro should consider: a) capitalizing on the strength of being the number one brand; make the users feel that they belong to a special group of smokers through point of sale which reinforces being number one; b) increasing the breadth and variety of the Marlboro Man advertising campaign without sacrificing the strength of his integrity[:] 1) show him not only at work, but also at leisure, . . . 2) show him enjoying the benefits of his chosen path, . . . 3) show him in charge . . . and desirable in magazines where he could be pictured with a woman, . . . 4) consider using a copy line to direct the visuals, [and] . . . make him more accessible and less removed." 2045060177-0203 at 0178, 0180 (US 20459) (A).

4228. In an April 1992 presentation to the Board of Directors, David Dangoor, Senior Vice President of Marketing at Philip Morris International, explained how the race car drivers pictured in Marlboro advertisements represented a "contemporized" and "relevant" Marlboro man:

> We are in constant search for more contemporary ways to convey the 'west' with more appeal to young adult smokers. Auto racing is one such avenue. Our drivers symbolize the modern day cowboy and the advertising support creates more relevance for today's

> consumer. . . . Marlboro's positioning remains strong and relevant. Its advertising whilst effective, needs careful attention to maintain its appeal to young adult smokers. We must continue to compete effectively at retail with more image enhancing promotions.

2045068451-8470 at 8456, 8460 (US 23931) (O).

4229. Philip Morris's "Marlboro Brand Review" dated April 12, 1992 analyzed Marlboro's past share growth and predicted future patterns. The document stated that, while Marlboro Red King Size and Marlboro Lights King Size had shown steady growth from 1989 to 1992, this growth "has not however compensated for the loss from the Red parent brand" which showed declining sales. The document discussed marketing strategies aimed at a key type of Marlboro consumer, the CHIMP, defined as 18-24 year olds who are "young, self-confident, socially-active." 2501081089-1104 at 1093, 1094 (US 20560*) (O).

4230. A document entitled "PM USA Business Update" dated October 8, 1992 stated that Philip Morris "faces two significant negative trends. The growth in discount cigarettes is reducing our premium sales and we are not obtaining our historic share of entry-level adult smokers." In order to "[a]ssure PM USA's long term prospects by obtaining our historic share amongst entry-level adult smokers," Philip Morris must:

> Contemporize all Marlboro creative with more arresting promotional advertising like Adventure Team and racing; Develop the Marlboro Adventure Team and similar high quality continuity programs into long term affordable promotion in C-stores [convenience stores]; Reinvigorate Marlboro Medium with stronger and more relevant advertising; Develop an alternate mainline campaign to Marlboro Country/Cowboy; [and] Relaunch Bucks, including a lower priced box, with an irreverent advertising campaign meaningful to the young adult smoker.

2046569728-9731 at 9728, 9729-9730 (US 20471) (A).

4231. A December 1992 Philip Morris document entitled "Motorsports Sponsorship Marketing Review" discussed the marketing of Marlboro to 18 to 25 year olds. The document

stated: "Motorsports Overall Objectives . . . To look at current and new program opportunities to extend our reach with starters and young adult smokers . . . . Formula 1 Marketing Strategy – Media: Focus on TV, cinema, and innovative outdoor campaigns; explore new programming, eg., MTV." As discussed above, racing-themed promotion was one marketing tool recommended in the October 8, 1992 "PM USA Business Update" to obtain Philip Morris's "historic share amongst entry-level adult smokers." 2501058650-8680 at 8658, 8667 (US 21702) (A); 204656728-9731 at 9728-9729 (US 20471) (A).

4232. According to the "Philip Morris USA 1994-1998 Plan Overview," Marlboro had approximately a 60% market share among young adult smokers in 1993, and Philip Morris understood that "Marlboro's favorable demographics are the key to long term growth." This share of young smokers was disproportionate to Marlboro's overall market share of 42%. 2071032180-2206 at 2181, 2185, 2187 (US 21964) (O).

4233. A July 1993 report entitled "Marlboro Adventure Team Image Study" showed that Philip Morris was pursuing the Marlboro Adventure Team promotion, which was one marketing tool recommended in the October 8, 1992 "PM USA Business Update" to obtain Philip Morris's "historic share amongst entry-level adult smokers." 204656728-9731 at 9728-9729 (US 20471) (A).

4234. During a March 26, 1993 speech, Michael Szymanczyk, then Senior Vice President of Sales at Philip Morris, stated, "The fact that there is not a clear discount brand leader among 18 to 24 year old smokers suggests that whoever catches these smokers may be able to retain them over a longer period of time." Szymanczyk further stated that "**we have to maintain our 60 share of young adult smokers, since we know that they are our future**." 2023771556-1604 at 1587-1588, 1603 (US 20395) (O) (emphasis added).

4235. A document entitled "Worldwide Marlboro Monitor: Five Year Trends 1988-1992," written in April 1993 and produced from the files of Philip Morris's Marketing Research Department, stated: "In markets where Marlboro Red's share of young adult smokers has declined, **share of starters was also down. Thus, the ability to attract new smokers and develop them into a young adult franchise is key to brand development**. . . . **Longer-term brand development depends more on a growing share of starters translating into a strong franchise of young adult smokers**. . . . If the young adult smoker franchise is not growing, the brand profile ages over time, which means a smaller proportion of its smokers are in the prime target. As a result, the brand is less visible and impactful among our target smokers and their peer group." 2044895379-5484 at 5389 (US 85185) (A) (emphasis added).

4236. On April 2, 1993, Philip Morris cut the price of the world's best-selling cigarette – Marlboro – by almost 20%. This dramatic price cut came to be known as "Marlboro Friday." Marlboro Friday successfully ended the price war that "discount" (cheaper) brands had been waging on the "premium" brands such as Marlboro. Prior to Marlboro Friday, Marlboro's share of the United States cigarette market, once around 30%, had fallen to 22%. Philip Morris, like the other Cigarette Company Defendants, had responded to the gradually falling volume of cigarette consumption in the 1980s and early 1990s by pushing up prices to maintain profits. Manufacturers of generic cigarettes had held down prices to maintain volume. The widening gap between premium and generic products had been filled by low cost brands. However, Marlboro Friday halted the growth of the discount brand market. By 1994, due to the significantly lower cigarette prices resulting from Marlboro Friday's sharp reductions of the wholesale prices of premium cigarettes, total cigarette consumption stabilized – a reversal of the previous ten consecutive years' of decline. By 1995, Marlboro had regained its lost market share, and

premium and generic prices were rising together. 520879974-9977 (US 87761) (O); Chaloupka WD, 86:6-87:13.

4237. Szymanczyk stated in a speech to Equipment Manufacturers in October 1993: "Marlboro's age profile reveals a brand that has a higher share among each successively younger adult age group. Its share of adult smokers under age 25 is greater than the combined share of all other brands, premium or discount." 2062331315-1324 at 1322 (US 20510) (O).

4238. Philip Morris's "1994-1998 Plan Overview," apparently drafted in 1993, stated that Philip Morris's primary goal was "to deliver predictable IFO growth, cash flow and share growth." The document stated: "Marlboro has over a 60% share of young adult smokers. Its share of the young adult smokers coupled with its ability to retain the loyalty of smokers as they age are Marlboro's largest assets and the foundation of its growth." 2071030043A-0068 at 0043A, 0050 (US 20520) (A).

4239. In 1994, Bob P. Roper, International Vice President of Marketing for Philip Morris, forwarded to Geoffrey Bible, President and Chief Executive Officer of Philip Morris Companies, notes from the Marlboro summit in Monaco. The notes summarized the "key conclusions of our worldwide review of the issues facing Marlboro" and stated: "Generally speaking in Asia, the full flavour segment is declining. . . . Despite that, **Marlboro Red's share of young adults and beginners is up everywhere which is encouraging.**" 2048237361-7370 at 7361, 7366 (US 21987) (O) (emphasis added).

4240. Jeanne Eiban and Linda Schwartz, both in Philip Morris's Direct Marketing Group, sent an inter-office memorandum dated February 9, 1994 to Roy Anise, a Manager in the Philip Morris Market Research Department, proposing "heavy-up name generation options in Region 5 " because of the paucity of information regarding that Region's 21-25 year olds in

Philip Morris's database. The memorandum stated that "Marlboro's goal is to maximize the number of YAM/YAF [Young Adult Male/Young Adult Female] smoker contacts in this geography, and subsequently follow-up with branded direct mail packages to these smokers in order to establish an on-going line of communication." 2061808612-8620 at 8612 (US 20508) (O).

4241. On March 19, 1994, advertising agency Leo Burnett held an internal meeting called "Camp Marlboro" to discuss Leo Burnett's performance on Philip Morris and Philip Morris International business. Geoffrey Bible, Atria's CEO, gave a speech at Camp Marlboro in which he told Leo Burnett that they were the "guardians of Marlboro, working with PM senior management." At Camp Marlboro, Bible indicated that Leo Burnett should "Leverage core values which are attractive to YAMS by portraiting [sic] the full breath [sic] of Marlboro country: Masculinity, Freedom, Limitless Opportunity, Self-sufficiency, Mastery of destiny, Harmony with Nature." After Camp Marlboro, Karen Green, Leo Burnett Planning Director and Senior Team Member, wrote a "Summary of Findings" which indicated that the "**Marlboro brand strengths**" included "**No. 1 brand among starters/**YAS, Brazil, Latin America, **USA**." "Starters" is a term used for those who are starting to smoke, who are most often underage. Dudreck PD, United States v. Philip Morris, 6/21/02, 83:9-107:19; LB0058147-8186 at 8176, 8185 (US 22070) (O) (emphasis added).

4242. The March 24, 1994 plan for Philip Morris's Chesterfield brand prepared by Young & Rubicam for Philip Morris stated: "Smoking enthusiasm is firmly grounded in the emotional connection . . . **[t]he emotional connection – adventure, living on the edge – is the deep basis for category attraction** . . . [l]ater, more rational issues may counterbalance this attraction." Moreover, the plan stated: "Significant choice moments in cigarette smoking tend to

coincide with critical transition stages in life. . . . **Choice of a 'starter' brand [coincides with] [y]outhful conformity/rebellion**." 2500086977-7024 at 6983, 6984 (US 27908) (A) (emphasis added).

4243. The 1994 Revised Marlboro Media Plan dated May 20, 1994, stated that an objective is "to find the most effective and efficient balance of media which reinforce/build brand image among key YAS 21-24." 2060331504-1687 at 1523 (US 20503) (A).

4244. The Philip Morris Continuous Consumer Tracking Survey (also called "Continuous Tracking Survey") is a telephone survey commissioned by Philip Morris and performed by its various market research suppliers. It is an ongoing survey that Philip Morris has conducted since approximately 1980. Until 1988, the survey was conducted approximately twice per year. In approximately 1988, on the recommendation of Carolyn Levy, director of the department handling the survey, the data collection methodology was modified to become a "continuous" study in order to avoid "gaps" in information. The method of calling is a "random digit dialing" procedure, where surveyors call people who claim to be adult smokers and ask them questions about their cigarette brand preferences and their buying behavior. According to Levy's testimony at her June 23, 1998 deposition, "[H]istorically, and we continue to this day, our method is to go for the youngest male who is at home. So the idea was you select the youngest male adult smoker in the household who's home at the time. . . . We try to go to the hardest to find first [the youngest male] if they are there." Questions asked include: the promotions they may have seen or purchased; the cigarette brands they have purchased in the last week; the type of store at which they purchase cigarettes; whether they are saving Marlboro Miles; their knowledge of certain brand images; promotion and advertising awareness; and the number and ages of all smokers in the household. Levy PD, California v. Philip Morris, 6/23/98,

18:18-30:12; Levy WD, 17:18-20:15, 27:2-28:19, 41:7-43:18, 48:4-51:21.

4245. Philip Morris has conducted extensive consumer research to help inform and shape marketing campaigns that appeal to their youngest potential smokers. For example, by its continuous smoker tracking survey in November 1994: (1) Philip Morris determined that Marlboro and Camel are the leading non-menthol brands for male smokers ages 18 through 24; (2) Philip Morris examined the lifestyles and attitudes of 18-24 year old male smokers to explain their brand choices, including their leisure time activities (e.g., hanging out with friends, keeping car looking good, talking on the phone with friends, going to bars or rock concerts), social circles, attitudes about smoking, brand image, and their aspirations and objectives; (3) Philip Morris profiled male Marlboro smokers between the ages of 18 and 24 and compared them with the profiles of Camel male smokers of the same age; (4) Philip Morris determined the Marlboro Brand image among 18 to 24 year old males included: cool, outgoing, popular, outdoorsy, adventurous, and independent; (5) Philip Morris's profile of an 18 to 24 year old male Marlboro smoker was a relaxed smoker who feels unpressured; (6) Philip Morris determined that, unlike Marlboro smokers, Camel smokers were attracted by the individuality of their brand (and the advertising packaging); (7) Philip Morris researched the size of its smoker base and determined that Marlboro male smokers age 18 to 24 made a disproportionately high contribution to Marlboro's total volume comprising 7 million smokers, and accounting for one in five of Philip Morris's total smokers; and (8) Philip Morris determined that smokers 18 to 19 shared a similar racial make-up and that 86% were white males who smoked Marlboro Red. 2048735500-5604 at 5501, 5505, 5508, 5518, 5531-5541, 5543, 5547, 5555 (US 21971) (A).

4246. A report dated November 1994 entitled "Profile of the Young Adult Marlboro Smoker" indicated that in Marlboro Ultra Lights test markets, Philip Morris conducted research

among 18 to 21 year olds to determine whether the test marketing of Marlboro Ultra Lights was affecting the brand image of Marlboro Red and Marlboro Lights. The report found that Marlboro Ultra Lights remained a minority brand in 1994 but was becoming more mainstream. It also found that Marlboro Ultra Lights offered an alternative for young males who were currently smoking Camel, who it profiled as needing to stand out and be different. 2048735500-5604 at 5565-5604, 5563-5564 (US 21971) (A).

4247. On November 29, 1994, Shari Teitelbaum, Director of Marketing and Sales Decision Support for Philip Morris, wrote an internal draft memorandum to Karen Chaikin, Manager of Trade and Business Programs, that summarized and attached the research results of the "Ohio Retailers Study." This memorandum showed Philip Morris's knowledge that underage purchase of cigarettes is frequent. In the memorandum, Teitelbaum concluded from the results reported in an attached table: "It appears that minors attempting to buy cigarettes happen on a fairly regular basis. Approximately 85 percent of retailers say that minors under the age of 18 attempt to purchase cigarettes in their store at least once a day. Of these, more than half say this happens at least three to four times a day, including 16 percent saying this happens ten times a day." This conclusion and the corresponding table were omitted from the final version of the memorandum and attachment, which were sent on December 9, 1994. 2046828693-8693 (US 21802) (O); 2046828694-8697 (US 21803) (O); 2046828612-8615 at 8612 (US 20479) (O) (emphasis in original).

4248. A document entitled "Proposed Script for Marlboro Story," apparently drafted in 1995, traced the development of Marlboro advertising themes from the Marlboro Man to the Marlboro Racing Team and Marlboro Adventure Team. The document indicated that the Marlboro Man represented independence and rugged independence, whereas the promotional

events Marlboro Racing Team and the Marlboro Adventure Team used themes of freedom and adventure. As discussed above, the Marlboro Adventure Team promotion was one marketing tool recommended in the October 8, 1992 "PM USA Business Update" to obtain Philip Morris's "historic share amongst entry-level adult smokers." 2071349278-9281 (US 20526) (A); 2046569728-9731 at 9728-9729 (US 20471) (A).

4249. Philip Morris opposed bans or limitations on self-service display advertising at retail stores which would limit the availability and visibility of their cigarette brands at retail. A Philip Morris document produced from the files of Joshua Slavitt, Director of Policy & Programs for Tobacco, Philip Morris Management Corporation, written in or after 1995, provided talking points in "Opposition to Ban on Slotting Allowances": "Self-service display advertising is an effective means to enhance awareness and encourage loyalty at the point-of-purchase for individual brands among adult smokers. Cigarette racks and promotional displays are positioned to help generate greater visibility and accessibility for adult smokers' favorite brands." 2063018737-8739 at 8737 (US 85164) (O).

4250. In 1995 Philip Morris tracked the smoking preferences of college students through an analysis of College Scan 1995, a telephone study conducted among 3,000 full time college students 18+ years of age in Spring 1995. The Philip Morris analysis stated that "Marlboro's share reached an all-time high (61.4%) in 1995, Camel's share continued to decline, and college smoking incidence . . . historically low, appeared to be stabilizing at about 14%." The analysis also concluded:

> Philip Morris's share of adult college smokers (69.3%) is up in 1995 (+5.3%). The gain is traceable mainly to Marlboro and Parliament. . . . Among full time college students, RJR's share has been declining since the price reduction of Marlboro Friday in 1993. . . . Together, Marlboro and Camel comprise 80.2% of the college market. . . . Marlboro's growth has come largely at the

> expense of Camel and Salem. . . . Marlboro has reached all time highs among . . . 18-19 and 20-23 year old adult full time college students. . . . Camel has declined among . . . 18-19 and 20-23 year old full-time college students.

2040171445-1455 at 1445, 1446 (US 37478*) (O).

4251. Susan Norris, a fifteen-year Philip Morris employee, testified in this case that during her tenure as a Brand Manager for Marlboro from 1995-1999 she attended "at least one presentation" on Generation X regarding "attitudes, lifestyles, trend, trend changes, trend forecasts as it relates to young adults. I assume younger adults." Norris testified that the presentation was either given by the Philip Morris consumer research department or an outside consumer research department brought in by Philip Morris. Norris testified that the presentation was attended by Philip Morris marketers and employees from the consumer research department. Norris further testified that she attended the presentation because "to the extent that I was working on Marlboro programs or new products, I needed to understand what young adults were thinking. So certainly that would have been important for general knowledge as a marketer." Norris testified that she was unaware of what age groups Generation X encompassed at the time she attended the presentation. Norris PD, United States v. Philip Morris, 7/31/03, 254:12-257:8.

4252. Nancy Lund, Senior Vice President of Marketing at Philip Morris, testified about a study entitled "Metro Area Consumer Retail Study." This study, apparently drafted in the 1990s, was performed by Philip Morris to learn where it should place Philip Morris cigarette products in retail stores to ensure that its products drew the maximum amount of consumer attention. As part of the study, consumers wore eye-tracking glasses while shopping so that researchers could track their eye movements to learn what displays and products drew the most consumer attention in retail outlets. The study found that the best, most visible, point of sale spots were "on the counter, behind the counter or cashier, and on and around the door."

Currently Philip Morris's cigarette displays are consolidated behind the counter at retail outlets, and its point of sale materials are similarly placed. The study also reported that stores that operated under Philip Morris's retail program – Retail Masters stores – provided higher visibility for Marlboro than other cigarette brands. Lund PD, United States v. Philip Morris, 6/27/02, 200:25-203:15; 2073194491-4524 at 4492, 4494 (US 42869) (A).

4253. A February 1, 1995 letter on Leo Burnett letterhead from Esther Terrell Franklin, then researcher for Leo Burnett, addressed to Susan Norris, Marlboro Brand Manager from 1995-1999, delivered an attached study entitled "Insight: A Look at Today's Young Adults." In the letter, Franklin wrote: "*InSight* is part of a larger project, Young Adult Trend Track, initiated by the Philip Morris research group. The purpose of this project is to keep the entire Philip Morris team abreast of the current lifestyles of young adult consumers." Under the heading "Notes from the Editor," Franklin, listed as Editor-In-Chief, explained the purpose of the project: "[t]his booklet (and the editions which will follow) will help you gain a clearer understanding of [Generation X], by giving you a sense of their hearts, their minds, their souls. And by beginning to better comprehend the young adult mindset, advertising to this segment can be truly inviting, impactful and influential." Half of the study's participants were non-smokers. At her July 31, 2003 deposition in this case, Norris was unable to identify what age groups Generation X encompassed in 1995 when she received the study. 2041601887-1931 at 1888, 1889, 1891 (US 38213) (O); Norris PD, United States v. Philip Morris, 7/31/03, 238:25-250:6.

4254. A presentation dated May 1995 bearing Philip Morris and Young & Rubicam insignias entitled "'Creative Frame' Discussion Guide for 1996 Creative Direction" depicted the dynamics involved in smokers' cigarette brand switching over the course of their lives. Under the heading "Understanding the 'Breakaway Brand' Window of Opportunity - Choice Dynamics

Evolution," the presentation stated that "significant choice moments in cigarette smoking tend to coincide with *critical transition stages in life*." The document listed the following life transition stages:

Choice of a 'starter' brand	----->	Youthful conformity/rebellion
'Breakaway' brand	----->	Early maturation: individuation and self-assertion
Choice of 'mature' brand(s)	----->	Later maturation: self management/trade-offs

The document reported that choice dynamics are determined by four factors, which were depicted as three quadrants divided by the following: "Group Identity" and "My Identity" from left to right and "Smoking Enthusiasm" and "Smoking Compromise" from top to bottom. Handwritten notes on the document described the representation as a "Consumer Lifecycle" and noted that "can be analogized to product life-cycle." Describing smokers characterized by the upper left quadrant of "Group Identity" and "Smoking Enthusiasm," the document stated: "Issue: Rebellion/Conformity," "Smoking involved," "Attracted to category center of gravity," and "Preoccupied with peer approval." This quadrant was identified as the transition stage in which consumers choose a "Starter Brand" 2071443747-3788, 3749, 3767, 3768-3772 (US 40459) (O) (emphasis in original).

4255. In 1995, Philip Morris decided to attempt to expand its Virginia Slims target audience, previously age 25-44, to include younger women aged 18 and older. As the series of research reports below demonstrate, Philip Morris conducted marketing research itself and also contracted with third parties for research on women 18 plus. The "Regional Analysis of 18-29 Year Old Women," conducted by Roper Starch for Philip Morris, described the new target group

as having the "psychographics" of being in transition to becoming independent, getting their first real job, moving away from home, finishing school, and establishing themselves as individuals. 2045812333-2387 (US 38490) (A). Focus group research on women age 18 to 24 conducted for Philip Morris explored whether an attitude of independence would appeal to these women. 2063684453-4480 (US 39819) (A). A Roper Starch Report prepared for Philip Morris USA dated June 1995 entitled "You've Come A Long Way Baby, But Where Are You Going Now?" analyzed the behavior and attitudes of 18-29 year old females. 2045812333-2387 (US 38490) (A). A June 29, 1995 memorandum from Suzanne LeVan, Vice President of Premium Brands, discussed attracting these younger smokers from the brands they currently smoked, Marlboro, Winston, and Camel. 2063684304-4306 (US 70272) (O). To effectively reach these smokers, Philip Morris conducted qualitative research "to understand the attitudes that are relevant to switching from a . . . herd brand to a non-herd brand and to . . . explore both product and imagery associated with those two categories of brands and to provide input on new product concepts that might be available for Virginia Sli" LeVan PD, United States v. Philip Morris, 6/25/02 148:12-18; see also 2063684338-4340 (US 39817) (O).

4256. On June 23, 1995, Nancy Lund wrote a memorandum to Marian Wood, a Philip Morris research analyst, forwarding and summarizing a report from Marketing Perceptions, a marketing research contractor for Philip Morris, entitled "Marlboro Women." Marketing Perception had undertaken a qualitative research study in June 1995 to determine how female Marlboro smokers perceive the Marlboro brand image. The results of the research study showed that Marlboro successfully conveyed an aggressive, bold, adventurous, independent, and confident image. This study also concluded that the continuity programs reinforced this Marlboro brand imagery. 2071580565-0566 at 0565-0566 (US 20528) (O); 2071580567-0605 at

0596, 0601-0605 (US 40489) (O).

4257. A July 1995 Qualitative Research Report prepared for Philip Morris entitled "'Settled' Women's Issues" sought "[t]o understand changes in lifestyle or attitudes which may prompt switching from a 'herd' brand to a 'non-herd' brand." The study found that "many herd brand smokers admitted that their brand selection was based on the overall 'popularity' of the brand and its acceptance by peers." "Herd brand" is a term used at Philip Morris for the few brands such as Marlboro, Camel, and Newport that are selected by the majority of teenagers when they begin to smoke. 2063684341-4371 at 4342, 4344 (US 39818) (A); see also 2072047214-7216 (US 24585) (O) (referring to "herd" brand smokers).

4258. Using this research, Philip Morris designed a new campaign "It's a Woman Thing" and a bar program aimed at women aged 18 and older; this campaign was launched after June 1995 and successfully increased Virginia Slims's share of women ages 18 to 24. A set of talking points for a presentation given by CEO Michael Szymanczyk in late 1998 or early 1999 referred to Virginia Slims's growth of market share among women 18 to 24 in 1997 or 1998 and stated: "Virginia Slims growth among women 18 to 24 years old driven by new 'It's a Woman Thing' campaign and 'Dueling Diva's' bar program." 2070672027-2027 (US 85189) (O); LeVan PD, United States v. Philip Morris, 6/25/02, 176:9-178:12.

4259. A July 5, 1995 Philip Morris internal memorandum from Jay Schwartz, a senior analyst in Philip Morris's Consumer Research Department, regarding "College Scan - Spring 1995" and was sent to various Philip Morris employees, among them Suzanne LeVan, Vice President of Marlboro. The memorandum stated that College Scan, a nationally projectable telephone study of college students age 18 plus regarding their smoking habits, incidence rates, and brand choices, was conducted during April and May of 1995. 2040171445-1455 at 1445

(US 37478*) (O), 1/10/05 (LeVan). While discussing the "College Scan" document, LeVan testified that she agreed with the statement: "Marlboro scores by far and away the highest in terms of brand usage and smoking incidence . . . " among 18 year olds. LeVan PD, United States v. Philip Morris, 6/25/02 185:19-22.

4260. From data obtained in part from its continuous tracking survey and in part from other qualitative and quantitative research performed by Philip Morris in August 1995 through its contractor Marketing Perceptions and used by the Marlboro Brand Group, Philip Morris is aware that young females (starting at age 18) comprise a larger part of the Marlboro franchise compared to total Philip Morris brands. Thus, Philip Morris continued to conduct research starting at age 18 into consumers' perceptions of its brands' images to ensure the effectiveness of its marketing campaigns with young consumers. 2045596130-6141 (US 20462) (O); LB0175849-5934 (US 33731) (O).

4261. Philip Morris solicited research proposals for national consumer research to profile the demographics, lifestyle, world view and culture, and entertainment and media consumption of young people between the ages of 18 and 24 living in urban areas. 2045592699-2709 (US 38434) (O).

4262. In a September 19, 1995 Philip Morris memorandum entitled "Parliament Lights Menthol Blind Tasting," authored by Melissa Jeltima, a Philip Morris scientist, and addressed to Shelby Rafferty and George Yatrakis, Jeltema wrote that: "**Interest in this product will likely come from a variety of sources, including new smokers**." 2051835270-5271 (US 38803) (O) (emphasis added).

4263. A 1996 Philip Morris document, "The Importance of Promotional Display Visibility, Location, and Call-out . . . A Selling Story," discussed the use of POS promotions to

attract "new" customers. The document discusses various POS promotions including: "Outdoor (banners) to impact new or potential customers . . . Indoor to increase consumer awareness and understanding of offer." Effective promotions positively affect sales: "When the offer is effectively communicated to the consumer such that value is perceived . . . the promoted product will typically sell faster than non-promoted product!" 2072953301-3316 at 3302, 3314 (US 42434) (O).

4264. A Special Roper Reports Analysis dated January 1996 entitled "'Talkin' About My Generation:' An Examination of Generation X" discussed the Roper organization's study of the purchasing behavior of Generation X, those born between 1966 and 1985. The analysis was prepared for Philip Morris and presented to a group of Philip Morris Brand and Consumer Research employees. 2047130104-0170 (US 38583) (A).

4265. In a May 22, 1996 "CPC New Products" speech, Bob Mikulay, Senior Vice President for Marketing at Philip Morris, stated, "The final area for review today is the young adult smoker. While these 18-24 year old smokers currently represent only 13.9% of all smokers and 11.1% of industry volume, they are absolutely critical to our future. Because brand loyalty in the industry is high and adult smokers tend to retain their brand as they age, the ability to attract and retain these smokers signals the industry's leaders in future years. Marlboro is the clear segment leader with a young adult smoker share of over 62% . . . . Newport is the #2 YAS brand, with a smoker share of 13.1%. Camel is #3, at a 10% share of YAS. Because of the segment's importance, we will aggressively defend Marlboro's position as the competition's future is dependent on penetrating this category." 2041518797-8956 at 8819-8820 (US 23907) (O).

4266. A July 22, 1996 Philip Morris USA memorandum written by Susan Kaufman to various employees at Philip Morris USA and Leo Burnett stated that "YAMS continue to be a

key smoker group for the Racing equity" and "Racing speaks strongly to YA" 2072516263-6267 at 6263 (US 41558) (A).

4267. A 1996 telephone study produced by Philip Morris USA surveyed 850 smokers on "the appeal of racing in key demos in order to assess its viability as a national marketing equity." The study concluded that "[r]acing imagery and Marlboro 'fit' on a number of levels" because racing "[o]verlaps core imagery of confidence, determination, masculinity, independence and control. . . . Reinforces Marlboro's status as a popular, worldwide brand. . . . Lends an upbeat tone of excitement, competitiveness, dynamism, challenge and 'edginess' to brand image [and] Provides relevant, aspirational but obtainable images." Additionally, "traits associated with the drivers are consistent with those often mentioned for the cowboy – masculinity, confidence, strength, determination, independence and skill." In sum, "[r]acing as a communication vehicle (i.e. calendar, newsletter, advertising) has strong national potential, particularly among YAS by communicat[ing] values of masculinity, independence and strength . . . excitement . . . color and cutting edge modernism to the base image." 2072475100-5149 at 5102, 5122, 5123, 5148 (US 85191) (O).

4268. Philip Morris recognizes the importance of product promotion at retail to increase the volume of cigarettes sold. A Philip Morris document planning retail promotions for 1996 entitled "The National Promotion Process" stated "Promotions are critical to growing PM volume & share and a key element of Category Management. Placing the right promotions in the right stores, at the right time and effectively communicating the offer to the consumer will . . . strengthen brand image & awareness . . . increase volume . . . [and] increase share." 2072953660-3671 at 3661 (US 42460) (O).

4269. A 1997 "Marlboro Metro Market Plan" tracked "Marlboro Share of Young Adult

Smokers (18-24)." 2073966872-6883 at 6875 (US 70637) (A). A 1997 presentation entitled "The Metro Plan Overview & Update" noted that "Marlboro is underperforming in Metropolitan areas." To reverse this trend, "Metro Marketing Goals" were set for "Marlboro Leadership [in] retail presence . . . market share . . . [and] share of young adult smokers." By adopting a "Tailored Marketing Plan" with "promotions . . . POS - new & breakthrough . . . [and] merchandising display" the brand would "[e]stablish the POS 'Look' consistent with brand strategies" and "[s]ell and place product, and incentive promotions . . . to increase . . . volume & share store by store." 2063007459-7477 at 7460, 7464, 7465, 7466 (US 70269) (A).

4270. Prior to the MSA, Philip Morris had a leadership program in outdoor (billboard, transit, and stadia) advertising that was designed to get "great locations on great expressways." Camisa PD, United States v. Philip Morris, 6/1/02, 115:20-117:2.

4271. Philip Morris focused its efforts on retail visibility – making its brands highly visible at convenience stores – because its own consumer research indicated that most young people visit and purchase their cigarettes at convenience stores. The 1998 "Generation X/C-Store Study" conducted by Philip Morris explored 18 to 25 year olds' "Attitudes about Convenience Stores . . . Behaviors related to Convenience Stores . . . How they perceive the Convenience Store visit." The study determined that: "Most of these young adult smokers routinely visit and purchase cigarettes almost exclusively at C-Stores." It also found that "Few among these young adult smokers are carton buyers, and most do not want to be carton buyers." 2082512930-2986 at 2931, 2935, 2986 (US 45497) (A).

4272. In 1998, Philip Morris USA was concerned that its share of so-called "young adult smokers" was declining. In order to counteract its dropping share of so-called "young adult smokers," Philip Morris launched new Retail Visibility and Bar Event Programs, as well as

related magazine and newspaper advertisements with the purpose of increasing Marlboro's "perceived popularity." In a June 1998 "Metro YAS Tracking Study-Pre Wave" Philip Morris stated: "To counteract the softness in Marlboro's share among young adult smokers, retail visibility promotion programs and bar event programs were launched in selected areas beginning in May 1998. The programs were implemented to increase Marlboro's top-of-mind awareness and perceived popularity. In addition, they are designed to improve the brand's relevance by increasing its association with YAS' lifestyles and self images in these Metro areas." Additionally, the document noted that "**Point of purchase is the key source of brand visibility.**" 2071693599-3614 at 3600, 3608 (US 24574) (A) (emphasis added).

4273. An internal Philip Morris memorandum dated June 29, 1998 from Natalie Ellis, then a consumer researcher for Philip Morris, to a distribution list of Philip Morris employees discussed and attached the results of the above referenced Tracking Study. In the memorandum, Ellis reported: "**Seventy percent of the smokers surveyed thought Marlboro was the most visible brand at the store where they buy cigarettes most often.**" The memorandum further stated that "**[p]oint of purchase is the key source of brand visibility**," more so than magazines, bars or clubs. Under the heading "Description of Marlboro Signs/Posters at Point of Purchase," the Tracking Study further found: "Young adult smokers, particularly males, noticed the Marlboro Man most at their point of purchase in the past three months." Under the heading "Brand Image Baseline," the Tracking Study ranked in order of consumer opinion phrases which describe consumers' perceptions of the Marlboro brand image, including the following: "Most popular brand," "Brand my friends would smoke," "For someone my age," "Advertises more than most other brands," "Growing in popularity," "Social," and "Trendy." When asked why it is important that Marlboro be perceived as a "Brand my friends would smoke," Susan Norris

testified that for Marlboro,

2073056226-6242, 6226, 6236, 6237, 6240 (US 42807) (O) (emphasis added); Norris PD, United States v. Philip Morris, 7/31/03, 227:10-238:10 (Confidential).

4274. Philip Morris tracking found that its summer 1998 Retail Visibility and Bar Event Programs successfully increased the perceived popularity of Marlboro. A September 1998 "Metro YAS Spending Study – Post-Wave I" stated that: "Awareness levels for Marlboro promotions noticeably increased after the Retail Visibility Program was implemented. . . . All smokers report seeing more Marlboro advertising in bars and Marlboro smokers are seeing more advertising in local publications. . . . In the medium spending markets, the Brand's programs succeeded in bumping up Marlboro's perceived vitality. . . . [and] Young Adult Smokers perceptions were strongly affected [in the perceived increase in popularity of Marlboro]." LB0170038-0053 at 0038, 0042, 0044, 0050 (US 25906) (O).

4275. An October 6, 1998 letter from Natalie Ellis and copied to Philip Morris's advertising agency, Leo Burnett, detailed the findings of Metro YAS Tracking studies, that were instituted to "measure any changes in brand visibility and perceived brand popularity before and after the summer Metro and bar progra" Ellis wrote that one key finding was: "smokers in this study were most likely to recall seeing advertising at retail, followed by magazines, local nightlife oriented publications and in bars and clubs. Marlboro enjoys a clear advantage at POS and in magazines." The letter attached September 1998 the "Metro YAS Tracking Study, Post Wave I, Final Report." The report stated that, at least as recently as 1998, Philip Morris launched nationally in urban metro areas retail visibility, promotion, and bar programs to counteract the decrease in Marlboro's share among so-called young adult smokers, to increase Marlboro's "top-of-mind" awareness and "perceived popularity." In testimony in this case, Philip Morris Senior

Vice President of Marketing Nancy Lund confirmed that these programs were launched "to increase [Philip Morris's] share of young adult smokers." LB0170036-0037 (US 25905) (O) ; 2073056243-6263 at 6243, 6245 (US 21818) (O); Lund PD, United States v. Philip Morris, 6/27/02, 195:23-196:13; 2072353137-3148 (US 87799) (O); 2072353198-3109 (US 87800) (O); 2072353085-3096 (US 87801) (O); 2072353124-3135 (US 87802) (O); 2072353111-3122 (US 87803) (O).

4276. In a January 5, 1999 speech, Shelby Rafferty, who for approximately eight years was responsible for marketing Philip Morris's Parliament brand, stated with respect to the target market for the national launch of Parliament: "I have talked a lot already about who the audience is . . . Camel, Winston and Newport . . . but why these three brands? And I think that can be summarized in a few words . . . they are all vital and growing . . . particularly among young adult smokers." 2081804781-4820, 4786 (US 45449) (A).

4277. A new Marlboro promotion called "Cowboy's Place," created by Philip Morris's advertising agency, Leo Burnett, for Philip Morris's Marlboro brand was described in a document dated February 2, 1999. The document acknowledged that Marlboro's traditional advertising image "plays on the '**approaching adulthood**' side . . . [featuring] independence," and compared that to the "competition" - specifically, Camel and Newport - whose advertising "plays on the 'being young (adult)' side . . . [featuring] sociability, nightlife, partying, fun-loving, experiencing the moment." Leo Burnett recommended that the "Cowboy's Place" promotion feature the themes of sociability, spontaneity, and partying usually featured by Camel and Newport. Leo Burnett promised that "Cowboy's Place" would provide the "**[o]pportunity for Marlboro to own** '**the road to adulthood**.'" LB0090212-0230 at 0216, 0217, 0218 (US 33211) (A) (emphasis added).

4278. A Leo Burnett document entitled "Virginia Slims - Stuck in the Seventies" establishes that Philip Morris initiated the "Find Your Voice" campaign in 1999 to make Virginia Slims more appealing to younger women. The document stated that "Find Your Voice" advertisements "will begin running in December 1999 publications" and predicted subsequent "volume growth" for Virginia Slims cigarettes. LB0131023-1026 at 1023, 1026 (US 33402*) (A).

4279. A presentation deck entitled "Philip Morris Portfolio Management Discussion," stated as its "underlying premise" that "[t]he smokers you have are the smokers you are most likely to keep." 2070648930-8964 at 8954 (US 24534) (O). Suzanne LeVan testified that this presentation was given to Philip Morris employees on June 25, 1999 by Michael Peters from the Leo Burnett Company. LeVan confirmed that "brand loyalty," as captured by this presentation, was a concept that was frequently internally discussed at Philip Morris. LeVan defined "brand loyalty" by referring to an idea included in the presentation: "that premium tobacco brands and smokers are very highly loyal and that they don't switch brands very often." LeVan PD, United States v. Philip Morris, 6/25/02, 225:3-228:12; 229:4-230:11.

4280. A draft presentation dated August 6, 1999 bearing Philip Morris and Young & Rubicam insignias entitled "Life after Launch: Parliament Creative Development and Photoshoot for Year 2000" depicted a transition experienced by smokers from "Group Identity" to "My Identity." According to the presentation, smokers in the "Group Identity" stage are confronted with the issue of "Rebellion/Conformity" and are "[p]reoccupied with peer approval" and "[h]ave experienced 'starter' brands." The presentation reported that it is during this stage that smokers choose their "first usual brand." The presentation listed Parliament's audience as "YAS - Marlboro outswitchers to Camel, Winston & Newport" as well as "regular Camel, Winston &

Newport smokers." Under the heading "Creative Framework," the presentation listed that the goal for Parliament was to "[c]reate a place that connects with YAS on an emotional level." 2080490740-0774, 0746-0747, 0760, 0765 (US 70717) (A).

4281. After negotiating and entering the MSA in 1998, Philip Morris increased its media presence in 1999 by placing more advertisements both in magazines with smaller but comparatively young readership and in magazines with larger but comparatively older readership. Philip Morris's December 23, 1999 "Marlboro Mainline Media Plan" stated that Philip Morris placed 28% more advertisements in magazines aimed at its "primary audience" which it called "YAP [Young Adult Progressive]." Philip Morris continued to advertise in "lower priority audience titles (Older Adult Smokers)" because these magazines acted as "'reach boosters' among YAS audience." 2071230813-0888 at 0835-0836 (US 40404) (A). Philip Morris increased its spending on placing advertisements in media in 1999. 2085313660-3660 (US 85193) (O).

4282. Philip Morris's 1999 "Marlboro Marketing Mix Monitor" compared "the profiles of 7 key marketing equities: Advertising . . . In-Store Advertising . . . ROP/Bar Nights . . . Party at the Ranch . . . Racing School . . . Marlboro Menthol . . . [and] New ways to use Miles." The report concluded that: "Marlboro's core product imagery remains rooted in quality, popularity and flavor. The brand's personality is popular, outdoorsy, adventurous, active and a leader. . . . Female smokers think of Marlboro as popular and sociable." The report further concluded that marketing at retail (POS) acted similarly to print advertising to communicate Marlboro's "personality." It stated: "[a]ttribute and personality communication of print and POS is very similar" and "POS acts like print advertising." 2073970989-1050 at 0991, 1049, 1050 (US 24685) (A).

4283. An April 14, 2000 memorandum from Michael M. Cassidy, an employee of Philip

Morris, to various Philip Morris employees entitled "YAM Scan II-Final Presentation Summary" discussed "[w]hat is happening with young adult males." The memorandum indicated that, based on a series of focus groups conducted with males aged 19-24, young adult males choose a cigarette by considering a brand's imagery and the associations attached to a brand, and pick the brand to match the image they want to portray at that moment. The memorandum further confirmed that Philip Morris extensively studied perceptions of its brand image for Marlboro, Marlboro Lights, and Marlboro Ultra Lights. 2080985436-5438 at 5436 (US 45363) (A).

4284. A September 2000 Philip Morris document entitled "Marlboro Bar Program 2001" stated that the purpose of the Marlboro Bar Program was to: "[c]reate news at the local level among YAS . . . [by] [i]ncreas[ing] visibility in bars." In furtherance of this goal, Philip Morris "[c]ontracted with 2687 bars in 62 markets . . . . [and] [i]ncreased the wall graphics program from 2457 to 3299." Wall graphics advertising Marlboro cigarettes remain in bars year round. 2701400725-0738 at 0725, 0726 (US 46092) (O).

4285. Contrary to its assertions that the goal of its marketing was to maintain brand loyalty and to get adult smokers to switch to their brands rather than to attract new smokers, as recently as 2001, Philip Morris tracked industry volume of cigarette sales on a weekly basis. One such tracking report showed volume for the current week and the difference from 2000 in both raw numbers and percentages, indicating that Philip Morris was interested in the overall size of the market, not just its share. 2700100027-0057 (US 25647) (O).

4286. Starting in the calendar year 2001, Philip Morris implemented a new marketing strategy called "Focus on Four." This strategy was "a way of focusing [PM's sales force] resources . . . both monetarily as well as manpower . . . on four brands: Marlboro, Virginia Slims, Parliament and Basic. . . . Those brands contribute most to Philip Morris's business objectives . .

. . Parliament is not the largest national market share, but it . . . is a large brand particularly in the Northwest." LeVan PD, United States v. Philip Morris, 6/25/02, 40-43.

PM3000613782-3913 at 3879 (US 88647) (A); PM3000540103-540118 at 0111 (US 88649) (A) (Confidential).

4287. In a June 28, 2002 email to, among others, Nancy Lund, Senior Vice President of Marketing at Philip Morris, Marlboro Vice President Suzanne LeVan reported "specifics from the conversation" she had that day with CEO Michael Szymanczyk regarding RJR' Camel Turkish Royale line extension and associated promotions. LeVan stated that, in her opinion, Camel's Turkish Royale promotion was a "great way to get YAS trial by news & promotion in the marketplace." 2067198070-8071 at 8070 (US 85194) (O).

4288. Shari Teitelbaum, Director of Marketing and Sales Decision Support at Philip Morris, testified that Philip Morris markets its products to smokers 18 years old and older. Teitelbaum testified that Philip Morris continues to conduct extensive research into the preferences of young smokers beginning at age 18, in focus groups, triads, and in-depth one-on-one interviews. Teitelbaum PD, United States v. Philip Morris, 4/16/02, 21:10-17; 23:14-25:19; 77:21-78:25.

4289. Michael Mahan, Vice President of Marketing and Sales of the Asia-Pacific Region for Philip Morris, testified that Philip Morris markets its products to smokers 18 years old and older, and further testified that some of Philip Morris's marketing efforts such as bar night programs are specifically directed toward young adult smokers which he defined as smokers age 18 to 24. Mahan testified that Marlboro's "prime target" is young adult smokers.

Mahan testified that he attributes Marlboro's overall success to the original positioning of the brand, good marketing, and a good quality product. Mahan described Philip Morris's communication strategy for Marlboro as using high-quality visuals and focusing advertising on the core elements of the campaign, which are "Come to where the flavor is" and "Marlboro country." Mahan also confirmed that point of sale promotions in retail stores used by Philip Morris to this day, as well as advertisements on the back covers of magazines used by Philip Morris until late 2000, could be seen by children. Mahan PD, United States v. Philip Morris, 5/31/02, 76-77, 84-85, 186-194, 120:20-122:2.

4290. Suzanne LeVan, Vice President of Marlboro and former Vice President of Philip Morris Premium Brands, is the highest level person at Philip Morris who is responsible for marketing Marlboro. LeVan testified that Marlboro's brand image has not changed since 1954. Marlboro's brand imagery is an "image that portrays quality, freedom, independence, adventure, and the gateway to the American frontier, the American West." LeVan admitted that if there were no new smokers, but only existing smokers, Philip Morris would eventually go out of business. LeVan PD, United States v. Philip Morris, 6/25/02, 124:14-17, 221:10-221:14.

4291. LeVan testified that: "[A]dvertising is a vehicle which . . . had a broad reach, that could in fact reach children, and it certainly reached adults who did not choose to smoke." Id., 261:13-23.

4292. At her June 11, 2002 deposition in this case, Ellen Merlo, Senior Vice President at Philip Morris, admitted that she was aware that Marlboro was the leading cigarette brand smoked by minors, and that Philip Morris has not "taken issue" with this statistic or undertaken to determine whether this conclusion was inaccurate. She also admitted that she was aware that over 80% of smokers start smoking before they turn 18. Merlo PD, United States v. Philip

Morris, 6/11/02, 42:22-45:15, 48:2-48:6.

4293. Notwithstanding its public statements that it intends to market only to adults 21 years of age and older, according to a report entitled

PM3002956620-6692 at 6624, 6692 (US 88650) (O) (Confidential).

(d) Liggett Intentionally Marketed To Youth Contrary To Its Public Statements

4294. Liggett, like the other Cigarette Company Defendants, was well aware of the import of the youth market, and designed its advertising and marketing to appeal to youths. Liggett's Board of Director Minutes dated August 17, 1960 indicate that Liggett purchased advertising time for NCAA football games and that its L&M Filters brand sponsored one of the college football bowl games. The minutes also indicate that Liggett used L&M, Chesterfield, and Oasis brand cigarettes to sponsor a college football contest at 100 colleges. Liggett's Board of Director Minutes dated September 21, 1960 indicate that Liggett's participation in the NCAA college football telecasts "enabl[ed] [Liggett] to attract the attention of the young college audience, a group always difficult to reach." LMIN000001249-1251 at 1250-1251 (US 85195) (A); LMIN00001252-1255 at 1254 (US 85196) (A).

4295. Liggett's Board of Director Minutes dated April 19, 1961 stated that Liggett sponsored television programs such as "Gunsmoke," "The Twilight Zone," and "Dr. Kildare." Liggett also sponsored the television show "Way Out," and in its corporate minutes Liggett stated that such sponsorship "appears to be attracting a young audience which we have had difficulty in

reaching heretofore." LMIN000001301-1304 at 1303 (US 85197) (A).

4296. Liggett's Executive Committee Minutes dated June 4, 1963 indicated that Liggett was advised by R. B. Walker, of the American Tobacco Company, of his surprise that Liggett had contracted for sponsorship participation of the "Jamie McPheeters" television show that featured a 12-year old boy. Walker advised Liggett that advertisement of cigarettes on this program might be questioned since the television show might be viewed by young people. Liggett's Executive Committee felt the idea that advertising on this show would appeal to youth was "far fetched." LMIN000005080-5082 at 5081 (US 87805) (A). Bennett LeBow, Chief Executive Officer of Vector Tobacco and controlling shareholder and Chief Executive Officer of Vector Group, the holding company that is 100% owner of both Liggett, Vector, and Liggett Vector Brands, acknowledged that Liggett went forward with the sponsorship despite the concerns expressed by Walker of the American Tobacco Company. LeBow WD, 65:17-66:9.

4297. On November 2, 2000, Liggett admitted that "it acknowledges that the tobacco industry has marketed to youth, which means those under 18 years of age, and not just those 18-24 years of age." Answer of The Liggett Group, Inc. to Plaintiff's Complaint For Damages and Injunctive and Declaratory Relief, United States v. Philip Morris (served 4/2/02).

4298. Bennett LeBow testified that, "I recall documents indicating that certain tobacco companies had targeted 13 and 14 year olds." LeBow WD, 61:6-13. LeBow also testified that he had concluded, after his attorneys reviewed internal tobacco industry documents and discussed them with him, that certain tobacco companies "had been targeting the sale of tobacco products to those under twenty-one years of age, including to those under eighteen years of age." LeBow WD, 42:2-18. Specifically, LeBow testified:

> Q: I want to ask you some questions about youth marketing. Is it your understanding that the internal industry documents the

> Kasowitz law firm studied and which you reviewed and discussed with Kasowitz attorneys indicated that the United States tobacco industry marketed cigarettes to youths?
> A: Yes. I recall documents indicating that certain tobacco companies targeted 13 and 14 year olds. I don't know where such documents came from and do not recall whether I reviewed or discussed such documents with the Kasowitz firm.

LeBow WD, 61:6-13; 508453918-3920 (US 20812) (A).

4299. LeBow further testified that "if the tobacco companies really stopped marketing to children, the tobacco companies would be out of business in 25 to 30 years because they will not have enough customers to stay in business." LeBow WD, 63:16-64:1. LeBow testified that a conversation with his six-year old grandson in which his grandson identified the fact that LeBow was in the cigarette business with the Joe Camel character, reaffirmed LeBow's belief that the industry marketed to youth, and that something was "dreadfully wrong." Id., 62:19-63:5.

(e) Lorillard Intentionally Marketed To Youth Contrary To Its Public Statements

4300. A July 24, 1963 letter from Shirley Young of Grey Advertising to Richard F. Kieling, Director of Market Research at Lorillard, discussed a Lorillard study which sampled the smoking behavior of students as young as 16 years of age. 89834681-4684 at 4681 (US 21108) (O).

4301. Manuel Yellen wrote a September 15, 1964 memorandum entitled "Lorillard Sales Position" to Morgan J. Cramer, Lorillard President and Chief Executive Officer. In this memorandum Yellen stated that Lorillard marketed Newport as "a 'fun cigarette'. . . . It was advertised as such and obtained a youthful group as well as an immature group of smokers." 01124257-4265 at 4262 (US 20033) (A).

4302. On June 2, 1966 Lorillard sent a letter authorizing Grey Advertising to conduct a "Penetration/Usage/Image" study designed to examine the success of Kent and True marketing.

The letter indicated that the study's results "will be tabulated out for the age cell of 16 thru 20 years, in order that we may analyze this group separately." 89834271-4271 (US 20943) (O).

4303. In 1966 and 1969, Eastman Chemical Products, a subsidiary of the Eastman Kodak Company, conducted extensive surveys of cigarette smoking behavior and attitudes that it provided to Lorillard. The introduction to the first volume of Eastman's 1969 study of cigarette smoking behavior and attitudes provided to Lorillard noted that: "In the 1966 survey group interviews, only adults aged 18 and over were included. . . . However in 1969 a better insight into the habits and attitudes of the younger age groups was needed. . . . So this [group interview] phase of the survey was concentrated on young people ranging in age from 12 to 24 years." 81560431-0496 at 0438 (US 85200) (A).

4304. Also in the first volume of Eastman's 1969 study of cigarette smoking behavior and attitudes provided to Lorillard, Eastman looked closely at smoking initiation behavior of individuals aged 7 to 21. Eastman found that over thirty percent of young males obtained their first cigarette, not from parents, friends or relatives, but from buying it (over 10%), stealing it (over 15%), or making it (nearly 10%). Both boys and girls reported about equally that their first cigarette made them feel grown-up. Among the subset of interviewees 16-24 years of age, nearly 20% of males and over 10% of females reported feeling "big," while nearly 20% of both sexes mentioned confidence and security as reasons why they started smoking. The study also examined regular smoking among youth ages 13 and up. Id., 0454-0455, 0458, 0460, 0465-0471. The The second volume of Eastman's 1969 study of cigarette smoking behavior and attitudes included a survey of the literature published between 1967 and 1969 on the smoking behavior of children as young as 11, as well as teenagers. 81560497-0541 at 0500-0508 (US 85201) (A).

4305. On August 13, 1970, Philip Gaberman, creative director for Robert Brian Associates, was involved in creating a new package design for Lorillard's Kicks cigarettes brand. Gaberman wrote a letter to Professor Charles Seide of Cooper Union, an art college, proposing the use of Seide's students in creating the Kicks package design. The letter stated: "We're adults. You've got a group of talented kids. Hence this letter. We have been asked by our client to come up with a package design . . . a design that is attractive to kids . . . (young adults). We were wondering if this project might serve as a challenging assignment for your package design class(es). . . . **Note: While this cigarette is geared to the youth market, no attempt (obvious) can be made to encourage persons under twenty-one to smoke. The package design should be geared to attract the youthful eye . . . not the ever-watchful eye of the Federal Government**." 92352889-2890 (US 21725) (O) (emphasis added).

4306. A February 1972 Lorillard report entitled "The Menthol Cigarette Market – A Summary" stated that "[t]here is a wide difference among Menthol brands, with Newport and Kool far more heavily youth oriented by volume than Salem." 89824702-4785 at 4734 (US 32092) (A).

4307. F.B. Satterthwaite, a Lorillard employee, wrote a June 7, 1973 memorandum to Lorillard President Curtis H. Judge, regarding Lorillard's analysis of its own and its competitors' brand shares by age. Satterthwaite stated that:

> The company analysis, based on cumulative brand shares by age group, though correct as far as it goes, is misleading. The favorable trends toward youth for RJR, Philip Morris and Brown and Williamson are completely explained by three brands - Winston, Marlboro and Kool, respectively. Without these three brands these companies present an older age pattern similar to the other two companies. The exclusion of Newport from their most recent period is detrimental to the overall Lorillard pattern.

91270029-0030 at 0029 (US 21109) (O).

4308. A report entitled "A Special Presentation for Lorillard . . . Cigarette Advertising 1974-1975" by Gallup gauged the effectiveness of advertising in particular magazines, including in the category of "Glamour (Age 15-34)" magazines such as, among others, *Seventeen* and *Teen*. 03496228-6630 (US 20057) (O).

4309. A document dated June 10, 1975 contained the script of a speech given by Curtis Judge, then CEO of Lorillard, to a "Maxwell Tobacco Seminar" describing Lorillard's marketing strategy for the latter half of the 1970s. In his speech, Judge stated: "Recent research indicates the Old Gold brand smoke profile has changed dramatically over the past few years from an older, blue collar market to a young adult market with better education and better income. We are currently testing new marketing efforts which are designed to develop strong appeal for Old Gold among this target audience." Judge also discussed Zack, a new filter cigarette "designed to find a place within today's casual, young adult lifestyle." 01424199-4215 at 4207, 4208 (US 20051) (O).

4310. An August 22, 1975 memorandum entitled "Progress Report - Zack Filter and Menthol" from R.E. Ritchie to A.J. Bass at Lorillard reported that "**retailers continue to comment that the majority of consumers are younger people between 14 to 25 years of age**. Sales from types of accounts like convenience stores continue to support these comments. I feel another sample program is needed with emphasis placed in the suburban areas where the younger people can be reached, and this to be done with outside samplers." 91529112-9114 at 9112 (US 21110) (O) (emphasis added).

4311. In a June 10, 1977 Lorillard memorandum from J. Gordon Flinn, Director of Market Research for Lorillard, to company president Curtis Judge, Flinn projected that, of the 55 million smokers in 1977, teenagers aged 14 to 17 accounted for 28% of the total.

03357069-7070 at 7069 (US 20055) (O).

4312. At a March 27, 1978 Lorillard field sales representatives seminar, several marketing ideas for Newport cigarettes were discussed. Discussion subjects included: sponsoring youth sports teams; advertising featuring black athletes; tie-ins with pro sports teams; sports posters and bumper stickers; give-away sweat bands; tie-ins with record companies; scholarships for underprivileged youth; "Tie-in with any company who help black . . . Target group age 16+;" and sponsoring Miss Black Teenager contests. Also specifically discussed was "[h]ow to reach *Younger* Smokers: P.O.S. material, sampling, Black inner-city newspapers, Tee-shirt give aways." 85530255-0264 at 0262-0263 (US 31998) (A) (emphasis in original).

4313. In a June 9, 1978 Lorillard memorandum entitled "Black Marketing Research-Findings and Recommended Actions to Date" to J.R. Ave, Senior Vice President of Marketing, and T.H Mau, G. Flinn, J. Rowe, J. Greene, and E. Ricci, Newport Assistant Brand Manager Robert Davis stated that Newport was "definitely a starter brand . . . . Newport is identified as an 'entry' brand." Under the heading "Demographics," Davis stated: "Black Newport and Kool smokers are even younger than the switching data would indicate." The memorandum characterized the Newport brand profile as being "Age 18-30." Davis also indicated in his memorandum that Newport appealed to high school as well as college students, in competition with Kool, "the dominant entry brand in the inner city." Because inner city convenience stores lacked financial resources to hold inventories of many competing brands, Davis recommended that, instead of forcing Kent and other brands on these retailers in addition to Newport, "the push should be for the brand with the most potential, usually Newport." Davis additionally recommended that Lorillard implement the recommendations discussed at the March sales seminar to market to teenagers: "Trial generating promotions, especially sampling;" "more

frequency at the local level in newspapers;" and developing in-store and neighborhood promotional activities. Davis concluded that: "the key to sustained . . . growth in 'inner-city' areas is 'image' promotion somehow tied in with events and trial inducing devices." 85530255-0264 at 0255-0256, 0258-0260 (US 31998) (A).

4314. An August 30, 1978 Lorillard memorandum from Ted Achey, Lorillard's Director of Sales in the Midwest, to company President Curtis H. Judge regarding "Product Information," demonstrates that Lorillard recognized the significance of the underage market to the company:

> The success of NEWPORT has been fantastic during the past few years. Our profile taken locally shows this brand being purchased by black people (all ages), young adults (usually college age), but **the base of our business is the high school student**. NEWPORT in the 1970's is turning into the Marlboro of the 60's and 70's. It is the 'In' brand to smoke if you want to be one of the group. Our problem is the younger consumer that does not desire a menthol cigarette. If that person desires a non-menthol, but wants to be part of the 'In' group, he goes to Marlboro . . . . I think the time is right to develop a NEWPORT NATURAL (non-menthol) cigarette to attract the young adult consumer desiring a non-menthol product. . . . A good test area might be the Camden, New Jersey Division.

03537131-32 (US 22357) (A) (emphasis added).

4315. An August 11, 1981 memorandum from Tom A. Mau to various Lorillard employees, 01110991-0992 (JE-021604) (A), attached a document entitled "Replies to 5-year Plan Questionnaire" which stated that "the easiest [brand] to keep riding is Newport. However, I think **we must continually keep in mind that Newport is being heavily supported by blacks and the under 18 smokers.** We are on somewhat thin ice should either of these two groups decide to shift their smoking habits." 01110993-1032 at 1030 (US 20031) (A) (emphasis added).

4316. An October 1981 report prepared for Lorillard by the research firm Shoi Balaban Dickinson Research entitled "An Exploratory Study for Newport Smoking and Purchase

Behavior of Young Adults" stated:

> One-half of these respondents began to smoke at ages 10 to 13 years, with most of the remainder starting to smoke between 14 to 17 years of age, with the pattern precisely equal between male and female respondents. Among these participants, it was rare to start smoking at an age older than 18 years. Marlboro and Newport were mentioned far more often than any other brands as the initial brand smoked. . . . Almost all of the respondents report current friends who smoke the same brand as the respondent, and there is a ready awareness of the brands their friends smoke. . . . One of the most striking findings is the very limited number of brands mentioned either as used by their friends or associated with smokers their own age.

The report further stated: "Both the male and female respondents thought of the typical Newport smoker as 'young,' and both cited Newport as a brand used by those who are just starting to smoke." 84411662-1689 at 1669,1680 (US 55999) (A); 83896981-7009 at 6989, 7000 (US 55927) (A).

4317. A November 25, 1981 Lorillard memorandum from Laurie Moroz, Manager of General Marketing Research, to J.R. Ave entitled "Smoker Incidence by Age Groups" attached estimates of smoking incidence (the number of smokers) within 11 age groups for the total population. The incidence chart included smokers aged 13 to 17. The author relied on census bureau projections, internal "switching study data," and "government studies on smoking among teenagers," and stated that "the teenage smoking figures are the least reliable." 03926040-6042 at 6040 (US 20065) (A).

4318. An August 2, 1982 Lorillard memorandum from Florian Perini, Senior Research Chemist, to M.A. Sudholt, Manager of Analytical Development, on the subject of "Idea Session July 27, 1982 of the Tobacco Science Group" contained a proposal that "Video Game Imagery [be] incorporated in pack design (youth appeal)." It detailed: "the widespread video game craze has certain fundamental features which we could be the first to exploit. Names such as PAC

MAN, SPACE INVADERS, TRON and their imagery can imaginatively show up on cigarette packs with repeat motifs . . . and patterns, and their bright imagery can have lasting appeal. Can extend concept to SPACE IMAGERY (Galaxy, Cosmos, Universe)." 96509517-9519 at 9519 (US 56890) (A).

4319. A March 14, 1983 Lorillard document regarding magazine and newspaper data detailed which magazines were likely read by teenagers 12 to 17 years old. The document stated that: "[T]here is no reliable research on 12-17 year olds. Lorillard and its agencies use only the adults 18+ figures when analyzing media. . . . There was a 1976 study that measured teenage readers but the firm (TGI) is no longer in business." In order to determine teenage readership, the document relied upon United States census figures to calculate the proportion of the population made up of teenagers, and derived teenage readership from that calculation: "Based on these figures, if we assume that teenagers read as much as their parents, then approximately 12% of any magazine readership would be teenagers." 04334493-4500 at 4494, 4497, 4499 (US 20067) (O).

4320. Laurie R. Moroz, Manager of General Marketing Research at Lorillard, stated in a September 2, 1983 memorandum to Curtis H. Judge, President of Lorillard, that "because the number of teenagers is declining rapidly, even a stable smoking incidence would mean a declining number of entering smokers." 03922854-2854 (US 21755) (O).

4321. A 1984 Lorillard document entitled "Kent marketing manager's conference speech presented by 'Monty' Kiernan, product manager, and Vickie Lamb [Assistant Brand Manager]," stated:

> **A year ago we unveiled a new long-range plan for Kent. It targeted sharply against the new market of younger smokers and was based on new totally offensive marketing strategies**. Every element in the brand's marketing mix has now been fine

> tuned. In 1985, we will move beyond the planning phase, we are into implementation. . . . You also know that with our industry under pressure and the competitive climate intensifying, any constraint to new user trial is unacceptable. . . . In recent years, entry level smokers . . . have gravitated to more artificial, smoother, fuller flavored brands. As a result the entire market is shifting . . . In 1985, Kent will make its move to meet this shift in consumer demand. We []now have every element in place. **We have targeted advertising and promotional programs to pull us younger.** Most importantly, [we] now have the product modification that can pull us up with no disruption to our user base. Combined, the totally integrated effort will drive Kent into a market growth position by mid-1985. By year's end, we should be strategically positioned to exploit maximum sales and profit opportunities.

04398447-8468 at 8447-8448, 8450 (US 20068) (O) (emphasis added).

4322. In February and March 1984, Lorillard conducted focus groups of young menthol smokers ages 18 to 24. A February 20, 1984 Lorillard document entitled "Topic Guide – Young Menthol Smokers" provided ways for an interviewer to gather information about young smokers. This document included a list of questions to ask young adults, including:

> How many packs do you usually buy at a time? . . . When do you buy cigarettes in a store, do you notice it if some brand has a special display? . . . Sometimes you might get a small free sample pack of a brand. Have you ever bought the brand later based on trying the sample? . . . How do you think of the cost of cigarettes compared to other things you buy – expensive, cheap, or what? . . . Quite often there are brands on display that are being promoted at a lower price than other brands. When you see that type of offer do you ever take advantage of the lower price? . . . What do you think of the idea of being able to buy cigarettes in packs of 10 cigarettes, which would be priced at half of what you now pay for a pack? Under what circumstances can you imagine yourself buying a 10-pack?

85377724-7729 at 7725-7727 (US 21078) (O). In a March 8, 1984 memorandum entitled "Young Menthol Smoker Focus Groups" to S.T. Jones, Lorillard Director of Product Development and Marketing Research, Laurie Moroz discussed "observations and hypotheses"

from these focus groups and stated: "the females in the 18 to 24 year old age group are more experimental and open to new brands than males." 85377682-7682 (US 87806) (O); 85377680-7681 at 7680 (US 87807) (O).

4323. Lorillard's September 1988 "Newport Image Study" concluded that "[i]n all areas Newport smokers were viewed as party-goers, those that do their own thing and [are] fun-loving" and "[i]n all areas Newport smokers were viewed younger and more fun-loving than Kool and Salem smokers." 89579737-9797 at 9784 (US 67673) (A); 89576893-6936 at 6935 (US 67669) (O).

4324. Despite the explicit acknowledgment in internal Lorillard documents that the desired image of Newport was youthful and fun-loving, Lorillard CEO Martin Orlowsky refused to answer questions confirming this fact in his written direct testimony. At trial, Martin Orlowsky admitted that, in his written direct testimony, where he was asked 10 to 11 times about various Newport advertisements featuring young slender models, he "answered the question in the same way" stating that the models "were at least 25 years of age" and "young is hard to define." Orlowsky TT, 10/12/04, 2216:15-25. Orlowsky also admitted that his attorney was with him the entire time or "for the most part" while he was reviewing his written direct testimony. Id., 2213:25-2214:2.

4325. Richard DiDonato, Division Manager at Lorillard, wrote in a March 16, 1989 memorandum to R.H. Orcutt, Lorillard Senior Vice President of Sales and Marketing, entitled "Style Lights Progress Report" that large, "bright, and extremely eye catching" point-of-sale materials are "effective in gaining consumer awareness" of the products. 89817995-7998 at 7996 (US 21107) (O). In a similar progress report entitled "Newport Slim Menthol Box 100's Progress Report," DiDonato wrote: "The **P.O.S. is extremely effective, it perfectly targets our potential**

consumer. It conveys a crisp, clear message and is easy to read, resulting in the reinforcement of brand awareness and the stimulation of consumer trial." 92007692-7693 at 7693 (US 57157) (O) (emphasis added).

4326. A document setting out strategies for Newport's Van and Music Truck Programs, Club Event Nights, Race Car Program, and other promotional events for 1991 and 1992 stated that the programs "maximize Newport's exposure to our target audience, where they live, and where they have fun." For example, the Newport Van Program sent out vans which acted as "mobile billboards," for the purpose of "developing new business." The document explained that "[y]oung adult smokers, especially in inner-city areas, will tend to emulate those adults that are already smoking. . . . **The targeted age factor plays a major role in selecting sampling locations**." Regarding Newport's Special Events programs at music festivals and street fairs with "exceptionally large crowds," the document stated: "The promotional effectiveness of getting potential smokers to touch, hear, taste and see the activities we provide . . . must have the desirable impact in generating trial and positive recall for Newport." 93374749-4761 at 4756, 4757, 4761 (US 85204) (A) (emphasis added).

4327. Orlowsky admitted that Lorillard was concerned with the importance of entry level smokers as demonstrated in its "Newport 1992 Strategic Marketing Plan" dated August 15, 1991. The plan discussed Newport's "1992 Key Issues," which included "Fewer entry level smokers," and mentioned the importance of the "Alive With Pleasure" advertising campaign, coupled with price promotions, to "generate interest and trial among entry level smokers." Although the document stated that Newport's "primary target" was 18 to 24 year olds, Lorillard was well aware that the majority of smokers entered the cigarette market before the age of 18. Orlowsky admitted seeing this document while in his position as Lorillard's Senior Vice

President of Advertising and Brand Management. Orlowsky WD, 40:22-41:2, 45:1-13; 92011118-1156 at 1124, 1130, 1134, 1137 (US 22352) (A).

4328. The "Newport 1992 Brand Plan" recommended marketing to the "young adult audience" through print media "to increase brand awareness and reinforce brand image." 92278882-8951 at 8898 (US 21114) (A).

4329. A 1992 Lorillard presentation on Kent stated that "Kent's franchise is one of the oldest of all cigarette brands (50+)" and that "one way to reduce Kent's smokers' median age is to to [sic] introduce substantially younger smokers (18-34) into the franchise." The presentation also stated that "magazines are the only medium that allows us to target a particular demographic group." 94245877-5885 at 5877-5878 (US 85205) (O).

4330. Lorillard's September 23, 1991 "Harley-Davidson Year I Strategic Marketing Plan" stated: "Harley-Davidson cigarettes are positioned to appeal to young adult male smokers, 18-24 years of age with high school educations, generally blue collar occupations as a brand which offers a unique smoking experience by virtue of its association with Harley-Davidson motorcycle imagery." 94258098-8143 at 8105 (US 85206) (A).

4331. An August 17, 1993 letter from Ronald Goldbrenner, Lorillard Associate General Counsel, to Timothy K. Hoelter, Harley Davidson Vice President and General Counsel, indicated that Lorillard was still seeking a trademark license for the Harley Davidson name for use with a new cigarette brand. 88024283-4286 at 4284 (US 21105) (O).

4332. In two letters, one dated August 17, 1993, and the other dated August 27, 1993, Timothy K. Hoelter wrote to Ronald Goldbrenner expressing Harley Davidson's concern that Lorillard's proposed upcoming cigarette advertising campaign to introduce its new Harley Davidson brand, especially when combined with the low price of the brand, would "recruit

underage smokers." In fact, Hoelter indicated that Harley Davidson had hired a market research firm specializing in child research to evaluate the Lorillard advertising campaign, and that this firm had concluded that "the campaign will appeal to underaged children." 91384161-4162 (US 54404) (A); 92670418-0419 at 0419 (US 21760) (A).

4333. By letter dated August 30, 1993, Goldbrenner responded to Hoelter's August 27 letter with a warning to Harley-Davidson:

> In your letter you refer to market research which Harley-Davidson has conducted. As you know, Lorillard's 'American Quality' campaign is an important trade secret, as are the timing and details of virtually all new products and advertising campaigns. Your letter raises serious concern on our part for the basic protection of very important Lorillard trade secrets. . . . Furthermore, if such research has been improperly conducted or analyzed, it may be very damaging to the reputation and business of Lorillard's disclosure, whether or not trade secrets are involved. . . . We would further appreciate your forwarding to us an immediate copy of the test results and methodology so that we will be better able to discuss this matter with you. We cannot impress upon you too strongly your obligation to maintain these materials in confidence and to permit us to review and validate the market research you describe so that we may properly assess this matter.

92670436–0437 (US 57194) (A).

4334. Despite Hoelter's letters protesting the appeal of Harley-Davidson cigarettes to underage persons, Lorillard proceeded to introduce the brand and marketed the cigarettes until 1996 when Lorillard replaced Harley-Davidson which had "fail[ed] to make sales goals" with another brand called Maverick. 94917017-7017 (US 88152) (O); 92715334-5457 at 5440-5442 (US 87927) (O).

4335. In a fact sheet entitled "Newport America's #1 Menthol" that Victor Lindsley prepared in April 1993, Lindsley discussed Newport's "20 straight years of volume growth" beginning in 1972, which he credited to the brand's marketing: "To communicate the Brand's

'Pleasure' image among targeted smokers, the 'Alive with Pleasure' campaign was created. The campaign, which has remained unchanged over the past 20 years, is a reflection of the franchise in social situations, capturing highly original, relevant, pleasurable experiences with a unique visual twist." This campaign, coupled with "a powerful promotion plan," moved Newport all the way up to the "#1 Menthol Brand" and the "#3 Brand" in the nation. 89959484-9486 (US 22350) (A).

4336. In a November 2, 1993 memorandum sent to Lorillard employees on the subject of "Special Promotions - POW! 'Pleasure on Wheels,'" Richard DiDonato wrote: "POW is a promotional program that utilizes Newport vans, operated by agency personnel, to distribute promotional items to Newport purchasers. The objective of the POW program is two fold:

- Generate incremental volume thru [sic] impulse purchase and long term conversion
- Reinforce Newport's image as the 'peer brand' among young adult smokers."

92092650-2651 at 2650 (US 57159) (O).

4337. Newport's 1994 Brand Plan, dated November 16, 1993, stated that "Newport's creative product must strengthen Newport's competitive edge as the 'peer' brand among younger adult smokers," and that Newport is "positioned to appeal primarily to general market/urban center adult smokers ages 18-24." 91945017-5124 at 5033, 5045 (US 21113) (A); 92002948-3012 (US 87808) (A); 92003013-3021 (US 87809) (A).

4338. A January 1994 document entitled "Final Report on Eight Focus Groups with Black and White Users of Newport, Salem, and Kool Cigarettes on Issues Related to Newport Cigarettes and its Advertising Campaign" was prepared by RIVA Market Research for Lorillard. In the "Executive Summary," the report stated that "Black Newport smokers perceive Newport as the 'in' cigarette, or cigarette of choice among themselves and their peers. They view it as a

popular cigarette which fits with their lifestyle." The report continued: "White Newport Smokers (men) really enjoy the taste of Newport cigarettes, yet feel they are 'out of the mainstream' because most of their friends smoke Marlboro Lights. The women feel they are smoking a 'cool' cigarette that people with happy, active, and upbeat lifestyles smoke, as Newport ads project." This report also stated that "Lorillard's Newport brand recognizes younger adult smokers as an important consumer base for this cigarette. This market is defined as a 'twenty-something' market; adults ages 18-29." 91950191-0242 at 0193, 0195 (US 74423) (A) (emphasis in original).

4339. Lorillard's "Newport '95 Promotional Platform Preliminary Presentation" dated November 30, 1994 stated that one objective was "[t]o develop a comprehensive Newport Promotion Program which . . . Enhances image as one of the 'cool' brands." 91945211-5218 at 5216 (US 85208) (A).

4340. A July 15, 1996 memorandum from Dick Westwood at Strategy & Tactics, Ltd. to Scott Benson, Group Manager of Marketing Research at Lorillard, regarding "The Menthol Market Study Reanalysis," concluded:

> Brand imagery should be pursued as the primary lever Lorillard can deploy in acting against the menthol market. Some Image Segments are, indeed, taste-based (for example, the Taste/Sensation segment with its focus on mintiness and iciness), and it is appropriate to pursue such segments through a taste-centered strategy. **But other market segments – including the Social Acceptance segment which is Newport's primary strength – are defined by more subjective aspects of imagery** and, for these, taste profiles need to be subsumed to fitting the image that the Company is seeking to create. . . . From a taste perspective, Newport is currently oriented to the Stronger end of the spectrum where, from the standpoint of taste characteristics, it competes primarily with Kool. However, the two brands play in different Image Segments – Social Acceptance and Strength respectively, and thus do not interact as directly as taste alone would suggest. Thus, for example, although both brands skew to

> males and African Americans, Newport has been able to attract a considerably younger adult smoker as its user base.

96290861-0869 at 0869 (US 85209*) (A) (emphasis added).

4341. A September 4, 1997 Lorillard memorandum from M.L. Orlowsky, CEO of Lorillard, to George Telford, Vice President of Brand Marketing for Lorillard, confirmed that the 1998 marketing budget for Newport would be $137.5 million. 82458620-8620 (US 85210) (O).

4342. In approximately 1998, Lorillard undertook a nationwide advertising campaign for Newport cigarettes captioned "Pleasure! Fire It Up!" in newspapers and magazines. Among several treatments, "Pleasure! Fire It Up!" advertising depicted attractive young men and young women smoking cigarettes, often in circumstances involving sports and other physical activities. (US 11209) (A); (US 11247) (A); (US 11257) (A); (US 11283) (A).

4343. A March 27, 1998 letter to Collett Thatch, the Senior Brand Manager for Newport, from Dorothy Straub at Saatchi & Saatchi, provided information on competitive print advertising campaigns. The letter described Lucky Strike as "making a concerted effort to reposition themselves as a contemporary retro cigarette (see inside visual of a James Dean look-a-like leaning on a 60's convertible coupe)." At the bottom of the advertisement was a toll-free number to call which provided information on upcoming "trendy bars/special promotions and money saving coupons." 86165773-5775A at 5775 (US 22207) (O).

4344. Lorillard's 2002 marketing and promotion budget was

Telford PD, United States v. Philip Morris, 6/26/02, 102:3-7 (Confidential).

4345. In this case, Lorillard's senior group brand director Victor D. Lindsley III, testified that the long-running advertising "concept of Newport Pleasure . . . should be appealing to anyone that likes to have a good time." Lindsley also testified that Newport's advertising theme

of "pleasure," especially the advertised "pleasure" of hanging out with friends, appeals to all ages including youth. Lindsley PD, United States v. Philip Morris, 5/16/02, 113:8-15, 115:7-116:3.

4346. As acknowledged by George Telford, Vice President of Brand Marketing at Lorillard in testimony in this case,

Telford PD, United States v. Philip Morris, 6/26/02, 85:13-88:14 (Confidential).

4347. Telford also testified that, as part of Lorillard's direct marketing efforts, the company collects demographic information about smokers' age, gender, and race, data which is then used by Lorillard to focus its marketing efforts. Telford further testified that Lorillard tailors its advertising for different brands based on the particular demographic profile of those brands. Because Newport advertisements are targeted at the younger segment of the adult smoking population, Lorillard advertises Newport in publications like *Sports Illustrated, Playboy,* and *Penthouse*, all of which have substantial youth readership. Telford PD, United States v. Philip Morris, 6/26/02, 59:22-62:2, 63:20-64:3.

(f) American Tobacco, BATCo and B&W Intentionally Marketed To Youth Contrary To Their Public Statements

4348. In a September 25, 1957 memorandum to Albert R. Stevens and Alan C. Garratt, B&W Advertising Managers, F.X. Whelan, American Tobacco Company Assistant Treasurer and Credit Manager, stated: "The first cigarette to saturate the morning television market will achieve positive results. . . . There is also the point that there is a vast audience of children at this time of day and, while I am not prepared to discuss the ethics of this particular phase, a child accompanying his mother to the market has an overwhelming passion for suggestion. . . . Many a Saturday I have gone to the A&P in my town and come back with several excess items over my

wife's list because my children who were with me had seen a product advertised on television and wanted it." Whelan concluded: "**To sum up, I believe the advantages in morning television are . . . [i]t delivers the message to the housewife at the best possible time – and to her children.**" ATX030308897-8899 at 8898 (US 21121) (O) (emphasis added).

4349. An April 6, 1960 American Tobacco memorandum from James R. Huott of the Filing Department to Karl W. Schullinger, Assistant to the Advertising Manager, stated that "the largest potential market for Lucky Strike is in the younger age groups," and that "Bonanza" would be a better television venue for Lucky Strike than "Lawrence Welk" because "Bonanza" was viewed by a greater number of people in the "younger age groups." An attached chart showed that three times as many "Teen-Agers (boys and girls 13-17)" watch "Bonanza" as watch "Lawrence Welk." ATX030308900-8901 at 8900 (US 20583) (A).

4350. An August 1962 proposal to the Tobacco Manufacturers' Standing Committee ("TMSC"), later renamed the Tobacco Research Council, by Market Investigations, Ltd. summarized "a large scale survey of smoking by children" that had already been performed for the British cigarette manufacturers (including BATCo) in 1961, and recommended that the TMSC fund further studies of "the trend in smoking by children and young adults" including "[t]he change in smoking habits as children grown older; particularly in the three or four years before the age of fifteen." Like CTR in the United States, TMSC was an organization that funded industry industry-sponsored research in the United Kingdom; BATCo officers sat on the TMSC Board. The 1962 proposal from Market Investigations Ltd. was entitled "Smoking by Children and Adolescents, Memorandum on Further Research to the Tobacco Manufacturers' Standing Committee" and suggested interviews of "ten and eleven year olds." The proposal stated: "Children in their teens present a dilemma for the tobacco manufacturer. On the one hand

you want to discourage children from smoking. . . . On the other hand, it is difficult for you to lend your weight to a campaign against smoking by young people without running the risk of discouraging them from taking up smoking altogether." 105408812-8815 at 8812-8813 (US 26273) (A).

4351. American Tobacco continued to study the impact of certain advertising on children ages 16 and above after it adopted the 1964 Advertising Code. American Tobacco determined that its advertising was reaching the 16 to 20-year old market. Gesell PD, Minnesota v. Philip Morris, 9/18/97, 54:19-55:11, 57:1-59:2.

4352. On December 15, 1967, Brad H. Littlefield, B&W Assistant Brand Manager, sent B&W internal correspondence to J.W. Burgard, Executive Vice President of Sales and Public Relations, which was copied to A.Y. Yeamen, B&W General Counsel, regarding "Analysis of Youth Audience Subgroups" for television viewing. Littlefield discussed the 2-20, 2-17, 6-20, 6-17, and 12 to 17 age groups as audiences for prime time television, defined by Littlefield as "7:30-11:00 p.m., EST." LG2004540-4542 at 4540 (US 21202) (O).

4353. Mark F. Fox, Product Manager for American Tobacco, sent a January 10, 1968 letter regarding an analysis of the Tareyton brand demographic profile to Clive Michaels of the advertising agency Batten, Barton, Durstine & Osborn. Fox explained in his analysis that: "Specifically, the brand shows greater than average strength among women, the high school educated and the 16-20 age group." MNAT00399850-9851 at 9850 (US 21632) (O); MNAT00399852-9852 (US 88802) (O).

4354. A July 1968 document "[p]repared for the American Tobacco Company" and entitled "The Position of Brighton in the St. Louis Market" stated: "The purpose of the study is to provide American Tobacco with consumer feedback on the impact of the Brighton brand.

Such feedback, beyond the customary sales information that is presently available, would greatly aid the company in realistically assessing the sales performance – not only of Brighton – but of other new brands in test markets, and would aid the company in instituting changes in strategy (advertising, packaging, etc.) to maximize the success of new brands." The researchers telephoned approximately 4,500 individuals in the age groups of 16-20, 21-34, 35-49, and 50 and over. In addition, "Age and sex quotas were assigned so as to yield the correct proportions of teen-age contacts and adult male and female contacts." MNAT00405881-5912 at 5883-5585 (US 88157) (O).

4355. On August 2, 1968, William Scholz of Ted Bates & Company Advertising provided an analysis of brand switching studies to Anthony Mercer, a marketing employee at B&W. The analysis found that "Kool attracts more in the 16-25 age group than it loses." In addition, the analysis included an "Index of Starters – Menthol Brands" that included data on individuals ages 16-25. 170051478-1481 (US 26590) (A); 170051490-1490 (US 26599) (A); 170051499-1499 (US 26608) (A).

4356. A report dated April 3, 1970 discussed a "1969 Survey of Cigarette Smoking Behavior and Attitudes" that was written by Eastman Chemical Products for American Tobacco Company. The survey, which was performed on those aged sixteen and over, stated, "At age 14 60% of the boys who were to become smokers, had smoked their first cigarette." The survey further concluded, "The age at which people start to smoke regularly is an important factor in assessing the future markets for cigarettes." In the survey, consumers were asked the following question: "What brand or brands of cigarettes come to mind when I say: Is best for people who are just starting to smoke regularly?" The survey also recorded negative reactions to first cigarette smoked including "disliked taste," "coughed," "unpleasant," "dizzy" or "ill."

650340129-0193 at 0151, 0156, 0162 (US 20948) (A).

4357. A 1973 B&W report entitled "New Product Concepts" described the company's strategy to reach a "**Direct Target Group: 6.3 million 16-25 year old smokers**." The strategy plan was to "[t]o improve B&W's position in attracting young male smokers by making as direct an appeal as possible in product, packaging, and advertising to young males." Possible names for a cigarette appealing to this segment included Laredo, Lancer, Durango, Champion, and Voyager. 670186789-6824 at 6811, 6815-6816 (US 21431) (A) (emphasis added).

4358. As an example of clear evidence that Defendants' Advertising Code was no restraint whatsover on Defendants' pursuit of the teenage market through media advertising, a February 21, 1973 internal B&W memorandum from R.L. Johnson, an employee of B&W's Advertising Department, to R.A. Pittman, a B&W Vice President, regarding Kool sales recommended that B&W should focus its media spending to the magazines that teenagers read: "**Kool's stake in the 16-25 year old population segment is such that the value of this audience should be accurately weighted and reflected in current media progra As a result, all magazines will be reviewed to see how efficiently they reach this group and other groups as well**." 680135996-6002 at 5996-5997, 5998 (US 20989) (emphasis added) (A). Johnson explained the reason for its targeted approach: "Kool has shown little-or-no-growth in share of users in the 26+ age group. Growth is from 16-25 year olds. At the present rate, a smoker in the 16-25 year age group will soon be three times as important to Kool as a prospect in any other broad age category." Id. (emphasis in original).

4359. A September 1974 report written by Kenyon & Eckhardt for B&W's New Ventures Project entitled "The 'New' Smoker" detailed Kenyon's focus group research conducted on behalf of the company, as reflected by the report above. Focus groups were conducted on

regular smokers under age 22, and data was tabulated for smokers age 16 and older. The research identified the typical smoking initiation process occurring before 10, and continuing into the junior high school or the early high school years. Influences on initiation included the desire to belong to a group and to rebel against parents. The research found that smoking initiation was prompted by psychological factors: "overcoming the unpleasant physical reaction became a strongly motivated goal. The psychological rewards for 'conquering' smoking seemed to center on proving manliness and strength to themselves and others and, for the most part, they seemed to feel it was worth the effort." The study concluded that "**the younger smoker is of pre-eminent importance**." 779217759-7833 at 7760, 7763-7768, 7827 (US 21054) (O); 779217758-7793 at 7760, 7768 (US 85211) (O) (emphasis added).

4360. A June 1974 B&W document entitled "Tramps Cigarette National Marketing Plan" described a plan to "[p]lace marketing efforts against all current smokers and those who are pre-disposed to commence smoking in the near future." The stated objective of the marketing plan was to "generate maximum exposure against a target audience of men and women 18-34." 670170921-0935 at 0926, 0930 (US 20965) (A).

4361. As Sharon Smith admitted at trial, tracking data purchased by B&W on individuals as young as sixteen was used by the company's marketing department in the 1970s. Smith TT, 1/7/05, 9249:22-9250:20. For example, a September 23, 1974 B&W Five Year Plan for all of B&W brands, written or approved by Richard L. Johnson in B&W's Advertising and Marketing Planning Department (which he subsequently managed), stressed the importance of effective marketing to young "starters" for the continued profitability of the company. The plan stated that, although B&W's share of smokers under twenty-five was greater than the rest of the industry, this was due entirely to Kool: "[w]ithout Kool's influence, the Company's profile is

female, old and getting older . . . a relatively undesirable situation." The document anticipated a coming battle over the shrinking pool of 16-25 year old potential smokers:

> [T]he younger smokers' importance cannot be denied. They have distinct brand choices and association appears to exist between growth brands and segments, and the younger smoker. Industry switchers and starters are predominantly found in this under-25 year old category -- especially among women. If the pool of starters and switchers shrinks, as it is expected to, even more effort could be waged against under-25 year olds in the battle for remaining new users.

The plan indicated that youth smokers were the market's growth: "among under 25 year olds, users have almost doubled. Kool's growth in this market is the greatest of any brand. It is also the fastest growing cigarette in the total market." The plan recommended that "[n]ew ways to selectively reach younger smokers and females entering the market should be found," and "[t]he need to make revitalization programs on established brands work is now critical." It summarized: "Segments or brands with attraction to the young and the female will be more likely to grow than segments or brands with male or older appeal. . . . Advertising funds may be more productively employed on growing brands than on declining brands in a more stable environment. In that regard, the transfer of advertising money from declining brands to growing brands could be worthwhile." 682823798-3801 at 3801 (US 21032) (A); 680500903-1076 at 0918, 0930, 0942, 0945 (US 21607) (A).

4362. B&W has claimed that it tracked marketing data on 16- and 17-year-olds only because it purchased syndicated data from third party vendors, and it had no choice over age ranges that began at age 16. To the contrary, though, the company both paid money for syndicated data on 16- and 17-year-olds as part of a larger age range, and also paid money to disaggregate and analyze the data specifically about 16- and 17-year-olds. A September 26, 1974 document authored by C.S. Muije, B&W Manager of Market Research, stated "a $3,000

exploratory study of brand switching among young smokers as they age was authorized . . . if the pilot study is successful, we estimate that another 12 to $15,000 will be needed to exhaustively track and table switching as younger smokers age. For example, we should be able to tell initial switching experiences as 16 to 17-year-olds start smoking and then track them up to age 21." 027887-7887 (US 34185) (A); Smith TT, 1/7/05, 9247:1-9248:7.

4363. A December 11, 1974 B&W document entitled "Marketing Planning Project Specifications Sampling" provided a framework for the company's product sampling activities. The report noted that "those [smokers] that are most inclined to switch (people under 30) are hard to reach selectively," and that one of the tasks for the supplier chosen to assist B&W in this effort was to "develop a national sampling program(s) on an established brand – Kool King Size – and a new product to be designated at a later date." 6801063446350-6347 at 6344, 6346 (US 20985) (A).

4364. A December 12, 1974 B&W report entitled "Target Audience Appendix" concluded that the target audience for Kool was a "pool of switching smokers" including 2.5 million people ages 16 to 25. The document also stated that the target audience for the Kool King Size sampling effort described above should take into consideration the "relative value" assigned to various groups of smokers, including 15 to 24 year olds. 680106344-6350 at 6349 (US 20985) (A).

4365. A B&W document from 1975-1976 entitled "Viceroy Agency Orientations Outline," was written to "prepare agencies for the creative and positioning assignments on Viceroy." The outline stated that Viceroy's target audience was "males 16-35, primarily." The document also stated that the "'Racing Campaign' . . . clearly positioned the brand as a young, exciting, full-flavored, satisfying cigarette." 680116947-6968 at 6947, 6959-6961 (US 21877)

(A).

4366. A 1975 B&W marketing presentation entitled "Cigarette Brand Switching Studies" stated that "Kool has a young age profile. The largest proportion of Kool's smokers are between 16 and 25 years of age," and that "Kool's young age profile contrasts with the older age profile of the other major menthol brand – Salem and is more similar to that of Marlboro." The presentation also stated that starters made up 15% of smokers ages 16 to 25, and that "Kool attracts a high level of starting smokers[,] especially 16-25 year old starters." 665076894-6916 at 6899, 6904, 6916 (US 20958) (A).

4367. A May 26, 1975 report entitled "What Have We Learned From People? A Conceptual Summarization of 18 Focus Groups Interviews on the Subject of Smoking," was prepared for B&W by the Ted Bates agency. A section of the report entitled "How Can We Introduce Starters and Switchers to our Brands," stated:

> With only very few exceptions, young people start to smoke because of their peer group." The document also stated that "an attempt to reach young smokers, starters should be based . . . on the following parameters: [p]resent the cigarette as one of a few initiations into the adult world. Present the cigarette as part of the illicit pleasure category of products and activities . . . . Consider a sampling technique to allow the young starters to actually try your brand . . . . In your ads create a situation taken from the day-to-day life of the young smoker but in an elegant manner have this situation touch on the basic symbols of the growing-up, maturity process. To the best of your ability (considering some legal constraints) relate the cigarette to 'pot', wine, beer, sex, etc.

680092632- 2668 at 2664-2665 (US 21693) (O); 170043558-3593 at 3581-3582 (US 20293) (A); 679018003-8278 (US 87928) (O).

4368. A document dated September 10, 1975 from L.M. Marshall, Jr., Ted Bates Advertising, to Mike A. Willson, B&W employee, regarding "Kool Analysis of Brand Switching Study – Wave 18" reported on smoking behavior of "the 16-25 age group." 665076813-6817 at

6813, 6814 (US 20957) (A).

4369. A 1976 B&W summary report entitled "Starters" recorded data and tracked starting smokers as a percentage of all smokers from 1969 to 1976, by gender and by age group. One of the age groups was "16-25." The report concluded that, "**The 16-25 age group has consistently accounted for the highest level of starters**." 170040333-0333 (US 22359) (O) (emphasis added).

4370. R.D. Lewis, B&W Manager of Marketing, sent a report dated April 1, 1976 entitled "Final Report - Study of Brand Switching Among Young Adults Smokers (Project # 1974-244)" to Robert A. Pittman, Senior Vice President of Marketing at B&W. This report stated that "[t]he 16-25 year old smokers have a much higher level of brand switching (59%) than the 26-35 year old smokers (37%)." 677354259-4263 at 4260, 4263 (US 20978) (O) (emphasis in original).

4371. An August 4, 1976 letter to Frank McKeown at B&W from Jeffrey Clinaman at Zimmer-McClaskey-Lewis attached a "recommendation for Kool's 1977 Promotion Program." The plan recommended a Kool Basketball Premium: "Basketball is a major source of recreation among young, black males. We would capitalize on this interest by offering a basketball premium, perhaps even green and white to tie in with Kool." The plan also advised that "Since Kool is heavily oriented toward the young and the brand's starter index is 10, **it will benefit us long-term to develop promotion events that involve the young and especially, to convince the starter group to smoke Kool**." 777080491-0522 at 0491, 0500, 0508 (US 31585) (A) (emphasis added).

4372. An August 10, 1976 document, written by Robert G. Yizar, B&W Assistant Brand Manager, about the Pontiac Kool Jazz Festival, stated: "Audience composition covered the age

spectrum with a slight skew toward the 16-25 age group." 666011286-1287 at 1286 (US 20960) (A).

4373. An August 22, 1976 document prepared for B&W by Young & Rubicam International entitled "Starters, Creative Workplan" summarized problems with the Viceroy brand and suggested Viceroy advertising objectives for the company:

> 1. Key Fact. Every year two million people in this country start smoking. 50% of them gravitate toward full flavored cigarettes – Marlboro and Winston. Viceroy gets none of them.
> 2. Problem The Advertising Must Solve. New smokers are not attracted to Viceroy because it has no clear image either as a smoke, or in terms of its personality.
> 3. Advertising Objective. To convince new smokers that Viceroy has the flavor and taste that they want as well as the image that is suitable to their needs and self perceptions.

170010440-0440 (US 20283) (O).

4374. A 1977 "Study of Consumer Awareness of and Attitudes Toward 24 Leading Cigarette Brands" produced by B&W concluded that the three factors that determined "sales success" were "[b]rand share of advertising pressure [and] [i]ntrusiveness and memorability of the advertising," "[p]ersuasive brand imagery," and "[b]rand [l]oyalty." 660110387-0390 at 0387 (US 20955) (O).

4375. A "Brown and Williamson Tobacco Corporation Problem Lab" dated April 27, 1977 recorded a brainstorming session addressing "[h]ow to better estimate future environment for tobacco industry and B&W growth" and B&W's need to "measure the intensity of the attitudes of children or other precursor groups." The group of B&W employees and executives participating in the session generated the following ideas generated at the session:

> 15. Wish I knew the impact of smoking and health propaganda on kids in schools – future customers' attitudes.
> 16. Correlate smoking incidence between kids and parents.
> 17. Psychological analysis, predictions: who's going to be kids'

heroes.
18. A six-month report on heroes of beginning age smokers (Do it every six months). . . .
25. Look at images of children and images of starting smoking age – are there certain characteristics that pre-dispose a child to smoke. . . .

1. Contact leading firms in terms of children research, e.g., Gilbert/Reilley. . . .
3. Contact Sesame Street.
4. Get a raft of 15-year olds who are not smoking . . . go back 3 or 4 years later and see who is smoking.
5. Contact Gerber, Schwinn, Mattel. . . .
7. Run a series starting at 6. . . . Learn correlation between age 6 and 18. . . .
9. Look at 13, 14-year olds and images of what they want to be.
10. Take a group of 6, 10, 14-year olds. Four years later see if can [sic] predict. Predict age group behavior based on previous responses. . .

680067120-7123 at 7120-7122 (US 20982) (O).

4376. A B&W report entitled "Situation Analysis" dated June 23, 1977, forecasted Kool's performance among teens: "Population data indicate that the 16-20 year old segment will be diminishing in size – the historical stronghold of Kool smokers and starter smokers." The "Demographic Profile for Media Selection" for the "Kool Kings & Box" style of cigarettes was described as "Young adult males, 16-25, young blacks (both sexes), 16-25, and some females 16-25." The document also included a chart on consumer awareness of Kool which contained data on the 13 to 24 age group. 666022186-2223 at 2193, 2200, 2219 (US 30803) (A).

4377. An October 18, 1977 report prepared for Imperial Tobacco, a member of the BAT group of companies, by Kwechansky Marketing Research stated: "Since how the beginning smoker feels today has implications for the future of the industry, it follows that a study of this area would be of much interest. Project 16 was designed to do exactly that – learn everything there is to learn about how smoking begins, how high school students feel about being smokers,

and how they forsee [sic] their use of tobacco in the future." The "recruiting qualifications" for the study were respondents "aged 16 or 17, attending high school, and smokers of 5 cigarettes or more per day." 566627826-7935 at 7839, 7840 (US 20939) (A).

4378. B&W recognizes the importance of imagery and packaging to make its products attractive to teenagers. An April 20, 1978 B&W document entitled "Implications for Cigarette Industry" stated that "[i]magery will continue to be important in brand selection for teenagers" and "[p]ackaging will become more important if not the most important advertising vehicle." 667007711-7714 at 7711, 7712 (US 20961) (O).

4379. An August 1978 B&W document entitled "Kool Family Utopian Objectives 1979-1985" discussed strategies for Kool to replace Winston "as the No. 2 cigarette in the country by 1985." The author wrote that to accomplish this goal, "Kool must achieve a user image that is acceptable to the majority of young adult and starter smokers." A section of the document entitled "Demographic Objectives" included the statement: "[r]eturn the starter index to 11% by 1982 and maintain this level as the highest starter index in the industry. . . . [t]he starter index has been the historical pillar of Kool strength and to return it to 11% will be to build longevity into the franchise." Strategies to achieve this objective included "advertising pressure against high filtration styles in young adult skewed publications" and to "[d]ominate specific young adult publications with a particular style." 680559149-9162 at 9149, 9152-9154 (US 54048) (A).

4380. A November 10, 1978 presentation to B&W by Acton Marketing Ltd. entitled "Kool Jazz Festival and Country Shindig Final Recommendations" stated that one of the Kool Brand Group's "primary objectives" was to "directly link Kool with music." A June 7, 1983 "formal" and "approved by Senior Management" memorandum from B&W Senior Brand Manager G.T. Reid to Senior New Products Manager M.A. Schreiber, entitled "Kool Copy

Strategy," stated: "The Kool property uses musical symbolism to communicate the strategy. The brand desires an improved quality image and universal appeal to all age groups." 666022850-2898 at 2856 (US 88158) (A); 675159236-9242 at 9238 (US 21749) (A).

4381. A BATCo document dated April 4, 1979 entitled "Year 2000" listed predictions for changes from 1979 to 2000, and advised "in **most** markets we do not examine smoking habits of those under 15." 109883101-3103 at 3101 (US 21518) (A) (emphasis added).

4382. An internal B&W document dated September 21, 1979 from Robert Chambers, a B&W Brand Manager, attached a report entitled "The Growth of Menthols, 1963 to 1977" describing Kool's growth phase from 1963-1977. The report stated: "Salem had created a vast market potential for menthol, and Kool had retained its taste, while brands in the 'tar' derby had dropped 'tar' and taste. This put Kool in a good position to capitalize on two emerging markets – the blacks and college-aged marijuana users. The post-war baby boom had, by this time, swelled the population of young and black; and Kool was positioned to take advantage. Kool increased its advertising and promotion to blacks and youth, who were both heavy pot users and heavy menthol smokers." 660110384-0386 (US 20954) (A).

4383. An October 1979 B&W document entitled "History and Key Trends in the U.S. Cigarette Market" contained several reports prepared for the company describing market trends occurring in the United States in previous decades. One of the reports described "Kool's growth phase" between 1963-1974: "Use of marijuana by young people was growing . . . according to a . . . consumer survey, 52% of marijuana users aged 12-17 also smoked cigarettes compared with only 11% of non-users. No hard data are available on the brands of cigarettes used by smokers of pot but menthols would appear to hold an above average share among such smokers. **This would be consistent with Kool's position as the favored cigarette of young smokers**." The

report on menthols also tracked Kool's share of smokers ages 16 to 25 and specifically noted Kool's share of black male smokers ages 16 to 34. 670624932-5364 at 4932, 5008-5009, 5013-5014 (US 53869) (A).

4384. Nicholas Brookes, Chairman and Chief Executive Officer of B&W from 1995 until 2000, testified in this case that B&W did not institute a company policy prohibiting research on youth marketing and smoking behavior for those under 21 until the "late 1970s or early 1980s." Brookes also admitted that prior to the early 1980s, B&W conducted marketing research on individuals as young as 16, specifically on the switching behaviors of individuals between the age of 16 and 25. Brookes also testified that since 1998 "the emphasis of the Marketing Department has moved . . . from mass media types of advertising to one on one marketing, and where you're able to verify that the individual is a smoker who's of legal age, i.e. eighteen or nineteen years old, then we might very well, you know, just talk to them about their smoking habit, but it would be on a one-to-one basis." Brookes PD, United States v. Philip Morris, 5/2/02, 134:24-136:23, 146:18-147:18, 148:2-148:19.

4385. Another B&W document entitled "Kool Switching History" tracked demographic data and smoking incidence of people aged 16 and older from 1966 to 1980. 542011811-1812 (US 20934) (A).

4386. According to B&W's internal 1981 "Kool Strategic Brand Plan," the company decided that "Kool resources will be allocated against geographic and demographic segments which represent the highest opportunity [including] [y]oung adult starting smokers." 670624652-4705 at 4654 (US 20973) (A).

4387. A February 4, 1981 B&W study entitled "Viceroy Switching Study Analysis Wave 28" stated that because "starting is a function of awareness among potential smokers which

is directly related to brand size (S.O.M.) and levels of [promotional] support, Viceroy's Parent's low starter rate is understandable. Viceroy Parent has not been advertised since 1977." The report also stated that "Viceroy Rich Lights' starter rates (15% and 11%) are significantly greater than the category and competitive brands, primarily because the brand was introduced relatively recently and supported by a relatively high spending rate." 670110917-0959 at 0937, 0945 (US 20963) (O).

4388. In an April 22, 1981 internal memorandum to Dick Veatch, B&W Brand Promotion Manager, from P.W. Stebbins, B&W employee, memorialized a phone conversation with Betty Carr regarding a Barclay sampling program, in which Carr reported that her Houston store, Tobacco Road, had been inundated with teenagers trying to sell or exchange the cigarettes they received as part of a Barclay promotion. Carr indicated that a similar situation had occurred with Kool Milds sampling in Houston. 666006105-6106 (US 20959) (A).

4389. Kwechansky Marketing Research wrote a report dated May 7, 1982 for Imperial Tobacco Limited entitled "Project Plus/Minus" that focused on two age groups: 16 to 18 year olds, and 19 to 24 year olds. The report built on "Project 16," an earlier study which examined "why do young people start smoking, and how do they feel about being smokers?" The report stated that a smoker's first brand choice comes from "peer example," and that "Imperial Tobacco's brands have the apparent lions [sic] share of this [the youth] market." The study stated that "the age of brand independence and of cessation of peer brand judgment seems to be getting lower," and concluded with an analysis of brand choice of cigarettes by young people. The report stated: "Juvenile dabblings with smoking take place mostly for reasons of seeking to sample forbidden fruit." 566627751-7824 at 7753, 7755, 7812, 7813, 7816 (US 20938) (A).

4390. A B&W document apparently drafted in 1983 entitled "Kool Advertising" stated

as a "Problem" that "[o]ur campaign does not currently appeal to young adults of all races (<25)," due to "trial growth weakest of all age groups" and "franchise aging rapidly." As the solution, the document recommended that Kool advertising "go for the fantasy" and "go for cool." 675159252-9253 (US 21730) (A).

4391. On April 13, 1983, B&W Artistry Limited, Pinewood Studios, England, mailed a contract to B&W. This contract was signed by N.V. Domantay, Vice President of Brand Management for B&W, and memorialized the agreement to place Barclay outdoor advertising displays in the film "Supergirl." 675048039-8042 at 8039 (US 20976) (O). On August 4, 1993, David Remes, an attorney with Covington & Burling, wrote to Congressman Schiff "[o]n behalf of the . . . six principle U.S. cigarette manufacturers" that the billboard in Supergirl was "included against the manufacturers wishes." The statement in Remes' letter is contradicted by the signed agreement between B&W and Artistry Limited, Pinewood Studios. 947181920-1921 at 1921 (US 22527) (O); 675048039-8042 at 8039 (US 20976) (O).

4392. A letter dated April 28, 1983, from Sylvester Stallone to Bob Kovoloff at Associated Film Productions ("AFP") recorded his promise to smoke B&W cigarette brands in five upcoming movies in exchange for $500,000. 690132319-2319 (US 21044) (O).

4393. A June 14, 1983 letter from James Ripslinger, Senior Vice President at AFP to Sylvester Stallone provided further details of the agreement to use B&W's tobacco products in his next five scheduled motion pictures. The letter stated that AFP was "representing their client B&W." 685083120-3120 (US 21033) (O).

4394. A September 14, 1983 B&W document entitled "Belair 1984 Media Plan" recommended a media target audience for Belair that included males and females ages 16 to 29. 676025033-5033 (US 53922) (A).

4395. H.T. Hughes, a B&W Marketing Manager, wrote a letter dated September 16, 1983 to P.R. Hill, BATCo, and copied to G.E. Lajti, an employee of the B&W Marketing Research Department, responding to Hill's requests for "general socio-economic information on the domestic U.S. cigarette market" and information to fill "data gaps for the years 1972-1981." Hughes attached a questionnaire which, under the heading "Age," included a category for those "Under 16" and "16 to 25." 539003010-3021 at 3010, 3012 (US 20933) (O).

4396. A B&W September 17, 1983 internal memorandum from J.L. Hendricks, Brand Promotions Project Manager, to M.A. Schreiber, Senior Brand Manager of Kool, stated that "the purpose of this memo is to recommend a continuity promotional concept for Kool" and that the Record Club of America ("RCA") had offered their Record Club facilities to Kool for 50% off regular price. 676026171-6172 at 6171 (US 20977) (A).

4397. An October 1983 document entitled "Market Dynamics" reported research conducted by B&W to determine trends in starting smoking and switching brands. The document stated that "[s]tarters are concentrated in the youngest age groups," and included a chart indicating that smokers age 16 to 25 compromise 15.2% of former smokers and 34.0% of starters. The document further stated that "Kool's ability to attract starters has been because of high development among young smokers," and provided a table of "Kool Starters: Male smokers 16-25" with data from 1979 to 1982. Concluding that "starters are concentrated in the younger age groups" and "starters are influenced by their peer group," the authors recommended that "**to increase Kool's share of starters, it will be necessary to increase Kool's share among young smokers.**" 670585199-5216 at 5211-5212, 5214 (US 20972) (A) (emphasis added).

4398. A 1983 B&W document entitled "Switching Overview" examined several brands to determine which ones were "attracting starters" or "attracting switchers" and which were

"losing due to switching-out," and concluded that "Marlboro is the only male brand attracting starters." As to female brands, "[Virginia] Slims, Eve and Satin [are] attracting starters." 674017018-7030 at 7020-7021 (US 20975) (O).

4399. An October 26, 1983 memorandum from D.R. Scott, B&W Director, Audit and Special Services, to N.V. Domantay, Vice President of Brand Management for B&W, attached an internal audit of B&W's relationship with Associated Film Productions ("AFP"). The audit revealed that B&W paid AFP $30,000 quarterly to "place B&W advertising and products in selected new movie productions." The audit indicated that AFP had succeeded in making placements in 22 movies and one television show between 1981 and 1983 including "Nine to Five," "Body Heat," "Only When I Laugh," "Sharkey's Machine," and the television program "The A Team." AFP had also placed B&W advertisements in movie theaters until August 1983 for approximately $100,000 per year. 685086478-6487 at 6477-6481, 6487 (US 21731) (O); 549000789-0789 (US 20936) (O).

4400. An October 26, 1983 report produced by the Information Center for B&W on the "starting age of all smokers on the switching study" shows starting ages ranging from 1-86, with most smokers starting between the ages of 12-18. Handwritten comments on the report state "get smokers as young as possible" and "Brand Choice of Starters [females 16-25] can best be predicted by Brand Choice of Smokers [females 16-25]." 670579884-9946 at 9888, 9891, 9896 (US 25429) (A).

4401. A January 1984 report entitled "Additional Analysis: The National Brand Switching Studies" prepared by Market Facts for B&W concluded that "[b]y age group, incidence among 16-25 year olds rose" and that "[f]irst time starters are a great deal younger, and smoke considerably less than the other categories of smokers." 670579702-9724 at 9705, 9723

(US 20971) (O).

4402. Linking Kool to music remained a goal for B&W. On May 18, 1984 B&W Special Events Manager R.J. Miller sent a letter to Dino Santangelo at Festival Productions regarding "Kool Jazz Festival Advertising." The letter discussed print, television, and radio advertising for the Kool Jazz Festival. 682144612-4614 (US 25449) (A).

4403. A July 30, 1984 Imperial Tobacco Limited document entitled "Proceedings of the Smoking Behaviour-Marketing Conference, Montreal, Quebec, July 9th-12th, 1984, Session 1" was distributed to many people including BATCo's Dr. L.C.F. Blackman; Tilford Riehl, Division Head, Product Development, B&W; Andy Mellman, Marketing, B&W; Michael Brennan, Scientific Advisory Board, Center For Tobacco Research; and C.I. (Ian) Ayers, Research Manager, BATCo. The report stated that "our future business depends on the size of [the] starter population," and asked, "Can we develop models of how smoking careers unfold?" The document indicated that Wayne Knox, Marketing Manager, Imperial Tobacco Limited, had "pointed out that the failure to develop new smokers may have more detrimental impact on the industry in [the] future than losses due to quitting." 536000000-0090 at 0016, 0017, 0027 (US 22338) (A).

4404. A B&W 1985 Strategic Marketing Plan stated: "High attraction of starters key to growth whether by company (PM) or brand (Newport, Virginia Slims, Marlboro or Generics)." The document also discussed the marketing strategy for Kool: "concentrate efforts on young adult, male prime prospects. . . . Advertising should symbolize both the best cigarette (quality) and a contemporary image of masculinity, self-assurance, confidence and control (cool)." 670146621-6701 at 6626, 6637, 6638 (US 30805) (A).

4405. A March 6, 1985 B&W memorandum from Brand Assistant A.G. Forsythe to

R.D. Sharp, a B&W Group Product Director, copied to Brand Assistant D.N. Lapere and L.D. Johnson posed the question: "How did Marlboro and Newport become the in-brands?" With respect to Newport, the response was "Newport was a regional brand that depended primarily on local programs targeted to young adults (beach events, sampling, vans, etc.) supported primarily by outdoor. Like Marlboro, Newport has maintained creative consistency since the early 70's. The Newport campaign has been tightly targeted to young adults. During this time, Kool either had no user image campaigns or was depicting older models. As a result 'Ports' [Newports] has become the in-brand among young Black adults while Kool has declined significantly among this group." This document also stated that "Kool must aggressively seek to re-establish itself among young adults with aggressive programs" such as music events and outdoor advertising. 554000052-0060 at 0053 (US 20937) (A).

4406. An April 19, 1985 internal B&W memorandum from Lawrence E. Gravely, Research Operations Manager, to Betty A. Sproule, Research, Development and Engineering, regarding "ARE STARTERS YOUNG OR OLD?" stated: "This is in response to your question of April 18, 1985. This data comes from the 1984 Brand Switcher . . . Starters are: 50.8% [ages] 16-25." 670541820-1820 (US 20970) (O).

4407. An internal April 29, 1985 document analyzing the success of the Marlboro brand entitled "Resolve Brand Marketing Strategies" stated that B&W's market weaknesses were among starters and switchers, largely due to the company's "failure to meet needs of young smokers." The author also stated that Kool needs to "focus on young adults." 528000268-0279 at 0269, 0275 (US 20924) (A).

4408. A July 9, 1985 B&W document entitled "Beta M National Theoretical Media Plan" stated that the "target audience for B&W's BETA-M cigarette" was "[w]omen [s]mokers

18-34 years of age," and recommended placing advertising in magazine "because of its special editorial directed to young women ranks high with women smokers 18-34." It further recommended placing advertising in *Rolling Stone*, *Record*, and *Spin*, all described as "young targeted music books." 670661599-1665 at 1627, 1628 (US 23054) (A).

4409. BATCo's November 1985 General Marketing Policies declared that "overall BATCo strategy will be market specific and multi-brand but within each major market major effort behind one brand aimed at starters/young adults." 109870521-0561 at 0536 (US 21925) (A).

4410. A 1987 document entitled "Econometric Analyses of the Kool Brand Family and Newport Brand Family With Recommendations" included data on the birth rates of teenagers, including both "white birth rates" of "17, 19, 26 and 27 yr. olds," and the "non-white birth rates" of "13, 16, 17, 18, 21 and 26 yr. olds." 795005304-5331 at 5307 (US 21056) (A).

4411. A February 17, 1987 memorandum entitled "Kool Isn't Getting the Starters" from D.V. Cantrell at B&W to I.D. Macdonald, B&W Marketing Vice President, addressed "the fact that Kool is no longer attracting new smokers (further referred to as starters)." The memorandum explained that "Menthol brands have been said to be good starter products because new smokers appear to know that menthol covers up some of the tobacco taste, and they already know what the menthol tastes like, vis-a-vis candy." 621079918-9921at 9918, 1920 (US 30792) (A).

4412. A July 2, 1987 B&W memorandum to "all area promotion managers" entitled "Kool Nights Bar Promotions" described a program "to conduct bar promotions in inner-city, Black neighborhoods to increase awareness and trial of Kool Milds and to further reinforce Kool as the leading Menthol Brand." Under the program, packs of Kool Milds would be made available for sampling (free give-aways) and area managers would be allocated "bar kits"

including promotional items such as Kools Milds ashtrays, "Kool & Mild Today" table tents, and "Kooltown" t-shirts. In a section entitled "Publicity," the memorandum suggested having local radio stations co-sponsor Kool Night events in order to "maximize awareness and attendance at your event; however no funds are authorized for this purpose." In addition, the memorandum instructed that the radio stations could broadcast the date, location, and times of the events, but could not mention the word Kool during any on-air promotion. 671712346-2355 at 2347-2349 (US 22182) (A).

4413. A November 1993 report entitled "The Psychology of Significant Moments and Peak Experiences in Cigarette Smoking, The Motivations and Semiological of Smoking" was prepared by Hugh Baines Research for BATCo. One section of the report focused on children's motivations to begin smoking, finding that: "Children's reasons for experimenting with smoking: Children start to experiment with smoking for a variety of reasons. Observing adults smoking, children from a very early age often use substitute objects as 'pretend cigarettes' in play, mimicking the actions adults make when smoking." 500287512-7596 at 7532 (US 20624) (A).

4414. An August 2, 1994 letter from Laura Moorhead at Campbell Mithun & Esty, an advertising and marketing communications firm, to Donnar Sengalaub, a B&W Marketing Financial Analyst, showed that in 1994, B&W was placing its media and sale promotion dollars behind Kool rather than its other brands such as Viceroy and Capri. An August 25, 1994 invoice from Campbell Mithun & Esty indicated that in 1994 B&W placed Kool advertisements in magazines with a substantial youth readership, such as *Sporting News* and *Sports Illustrated*. According to MRI data, nearly 28% of readers of *Sporting News*, and nearly 18% of readers of *Sports Illustrated* were between the ages of 12 to 17 in 1994. 671443677-3677 (US 20974) (A); 461301164-1167 at 1166 (US 21994) (A); Krugman WD, 116:3-122:7.

4415. Carl Schoenbachler, President and CEO of BATIC, testified that B&W in the mid-1990s was interested in acquiring Santa Fe Tobacco because B&W needed to address the problem of having "a fairly old brand portfolio when measured in demographic ter" Santa Fe Tobacco's main brand, American Spirit, had "grown year after year after year and so, and . . . [was] a very much younger, ASU 30 type of brand." BATIC is the upstream parent of Brown and Williamson Tobacco, which ultimately is owned by BATCo. BATIC is a holding entity for Brown and Williamson Tobacco and related tobacco subsidiaries, and also provides management services for Brown and Williamson. Schoenbachler testified that Santa Fe Tobacco was ultimately purchased by RJR. Schoenbachler PD, United States v. Philip Morris, 10/29/02, 37:14-40:5.

4416. Sharon Smith, when she was Director of Creative Services and Director of Lucky Strike, attended meetings annually in London with individuals from other BAT group companies where information and research was shared concerning Lucky Strike advertising. Although B&W claims it does not market to persons under age 21 or perform market research using persons under age 21, the BAT global policy is that it markets to and conducts market research on persons ages 18 and above. BAT group companies conducted consumer research on Lucky Strike which included individuals as young as18 that was shared with individuals at B&W. Smith WD, 37:23-39:6; 500049909-9912 (US 20618) (O); 283000783-0789 at 0783-0784 (US 87810) (A).

4417. The 1995 Brand Plan for Lucky Strike cigarettes stated that one of the brand's strengths was its "young adult male franchise in most [i]nternational markets." The Brand Plan also discussed the opportunity to attract YAUS (young adult urban smokers) because of the "[a]ging consumer profile for Marlboro." The target consumers for Lucky Strike were described

as "independent young adult males who are the role models that will lead a breakaway from the herd mentality of Marlboro." 500029079-9090 at 9080-81 (US 66280) (A).

4418. On January 11, 1995 Tim Rutter, Creative Alliance employee, sent a document entitled "Growing the Kool Franchise" to Robert John Dunham, Kool Brand Manager, which included "initial, topline ideas for enhancing the growth of Kool." Rutter stated that "[t]he Kool franchise continues to age, attracting fewer and fewer new customers each year." Suggestions for "growth" include vending machines and Kool signage inside jukeboxes in bars and nightclubs. 291001508-1508 (US 67743) (A); 291001509-1515 at 1509, 1513 (US 22992) (A).

4419. A letter dated October 10, 1995 from Nicholas G. Brookes, B&W Chairman and Chief Executive Officer, to Hilary Barton, BATCo employee, enclosed "briefing notes" including one entitled "B&W's Strategic Vision." The notes stated that in 1995 B&W's strategic vision was to generate "sustainable long-term growth through increased penetration of young adult smokers (Kool, Lucky Strike)." The briefing notes also stated that "[b]uilding a strong position in the YAS segment has been identified as a priority during the plan period." 582302425-2436 at 2426, 2434 (US 20942) (O).

4420. B&W Director of Creative Services Sharon Smith testified this case that the "B Kool" campaign grew out of "Project Look." "Project Look" was an effort in the mid 1990's by B&W to re-position Kool as a brand for so-called "young adult smokers" when market research showed that Kool received low ratings for "leading brand," "kept up with times," and "for a younger adult." Kool was B&W's most profitable brand and the success of B&W depended on the success of Kool. As discussed in an April 28, 1998 Business Briefing video featuring Senior Market Analyst Nick Wilkerson, the purpose of "Project Look" -- which included the new Kool soft and box packs, the "Team Kool Green" Indy car, and "B Kool" advertising campaign -- was

to reestablish the Kool brand among younger adults. Wilkerson stated in the video that B&W wanted to launch these campaigns at the beginning of 1998, before the marketing environment became more restricted. Smith WD, 7:11-18, 10:11-15; 582302425-2436 at 2426 (US 20942) (O); USX1640103-0104 (US 47668) (A); DXA1100054-0054 (US 87811) (A).

4421. A 1996 B&W study of the Kool brand reported that "Young Adult Smokers (YAS) represent approximately 11% of total smokers in the U.S." and that "[b]uilding a strong position in the YAS segment is critical to achieving long-term sustainable growth in the U.S. market." The document further stated that B&W "Continues to Significantly Underperform" in this important segment. 314002773-2792 at 2776 (US 21835) (A).

4422. In a 1996 BATCo memorandum entitled "Brand Portfolio Strategy Development," Bob Miller, BATCo's Head of Marketing Information, stated that "[g]aining young adult smokers is critical for the future growth of our brands and business (ergo, YAUS [young adult urban smokers] target audiences across many key brands)." 780011787-1790 at 1787 (US 22197) (A).

4423. A March 27, 1996 Marketing Research-Initiating Project brief outlined a research project in conjunction with the 125th anniversary of the Lucky Strike trademark. The objective of the research was to "understand consumer's general perception on the idea of . . . celebrating the 125th anniversary of the Lucky Strike Trademark." Participants in the research included individuals as young as 18. The research results were to be submitted to the Lucky Strike United States International Brand Group in Louisville, including Paul Wessel, a Vice President of Marketing at B&W. This evidence contradicted the company's professed policy of not conducting marketing research on individuals under 21. 780003262-3264 at 3262-3263 (US 22196) (A); 66000000-0024 (US 87813) (A); 307000035-0036 (US 87814) (A); 465960989-1027 (US 87815) (A); 465961028-1029 (US 87816) (A).

4424. Paul Wessel, B&W Divisional Vice President, testified in this case that employees in the International Brand Group in Louisville had access to a database that included research on individuals under 21, despite B&W's policy of not conducting consumer research on individuals under 21. He further testified that these consumer surveys included information on brands such as Lucky Strike and State Express 555 which are sold in the United States. When asked whether the consumer surveys were limited to individuals under 21, he testified that "they would go market by market, subject to age of majority . . . [and that] some markets go lower than 21, down to 18." Wessel PD, United States v. Philip Morris, 3/19/03, 64:6-71:4.

4425. In the "Project Look Overview Brief" dated October 1, 1996, Nick Wilkerson, Director of Market Strategy and Development for B&W, discussed "Kool's shortfalls in image attributes [among] . . . Young Adult Smokers." The document indicated that Project Look aimed to "return Kool to its heritage by making the brand relevant over time to male smokers aged 21-30" by sponsoring race events and by the promotion of sports and music events. With respect to promotions, the document stated that "primary consideration should be given to addressing the wants and needs of Noisy Boys." 295020733-0739 at 0734, 0736-0737 (US 36451) (A).

4426. A summary of an October 11, 1996 B&W marketing meeting in Louisville documented that

800058817-8821 at 8820 (US 56547) (A) (Confidential).

4427. A November 7, 1996 document entitled

stated that one of BATCo's the

The Marketing Plan also disclosed that, for the State Express 555 brand,

800251281-1299 at 1282, 1287 (US 56593) (A) (Confidential).

4428. The 1997 Media Plan for Kool cigarettes listed the following among its objectives" "Communicate 'Up-to-Date', 'Leading Brand', 'Quality', and Popular.'" The 1997 preliminary list of magazines in which Kool advertisements were placed included publications such as *Spin* and *Sport*, each of which had a youth readership (readers between the ages of 12 to 17) of over 30%. 462205141-5145 at 5141 (JD-011795) (O).

4429. The 1997 Creative Plan For Kool cigarettes included a section on the development of creative images to be used in advertisements, in POS, and in communications to support the Kool Indy car sponsorship. The plan indicated that the images should "[r]eflect masculinity, popularity, and young adult imagery in a manner that differentiates Kool from Newport and Marlboro Menthol through a contemporary exploitation of the Kool Indy car program." 176020757-0775 at 0773 (US 23344) (A).

4430. The 1997 Media Plan for Lucky Strike cigarettes described its "Target" as "21-25 Year Old Male Smokers . . . Bohemian Noisy Boys." 176020856-0926 at 0910 (US 23357) (A).

4431. In 1997 B&W sponsored the H.O.R.D.E. (Horizons of Rock Developing Everywhere) Festival, an annual all-day music festival which was staged in 28 cities across the United States over the summer. Prior to the H.O.R.D.E Festival, B&W sponsored the "Extremely Kool Band-to-Band Combat" competitions in 10 United States cities "with the grand prize being the opening act on the Second Stage at three H.O.R.D.E shows." The objectives for the "Extremely Kool Band-to-Band Combat" competitions included "[i]mprov[ing] perceptions

of Kool as a popular, up-to-date, leading brand" and capturing names for B&W's smoker database. 306014279-4279 (US 22102) (A).

4432. A 1997 BATCo report entitled

stated that

325335439-5468 at 5443, 5445, 5451 (US 24093) (A) (Confidential).

4433. Other internal documents confirm that B&W sought to "update the image of its Kool brand" with its "B Kool" advertising in the late 1990s. Advertising awareness for Kool increased between 1997, when the "B Kool" campaign was initiated, and 1999. Adult smokers under 30 who were aware of the advertising were more likely to associate Kool with "key imagery measures" that included popularity and sophistication. The "B Kool" campaign communicated an image of the Kool smoker as independent. Masculinity and confidence were also themes associated with the B Kool campaign. Masculinity, popularity, sophistication and independence are all themes that appeal to youth. 462110343-0376 at 0344 (US 22490) (A); 309031048-1071 at 1051 (US 22660) (A); 315022030-2207 at 2041 (US 22496) (A); Biglan WD, 36-95; Krugman WD, 94:1-99:23; Smith WD, at 16:20-17:6.

4434. A February 12, 1997 agreement between B&W and Gateway Motorsports Corporation made Kool the "Official and Exclusive Tobacco Sponsor" of the 1997-1998 CART World Series event at Gateway International Raceway. B&W received the right to display Kool banners and signage around the racetrack, as well as point of sale signage "in and around all

concession areas." The agreement also included provisions guaranteeing that Kool would receive six P.A. announcements each day of the event, and provisions authorizing B&W to conduct a direct mail promotion in connection with the event. 323011515-1519 at 1515-1516, 1517 (US 47068) (A).

4435. A May 30, 1997 BATCo plan entitled "Lucky Strike – Strategic Development of Get Lucky Campaign" produced from the files of B&W demonstrated that B&W had access to and reviewed BATCo marketing research using smokers under 21. The plan discussed Lucky Strike's "[e]xtremely successful sales results . . . achieved in the two key test markets," and indicated that the principal target group of the Lucky Strike campaign was male young adult urban smokers ages 18 to 25 who were "opinion leaders and trend setters." The document described Lucky Strike as: "James Dean – an archetypal Luckies smoker," "a legendary marque of teenage rebellion and rock 'n' roll heroes of the 1950's." It stated: "Lucky Strike is one of the greatest 'badges' of all time . . . . Cigarette consumers crave this sort of 'badge'; it is more important to them than anything else. This sort of authenticity is rare and invaluable since it demonstrates to peer groups that you are 'in the know.'" 844002422-2437 at 2432, 2434, 2437 (US 21921) (A).

4436. An August 21, 1997 letter from Roger DiPasca at Grey Advertising to Nick Wilkerson, Sharon Smith and Leslye Thornton, Manager of Marketing Research at B&W, included information regarding a "psychographic" study the focus of which was young men whose personalities were described as "noisy boys #2 and 3." 220280849-0849 (US 20542) (A).

4437. Nicholas Brookes testified in this case that B&W advertised its Kool cigarettes using a marketing campaign known as "B-Kool." According to Brookes, the campaign had an "ASU 30 [adult smoker under 30] focus" and was "focused on a play of words . . . around the

name of our brand Kool." When asked whether B&W considered whether the "phrase 'B Kool' might be attractive to youth," Brookes responded: "I am sure we did not." Brookes PD, United States v. Philip Morris, 3/31/03, 58:19-60:24.

4438. B&W continued its efforts to market via various types of music. GPC, a B&W Brand, was the title sponsor of the 1998 and 1999 George Strait Country Music Festival National Tours. The festivals were comprised of 10 or 12 events across the summer months, with activities such as a country and western GPC smoking room; GPC also appeared on promotional material for selling tickets and signage. 283204039-4040 (US 85221) (A).

4439. An April 6, 1998 B&W memorandum entitled "Kool Mix Nights" from Jeff Picket, Manager of Trade Marketing Promotions, to Roger DiPasca at Grey Advertising suggested promotions at urban dance clubs. 210430224-0228 (US 21825) (A).

4440. "BAT's America-Pacific Regional Plan 1999-2001," circulated for editing by B&W employee Doug Brown on October 22, 1998, stated BATCo's regional strategy: to

The Kool portion of the Regional Plan described initiatives implemented to position Kool for long term share growth

Two prior initiatives implemented in new advertising creative and new packaging, increased awareness

142000500-0663 at 0503, 0558-0559 (US 23342) (A) (Confidential).

4441. A December 8, 1998 TMG Worldwide proposal to B&W for the development of a Kool brand loyalty program contained a situation analysis that provided information on the growth of the age 18 and older "smoker universe." The report detailed the growth of the Marlboro, Newport, and Camel brands from 1994 to 1998 among this population in contrast to the decrease in the number of Kool smokers among the same population. 318034354-4406 at 4360-61 (US 22215) (A).

4442. In a 1999 slide presentation entitled "ASU30 Project," manager Rick Stevens analyzed BATCo's "ASU30 Performance 1998," stating that younger adult smokers were a "critical factor in the growth and decline of every major brand and company over the last 50 years." Furthermore, a slide entitled "Value of YAS," included the admissions "[m]arket renewal is almost entirely from 18 year old smokers" and "[n]o more than 5% start smoking after age 24." The slide presentation also included an analysis of "Generation Y" that observed "one in nine teenagers has a credit card." 321539777-9806 at 9782, 9787-9788 (US 24084) (O). This view of the fundamental importance of attracting the youth market is shared by B&W: in this case, Sharon Smith testified that it was preferable for a cigarette brand to have a young age profile. Smith WD, 14:23-15:1.

4443. A May 19, 1999 memorandum from Patrick Carroll, BATCo affiliate employee, to Brian O'Connell, a BATCo employee, and copied to Susan Ivey, then CEO of B&W and now head of Reynolds American, entitled "Potential Marketing Uses on the Internet," stated that "the most valued smoker at BAT is the ASU 30." 321884042-4042 at 4042 (US 88159) (A).

4444. In testimony in this case, Carl Schoenbachler, current president and CEO of BATIC (a former parent of B&W Tobacco and holding entity for B&W Tobacco), was asked if the statement, "The key to sustainable long-term profit growth in the U.S. is ASU30," was

accurate. Schoenbachler responded: "Yes, I would say that's true." He explained that "there tends to be a great deal of loyalty in cigarette brands. So, just a natural mathematical equation would suggest if you -- if you don't have thirty-year-olds smoking your product, you won't have forty-year olds and fifty-year-olds. It's a very brand loyal business." Carl Schoenbachler conceded that there would be a financial benefit for B&W if it was able to obtain market share in the under 21 age group. He also testified that although the company has a stated policy of not marketing to non-smokers, "it was a reasonable conclusion" that B&W would become unprofitable if non-smokers did not become smokers. Schoenbachler PD, United States v. Philip Morris, 5/21/02, 72:16-21, 73:13-22, 141:11-141:21; 152:20-25.

4445. A regional overview of the American Pacific strategies, entitled and produced from the files of B&W, stated that

One of the was

250300207-0268 at 0210, 0222 (US 25512) (A) (Confidential).

4446. In May 2000, B&W launched a new advertising campaign for Kool known as the "House of Menthol" campaign. B&W sought to market to youth through its "House of Menthol" advertising. Richard Newman, executive vice president and worldwide account director at BATES USA, stated that one of the meanings associated with "House" is house music, a type of

music that is popular with teenagers. 700500191-0193 at 0193 (US 85223) (A).

4447. Contrary to its public assertions that it does not conduct research on individuals under 21, B&W, as recently as 2001, conducted focus group research on individuals as young as 18. A January 16, 2001 email from Kevin Korte, B&W Senior Manager, Process Innovation and Recon Development, to a BATCo employee, indicates that

271101190-1121 at 1194-1195 (US 22210) (O) (Confidential).

4448. Nicholas Brookes conceded in testimony in this case that it is possible that some nonsmokers might be "prompted by an advertisement" to start smoking. Brookes PD, United States v. Philip Morris, 3/31/03, 77:17-78:1.

4449. The former President and CEO of B&W, Susan Ivey, now CEO of Reynolds American, testified that advertising targeting young adults ages 21-30 could also appeal to youth. Ivey WD, 16:4-6.

4450. Carl Schoenbachler, current president and CEO of BATIC, testified that B&W's marketing expenditures have increased since the MSA. Schoenbachler PD, United States v. Philip Morris, 5/21/02, 108:20-109:5.

4451. Paul Wessel, B&W Divisional Vice President, testified in this case that B&W defined youth as "people who are below the age of majority to smoke," which would be 19 in certain states. Wessel also testified that B&W would market to individuals as young as 19 in states where that was the age of majority. Therefore, contrary to its stated policy not to market its product to individuals under 21, B&W marketed its cigarettes in certain circumstances to individuals under 21. Wessel PD, United States v. Philip Morris, 3/19/03, 58:21-59:9.

(g) RJR Intentionally Marketed To Youth Contrary To Its Public Statements

4452. RJR requested and obtained a proposal dated March 14, 1958 from George MacGovern of the William Esty Company to study high school students' attitudes toward cigarette smoking. 501113763-3764 (US 22361) (A).

4453. A December 9, 1959 letter from MacGovern to W.A. Sugg, RJR, enclosed a marketing study of the smoking habits of high school and college students undertaken by the William Esty Company resulting from the March 14, 1958 RJR proposal. One of the conclusions reached was that, "Preference-wise, CAMEL and WINSTON are shown as holding their shares substantially constant while SALEM increased its share, especially among high school students." 501113723-3730 at 3723 (US 22366) (A).

4454. The December 1958 report prepared at RJR' request was entitled "Summary of Findings" of "The Youth Research Institute Study Regarding Cigarette Smoking Among 8,112 High School and College Students in 82 Cities Throughout the United States, October-November, 1958." The report included data and conclusions on smoking incidence, smoking volume, and brand preferences of 3,052 high school students, 58% of whom were smokers, and 5,060 college students, 73% of whom were smokers. Both the high school and the college categories were further broken down into "freshman-sophomore" and "junior-senior" classes. 501113743-3749 at 3744 (US 22362) (A).

4455. George MacGovern, of the William Esty advertising agency, sent a January 16, 1964 letter to RJR that attached a plan in response to another RJR' request for research proposals to study, among other things, trends "on cigarette smoking at the teen-age level." 517145828-5830 at 5828 (US 80621) (A).

4456. A lengthy February 1964 report prepared for RJR by the William Esty Company

summarizing a national report on smoking trends included further information on smoking incidence, smoking volume, and brand preferences for 8,863 families who participated in the National Family Opinion ("NFO") panel. Information in this report was collected on smokers as young as 16. 500396569-6607 at 6572 (US 20632) (A).

4457. In a March 12, 1964 letter from W.A. Sugg at RJR to William S. Smith of the Tobacco Institute Advertising Committee, Sugg attached the February 1964 study and stated: "We [RJR] put a similar survey in the field about February 10. . . . This and later studies will help us in evaluating changes in incidence of smoking, volume of smoking, and brand switching resulting from the report of the Surgeon General's committee and subsequent developments. . . . **The most interesting finding in the study is the great strength of WINSTON among young smokers, the brand having its highest preference share with teen-agers**, its next highest with young adults, and its lowest popularity with smokers 50 years of age and older." 501795141-5141 (US 20687) (A) (emphasis added).

4458. A March 16, 1965 document produced from the files of RJR contains charts on the audience composition of various daytime television programs, including one reporting data on the percentage of viewers under age 17 for programs such as *Andy of Mayberry*. Subsequent charts break down the viewership of these programs into age groups as young as 2 to 5 years old. According to this document, 35.7% of the total viewers of *Andy of Mayberry* were between the ages of 2 and 5. 501934748-4757 at 4748-4749 (US 87818) (O).

4459. In an April 9, 1968 memorandum entitled "Teenage and Adult Smoking Attitudes," T.P. Haller, Marketing and Research Department at RJR, recommended that RJR needed semi-annual studies of teenagers (both smokers and non-smokers) in order to "forecast our future requirements in leaf buying, plant facilities, manpower, etc." Among other benefits,

Haller stated that the study "will put light on the very vital teenage sector of the market." 517142447-2448 (US 21659) (A).

4460. In a September 19, 1969 draft document entitled "Proposal of a New, Consumer-Oriented Business Strategy for RJR Tobacco Company," Claude E. Teague, Assistant Director of Research, analyzed the behavior of the "pre-smoker," Teague's term for a person who had not yet begun to smoke, most often a teenager. In his analysis, Teague stated that "the propensity of a pre-smoker to begin to smoke cigarettes is largely determined, on the positive side, by the gratifications he expects to receive. These are largely social and emotional gratifications which may be completely offset by health anxieties and changes in the social acceptability of smoking." 500915701-5719 at 5706 (US 21433) (A) (emphasis in original).

4461. As early as 1964, as set forth above, and during the 1970s, RJR gathered and interpreted data on the smoking habits of 14 to 17 year olds from the National Family Opinion ("NFO") survey results. National Family Opinion data could be used to determine how underage smokers perceived certain aspects of certain brands. Donald Tredennick, Manager of Marketing Research at RJR, testified that during the 1970s he could use information from publicly available sources to determine why people under 18 started smoking. Tredennick further testified that, in the mid-1970s, RJR became aware by using various consumer research methods that their "share of market among younger people [was] much lower than it had to be in order to maximize [their] volume." Tredennick PD, 5/13/02, 42:16- 46:20, 104:3-105:05, 148:22-149:09, 144:05-22, 171:07-24. The data on "teenage smokers" (14-17) from the NFO enabled the company to become very familiar with the teenage smoking market. Specifically, using the data, the company could calculate: the relative share of RJR in capturing this market; the share of each of the company's competitors in this age group; RJR's share among this age group among its own

key brands; the share of the company's competitors in this age group by key cigarette brands, the share of the total market broken down by age and gender, and the number of cigarettes smoked per day in this age group broken down by gender. 501443912-3921 at 3913-3915 (US 20681) (O).

4462. At an April 7, 1971 meeting between representatives of the RJR's Marketing Research Department and the William Esty Company, RJR decided to include and count smokers ages 13 and under and to begin profiling 14 to 20-year olds in future National Family Opinion surveys. 500347108-7111 (US 20628) (A).

4463. A July 2, 1971 letter from William Esty Company to Jerry Clawson, RJR's Marketing Research Department employee, reported the preliminary findings of a study requested by RJR regarding "smoking incidence and preference shares, by age, among those aged 14 to 20 responding to the new questionnaire" during the National Family Opinion survey. The letter concluded, "[f]inally, Jerry, you expressed interest in learning the number of cigarette smokers 13 or younger found in the sample. There were 14 such smokers [out of sample of 1,850 respondents], thirteen aged 13 and one aged 12." 506052583-2584 (US 20751) (A).

4464. A November 29, 1971 report issued by the RJR's Marketing Research Department entitled "Marketing Research Report on NFO [National Family Opinion] Profiles for Camel Regular and Filter [Cigarettes]" concluded that "there are indications of progress in expanding our franchise among younger adult smokers." Attached to this report was a chart entitled "Younger Smokers - Ages 14-20." 501426066-6095 at 6067, 6095 (US 20679) (A).

4465. Claude Teague wrote an April 14, 1972 report entitled "Research Planning Memorandum on the Nature of the Tobacco Business and the Crucial Role of Nicotine Therein." On the topic of smoking initiation, Teague wrote that a smoker "appears to start to smoke for

purely psychological reasons -- to emulate a valued image, to conform, to experiment, to defy, to be daring, to have something to do with his hands, and the like. Only after experiencing smoking for some period of time do the physiological 'satisfactions' and habituation become apparent and needed. Indeed, the first smoking experiences are often unpleasant until a tolerance for nicotine has been developed." 500915683-5691 at 5686-5687 (US 20659) (A). Teague repeated these statements, almost verbatim, in a 1973 memorandum discussing "factors influencing pre-smokers to try smoking, learn to smoke and become confirmed smokers." 502987407-7418 at 7408 (US 20708) (A).

4466. A September 21, 1972 memorandum written by Joseph H. Sherrill, Director of Marketing Research at RJR, to William S. Smith, Tobacco Institute Advertising Committee, entitled "Company Shares Broken by Age Groups" stated "Philip Morris [is] the fastest growing company . . . among smokers under 35" and "that in the last six years Marlboro King has almost doubled its share with most all of its growth coming from young adults." 500769839-9840 at 9839 (US 21454) (O).

4467. A September 26, 1972 memorandum entitled "Share of Smokers: By Age - Top Ten Brand Items" from Sherrill to Smith included tables tracking brand share among teenagers ages 14 and older based on April 1972 data. In the memorandum, Sherrill stated that "Marlboro King and Kool King have significantly higher shares among younger smokers than among the population in general." 500810043-0046 at 0043 (US 21456) (O).

4468. In an October 25, 1972 letter to Robert A. Rechholtz, RJR Vice President and Marketing Director, Beverly Walker of Universal Pictures solicited the use of contemporary Winston and Camel cigarette radio advertisements for placement in the film "American Graffiti." Walker stated that "[t]he value of this type of subliminal advertising is known and accepted by

now. It certainly seems an excellent means of having your products identified with the warmest aspects of American life, to a captive audience at 'prime' time." 500201433-1433 (US 21875) (O).

4469. In a February 2, 1973 RJR research planning memorandum entitled "Some Thoughts About New Brands of Cigarettes for the Youth Market," Teague addressed a dramatic decline in RJR market share due to Marlboro's success in attracting new teenage smokers. Teague addressed the significance of the underage market in these terms:

> At the outset it should be said that we are presently, and I believe unfairly, constrained from directly promoting cigarettes to the youth market; that is, to those in the approximately twenty-one year old and under group. Statistics show, however, that large, perhaps even increasing, numbers in that group are becoming smokers each year, despite bans on promotion of cigarettes to them. If this be so, there is certainly nothing immoral or unethical about our Company attempting to attract those smokers to our products. We should not in any way influence non-smokers to start smoking; rather we should simply recognize that many or most of the '21 and under' group will inevitably become smokers, and offer them an opportunity to use our brands. **Realistically, if our Company is to survive and prosper, over the long term, we must get our share of the youth market. In my opinion this will require new brands tailored to the youth market** . . . . Thus we need new brands designed to be particularly attractive to the young smoker, while ideally at the same time being appealing to all smokers. Several things will go to make up any such new "youth" brands . . . What image? and What quality? Perhaps these questions may best be approached by consideration of factors influencing pre-smokers to try smoking, learn to smoke and become confirmed smokers.

502987407-502987418 at 7408 (US 20708) (A) (emphasis added).

4470. Donald Tredennick, former Director of Consumer Research at RJR, subsequently reviewed the aforementioned Teague memorandum entitled "Some Thoughts About New Brands of Cigarettes for the Youth Market," and made extensive notes on a copy of the memorandum. His handwritten comments included: "Outlandish attempt to exploit perceived vulnerabilities of

youth (clearly 19 + under) . . . must start before 18 . . . clearly 21 + under including 'teens' . . . although bad marketing, his intent is clearly to induce non-smokers to become smokers . . . **almost the smoking gun**." 519556867-6878 at 6867-6868, 6871 (US 85227) (O) (emphasis added).

4471. John McCain of the William Esty advertising firm sent a March 8, 1973 letter to Jack Watson at RJR concerning National Family Opinion preference share data for 14-20 year old Marlboro and Winston smokers. McCain wrote that "[m]any manufacturers have 'studied' the 14-20 market in hopes of uncovering the 'secret' of the instant popularity some brands enjoy. . . . Creating a 'fad' in this market can be a great bonanza. To date, success, if it comes, has often been a function more of luck than of prior marketing perception." 508453918-3920 at 3919 (US 20812) (A).

4472. An April 12, 1973 RJR marketing group memorandum credited Marlboro's appealing advertising for its growing market share, particularly among young smokers:

> **The Reynolds marketing group feels that the favorable share trend for Marlboro as compared to Winston is due almost entirely to the fact that Marlboro has hit upon a highly successful advertising copy approach**. . . . Marlboro's ability to gain market share while Winston is losing market share should, in my judgment, be the primary concern of Reynolds in the cigarette field. . . . In my opinion some way must be found to sharply reverse the present market share trend on Winston vs. Marlboro if Reynolds is to retain its preeminent position in the cigarette field. It was said that young smokers are smoking Marlboros two-to-one over Winstons. This is an alarming statistic for Winston.

500165434-5439 at 5437-5438 (US 21494) (A) (emphasis added).

4473. A May 4, 1973 proposal entitled "Meet the Turk" was presented to RJR management "to expose Management to the opportunity to aggressively position Camel Filter against the young adult market (male)." The proposal stated that males aged 14 to 34 "represent

approximately 35% of 85 mm NFF [non-filter full flavor] smokers." 500723696-3718 at 3697, 3699 (US 20647) (A).

4474. The November 1973 RJR Winston Box Marketing Plan recommended increasing marketing efforts to support the Winston box franchise because "[b]oth Winston and Marlboro enjoy their strongest franchise among the under 25 year old smoker and especially the young male smoker" and "[w]hile only 7.2% of all adult smokers (18 and over) smoke a cigarette in a Box, **24.4% of those 14-20 yrs. . . . smoke a Box cigarette**" 500724265-4313 at 4272, 4273 (US 20648) (A) (emphasis added).

4475. A December 4, 1973 inter-office memorandum entitled "Cigarette Concept to Assure RJR a Larger Segment of the Youth Market" from Frank G. Colby, Associate Director of Scientific Information at RJR, to R.A. Bleyins stated that to succeed in the youth market, the company should "develop a new RJR youth-appeal brand" that "delivered more 'enjoyment' or 'kicks.'" The memorandum stated: "**it should be easy to develop, within a relatively few weeks, these new youth-appeal cigarettes for market testing** for which the following advertising claims could be unequivocally proven: They will deliver more flavor, more enjoyment, and more puffs for the money than any large selling cigarette on the market, or for that matter, than any other cigarette now on the market." 501166152-6153 (US 23051) (A) (emphasis added).

4476. A December 5, 1973 RJR internal study entitled "Salem 'Ripe 'n' Ready' Campaign Evaluation - Final," included a profile of black smokers ages 14 to 20. The study discussed the Salem "Ripe 'n' Ready" campaign, which was designed to increase Salem's market among black smokers but which was eventually terminated because it "failed to achieve its objective." 500791561-1577 at 1566 (US 85228) (A).

4477. In 1974, Donald Tredennick, Manager of Consumer Research for RJR, was directed by a supervisor to determine what caused smokers to select their first brand of cigarettes. In response to this direction, Tredennick sent a July 3, 1974 memorandum to F. Hudnall Christopher, Director of Marketing Research for RJR. Using publicly available sources and consumer surveys of people over 18, Tredennick found that "most smokers begin smoking regularly and select a usual brand at or before the age of 18." Tredennick further stated: "If a person is going to smoke cigarettes, he generally starts during his teens, primarily to conform with a close friend or friends, to give himself greater confidence in stress situation, or to avail himself or [sic] the physical enjoyment smoking offers . . . . The main causes of initial brand selection; i.e., the influence of friends, the user image a brand projects and differentiated product characteristics, are logically related to the reasons a young person begins to smoke." A table entitled "Age Started Smoking," which included a category for "12 & Under," was appended to this memorandum. 501899346-9359 at 9346, 9351, 9352 (US 20688) (A).

4478. A February 28, 1974 inter-office memorandum from A.H. Laurene, Director at RJR, to Murray Senkus, Director of Research for RJR, and Claude Teague, with the subject "New Product Proposals Which Would Require Some Research," indicated that "a low tar cigarette ('tar' range of VANTAGE and below) with good Marlboro character might be a winner in the youth market and in the elder Marlboro smokers' market." The memorandum proposed research and development of a "Camel Filter cigarette with increased free nicotine level and more Camel than Winston taste." 508116703-6704 (US 20808) (A) (emphasis in original).

4479. Joan F. Stuart, RJR marketing research employee, sent a March 15, 1974 letter to National Family Opinion. In the letter, RJR requested that, when National Family Opinion conducted its consumer surveys, it continued to question 14 to 18 year olds. The letter also

requested different types of reports from National Family Opinion, including those entitled "Product Testing Availabilities," "Smoking Incidence and Brand Preference - ages 14-17," and "Sales Promotion/Special Events." 500487414-7416 (US 21865) (A). On April 16, 1974, Stuart sent another letter to National Family Opinion. In this letter, she asked NFO to separately break out the results of the sales promotion questions for "men over 17 years of age." 500571477-1478 at 1477 (US 22498) (A).

4480. In a March 21, 1974 letter from Jane Z. Martin of RJR's Marketing Research Department, to National Family Opinion's Kathe E. Schultz, Martin enclosed "the following books from [its] October, 1973 Screening of Smokers: . . . Cigarette Switching Matrix (Ages 14-20) . . . Cigarette Brand Preference Report (Ages 14-20)." 501375647-5648 at 5647 (US 48840) (O).

4481. According to an RJR conference report, Teague met with RJR's internal marketing staff and representatives from outside advertising agency Tatham-Laird & Kudner on June 5, 1974. The report of this meeting identified RJR's developments in the area of creating a "Cigarette Designed for Beginning Smokers," stating: "This cigarette would be low in irritation and possibly contain an added flavor to make it easier for those who have never smoked before to acquire the taste for it more quickly. It would not necessarily be low in tar and nicotine content. The taste would be somewhat bland; there would be minimal after taste/buildup – which would tend to cut down on the 'motorman's glove' morning-after mouth taste . . . . The idea is based on the fact that smoking to the initiate is a fairly traumatic experience." 501186367-6369 at 6367 (US 20673) (O); 500254578-4580 at 4578 (US 48080) (A).

4482. Douglas Cummins, an RJR employee, sent a September 24, 1974 letter with attachments entitled "Salem [cigarette brand] Back-Up Advertising [and] Creative Development

Statement" to A.M. Allen, William Esty Company. The letter discussed Salem's "image problem among young adults as identified by several research studies over the past year (including focus groups, the segmentation study, etc.). . ." According to the letter "[t]he attached sheet outlines the objective and strategy and should serve as a guide for all of us in evaluating new [cigarette] campaign alternatives." The creative strategy was to "[i]mprove the Brand's image among young adults" by repositioning Salem's personality: "[t]his Brand 'personality' positioning will also provide, as a secondary benefit, an image which will improve Salem's attractiveness to . . . current Kool smokers . . . as well as to the majority of young adult smokers entering the cigarette market for the first time." The letter recommended communicating "simple, clear product benefit(s) compatible with the projected [cigarette] Brand personality" which "should serve as a rational handle for the consumer to use to justify Salem trial even though his real motivation for trial may be our improved image. In effect, then, our image advertising will be working through the 'back door' of the consumers' mind." 501721136-1140 at 1136-1137 (US 21868) (O).

4483. A September 30, 1974 RJR document entitled "1975 Marketing Plans Presentation" (also referred to as "The Hilton Head Report") stated: "In 1960, this young adult market, the 14-24 age group, represented 21% of the population. . . . [T]hey will represent 27% of the population in 1975. They represent tomorrow's cigarette business. **As this 14-24 age group matures, they will account for a key share of the total cigarette volume – for at least the next 25 years.**" The presentation discussed the importance of youth smokers in reestablishing RJR's share of market growth and setting the marketing strategy that would be implemented to gain market share among youth. 500746950-6976 at 6951 (US 21609) (A) (emphasis added).

4484. In a November 26, 1974 memorandum entitled "R.J. Reynolds Tobacco Company

Domestic Operating Goals," the company stated its "[p]rimary goal in 1975 and in ensuing years is to reestablish RJR's share of growth in the domestic cigarette industry." Increasing the young adult franchise was crucial to reestablishing RJR's growth because the "14-24 age group in 1960 was 21% of population; in 1975 [it] will be 27%. . . . [and a]s they mature, will account for key share of cigarette volume for next 25 years. Winston has 14% of this franchise, while Marlboro has 33% – Salem has 9% – Kool has 17%." The memorandum indicated that RJR "will direct advertising appeal to this young adult group without alienating the brand's current franchise." 500796928-6934 at 6928 (US 22363) (A); 500796976-6983 at 6977 (US 21610) (O).

4485. In a "Secret" memorandum dated January 23, 1975 to RJR President of Marketing Charles Tucker, James F. Hind advised: "Our attached recommendation to expand nationally the successfully tested 'Meet the Turk' ad campaign and new Marlboro-type blend is another step to meet our marketing objective: To increase our young adult franchise. **To ensure increased and longer-term growth for Camel Filter, the brand must increase its share penetration among the 14-24 age group which have a new set of more liberal values and which represent tomorrow's cigarette business**." A handwritten cover memorandum to the "Secret" Hind memorandum revealed that Tucker subsequently obtained company approval of the "Turk" recommendation. 505775556-5561 at 5556, 5557 (US 78787) (O) (emphasis added).

4486. A document entitled "Smokers Screening – April 1976 Profile (14-17)" conducted by National Family Opinion for RJR contained 1976 brand preference information for respondents aged 14 to 17. 501376255-6406 (US 20678) (A).

4487. Dawson admitted in her modified written direct testimony that, while she was spokesperson for the Tobacco Institute and its member companies, she made statements that the tobacco industry had a longstanding commitment that young people should not smoke; yet, no

one from RJR informed her that in its internal 1975 memoranda, RJR set forth its intent to increase its share penetration for CAMEL Filter among the 14-24 year age group in order to ensure increased and longer-term growth. Dawson WD, 87:6-11; 505775557-5557 (US 50861) (A).

4488. J.M. Wallace, RJR Marketing Research Department employee, authored an October 30, 1975 product research report entitled "Share of Smokers by Age Group." Wallace's report provided an "annual update of trends in share of smokers by age. Information is drawn from the April NFO [National Family Opinion] panels." Wallace continued:

> Marlboro's traditional source of strength – younger smokers, though still sizable, is eroding at a rapid rate. Between April, 1974, and April, 1975, Marlboro King showed a five share point loss in the 14-17 year old age group and since 1973, Marlboro King's share of market has declined by eight share points in this segment . . . . Winston King did not capitalize on Marlboro's decline, but exhibited some softness itself - especially in the younger age groups (14-17 and 21-24) . . . . This growth for Salem occurred at a time when Kool King declined substantially in the 14-17 market and the 18-24 market. Thus, while Salem is beginning to show strength in the younger markets, Kool is showing major signs of weakness in the same markets.

500769032-9036 at 9032 (US 21814) (A).

4489. RJR annually engaged in ten year planning forecasts using youth data. According to a March 15, 1976 report entitled "Planning Assumptions and Forecast for the Period 1977-1986 for R.J. Reynolds Tobacco Company":

> The present large number of people in the 18 to 35 year old age group represents the greatest opportunity for long-term cigarette sales growth. Young people will continue to become smokers at or above the present rate during the projection period. The brands which these beginning smokers accept and use will become the dominant brands in future years. **Evidence is now available to indicate that the 14 to 18 year old group is an increasing segment of the smoking population. RJR-T must soon establish a successful new brand in this market if our position**

in the Industry is to be maintained over the long term.

Leary PD, United States v. Philip Morris, 5/2/02,102:9-105:11; 501630269-0288 at 0283 (US 21605) (A) (emphasis added).

4490. A May 4, 1976 RJR document discussed a "HI-FI category," defined as "14 mg [of tar] and lower," including brands such as Marlboro Lights and Winston Lights. This document included data that tracked "HI-FI" smokers ages 14 to 50 and over. 500379448-9474 (US 20629) (O).

4491. Tim Key, RJR Marketing Research Department employee, wrote an August 12, 1976 memorandum to T.L. Ogburn entitled "Share of Smokers by Age Group" which contained "an annual update of trends." The memorandum stated that Winston King's share among 14-17 year olds "is off two points for the second year in a row. Current share is 9%. Conversely, Marlboro King's share among this age group which had shown losses during the past three years was up one point. Current share is 32%." Key stated: "Salem King appears to have retained most of the share gain seen during 1975 among 14-17 year olds. Current share of 9% is only one point off the previous years [sic] high of 10%. Kool King has a larger share at 15% and was even with the previous year." Under "Corporate Comparisons," the memorandum stated: "Philip Morris posted a 4 point gain among 14-17 year old smokers (RJR and B&W each lost 2 points)." 500234050-4051 (US 48071) (A).

4492. An October 8, 1976 RJR Marketing Department Report entitled "Marketing Department Key Issues – Position Papers" observed that adult smokers under age 25 would "show a major shift in brand preference" away from Marlboro and that the decline in Marlboro's share of this market would continue to open the market for another dominant brand to emerge from peer group pressures. The basis for this projection was a National Family Opinion study

showing that "Marlboro's acceptance among 14-17 year olds had dropped from 39% to 32%. This pattern has been repeated by three brands with Pall Mall peaking in 1969, total Winston in 1970, and total Marlboro should peak share in 1978." The report further predicted a "reduction in the number of new smokers" due to "stronger enforcement of laws prohibiting sale of cigarettes to teen-agers," which, according to the report, would have a negative impact on RJR's sales and profits. 500387795-7899 at 7822, 7836 (US 20631) (A).

4493. At trial, CEO Andrew Schindler testified that the information and tracking data collected by RJR on 14-17 year olds was not used to create marketing plans. However, a Salem 1977 annual marketing plan contained information on the market share of certain styles of Salem among 14-17 year olds. Schindler TT, 1/24/05, 10862:5-11; Schindler TT, 1/25/05, 10914:15-10928:21; 505774340-4441 (US 90113) (A).

4494. An October 31, 1977 memorandum to T.L. Ogburn, Jr., written by Jeffrey F. Durgee, RJR Product Design, and copied to J.H. Sherrill, E.N. Monahan, and T.J. Key, regarding "Share of Smokers by Age Group," was "the annual update of trends in share of smokers by age group" with data "drawn from the April NFO panels" that included 14 to 17 year old smokers. The memorandum reported various trends among 14 to 17 year olds, including:

> Perhaps because of their higher susceptibility to fads, peer pressure, etc., younger (14-18) smokers show frequent, short-term changes from one brand to another. . . . As a group, younger smokers probably emulate the smoking habits of smokers in the next oldest group, the 18-24 year olds, since trends for younger smokers tend to follow (by 2-3 years) trends for the latter group. . . . Every year, Vantage and Carlton gain slightly among older (over 35) smokers. At the same time, the popularity of these brands seems to filter down to younger and younger age groups. . . . RJR's share of younger (under 18) smokers continues a 3 year decline. In 1975, RJR brands accounted for 28% of the smokers in this category. Today, they account for 25%. Among younger smokers, only Brown and Williamson brands have shown a similar decline. In contrast, Philip Morris has shown steady gains, not only among

> the younger smokers, but also among the adult (over 18) age groups. If share trends for the past 5 years indicate future share trends, Philip Morris will draw increasing numbers of young smokers (ages 14-35), giving it a decidedly younger franchise.

94681077-1079 at 1077, 1079 (US 32322) (O); 501380878-0982 at 0878-0880 (US 48844) (A).

4495. A June 23, 1978 RJR memorandum from G.H. Durity, Manager, Forecasting Group, to H.H. Cudd, Jr., Business Planning and Research Manager, stated: "**For legal reasons we do not include in our calculations persons under 18, although we recognize that they are potential smokers.**" 501730483-0483 (US 22532) (A) (emphasis added).

4496. A June 30, 1978 report entitled "Demographic Characteristics of Smokers," authored by RJR employee G. Harry Durity, attached tables "display[ing] the demographic characteristics of smokers as compiled from survey data supplied by National Family Opinion (NFO)." The tables included data on the incidence of smoking among males and females ages 14-17. 501989644-9655 at 9644 (US 49012) (A).

4497. In an August 24, 1979 internal document, written in response to a question by RJR employee G.A. Mason as to "whether the young adult market (35 years of age and younger) is responsive to . . . promotions," Kay Brubaker, also an RJR employee, asserted that "the young adult market is most responsive, in terms of participation, to retail sampling, disco sampling, and B1G1F's [Buy one pack get one pack free] in convenience stores." 500686342-6351 at 6342 (US 20646) (O).

4498. A November 11, 1979 letter from Dr. Vernen J. Knott, who was affiliated with the Royal Ottawa Hospital, proposed a five year study both of children as young as eight and of adults to see whether some people are predisposed to be smokers due to intrinsic pyschophysiological factors. Knott hypothesized that, since "smoking alleviates stress," it might have "clinical utility for psychiatric patients." The letter was submitted to the Canadian

Manufacturers Tobacco Council, whose members included Imperial Tobacco, RJR-MacDonalds, Rothmans, and Benson & Hedges. 500944757-4758 (US 20663) (O).

4499. In 1980, the RJR Marketing Development Department issued a series of internal reports entitled "Teenage Smokers (14-17) and New Adult Smokers and Quitters." The reports contained the RJR Marketing Research Department's analysis of the data provided by the National Family Opinion regarding the smoking behavior of 14-17 year-old smokers. 501443912-3921 (US 20681) (O); 501098917-8922 (US 23050) (O); 500768429-8438 (US 20649) (A); 500768427-8428 (US 22341) (A); 501254289-4301 (US 20674) (A); 501254267-4283 (US 22342) (O); 501757367-7384 (US 22343) (O); 500768754-8754 (US 20650) (A); 500794841-4843 (US 20653) (A).

4500. One of the series of "Teenage Smokers (14-17) and New Adult Smokers and Quitters" reports, dated February 1, 1980, written by Stephen R. Perry, RJR Marketing Research Department employee, discussed "franchise aging" – the process of young smokers entering the smoking population as older smokers leave the market, either because they quit or they die. The report stated: "For example, in 1979 approximately one million smokers became 18 years old while approximately 450,000 older smokers left the market. The extent that each company is affected by this process is determined by the age skew of its franchise." This report demonstrates RJR's knowledge that smoking initiation and brand choice most often occurred in the teenage years even before age 18: "[m]any adult smokers have already formed consistent smoking patterns by the time they enter the market at age 18." 501443912-3921 at 3912, 3915 (US 20681) (O).

4501. Another in the series of "Teenage Smokers (14-17) and New Adult Smokers and Quitters" reports, dated February 4, 1980, from Uziel Frydman, an employee of RJR's Marketing

Research Department, was sent to J.B. Stuart, also an employee of the Marketing Research Department. This report stated: "In the last five years, share of cigarette volume of the 14-17 year-olds declined by about 36%, from 3.14% in 1975 to 2.00% in 1979. . . . The share of companies of the 14-17 year-olds has changed very significantly in the last five years: RJR's share declined from 29.9% in 1975 to 21.3% in 1979. A large part of the share loss can be traced to Winston." 500768427-8428 at 8427 (US 22341) (A).

4502. Another in the series of "Teenage Smokers (14-17) and New Adult Smokers and Quitters" reports was dated July 9, 1980, and sent from Kay Duffy, RJR employee, to Uziel Frydman, an employee of the Marketing Research Department; Jerry R. Moore, RJR Marketing Development Department; and S.R. Perry. This report included the claim that the gathering of youth data is "a natural by-product of the tracking of adult smokers" which was conducted "in order to improve our ability to forecast future trends. . . . [and was] not designed to be used as a tool for developing marketing strategies for this population group." The memorandum stated that, while RJR was losing share among young smokers, Philip Morris was gaining share and that "18-24 year olds are more active than any other age group in terms of both quitters and new smokers." 501254289-4301 at 4289, 4297-4298 (US 20674) (A).

4503. Kay Duffy wrote an October 23, 1980 memorandum to L.W. Hall Jr., Vice President of Brands Marketing at RJR, entitled "Younger Adult Smokers." Duffy stated "[s]moking behavior of 14-17 year olds is analyzed . . . to improve our ability to forecast future trends." The memorandum stated: "P. Morris continues to gain share among the 14-17 year old age group. . . . P. Morris' large share among 18 year olds has made it the only company to realize substantial share gains due to the aging process." Duffy also stated that "RJR continues to lose share due to . . . a decrease in new smokers and an increase in quitters," that Lorillard and

American were also losing share and that Liggett Group, Inc. & Myers had an unchanged share. Finally, Duffy stated that "Brown and Williamson Tobacco Corporation gain share from . . . new smokers and quitters" although, like American, B&W share among 14-17 year olds had declined. 500686301-6313 at 6302, 6303 (US 21566) (A).

4504. An internal July 22, 1980 RJR memorandum from G.H. (Jerry) Long, RJR Executive Vice President, to Edward A. Horrigan, Jr., RJR's CEO, entitled "MDD [Marketing Development Department] Report on Teenage Smokers (14-17)," stated: "Attached is a MDD report covering the aforementioned subject. Last January, a report was issued on this subject that indicated that Philip Morris had a total share of 59 among 14-17 year old smokers, and specifically, Marlboro had a 52 share. This latest report indicates that Philip Morris' corporate share has increased by about 4 points; however, Marlboro remains the same at 52." This memorandum stated that "RJR continues to gradually decline," and concluded, "[h]opefully, our various planned activities that will be implemented this fall will aid in some way in reducing or correcting these trends." 508453894-3894 (US 20811) (A).

4505. According to an August 20, 1980 memorandum to Dick Nordine, RJR Product Design Department, from Diane Burrows, RJR Marketing Development Department researcher, RJR decided to no longer market on college campuses in or shortly after August 1980, based on data that indicated that the rate of smoking among college males was less than half that of out-of-school young adults. 526147009-7012 at 7010-7012 (US 79320) (A); Burrows PD, United States v. Philip Morris, 6/27/01, 24:3-10.

4506. On September 12, 1980, in preparation for a meeting with Wall Street security analysts, Gerald Long, Executive Vice President of RJR, wrote to L.W. Hall, Jr., Vice President of Brands Marketing; Ellen N. Monahan, Marketing Development Department; Greg Novak; and

H.E. Osman seeking "[a]ny information that you could specifically provide that would compare prime prospect age information for the various Winston, Salem, and Camel brand styles versus primary competitive brand styles" in order to counter the perception that RJR's "brands appeal only to older smokers." 503747121-7122 at 7121 (US 20723) (A) (emphasis in original).

4507. As the prior documents demonstrate, RJR's substantial market research on young people performed during the 1970s revealed that Philip Morris's Marlboro brand was dominating the youth market. By the early 1980s, according to internal documents and the testimony of Diane S. Burrows on June 27, 2001, RJR knew through research that the combination of so few young smokers choosing to smoke RJR brands and the tendency of those smokers to be loyal to their first brand of choice would ultimately lead to market share declines for the company if its brands continued to be unpopular with young people. RJR knew, as it stated in its "1975 Marketing Plans Presentation," that teenage smokers were "tomorrow's cigarette business" and accounted for "a key share of the total cigarette volume -- for at least the next 25 years." 500746950-6976 at 6951 (US 21609) (O); Burrows PD, United States v. Philip Morris, 6/27/01, 15:19-16:4.

4508. RJR also knew at this time that it was unlikely to be able to win the teenage market with a new, unknown brand, and that it would be wiser for RJR to revise an existing brand's image to make it more appealing to teenagers. In a September 29, 1980 RJR memorandum to Gerald Long entitled "Younger Adult Smoker Opportunity Analysis – New Brands," L.W. Hall stated about young smokers:

> Socially insecure, they gain reinforcement by smoking the brands their friends are smoking, just like they copy their friends' dress, hairstyle, and other conspicuous things. To smoke a brand no one has heard of – which all new brand names are – brings one the risk of ostracism. It's simply not the 'in' thing to do. If this theory is correct, it would be extremely difficult to achieve success with a

> new brand name who's [sic] primary thrust was against younger adult smokers. Certainly, there have been many attempts – 'Maverick,' 'Zack,' 'Luke,' and 'Redford' come immediately to mind – and all have failed. . . . My thinking is that to maximize our success among this important group, we should place our efforts and our resources behind our established brand names, keeping them young and contemporary through advertising, promotion, and line extension strategies and executions.

501340949-0950 (US 20677) (A)

(i) RJR's Joe Camel Campaign

4509. The following internal documents, from the early 1980s onward, demonstrate RJR's continuing research on teenagers, marketing to teenagers, and the development of the Joe Camel campaign intended to appeal to teenagers. Biglan WD, 320-340.

4510. Despite the fact that the documents below clearly demonstrate that RJR marketed Camels to youth with its Joe Camel campaign, RJR publicly denied doing so. For example, an April 27, 1998 RJR document entitled "Camel 'Mighty Tasty' Campaign General Statement/QA." intended for use in making public statements. claimed: "The goal of the campaign is to capture adult smokers' attention by taking a distinctly different approach than most cigarette advertising . . . We take pains to develop ad campaigns and use marketing vehicles to communicate with adult smokers, not youth. 524944105-4112, at 4105, 4111 (US 30567) (O).

4511. In the early 1980s, as Diane Burrows testified in this case, RJR did not have a successful young "adult" smoker brand that could challenge Marlboro's dominance of the younger smoker market. However, Burrows also testified that Camel was identified through focus group research performed in 1985 as the only RJR brand that younger smokers did not hate. In fact, RJR had tried already, unsuccessfully, to transform Camel into a youth brand with its 1973 to 1978 campaign "Meet the Turk." Burrows PD, United States v. Philip Morris, 6/27/01, 55:9-56:14; Long PD, United States v. Philip Morris, 10/18/01, 66:4- 25.

4512. Between 1979 and 1982, RJR CEO Edward A. Horrigan, Jr. initiated the Joe Camel campaign by asking his marketing department to look at the French "Funny Camel" campaign to see if RJR could reinvigorate Camel with a similar approach. According to Horrigan, people at the company were excited about the idea. The French "Funny Camel" campaign had been very effective with young people in France. As a February 7, 1984 memorandum from Dana Blackmar to Rick McReynolds about the "French Camel Filter Ad" stated: "I think the French advertisement for Camel Filters is a smash. It would work equally well, if not better, for Camel Regular. It's about as young as you can get, and aims right at the young adult smoker Camel needs to attract." 502303940-3940 (US 22067) (O); Horrigan PD, United States v. Philip Morris, 10/25/01, 25:1-27:8.

4513. In 1984, Frances V. Creighton of the RJR Marketing Research Department prepared an "Established Brands Research Proposal: Camel Younger Adult Campaign Focus Groups," a proposal that sought to "qualitatively explore three creative strategies/campaigns for their appeal, relevance, and fit with Camel among target 18-20 year old smokers." In order to compete with Marlboro, "the Brand is currently developing new advertising creative targeted to younger adult male smokers. Three advertising strategies are being pursued . . . : Freedom and Independence, Interactive Sociability, and Pack Graphics." 521895585-5587 at 5585 (US 20902) (O).

4514. In an October 18, 1984 document entitled "Younger Adult Smoker Perceptions of Camel, "Charles A. Martin of the RJR Marketing Development Department discussed how young adults' perceptions of Camel could be used to increase market share, especially among FUBYAS (First Usual Brand Younger Adult Smokers). Martin stated: "Camel is excellently positioned to appeal to FUBYAS who want to project themselves as being different from the

crowd because they seek the ultimate in adventure and excitement. It supports this image through its heritage and mystique. Camel is a brand which differentiates itself from the vast majority of other cigarettes in the market. Camel projects an image of virility that is heroic and 'larger than life.' And, as it is a brand that's not for everyone, Camel is exciting to smoke." 503561565-1570 at 1567 (US 21704) (A); 502656424-6660 (US 87821) (A).

4515. A 1985 RJR Report entitled "Are Younger Adult Smokers Important?" contained an extensive discussion of young smokers, that divided young adult smokers into two distinct classes: (1) "FUBYAS – those younger adults who are already smokers but have reached the stage of choosing a First Usual brand," and (2) "Switchers – younger adult smokers who have already chosen a First Usual Brand." The premise for this report was that "FUBYAS, not switchers, have driven the success of the brands of this century. They are leading indicators of growth and decline." This report examined the marketing strategy of Jack Daniels (calling it "the Marlboro of Bourbons") and Budweiser as brands that had successfully repositioned themselves as leaders in the youth market, noting marketing techniques used by Jack Daniels that were subsequently utilized in the Joe Camel campaign. As one example, the report stated that, to target the younger "adult" audience, "JD [Jack Daniels] puts more 'pages' in *Rolling Stone* than any other book." The report also commended Jack Daniels for its use of promotional merchandise: "JD-is an example of a viable positioning, executed in a 'non-standard' but authentic and unpretentious way, which reaches YA consumers, not only through their books, but by converting YAs into walking billboards. They started with a good idea and stuck to it." Finally, the report concluded with a breakdown of the "social groups" that make up young "adults," analyzing their values and attitudes as well as their likelihood to be smokers. The groups discussed in the report described pre-teens and teenagers more accurately than adults

using terms such as: "Rockers," "Party Parties," "Punkers," "Discos," and "Burnouts." The report concluded that these groups "are large, loosely knit BUT HIGHLY LABELED sub-societies FROM WHICH FUBYAS DRAW THEIR IDENTITY, i.e., by BELONGING to the group and using the group TO BE DIFFERENT from other younger adults." Although authorship of this report is unknown, a copy produced by RJR included Burrows' name in marginalia. 505931938-2044 at 1938, 1949, 1957, 2020, 2030 (US 20749) (O) (emphasis in original).

4516. A January 15, 1985 internal memorandum entitled "Camel Perceptions From Qualitative FUBYAS Research," written by Burrows to John Winebrenner, provided "some details of the Strategic Research Group qualitative research in August-September 1984, which led us to conclude that Camel holds potentially leverageable interest among 18-20 year old smokers (FUBYAS)." 517161840-1842 at 1840 (US 80666) (O).

4517. A February 1, 1985 focus group report written by Charles A. Martin entitled "Established Brand Research Proposal: Camel Younger Adult Smoker Focus Group" stated that, "[d]ue to the growing importance of younger adult smokers, Camel has developed a campaign which is directed solely towards this group." Martin summarized the findings of the focus group: "Overall, many of the male and female respondents held negative user and product perceptions of Camel. In their minds, Camel was thought to be a non-filtered, harsh product smoked by older males. However, exposure to the younger adult ads appear to somewhat improve these attitudes. This improvement stemmed primarily from two characteristics: humor, and relevancy to younger adult smokers. Certain ads did convey the message that Camel was an acceptable choice for younger adult smokers." Martin also discussed focus group reactions to advertisements featuring the "French Camel," which was the precursor to the Joe Camel campaign: "These ads were well-received due to the fun/humor aspects of the cartoons. More than any other theme, the

'French Camels' appeared to attract the respondents' attention. **The main drawbacks of these executions were that: one, they may be more appealing to an even younger age group** and two, there is some confusion as to the meaning behind them (some focus group members were hard-pressed to explain the purpose of the ads)." 521895554-5555 at 5554 (US 52788) (A); 504585737-5757 at 5738-5739 (US 50628) (A) (emphasis added).

4518. RJR continued to work toward launching its Joe Camel campaign, even though another company executive explicitly raised the issue of Joe Camel's appeal to youth. A March 5, 1985 memorandum from J.S. Carpenter, RJR Tobacco International employee, to John Winebrenner about the "'Funny' French Camel Design" described RJR's use of the "French Camel" campaign to attract young smokers in France. Carpenter wrote: "I must caution that this design was used in France during a time when an attempt was being made to 'youthen' the brand; the entire advertising and promotional campaign used at the time was geared to this end, with the 'funny' Camel playing a key role in the advertising. Indeed the design did help to achieve this end." 506768857-8857 (US 20765) (O).

4519. In a March 12, 1986 memorandum entitled "Camel New Advertising Campaign Development," labeled "RJR Secret," R.T. Caufield, of the RJR Brand Group, emphasized appealing advertising as key to repositioning Camel for younger smokers: "It is recommended that creative efforts reflect a primary focus on developing advertising which is highly relevant, appealing and motivational to 18-24 male smokers. This recommendation is based on consideration of the marketplace dynamics which are perpetuating Marlboro's growth (i.e., brand loyalty and peer influence), and which strongly suggest that repositioning Camel as the relevant brand choice for younger adult smokers will be critical to generating sustained volume growth." The report indicated that "advertising will be developed with the objective of convincing target

smokers that by selecting Camel as their usual brand they will project an image that will enhance their acceptance among their peers." 503969238-9242 at 9238 (US 79096) (A).

4520. In an August 14, 1987 report entitled "Camel General Market Campaign Focus Group Report – Tulsa," Frances V. Creighton discussed focus group reactions to "French Camel" advertisements: the "'Camel, Never Ordinary' [advertisement], which portrayed the 'French Camel' in various social situations, came perhaps the closest to meeting the objectives of Camel's advertising strategy." Creighton further stated that this advertisement was popular with the 18-24 age group. 521895431-5450 at 5434 (US 20898) (O).

4521. In 1988, RJR launched the Joe Camel campaign with the "Camel's 75th Birthday Celebration," a year long print and billboard advertising, promotional, and point of sale campaign. For the twenty years preceding the Joe Camel campaign, Camel's share of the overall cigarette market fell by 50%, from 9.2% to 4.3%. Camel had only 2.4% of the 14 to17 year old market in 1979, according to internal RJR data. By 1993, Camel, with the Joe Camel campaign in effect, had 13.3% of the teenage market, according to both official government survey data and data from surveys conducted by RJR itself. 506763382-3402 at 3383 (US 22231) (O); Eriksen WD, 1/17/05, 49:7-53:5; VXA1900036-0049 (US 63946) (A).

4522. RJR had extensively planned and researched the 75th Birthday Campaign before its launch in 1988. For example, in an August 21, 1987 RJR memorandum entitled "Camel's 75th Birthday Plan," Y.M. Jones stated that campaign promotional ideas "must appeal to the 18-34 year old mindset," and included an example of a "Party Animal" magazine pop-up insert. 521190415-0418 at 0416 (US 20895) (O); 506885567-5603 (US 87823) (A).

4523. An RJR August 24, 1987 inter-office memorandum planned for the Camel's 75th Birthday Campaign. Proposals ranged from having children or grandchildren of employees and

retirees send in "renderings" of "Old Joe" to be featured in *Caravan*, to arranging for an RJR night at Barnum & Bailey Circus during which an employee would play ringmaster and "the leading act would be, you guessed it, the camels, all wearing Camel 75 blankets." 507843401-3401 (US 20791) (O).

4524. RJR tested the promotions, advertisements, and other types of marketing that it intended to run as part of the Camel's 75th Birthday Campaign in which it launched Joe Camel. For example, S.L. Snyder, RJR Marketing Development Department employee, wrote an August 27, 1987 "Promotion Research Report – Camel 75th Birthday Promotion Ideas" evaluating promotional ideas targeting 18 to 34 year old smokers as part of the 1988 campaign. 521895453-5465 (US 21759) (O).

4525. An October 7, 1987 document entitled "Marketing Research Proposal: Camel 75th Birthday Hispanic Focus Groups" written by W.R. Penick of RJR's Marketing Development Department discussed focus groups responding to Joe Camel advertisements including groups composed only of males aged 18 to 24. 506877657-7658 (US 20769) (O).

4526. In an October 14, 1987 internal memorandum entitled "Content Outline/Camel 75th Birthday Video," C.A. Williams, an RJR employee, indicated that Camel's target was young males who currently smoked Marlboro. Williams wrote that the Camel's 75th Birthday Campaign was intended to make "Camel more relevant to our target smokers 18-34 male non-menthol competitive smokers (primarily Marlboro)." 521893143-3145 at 3143 (US 20897) (O).

4527. In another example of RJR's testing of its Camel's 75th Birthday Campaign, Frances V. Creighton prepared a November 1987 report entitled "Marketing Research Proposal - Camel Project Big Brand Perceptions Tracking Study." The report indicated that the planned

market testing would "evaluate target smokers' perceptions and attitudes toward Camel before and after the launch of [Camel's] 75th Birthday celebration" among a target audience of 18 to 34 year old males. 521895557-5559 at 5557 (US 20900) (O).

4528. RJR's testing of the Camel's 75th Birthday Campaign marketing found a positive response among the young male smokers it hoped to target. A December 4, 1987 memorandum from Creighton and Penick to E.J. Fackelman highlighted key findings and conclusions from the communications testing of the 75th Birthday advertising among male smokers ages 18 to 34: "**75th birthday advertising generated a very strong and positive emotional response among 18-34 year old male target smokers**." 506864599-4601 at 4600 (US 20768) (O) (emphasis in original).

4529. A 1988 RJR document entitled "Camel Advertising Development White Paper" provided the roadmap for RJR's repositioning of Camel with the Joe Camel campaign in order to take away Marlboro's majority share of the young smoker market. The document showed RJR's awareness that smoking initiation and brand choice occur in the teenage years: "[O]nly about 5% of all smokers start smoking after the age of 24 . . . . The majority of younger adult smokers will stay loyal to their first brand choice." It stated that Camel's current image, conveyed through advertising, was too "old," and that advertising using younger models and themes that appealed to youth (independence, rebelliousness, etc.) could make Camel's image younger:

> Camel's current existing market image (i.e., brand perceptions, not advertising perceptions) includes aspects that are highly consistent with the wants of younger adult males . . . including: independence, doesn't follow crowd, lives by own set of rules, stands up for beliefs, not afraid to express individuality, enjoys being different, won't settle for ordinary . . . . The major weaknesses in Camel's in-market image is that it is not considered by younger adult smokers to be contemporary, and thus is not relevant. Negative perceptions include: . . . a lot older than me . . . . In an attempt to address Camel's weaknesses. . . an alternative campaign 'Share a

> New Adventure' was developed. This campaign used models that were not as old looking and used more relevant situations to address the brand's 'older' image weaknesses. . . . The advertising will position Camel as an authentic brand for smokers who are admired and respected by their peers because their attitudes and lifestyles distinguish them as individuals who challenge convention and stand tall . . . . In order to fully target the younger adult market, Camel must displace Marlboro as the younger adult brand. Simply speaking, Marlboro is the younger adult smoker market. . . . Marlboro's key strength relates to peer acceptability and belonging. . . . Marlboro is perceived by younger adult smokers as a brand which provides a sense of belonging to the peer group. A variety of research studies including the Segment Description Study, the Marlboro Vulnerability Analysis, in-market perception research, as well as in-depth qualitative all show this. . . . The [Camel] advertising should elicit an emotional response to positively motivate target smokers to rethink their brand choice. . . . In order to stimulate [youths] to think about brand alternatives, the advertising and brand personality must 'jolt' the target consumer. Since Camel does not have a demonstrably different or unique product (rational) benefit to sell, this jolt needs to be based on an emotional response and is unlikely to be accomplished with advertising which looks conventional or traditional. Studies have shown that the so-called 'hot buttons' for younger adults include some of the following themes: Escape into imagination. . . . Excitement/fun is success: Younger adults center their lives on having fun in every way possible and at every time possible. Their definition of success is 'enjoying today' which differentiates them from older smokers.

506768775-8784 at 8777, 8779-8783 (US 20764) (A) (emphasis in original).

4530. In advertisements that featured the cartoon character Joe Camel, he was often shown engaging in "adult activities" that teenagers would aspire to do, including hanging out at bars, visiting casinos, riding motorcycles, or driving cars; Joe Camel was also portrayed as a cool, rebellious, and adventuresome character, all themes with great appeal to teenagers. Biglan WD, 320-340. For example, RJR planned to place a Joe Camel advertisement in the *Sporting News* and "other Jumbo Jr. Size Magazines" from April 1, 1988 through June 30, 1988, which was captioned "Get On Track With Camel's 75th Birthday!" and depicted Joe Camel in a

Formula One-type automobile racing suit, opening a bottle of champagne, with racing cars whizzing by in the background. 509131846-1847 (US 20823) (O). As Edmund Conger Leary, Senior Vice President of Marketing and President of Sports Marketing for RJR, testified at his May 2, 2002 deposition in this case, RJR conducted research among 18 to 24 year old smokers about "every aspect" of Joe Camel "for its appeal and relevancy to the target." Leary further testified that RJR understood that "kids would like to be adults." Leary PD, United States v. Philip Morris, 5/2/02, 59:7-60:15; 522668842-8856 (US 88160) (A); 522445029-5041 (US 88153) (O).

4531. Joe Camel advertisements were often combined with coupons for free Camel cigarettes because RJR knew that coupons were effective means to encourage product trial by young people. Burrows testified in this case that it is necessary to get a person to try an RJR brand before they will be loyal to it, and that methods to get someone to try an RJR brand include in-store promotions, e.g., free lighters with a certain number of packs purchased, or buy-one-get-one-free promotions. Leary testified in this case that advertising and promotion "can influence the behavior of purchasers" to try a brand, and that RJR uses "advertising and promotion to incent [sic] adult smokers of other brands to try our brands and hopefully to switch." As an example of this type of advertisement combined with a coupon, in 1988 RJR placed a multi-page advertisement for Camel cigarettes in various print media, including *Sports Illustrated*, a magazine with a substantial youth readership. The advertisement depicted Joe Camel in the foreground, with a beautiful woman sitting on the hood of a convertible automobile in the background. The second page of the advertisement was captioned "Some have it. Most don't," and stated, "You can have it free!" The advertisement contained a coupon for a free pack of Camels. Burrows PD, United States v. Philip Morris, 6/27/01, 60:10-61:14; Leary PD, United

States v. Philip Morris, 5/2/02, 45:2-11; 509131376-1378 (US 20822) (O).

4532. Creighton prepared a January 27, 1988 "Marketing Research Proposal 'Heroic Camel' Advertising Test" recommending that RJR conduct market research to determine the effectiveness of the "Heroic Camel" advertising campaign, and assure that it was positively received by 18 to 30 year olds. The "Heroic Camel" campaign showed Joe Camel in a "series of 'heroic' situations drawn from bigger than life fictional characters," including as a fighter pilot, a foreign legionnaire, " Hollywood," and a detective. These advertisements were run in 1989. 521895566-5570 (US 24813*) (O).

4533. C. Rashti of McCann-Erickson wrote a Contact Report recording the February 25, 1988 meeting between McCann-Erickson and RJR regarding "Camel – High Impact OOH, Second Half 1988 Creative and Project Big Idea Concepts." OOH means "out of home," or billboard advertising. Participants at this meeting discussed the upcoming 'Heroic Camel' advertising campaign as well as the use of "Camel Cash" – coupons with the appearance of dollar bills – instead of traditional coupons. "Camel Cash" was inserted into packs of Camels and could be redeemed for t-shirts, mugs, jackets, and other promotional items. 521895803-5805 (US 20905) (O).

4534. An RJR 1988 document entitled "Managing the 'Smooth Moves' Concept" spoke primarily to the lifestyle and social status of young adult smokers. The "Smooth Moves" creative program, as detailed in the document, had to "[d]irectly link this concept with the advertising campaign. . . . If you want to be a 'Smooth Character', you have to have 'Smooth Moves'." 506871767-1771 at 1767 (US 22449) (O).

4535. An RJR document entitled "Volume Impact of Camel YAS Growth" examined Camel growth among young adult smokers in 1988: "In 1988, Camel Ex. Regular posted a 2.2

point national gain in usual brand share among males 18-24 (the brand's target) and a gain of 1.4 points among total 18-24 (YAS). This was the largest 12-month YAS gain ever recorded on Tracker, for Camel or any other RJR brand." 517161869-1876 at 1869 (US 80669) (O).

4536. In an internal RJR March 20, 1989 memorandum entitled "Camel Performance Analysis" from G.C. Pennell to J. T. Winebrenner and R.M. Sanders, Pennell stated that "Camel's ability to reach and convert younger adult smokers is significant with the 18-20 year old group driving this growth. Accordingly, the brand should maintain its single-minded focus against this important smoker group." 517161877-1877 (US 80670) (O).

4537. An RJR report dated July 6, 1989 discussing the "Smooth Moves" Camel campaign in the 1990s showed that the company deliberately used the advertising theme of sex appeal in order to appeal to young males. Listed in the report as "Consumer Target Hot Buttons" were "Sex," "Girls, Women, Sex," and "Playboy Magazine, Penthouse Magazine." The "hot buttons" list, according to the author, "may serve as the theme or substance of promotions that will attract and appeal to the target. We are using this list as the starting point for developing promotions." The same report detailed a strategy for "smooth move" advertising, stating "good looking women are major hot buttons for the target." 507238911-8934 at 8915-8916, 8926 (US 22451) (O).

4538. In 1989, RJR placed Joe Camel advertisements in various media as part of "program 900162," which included "buy one, get one free coupons" and the following advertisements: (1) an advertisement with the words "Bored? Lonely? Restless? What you need is . . ." featuring the face of a beautiful woman gazing at the reader; (2) advertisements captioned "Camel Smooth Moves," including "Smooth Move #325 - Foolproof Dating Advice," which advised "[a]lways break the ice by offering her a Camel;" and "Smooth Move #334 - How to

impress someone at the beach," which advised that the reader "[r]un into the water, grab someone and drag her back to shore, as if you've saved her from drowning. The more she kicks and screams, the better" and "[a]lways have plenty of Camels ready when the beach party begins"; and (3) an advertisement captioned "Smooth Move #437 - How to get a FREE pack even if you don't like to redeem coupons." 513590183-0185 (US 20854) (O).

4539. A 1989 RJR document entitled "Camel Y&R Orientation" discussed the "strategic importance" of younger adult smokers: "YAS are the only source of replacement smokers. Less than one-third of smokers start after age 18." The document further stated, "To stabilize RJR's share of total smokers, it must raise share among 18-20 from 13.8% to 40% . . . ASAP." 507241613-1838 at 1617, 1620 (US 20774) (A).

4540. A September 15, 1989 RJR document entitled "Diez Y Seis Fiesta Event Summary" reported on Camel marketing at the Denver Diez Y Seis Fiesta, a festival that offered "kiddy rides, vendor booths, and live entertainment on both stages." The document stated: "The Camel booth was the most popular and a constant line existed all day as people waited to play the basketball game. Samplers distributed 275 caps, 480 playing cards, and 596 mugs as prizes. Samplers collected 385 screener cards filled out by those waiting in line. The Camel booth was also the most visible with its banners and yellow flags clearly standing out in the crowd . . . . Camel was definitely the strongest presence at the event. Camel hats could be spotted everywhere throughout the crowd." Other 1989 RJR documents provided summaries of similar events in Corpus Christi and Dallas, Texas. The Dallas event included a midway area with carnival rides for the children: "Camel presence, as a major sponsor, was certainly realized by all those at the event. 25 large banners were hung around the perimeter of the park. The Camel 30-ft. inflatable giant pack was situated next to the main stage." A Camel basketball game in a

"freestanding booth with banners, flags and giant packs" was located in the midway area with children's carnival rides which achieved "maximum brand impact." The documents indicated that 2,000, 5,000, and 28,000 free samples of cigarettes were distributed at these three events, respectively. 507525019-5023 at 5020, 5022 (US 20778) (O).

4541. Charlee Taylor-Hines, Young & Rubicam, New York, sent a November 27, 1989 memorandum regarding "Camel Creative Exploratory Focus Groups," which summarized Joe Camel's allure as discovered in focus group research: "Of all the executional approaches, 'Leader of the Pack,' was the consistent favorite across all groups. It combined the elements favored in the current campaign – Camel as hero, bright colors, simple yet involving scenarios – but also added a stronger sense of Joe being more involved in the action/adventure. There was also an element of Joe as the rebel." 507257278-7281 at 7278 (US 20775) (A).

4542. A May 4, 1990 RJR report entitled "Camel Brand Promotion Opportunities" discussed a number of promotional items geared directly at "young adult target smokers." The report described the "target smokers" as "approaching adulthood, hence they are sensitive to peer group perceptions regarding their maturity and masculinity. . . .Young adult target smokers are active, sociable and fun loving in nature. Their key interests include girls, cars, music, sports and dancing - all of which can include family and friends and can be accomplished on a limited budget." The promotional items suggested by this report included blank audio tapes with Camel logo, a Camel Walkman case and other "entertainment-oriented incentives." Other suggestions included the "Camel pocket game," which included chess, checkers, dominoes, or Parcheesi, all using Camel logos, graphics and visuals, or the idea that "Camel can even go so far as to design its own game to reinforce major marketing themes" such as "Camel sliders" in which the object was to slide a "slider" molded to look like Joe Camel across the tabletop and get closest to the

target. 509216033-6056 at 6035-6036, 6041, 6044-6045 (US 20826) (O).

4543. In a November 28, 1990 memorandum to Juacane Reynolds, an employee of RJR, proposing Camel promotions, Edward Battle, of Total Marketing, stated that the objective of "[a] successful promotion effort is to: Develop a targeted promotion concept that:

- Increases trial/retrial/conversion rates among competitive smokers.

- Builds promotion equity.

- Provides a mechanism for measurement results.

- Supports the brand's personality and reinforces brand positioning.

- Provides smokers with a compelling reason to buy Camel cigarettes."

509216028-6032 at 6030 (US 20825) (O).

4544. In a December 4, 1990 presentation entitled "Camel Advertising Overview," later made in a slightly shorter form on April 17, 1991, Young & Rubicam reported to RJR that the Joe Camel campaign had "set the stage for an exciting 1991," explaining: "Camel is the brand for the '90s and, wherever Camel's message is, it is there in a big way. If a market is covered, it is covered ubiquitously. If we run a one-shot ad or a local promotion, the execution must be so provocative and unexpected that it transcends its medium." 507490339-0354 at 0346-0347 (US 23010) (A); 522732100-2116 (US 87827) (O).

4545. Joe Camel advertisements run in the 1990s used the same themes and techniques used in the advertisements run during the Camel's 75th Birthday Campaign in 1988. The 1990s advertisements continued to portray Joe Camel as cool, rebellious, and adventuresome, showed him engaged in adult activities, and offered "Camel Cash," which could be redeemed for promotional items such as t-shirts, lighters, and mugs. One such advertisement, which RJR placed in various print media in 1992, was captioned "Camel Lights." It depicted Joe Camel

wearing sunglasses, a t-shirt, and blue jeans, with a pack of cigarettes rolled up in his sleeve and a lit cigarette hanging from his mouth, while casually leaning against a convertible car. 509131534-1534 (US 21717) (O); 515123613-3634 (US 87828) (A).

4546. An April 1991 RJR Executive Summary, entitled "Operating in a Restricted Environment," predicted that greater future restrictions on RJR's marketing and advertising were a virtual certainty, and explored ways to continue to market RJR's brands if such restrictions were implemented. The summary stated that the Joe Camel cartoon campaign was particularly at risk, and suggested that RJR should "[b]egin now to explore ways to transfer Old Joe's irreverent, fun loving personality to other creative properties which do not rely on models or cartoon depictions." The summary also indicated that billboards exposed young people to cigarette advertising: "Outdoor advertising continues to bear the brunt of anti-smoker criticism as regards unrestricted exposure to youth, and in fact, it is the medium that we are least able to defend in these terms." 507755082-5094 at 5085, 5091 (US 20787) (O).

4547. In an October 1991 research summary entitled "A Qualitative Assessment of Camel Advertising Equity," Ellison Qualitative Research reported to RJR the findings of focus groups of young adult smokers, ages 18 to 34, which were conducted to measure consumer perceptions of Joe Camel advertising. The research study found that:

> By all indications, the repositioning of the Camel brand seems to be generating a sense of upgraded appeal and relevance among key smoker segments – particularly adult males 18-24. A principal part of the repositioning – the 'Smooth Character' advertising and integrated communications programs – appear to be critical in helping to make the recent Camel effort successful.

507642890-2934 at 2892 (US 22055) (A). The 18 to 24 year olds mentioned as Camel smokers in 1991 were 15 to 21 years old when the Joe Camel campaign began in 1988.

4548. In the 1991 Ellison report, the market researchers also enthusiastically noted the

effectiveness of the Joe Camel advertising to allay consumer skepticism and create positive feeling and personal comfort with the brand: "This point seems particularly noteworthy, since consumers are generally reluctant to overtly admit to being influenced by advertising. Generally speaking – in a focused group environment – whether for cigarettes or for other packaged goods – consumers are inclined either to be critical of advertising and/or to deny that it plays any role in their choice of products." The researchers also stated that the respondents had strong positive responses to the Joe Camel advertisements, and were able to remember them in detail: "The details recalled and the strength of the favorable Camel advertising commentary were considerably beyond what is typically heard in focused groups . . . when awareness of/attitudes toward advertising – in the absence of stimuli – are explored." 507642890-2934 at 2906, 2910 (US 22055) (A). This focus group research report indicates that RJR was well aware that images connecting sex appeal with smoking would be effective in influencing youth to buy Camels. The responses of focus groups on Joe Camel advertisements revealed that the advertisements clearly communicated this theme: "He's the type the babes love . . . You can tell." 509045372-5416 at 5392 (US 22441) (A).

4549. Clare M. Smith, RJR Business Information and Analysis, wrote an October 18, 1991 memorandum entitled "Camel Campaign Equity Focus Group Final Report" regarding the Ellison Qualitative Research report. In it, Smith summarized the Ellison focus group findings, stating that "[o]verall, it appears to be the aspirational quality of Joe Camel that has fueled the popularity of the post-re-positioning campaign. Both competitive [Marlboro] male and female smokers commented on Joe Camel's ability to 'do everything, go anywhere and be anything.'" Smith also pointed out that focus group respondents were unwilling to see Joe Camel in "ordinary" scenarios, preferring to see him in aspirational situations: "Smokers commented on

situations perceived to be inappropriate for Joe Camel, including Joe as a 'couch potato' or showing Joe Camel working in a blue collar occupation. These activities were perceived as too ordinary for Joe Camel as respondents did not want to see Joe Camel in situations that they do on a daily basis. Smokers expressed their desire to see Joe Camel in fantasy situations . . . being the center of attention among a group of friends and always participating in cool activities." Smith recommended, based on this research, that "[f]uture [Joe Camel] campaign development should continue to avoid ordinary/boring activities and continue to focus on exciting and lively situations. . . . [and] on variety, humor and surprise." 509045369-5371 at 5370, 5371 (US 20821) (O).

4550. In a March 16, 1992 letter, Thomas C. Griscom, RJR's Executive Vice President, External Relations, forwarded to Preston Kirk a compilation of Camel market data that included data on 12 to 17 year olds. This data included "No. [number] of Smokers Underage (12-17). . . . Total Cigarettes Smoked Per Year - Underage. . . . Percentage of Total Cigarettes Accounted For by Underage Smoker. . . . Camel's Share-of-Market Among Underage Smokers. . . . Total Camels Purchased by Underage Smokers . . . [and] Percentage of Camels Bought by Underage Smokers." 512027239-7240 at 7240 (US 20845) (A).

4551. By 1992, it was clear that Joe Camel advertising had succeeded in reaching teenagers. A California Department of Health Services report estimated that Camel had achieved 96% of its total penetration among 13-year old teenagers, while Marlboro had achieved 82%, and Virginia Slims 69%. 2025685890-6054 at 5997 (US 20418) (O).

4552. A November 1993 Roper Starch report reported on an "Advertising Character and Slogan Survey" conducted with a "national sample of young persons, age 10 to 17 years" to track awareness of the Joe Camel Campaign. The study found that 86% of the 10 to 17 year olds

surveyed recognized Joe Camel. Joe Camel was identified correctly as advertising cigarettes by 95% of the 10 to 17 year olds who claimed awareness of the Joe Camel character. This percentage was higher than the percentage of children who knew that Ronald McDonald advertised McDonald's fast food and within 1% of the number of children who knew that the Keebler elves advertised for cookies. The top two responses of 10 to 17 year olds to the open ended question of "How would you describe Joe Camel?" were (1) he smokes, and (2) he is "really cool/acts cool/ thinks he's cool." RJR released the study in an attempt to deflect criticism that the Joe Camel campaign was directed at minors. 517145060-5108 at 5064, 5082, 5085 (US 20877) (O).

4553. A 1994 RJR document entitled "Camel Crisis Vision" tracked smokers ages 18 to 34, showing a peak in this market of almost 13% in 1993. 521896268-6289 (US 52790) (O).

4554. From 1995 until at least 1999, marketing agency Long Haymes Carr prepared a series of recommendations for placement of Camel advertisements in magazines and newspapers. Although these plans specifically referred to Camel's target as 21 to 24 year olds, the plans included strategies that clearly had great appeal to teenagers. For example, the "Camel 1994 Media Plan" suggested placement of advertisements in magazines including *Rolling Stone* and *Sports Illustrated*, both of which had a high percentage of 12 to 17 year old readers, and also suggested advertisements to increase awareness of Camel's NASCAR, drag, and bike racing programs. 513878927-8957 at 8929, 8942 (US 87829) (A); 524723099-3123 (US 87830) (A).

4555. The "Camel Cash 1995 Media Plan" recommended that RJR "heighten Camel's involvement at the Daytona NASCAR event with page insertions in broader appeal sports and/or automotive enthusiast publications." 514190393-0416 at 0399 (US 20856) (A); 519579346-9444 (US 87831) (A).

4556. Three cigarette advertisements used by RJR in 1996 included offers of Camel Cash. Two showed Joe Camel wearing sunglasses and a leather jacket and offered $25 savings on Ticketmaster tickets with 100 Camel Cash C-States; in one, Joe said "Wanna see a show?" and in the other, Joe said "Go ahead, it's on me." The third advertisement showed Joe Camel driving a car, saying "Take a Rockin' Road Trip" and included an offer of $25 savings on Ticketmaster tickets for "Camel Cash." 526310001-0015 at 0001, 0004 (US 21979) (O); 509137483-7486 at 7483 (US 21982) (O).

4557. The December 10, 1996 "Camel Final 1996 Media Plan" suggested that RJR "Heavy-up [increase] Camel Motorcycle program support during key events in 1996: Daytona, Sturgis, and Laconia." 518117818-7841 at 7825 (US 20880) (A); 524723230-3239 (US 87832) (A).

4558. The "1997 Final Media Plan" dated January 16, 1998 recommended supporting Camel campaigns at key biking events. 518116832-7488 at 6855 (US 21821) (A); 515129153-9177 (US 87833) (A); 514872663-2709 (US 87834) (A).

4559. The "Camel 1998 Media Recommendation Revision 5" recommended placing the "Biker" and "Billiards" series of Joe Camel advertisements. 522728834-8896 (US 52867) (A); 522728897-8904 (US 52870) (A); 522728905-8915 (US 52871) (A).

4560. Even after Joe Camel was replaced with "Kamel" and other campaigns for Camel cigarettes in 1998, RJR continued to market the brand to young people, particularly through its media placements. For example, the "Camel 1999 Media Recommendation" recommended that RJR "select and utilize media that provide a sense of change, disruption, and high impact." 522668862-8890 at 8864 (US 20911) (A). The "Camel 1999 Print Selection Rationale" identified magazine titles based on their ability to "[f]ollow the latest music trends and

entertainment news, [e]njoy the nightlife, [a]bility to evoke change and disruption." 522669065-9093 at 9068 (US 20913) (A).

4561. The "1999 Camel Media Recommendation Print Categories" recommended that Kamel 'Core' Books should be *Bikini*, *Jane*, *Spin*, and others, because of their younger reader profile. 522694030-4038 at 4030, 4307 (US 20914) (A).

4562. The "Camel 1999 Final Media Recommendation" identified as its objective to "[s]olidify awareness of Camel's brand identity among the target audience, adult smokers 21-24 (core target) . . . described as confident, fun-loving, adventurous, slightly irreverent, and having an individualistic attitude and outlook on life." 522728272-8320 at 8274 (US 21831) (A).

4563. During his May 8, 2002 deposition, RJR Senior Vice President for Marketing, David Iauco, testified that RJR sought to make its Camel Brand "a relevant brand to younger adult smokers." David Iauco PD, United States v. Philip Morris, 5/8/02, 149:16-150:12.

(ii) Other RJR Campaigns

4564. Throughout the 1980s, RJR recognized the need to attract young smokers to its brands and conducted research on how to appeal to them. In a September 20, 1982 memorandum, Diane S. Burrows, RJR Marketing Development Department researcher, stated, "if a man has never smoked by age 18, the odds are three-to-one he never will. By age 21, the odds are twenty-to-one." 500582269-2272 at 2270 (US 20641) (A). RJR used the research it conducted on young males and the research it collected on teenagers as young as 12 to develop its Joe Camel campaign that was launched in 1988. The following paragraphs discuss this research as well as RJR's efforts to market its other brands – Winston, Salem, and Doral – to youth.

4565. In 1981, RJR developed a system called "AGEMIX," to determine smoking

incidence and rates across demographic categories of sex and age for individuals as young as 12. A 1981 RJR document entitled "RJ Reynolds Cigarette Industry Volume Forecasting System" stated that the AGEMIX system allowed RJR to track the incidence and rates of smokers by sex and age. In a July 8, 1982 letter to Data Resources regarding the development of AGEMIX, Burrows wrote that AGEMIX allowed RJR to determine smoking incidence and smoking rates for individuals aged 12 and over, as the AGEMIX system included age breakdowns of 12 to 17, 18 to 24, etc. Burrows stated, "[s]ince few people start smoking after age 24, we will assume that incidence remains fixed as a group ages past 24." 502661958-1963 (US 20704) (O); 501291100-1101 (US 85234) (O); 503011402-1403 (US 50279) (O).

4566. A May 4, 1981 letter from Warren Cowan, President of the Beverly Hills public relations firm Rogers & Cowan, to Gerald Long, Executive Vice President of RJR, discussed Rogers & Cowan's past and continuing efforts on behalf of RJR to feature smoking favorably "in a prominent way" in movies, in celebrities' public appearances, on television, and in other arenas. Cowan stated, "[a]mong the films that met our criteria in which we were able to place products were: 'The Jazz Singer' with Neil Diamond. 'Backroads' with Sally Field. 'The Cannonball Run' with Burt Reynolds, Farah Fawcett and Roger Moore. 'Only When I Laugh' with Marsha Mason. 'Pennies From Heaven' with Steve Martin. 'Blowout' with John Travolta. 'Rich and Famous' with Candice Bergen and Jacqueline Bisset, and many, many others." The letter also discussed Paul Newman smoking RJR products in a recent spot on *Good Morning America* and placing stories about Mikhail Baryshnikov smoking four packs of cigarettes per day as part of his routine. 503579240-9244 at 9240-9241 (US 20718) (O).

4567. In a December 8, 1981 letter to E.N. Monahan entitled "Aging 18 Year Old Smokers Into NFO [National Family Opinion] Panel Data," Midge Barnes, RJR Marketing

Development Department, recommended "aging [i.e., counting] all known under 18 year old smokers into the NFO Panel Data at age 18 and classifying them as 'Continuing Smokers,' with only those smokers new to the business classified as 'new' smokers." 503412316-2318 at 2316 (US 21587) (O).

4568. A January 28, 1982 letter from Thomas A. Trumbull at National Family Opinion to Linda Mabee in the RJR Marketing Development Department confirmed that the January wave of the Mass Smokers Screening study produced for the company would include "the name, address, telephone number, and age and sex of each family member 17 years and older." Midge Barnes, RJR Marketing Development Department, had previously written to Paul J. Cousino at National Family Opinion on July 28, 1981, with respect to the same study to express Reynolds's desire "to address . . . any recommendations you have for introducing 17 year old smokers to the panel as they age into 18+." 502992729-2730 at 2729 (US 50276) (O); 503425601-5608 at 5602 (US 50372) (O).

4569. A March 22, 1982 document entitled "Export Family Strategy" discussed marketing strategy for Export cigarettes, RJR's leading Canadian brand:

> It is hypothesized that very young starter smokers choose Export 'A' because it provides them with an instant badge of masculinity, appeals to their rebellious nature and establishes their position amongst their peers. . . .It is at this transition point (ages 18-24) that Export 'A' is declining in its ability to hold the young adult males as they go through the maturing process, due to its out-dated irrelevant image. . . .Since we cannot direct our media or our creative to starter smokers, the optimal target group is young adult smokers between the ages of 18-24. . . . The key influencing factor to initial brand selection amongst new smokers appears to be conformity to what their friends smoke . . . .While Export 'A' appears to be chosen as a first brand based on this key influencing factor, we must strive for peer group acceptability throughout the maturing process, for all the Export brands.

800057286-7321 at 7299 at 7302 (US 21057) (A).

4570. A September 27, 1982 RJR memorandum from Burrows to P.E. Galyan, an employee in the Marketing Research Department, summarized the conclusions of the National Bureau of Economic Research on relative price sensitivity and stated, "A key finding is that younger adult males are highly sensitive to price. This suggests that the steep rise in prices expected in the coming months could threaten the long term vitality of the industry, by drying up the supply of new/younger adult smokers entering the market. **It could also undermine the long range growth potential of brands which rely on new/younger smokers, including Marlboro and Newport**." 503011368-1369 at 1368 (US 20709) (A) (emphasis in original).

4571. In a September 27, 1982 memorandum entitled "NBER Models of Price Sensitivity by Age/Sex" to Marketing Development Department employee Jerry R. Moore, Burrows summarized National Bureau of Economic Research findings on the relative price sensitivity of age and sex groups, including data on "teens 12-17." She discussed the NBER findings that "[t]eenagers and younger adult males are highly price sensitive," and that "[p]rice affects incidence; rate per day is virtually unchanged." Burrows also noted that the NBER findings were "highly consistent" with internal RJR findings. Burrows' memorandum stated further: "The loss of younger adult males and teenagers is more important to the long term, drying up the supply of new smokers to replace the old. This is not a fixed loss to the industry: its importance increases with time. In ten years, increased rate per day would have been expected to raise this group's consumption by more than 50%." On October 6, 1982, Burrows sent this memorandum to the Vice President of RJR Marketing Department, L.W. Hall, Jr. 503011370-1378 at 1370 (US 22347) (A); 503011368-1369 (US 20709) (A); 513318391-8392 (US 20851) (A).

4572. A 1983 document discussing "Project YAX," proposing that RJR develop a

"young adult smoker brand," stated:

> Premise: A brand that helps provide the younger adult smoker with peace of mind and a sense of well-being by representing appealing forms of escape. . . . Positioning hypothesis . . . A brand that stands for the **joy**, **closeness**, and **sense of belonging** of male/female relationships via intimate and/or romantic situations will be perceived by younger adult smokers as contributing to their sense of well-being. A brand that stands for **financial security** via achievable wealth-oriented imagery will be perceived by young adults as contributing to their sense of well-being . . . . A brand that stands for **good times** and **belonging** via fun, group situations will be perceived by younger adult smokers as contributing to their sense of well-being.

502761709-1714 at 1709 (US 78810) (O) (emphasis in original).

4573. Burrows testified in this case that, in the 1983-1984 time-frame, she recommended that RJR needed to increase its popularity among young adult smokers, possibly through development of a new brand. Burrows PD, United States v. Philip Morris, 6/27/01, 16:23-17:4.

4574. A June 29, 1983 report entitled "13-30 Corporation/R..J. Reynolds" summarized a meeting "[t]o develop concepts/options for media vehicle(s) for use in, on, under or around convenience stores which will satisfy the needs of . . . the convenience store customer . . . owner . . . [and] the R.J. Reynolds Company." The report described convenience stores ("Youth Oriented," "Hang-Out" and "Video Games"), convenience store customers ("Younger," "Children With Them," "Late at Night-Younger" and "Kids on Friday Night Buying Evening 6-Packs"), and convenience store purchasers ("Young, Single" and "People with Less Spending Money"). The report listed "beginning ideas" to be implemented at convenience stores to encourage purchase of RJR's cigarette brands, including "activity booklet appealing to young people – things to do," "develop a bike rack for kids with bikes – create ad space," "hook-up cigarettes with other youth purchases," "have a video game token given away with purchase," "create a music channel that is

closed-circuited into C.S. [convenience store] that is on-target to youth market," and "some kind of game or contest . . . via proof of purchase – with a weekly winner. Could be video game – high school sports quiz." The report considered ways to connect RJR marketing to dating: "facilitate boy meets girl at C.S.," and "how to legitimize the boy/girl encounter – e.g., movie schedules." 500863242-3272 (US 20654) (A).

4575. In a 1984 RJR report entitled "Strategic Research Report Market Overview and Key Trends/Issues," Richard Nordine provided a "broad overview of the cigarette market" spanning the preceding thirty years. Nordine stated: "[T]here are clear differences between growing and declining brands. Those which have younger adult profiles are growing and those which show older are declining (except Generics)." 517142223-2257 at 2224, 2230 (US 21764) (O).

4576. On February 2, 1984, R.J. Harden of the RJR Marketing Development Department wrote a memorandum to A.M. Curry entitled "A Perspective on Appealing to Younger Adult Smokers" which stated: "A cigarette brand's (and the associated company's) long-term vitality is strongly influenced by its ability to attract young adult smokers." 502034940-4943 at 4940 (US 20695) (A).

4577. In a February 29, 1984 memorandum entitled "Younger Adult Smokers: Strategies and Opportunities," Burrows stated:

> **Younger adult smokers have been the critical factor in the growth and decline of every major brand and company over the last 50 years. They will continue to be just as important to brands/companies in the future** for two simple reasons:
>
> [1] The renewal of the market stems almost entirely from 18-year old smokers. No more than 5% of smokers start after age 24. [2] The brand loyalty of 18-year-old smokers far outweighs any tendency to switch with age. . . . Marlboro and Newport, the only true younger adult growth brands in the market, have no need for

> switching gains. All of their volume growth can be traced to younger adult smokers and the movement of the 18-year-olds which they have previously attracted into older age brackets, where they pay a consumption dividend of up to 30%. A strategy which appealed to older smokers would not pay this dividend. . . . Younger adult smokers are the only source of replacement smokers. Repeated government studies . . . have shown that: Less than one-third of smokers (31%) start after age 18. . . . Thus, today's younger adult smoking behavior will largely determine the trend of Industry volume over the next several decades. If younger adults turn away from smoking, the Industry must decline, just as a population which does not give birth will eventually dwindle.

503049069-9072 at 9069 (US 20711) (A); 501431517-1610 at 1519 (US 20680) (A); 506653291-3348 at 3291, 3296 (US 85235) (O) (emphasis in original). In his written direct testimony, CEO Martin Orlowsky admitted that this memorandum was addressed to him. Orlowsky WD, 42:14-44:17.

4578. In the same document, Burrows emphasized the importance of positive and contemporary or modern marketing intended to attract young smokers: "the major younger adult brands have been succeeded by a brand which was positioned to be different from its predecessor and better 'in-touch' with the younger adult smokers of the time. . . .All of these successful brands have stressed positive product messages . . ." Burrows also recommended that RJR "**should make a substantial long-term commitment of manpower and money dedicated to younger adult smoker programs. An unusually strong commitment from Executive management will be necessary**, since major volume payoffs may lag several years behind the implementation of a successful younger adult smoker strategy." 503049069-9072 at 9070-9071 (US 20711) (A) (emphasis in original).

4579. In an April 13, 1984 RJR letter, Nordine stated that "[i]t is relatively easy for a brand to retain eighteen-year-old smokers once it has attracted them. . . .Conversely, it is very difficult to attract a smoker that has already been won over by a different brand."

502033156-3157 at 3156 (US 49017) (A).

4580. In an RJR document dated June 14, 1984 entitled "New Brands and Strategic Research Report: Project XG Qualitative Exploratory III MDD Topline Perspective," P.S. Cohen, an RJR employee, stated: "In recognition of the importance of younger adult smokers to RJR growth, Project Planning has been asked to develop a brand which appeals to the image and peer acceptance wants of 18-24 year old smokers." This effort was code-named "Project XG." Cohen further stated that, to appeal to the younger adult smoker, visuals would convey a sense of: "Adventure/controllable risk, Independence/freedom, Honesty/straightforwardness, 'In control'/ 'street-smart'/urban personality, Spontaneity/lack of inhibitions." 502034890-4895 at 4892, 4893 (US 20694) (O).

4581. A July 9, 1984 RJR document entitled "Project XG Brand Review" described "Project XG" as RJR's effort to "[d]evelop a Brand to appeal to younger adult smokers," and "[r]eplace Marlboro as the key brand among younger adult smokers (18-24)." 502761453-1487 at 1455 at 1457 (US 20705) (O).

4582. In a July 16, 1984 memorandum entitled "Thoughts on Younger Adult Smoker Study," Nordine remarked that "[i]n the past, trends with the younger adult sector have led to growth brands," and therefore RJR must "understand the driving motives of younger adults and the way they express these motives in their lifestyles." Nordine listed as an issue to explore: "What 'rules of thumb' are there are [sic] developing effective younger adult smoker marketing programs?" 503517461-7462 (US 20716) (O).

4583. In a September 17, 1984 memorandum, Burrows discussed Nordine's previously-stated hypothesis that, if schools permitted smoking, the effect would be to discourage student smoking. In response to Nordine's hypothesis, Burrows stated that prohibition of smoking may

feed into teenagers' rebelliousness and actually encourage them to smoke as a form of rebellion and as a way to get positive support from other rebels in their peer group. Burrows PD, United States v. Philip Morris, 6/27/01, 53:14-54:17; 503571003-1003 (US 20717) (O).

4584. In a January 28, 1986 document regarding Camel entitled "State of the Brand Report," Frances V. Creighton stated that "[t]he trend among 18-24 year old males has exhibited growth throughout 1985 reflecting targeting promotional activities throughout most of the year. . . . [S]hare among the 18-24 old male smokers is currently 5.7%, up +1.3% versus November [a] year ago." 505736433-6454 at 6435 (US 20745) (O).

4585. C.D. Greene, of RJR Camel Brand Team, wrote a February 11, 1986 memorandum entitled "Results of the Camel 1985 SDS Analysis." The purpose of this memorandum was to allow the Camel Brand Team to "gain a better understanding of Camel's target of male 18-24 year old smokers," whom Greene described as being "driven by a desire for social success." 514341837-1839 at 1837 (US 51847) (O).

4586. A document entitled "Youth Target 1987," prepared by The Creative Research Group for RJR-Macdonald Inc., RJR's Canadian subsidiary, expressly studied smoking habits, lifestyles, and value systems of smokers ages 15 and older. 521893064-3142 at 3070 (US 20896) (O).

4587. A June 8, 1987 document showed that RJR conducted a Canadian study allocating 17% of the interviews to 15 to 17 year olds. 512679728-9807 at 9732 (US 20848*) (O).

4588. An October 15, 1987 memorandum entitled "Project LF Potential Year 1 Marketing Strategy" from J.H. Miller to Emily C. Etzel and Ann E. Biswell, and copied to H.T. William C. Parks, discussed "introducing Project LF in 13 priority regions . . . . Project LF is a wider circumference non-menthol cigarette targeted at younger adult male smoker (primarily

13-24 year old male Marlboro smokers) . . . .[W]e are assuming $100MM for a national launch and $70MM for a regional introduction." Miller attached a table showing "Priority Regions" and "Remaining Regions" by brand: Marlboro, Winston and Camel. This document was contained in a file entitled "Youth Target." 505936377-6378 (US 50876) (A).

4589. A 1988 RJR document entitled "Strategic Overview" discussed Marlboro's success and advised that, in order to meet the goal of increasing RJR's market share, the company must target the "young adult" market. To meet this goal, "[s]everal research programs have been completed to increase understanding of YAS." 521895685-5732 at 5723 (US 20903) (O).

4590. A March 1988 report entitled "Younger Adult Smoker Opportunity" discussed "RJR's most critical strategic need – Younger Adult Smokers." The report stated: "Improved younger adult development is a key Corporate priority . . . – Necessary for core brand revitalization (#1 Corporate priority) – Lack of younger adults responsible for total Company volume trend." It indicated that RJR's "[m]arketing department [was] refocusing efforts against younger adult smokers." The report indicated the importance of unrestricted advertising in reaching these younger smokers; regarding a possible advertising ban, it stated that, "[i]f enacted, [an] advertising ban would severely limit RJR's ability to introduce [a] new brand or attract younger adult smokers." The report also stated that "[y]ounger adult smokers drive the growth of two major competitors" – Marlboro and Newport – which were "capturing an ever increasing share of younger adult smokers." Finally, the report explained that young smokers were crucial to the continuing survival of RJR because teenagers remain loyal to their brand of choice as they age and because teenagers smoke an increasing volume of cigarettes as they become adults: "younger adult smokers are the **key** to future growth for any company or brand for several reasons: (1) Aging explains **75%** of SOM [Share of Market] growth. (2) Benefits of younger

adult smokers compound over time as a result of **brand loyalty** and the **increase in rate per day** as smokers age." In summary, the report stated, "RJR must begin now to capture younger adult smokers: – Volume decline inevitable without YAS – Potential for future advertising restrictions – Marketing department restructured to address the issue." 506664499-4558 at 4499-4500, 4506-4507, 4557 (US 20763) (O) (emphasis in original).

4591. An August 1988 report entitled "Permanent Young Adult OOH (Out of Home) Plan" discussed RJR's OOH marketing ("out of home" primarily refers to billboards and other outdoor advertising) and made recommendations for targeting the younger adult smoker ("YAS") market. The overall plan for RJR's billboard efforts was described as "[c]ontinuous, high impact visibility in the most YAS-oriented media available." The overall objective was to: "Assure continuous OOH presence for highest potential Brands, utilizing locations, units and creative executions that are uniquely and singlemindedly relevant to younger adult smokers." The report recommended placing billboards in the areas most likely to be frequented by young adults, including:

> – Near venues where rock concerts are regularly held.
> – Along cruising strips/streets with heavy concentrations of fast food restaurants and convenience stores.
> – Near technical colleges, military bases, video game arcades, city basketball courts, motocross tracks, major record stores, etc.

The report stated that, with respect to marketing in such areas, "[t]raditional OOH selection parameters do not necessarily apply! Highly 'daily effective circulation' not critical - maybe YAS only in area on weekends - that's OK!" 507286174-6181 at 6175-6576, 6178 (US 22051) (A).

4592. A September 9, 1988 RJR resource allocation document stated: "RJR's YAS brands should reach YAS with a dominant promotion voice in 1989, i.e., at least $48MM should reach General Market YAS." 507181787-1824 at 1799 (US 20772) (O).

4593. A July 1989 internal RJR document entitled "Soundwaves Program Awareness and Perception Study" declared that the Soundwaves Program was:

> being developed to improve Salem's appeal, relevance, and share among younger adult smokers, the key subgroup fueling the brand's long-term decline. The program is designed to tie the Salem brand name with music, a very important and universal interest among younger adult smokers. The program will focus on the areas of music most meaningful to the 18-24 year old smoker target, new music, via various elements of the program-music magazine, record/tape offer, retail offers, media delivered offers, and local field marketing events – club nites and talent search.

514347738-7774 at 7738 (US 51850) (O).

4594. Marketing reports prepared for RJR, under the heading "Decision to Smoke," included the following statement: "66% of all new smokers by age 18." The document also reported on the brand loyalty of smokers, indicating that "90% [of] smokers use only one brand," and that the "Implications for 90's" are that 18 to 24 year olds will be "[c]ritical to long term brand vitality as consumption increases with age." Another report prepared for RJR, from approximately 1989, entitled "Younger Adult Smokers" discussed the strategic importance of younger adult smokers, stating that "YAS are the only source of replacement smokers-[l]ess than one-third of smokers start after age 18." The report analyzed the differences between "FUBYAS" (ages 18 to 20) and "Switchers" (ages 21 to 24), stating that "FUBYAS are in transition - belonging to the **FAMILY** (secure) replaced by belonging to selected **PEER GROUP** (not as secure)." MBDOJ06953-6966 at 6955-6956, 6969, 6993, 6996 (US 59747) (O) (emphasis in original).

4595. In a letter dated October 12, 1989 entitled "Dollar Value of YAS Over Time," Burrows provided "estimates (attached) of the value of capturing Younger Adult Smokers and holding them over time." The letter calculated the profits that RJR would gain "[i]f an 18 year

old adopts an RJR full price brand" for 3 years ($1,359), for 7 years ($3,710), for 10 years ($6,148), or for over 20 years ($18,794). Burrows concluded: "[o]ur aggressive Plan calls for gains of about 5.5 share points of smokers 18-20 per year, 1990-93 (about 120,000 smokers per year). Achieving this goal would produce an incremental cash contribution of only about $442MM during the Plan period (excluding promotion response in other age groups and other side benefits). However, if we hold these YAS for the market average of 7 years, they would be worth **over $2.1 billion in aggregate incremental profit**. I certainly agree with you that this payout should be worth a decent sized investment." 507181261-1261 (US 20007) (O) (emphasis in original).

4596. In an October 27, 1989 document, RJR Business Department employee L.B. Smith requested in-house legal advice concerning cash offers for consumer survey participation to "younger" adult smokers "ages **18**-24." The document indicated that "[t]he amount of the offer is intended to make it 'worthwhile' for younger adult smokers to respond" and that RJR did not require age information when respondents called the toll-free number. A copy was also sent to Douglas Weber, RJR's Director of New Products Development and Established Brands. 507187215-7215 (US 20773) (O) (emphasis in original).

4597. An RJR document entitled "1990 Workplan Objectives" stated that "**The number one priority for 1990 is to obtain younger adult smoker trial and grow younger adult smoker share of market**." In addition, the document asked "Why target the YAS market?" and answered:

Each Year:

- 800,000 new smokers (18+) enter the market
- 1,500,000 smokers leave the market

With about 50 million smokers, this means that each year there are:

- 1.6 share points of new smokers
- 3.0 share points of quitters

At least 95% of all new smokers are 18-24. About 70% are exactly 18 (i.e., aged in the 18+ market).

Each brand and company has a share of new smokers and quitters, which is reflected in their shares of YAS and older smokers. These shares drive long-term market performance.

513869196-9303 at 9197, 9198 (US 30058) (A) (emphasis in original).

4598. RJR sought to develop brands of cigarettes specifically targeted at young adult female and African American smokers. A 1989 internal RJR document titled "Smoker Dynamics" stated that "YAS [Younger Adult Smokers] are the only source of replacement smokers." The 1990 RJR Business Plan discussed the test marketing of two brands: "Project VF [Virile Female] . . . designed to attack Marlboro's vulnerability among younger adult female smokers" with the Dakota brand; and "Project UT [Uptown] . . . targeted to Newport's strong franchise among younger adult Black smokers." Schindler WD, 94:9-95:6; 507201540-1599 at 1563 (US 89344) (A); 507586669-6777 at 6686 (US 89345) (A).

4599. Memoranda discussing RJR's 1989 and 1990 focus group testing of Dakota reveal that the company sought to target less- educated young females. An April 13, 1989 Reynolds memo entitled "Project VF" described the "target" demographic as 18 to 20 year old female Marlboro smokers, with the "majority [having] no education beyond high school," and with "Long-term earning potential . . . low to middle income." A December 7, 1989 memorandum from Laura Bender, RJR Senior Brand Manager, entitled "Dakota Smoker Profile for Sales Conference" described the Dakota smoker as "an 18-24 year old female . . . [who] is fairly downscale with a high school education or less and generally has an 'unskilled' job." A June 16, 1989 document created by Trone Advertising, the advertising agency of record for Dakota, titled

"VF Year I Promotion Recommendations" described the target customer demographic as "Caucasian Females, Age 18-20" who aspire "to get married in her early twenties and have a family," and who spends her free time "with her boyfriend doing whatever he is doing." 507366520-6522 at 6521(US 89353) (A); 508768290-8291 (US 89336) (A); 507178161-8201 at 8166-67 (US 89350) (A).

4600. In January 1990, RJR marketing documents describing the test marketing of its new Dakota brand to 18 to 24 year old so called "Virile" women, those without college educations or professional careers, were leaked to the press, causing a public furor. A January 1, 1990 RJR document indicated that Philip Morris had informed RJR that it (Philip Morris) had not revealed that the marketing documents "leaked" to the *Washington Post* were indeed RJR documents: "they [Philip Morris] did not tell the *Post* reporter that the materials cited in the story were theirs [RJR's]." 507301283-1298 at 1286, 1298 (US 22726) (O).

4601. In a February 6, 1990 memorandum entitled "Dakota Public/Government Relations Plan," Lynn Beasley, now the COO of RJR, recommended, "[g]iven recent articles in the *Atlanta Constitution* and *Ad Week*, it is probable that Dakota's preliminary criticism will regard female targeting. Recommended responses in order are: 1) Deny female positioning as outlined in attached Q & A's." On February 17, 1990, an article ran in the *Washington Post* titled "New Ad Target, Virile Female: RJR Plans to Introduce Cigarette." The article stated that "[t]he R.J. Reynolds Tobacco Co. plans soon to introduce a brand of cigarette that, according to the detailed marketing strategy prepared for the company, targets young, poorly educated, white women whom the company calls 'virile females.' Reynolds plans to test the new brand, called 'Dakota,' this April in Houston." On the same day the article was published, the Chairman and CEO of RJR, James Johnston, issued a statement claiming that "[t]he Dakota marketing plan is

focused on current adult Marlboro smokers – nothing more, nothing less." RJR's press release failed to acknowledge either females or 18 to 24 year-olds as Dakota's primary target group. Schindler WD, 110:9-19; 518014738-4742 at 4738 (US 80215) (A); 515576297-6299 (US 89359) (O); 515010881-0882 (US 89360) (O).

4602. In a March 30, 1990 letter, RJR employee L.L. Bender described the press attention to RJR's Houston test marketing of Dakota cigarettes to the "Virile Female." Bender stated:

> I. LEARNING
> . . . Even with the tightest possible security, however, **we must operate with the knowledge that anything we write, say, or do can become 'public knowledge' overnight**. . . . Fortunately, focus group learning suggests that **exposure to the brands' advertising can quickly reorient brand perceptions/positioning.** Surprisingly, focus group learning also indicates a **straightforward 'statement' ad or letter from the company would be less effective at reversing negative brand perceptions than advertising.** In fact, detailed explanations of our position seemed to surface new issues and fuel the controversy.
> II. IMPLICATIONS FOR FUTURE [NEW BRAND] INTRODUCTIONS/ CONTROVERSY
> 'Target' definitions should be broad and refer only to competitive brands. . . . Proposals/recommendations that are not accepted should be discarded immediately. Out of date documents should also be destroyed. If anti's, the press, or government officials misrepresent the brand, advertising reflecting correct brand positioning should be run as soon as possible. However, this advertising should not be designed to refute claims directly.

507511965-1967 at 1965-1966 (US 20777) (O) (emphasis in original).

4603. In 1989-1990, RJR also sought to develop a cigarette brand, "Uptown," targeted at young adult uneducated African Americans. Project Uptown was part of RJR is "Black Initiative" to increase RJR's share of 18 to 20 year old black smokers by 2.5 points in 1990. An internal RJR document that pre-dated Project Uptown, "Black Opportunity Analysis," stated that"Black Smokers have been identified as a potential opportunity sector for RJR" and that

"[s]everal studies have suggested that Blacks are becoming polarized into an 'elite' and an 'underclass' . . . [it] is the 'underclass' who are smokers." In a section of the document titled "Blacks as People," it states, "[i]nner city Black smokers are resigned to a future which permits only modest aspirations. . . . Younger adult inner-city black men seem to have fewer goals than the females. . . . From their discussions, it was evident that most of these men had surrendered to their dismal fate rather than actively seeking a solution." A March 6, 1989 document produced from RJR' files entitled "1990 New Marketing Ideas" referenced an "Inner-City Black Targeted Brand" that would be a "distinctive cigarette brand targeted at the Inner-city Black smoker" and would "leverage the Black consumers' desire to use products which . . . are more 'potent' (e.g., Blacks drink malt liquor rather than beer)." An October 18, 1989 RJR marketing research report titled "Project UT [Uptown] Creative Qualitative Research" stated "Project UT is a new brand targeted to younger adult Black smokers," and described the results of focus group testing conducted in Chicago among 18-24 year old African American males and females who had "a high school or less education, and a total household income under $20,000 per year." Only after the Secretary of HHS at the time, Dr. Lewis Sullivan, gave a speech condemning Uptown did RJR decide not to bring Uptown to market. Schindler TT, 1/25/05, 10952:4-10953;14; Schindler WD, 112:2-22, 121:19-24; 505925251-5295 at 5253, 5263, 5278 (US 89347) (A); 507297419-7442 at 7438 (US 89351) (A); 507318253-8287 at 8254, 8257 (US 89346) (A).

4604. On January 10, 1990, J.P. McMahon, RJR Division Manager, sent a memorandum headed "**VERY IMPORTANT, PLEASE READ CAREFULLY**!!!" to all Division Sales Managers requesting that they identify stores frequented by "young adult shoppers" that were located near high schools, colleges, or other areas frequented by such individuals. McMahon wrote: "I need all of you to study the attached scroll list of monthly accounts in your assignment

that are presently doing more than 100 CPW [cases per week] for purposes of denoting stores that are heavily frequented by young adult shoppers. These stores can be in close proximity to colleges, high schools or areas where there are a large number of young adults frequent the store." Such stores were to be classified as "young adult" and singled out for special treatment, even if the stores were not otherwise considered "Preferred Presence units." 507341428-1430 at 1430 (US 22376) (O) (emphasis in original); 509056992-6994 at 6992 (US 22378) (O).

4605. Almost four months later, McMahon sent a May 3, 1990 letter to all sales representatives to "clarify" the language in his January 10 letter. In it, McMahon stated:

> In reviewing my files, I have noticed that I sent you a letter dated January 10th of this year, asking you to identify stores located in close proximity to high school and colleges for placement of our premium items. First of all, looking back on this letter, I realize I was wrong in identifying the specific age group of these young adults. It has always been this company's policy that we do not promote or sell our cigarettes to anyone under the age of 21.

516018462-8462 (US 51982) (O).

4606. In an April 5, 1990 RJR memorandum entitled "Young Adult Market . . . Account Grouping," R.G. Warlick, RJR Division Manager, requested that all sales representatives in Norman, Oklahoma, provide him a list of their "Y.A.S. accounts," meaning "[a]ll package action calls [locations that sell cigarettes by the pack rather than the carton, i.e., convenience stores] located across from, adjacent to are [sic] in the general vicinity of the High Schools or College Campus. (under 30 years of age)." 89281671-1671 (US 22735) (O).

4607. An RJR document dated June 21, 1990, entitled "US Cigarette Market in the 1990s," stated that the "majority [of smokers] become regular smokers before age 18. . . ." 507798137-8230 at 8142 (US 20789*) (A).

4608. In 1992, RJR supposedly adopted a policy which proscribed marketing to anyone

under 21 years of age. CEO Andrew Schindler the policy in fact meant that RJR would not use source data information gathered from research into the smoking preferences of 18 to 21 year olds. Schindler further testified that RJR does not "interact with" or "talk to" 18, 19, and 20 year olds, but rather "conducts its interactive marketing practices only with those 21 and older." Schindler WD, 170:16-171:18; 208:16-18. Beasley PD, United States v. Philip Morris, 6/25/02, 54:17-55:19; 77:19-78:4, Burrows PD, United States v. Philip Morris, 6/27/01, 14:5-7. In his May 2, 2002 deposition in this case, Edmund Conger Leary, Senior Vice President of Marketing and President of Sports Marketing for RJR, testified that RJR "marketed to adults 18 and up" prior to 1992. Leary PD, United States v. Philip Morris, 5/2/02, 19:13-18, 22:14-16, 30:3-33:12.

4609. A May 28, 1992 RJR internal memorandum entitled "Advertising Practices," from James C. Schroer, Executive Vice President of Marketing and Sales, to Lynn Beasley and other marketing staff, set out RJR's supposed policy change to stop marketing to individuals younger than 21: "it would be in our long-term best interests to join the ranks of our competitors and limit our advertising and marketing efforts to smokers 21 years of age and older." The memorandum recognized that all of RJR's competitors publicly stated that they did not market to anyone under 21: "[n]one of our competitors in their public statements admit that they advertise or promote their products to anyone under 21." 513180912-0913 (US 51672) (A); 511388874-8875 (US 22497) (O); 513385651-5652 (US 20852) (O); 507647460-7461 (US 21680) (O); 522908112-8112 (US 87746) (O).

4610. This same May 28, 1992 memorandum reveals, however, that the motivation behind RJR's policy change was to blunt attacks by adversaries, rather than any desire to actually avoid marketing to youth:

> The fact that our public statements on this issue differ from our competitors' and, on the surface might appear inconsistent with

> elements of the Cigarette Advertising and Promotion Code, has not gone unnoticed by our adversaries . . . . [w]e don't believe for a minute that this will silence our adversaries in their attempts to misrepresent our motives or the effect of advertising. We do feel that it will blunt this point of attack and provide us with a three-year 'cushion' that can be used in response to claims that we're after the underage market . . . All brand positioning statements that currently reflect audiences below the age of 21 should be revised to reflect audiences which are 21 or older.

511388874-8875 (US 22497) (O).

4611. Despite RJR's supposed post-1992 policy proscribing marketing to anyone under 21 years of age, RJR made no changes in its marketing efforts after enacting this policy. For example, RJR did not restrict the locations of cigarette vending machines to only age 21-plus venues. Nor did RJR withdraw or change its "Joe Camel" campaign even though Andrew Schindler testified that the target group of this campaign was 18 to 24 year olds. Schindler agreed that RJR conducted research among 18 to 24 year old smokers about "every aspect" of Joe Camel "for its appeal and relevancy to the target." Schindler WD, 166:15-20, 174:1-3.

4612. Despite RJR's supposed policy, Schindler stated that if an 18 year old sees an RJR ad campaign which was developed to target 21 year olds, likes it and switches to R.J Reynolds cigarettes as a result, "It is not a problem because they are of legal age to buy the product." Schindler WD, 173:14-21.

4613. In fact, after 1992, RJR continued to conduct market research on those under 21. In May 1994, RJR conducted a "Tracker Tag-On" among 300 smokers "age 18+" to determine whether these smokers would be interested in a cigarette without additives. 513823320-3325 at 3320 (US 22463) (O).

4614. A survey dated November 28, 1995 bearing the legend "Property of RJRTC" on every page analyzed whether "Adolescents Will Not Be Predisposed to GTC." "GTC" was the

in-house code name for RJR's tobacco heated products such as Eclipse. The survey discussed reasons why an adolescent would be inclined to smoke GTC: "Less Concern About The Risks Associated With Smoking (Minimize Initial Physical Reaction To Smoking). . . .More Likely To Experiment. . . .Less Likely To Quit Smoking Under A Perception of Lower Risk Associated With Smoking And Because Smoking Is Seen As Less Objectionable Among Peers. . . .By Influencing Adult Smoking Incidence, Impact Is Made On Smoking By Adolescents Through Parental Example. . . .In Fact, Parents May Be Less Forceful About Their Kids [Not] Smoking If They Perceive The New Product As Having Healthier Benefits." 514510001-0015 at 0006 (US 51860) (O).

(iii) RJR's Repositioning of Salem and Winston Towards The Youth Market

4615. In the mid 1990s, despite RJR's supposed 1992 policy of not marketing to those under 21, RJR repositioned its Winston and Salem brands to make them more appealing to younger smokers. Documents discussing these efforts specifically identify 18 to 24 year olds as RJR's target. For example, a 1996 RJR "Competitive Summary" discussed repositioning Salem. Identifying Salem's competitors as Newport and Marlboro Menthol, the document stated, below a chart of 18 to 24 year old brand share, that it was "[c]ritical that Salem have front door opportunity to ensure long-term viability." 514200832-0889 at 0865-0866 (US 20857) (O); TLT0132032-2268 (US 87838) (O).

4616. An October 24, 1996 email from RJR employee Diana Martin to fellow employee Gus Lejano attached a document discussing the repositioning of the Winston brand. Martin's e-mail attachments indicated that "[s]ustained growth driven only by younger adult smokers" and contained data on Winston's share among 18 to 24 year olds. Martin also advised: "[s]uccessful repositioning [of Winston] requires young adult smokers." 700186251-6251 (US 54461) (O);

700186252-6252 (US 54462) (O); 700186253-6253 (US 54463) (O); 700186254-6255 (US 54464) (O); 700186256-6256 (US 54465) (O).

4617. In a March 14, 1997 memorandum sent by Daniel Murphy at Diagnostic Research International to L.G. Dube, an RJR employee, Murphy indicated that his company was evaluating Salem's market share among 18 to 34 year old smokers in various markets. Similarly, the M/A/R/C Group performed research in 1997 on behalf of RJR to evaluate the awareness of the "SALEM MVP Proposition" and whether it "improves overall brand perceptions and positively impacts brand buyer dynamics" on smokers as young as 18. 519941785-1786 (US 85239) (O); 516949904-9907 at 9905-9906 (US 85240) (O).

4618. A 1997 memorandum from Regena Pasterczyk, Senior Brand Research Manager for Winston and Senior Information Manager in RJR's Business Unit Research Department, to Lynn Beasley, Vice President of the Winston business unit, summarized the findings among respondent groups that included 18 to 20 year olds: "no additives, no artificial ingredients, and a 'no bull' brand is clearly coming across among the critical 18-34 NM competitive prospect group." "No Bull" was the slogan that RJR used to launch its repositioned Winston in 1997. 519588649-8659 at 8649 (US 22465) (O).

4619. A September 4, 1997 Tracking Research Report entitled "Winston 1997 Hispanic Tracker Pre-Wave Results" published by the Business Information and Analysis Department at RJR revealed that following the introduction of its Winston "No Bull" advertising campaign in August 1997, RJR developed "a comprehensive national tracking plan . . . to monitor the awareness and penetration of the launch among [Hispanic] **smokers 18**+." 520650706-0727 at 0706 (US 52621) (O) (emphasis added); 518090228-0255 at 0233, 0242, 0244-0249, 0251 (US 52152) (O); 518090256-0268 at 0260-0265, 0267 (US 52153) (O).

4620. At trial, RJR's CEO Andrew Schindler admitted that 1997 Winston Launch plans for the "No Bull" campaign included quantitative information obtained from a survey of 18-34 year olds, and that such quantitative information could inform the company with respect to the marketing of its products. Schindler TT, 1/25/05, 10942:8–10947:16; 520601649-1699 (US 22116) (A).

4621. A January 5, 1998 document entitled "Winston 1997 Hispanic Tracker Post-Wave Results" reveals that RJR marketed to persons under age 21 through its No Bull campaign. It tracked the effect of the "No Bull" campaign on Hispanic smokers ages 18 and over. These individuals were asked if they had "ever tried," "recently tried," "ever purchased," or "recently purchased" Winston cigarettes, and asked about "proposition awareness" of the "Winston No Bull" marketing campaign. 520650728-0755 at 0729, 0744-0749 (US 22468) (O).

4622. In the "Winston 'No Bull' National Launch Tracking Report IV- November" dated January 8, 1998 from A. Phillips, an employee of RJR, to E. Leary, Director of Winston Brand, RJR tracked the total of smokers ages 18 and older who had ever tried and ever purchased Winstons since the brand's national launch. It concluded that "new business to the brand is coming primarily from younger adult smokers, 18-34, where purchase . . . and repeat purchase . . . have doubled since [the Launch]." 519921955-1983 at 1958 (US 22467) (O).

4623. During her June 20, 2002 deposition, Frances Creighton, RJR Senior Vice President for Marketing, testified that RJR tracks brand performance and brand perception among smokers as young as 18. Creighton PD, United States v. Philip Morris, 6/20/02, 54:5-57:7.

4624. An August 18, 1999 email from Tyler Brule of Time Inc. to Melanie Barbee and Frances Creighton, a Marketing Vice President at RJR, outlines some advertising concepts for

the "21st Century Turks" campaign. In it, Brule explains: "[t]he style is strong, very striking and new for the US, which is key if you're going to stand out in *Rolling Stone*, *Details* et al. The look won't be as cartoony as where you've been lately but more iconic and animated by the characters we cast." In providing specific examples of ad executions, Brule wrote:

> All of the characters stand out because they're young Turks, doing they're [sic] own thing, living life and having a great time doing it . . . . whirling dirvish [sic] - on a nightclub dance floor a girl dances the night away. She's happy by herself, guys and girls look on at her with envy and the scene feels like it could by [sic] Ankara or Akron. She's beautifully styled, with a pack of full flavours tucked into her waistband . . . the coolest commute - in a vintage Mercedes–late 60s model–a girl's driving along smoking her menthol and experiencing the pleasure of the open road.

RJR000001499005724700286110-6111 (US 61795*) (O).

(5) Defendants Exploit Young People's Desires To Smoke "Popular" Brands Their Peers Smoke

4625. Defendants claim in public statements that young people begin to smoke due to peer pressure, rather than due to Defendants' marketing efforts. For example, in a May 24, 1979 letter to Joseph A. Califano, Jr., Secretary of the Department of Health, Education and Welfare, Horace R. Kornegay, President of the Tobacco Institute, stated that "your statements appear to reflect the erroneous view that brand advertising has an effect on the decision to begin smoking," and asserted that the 1978 Surgeon General's Report "suggested that the primary motivating factors in smoking by young people were the influence of peers, smoking parents, and older siblings." TI05031337-1338 at 1338 (US 21245) (A). See US FF § III.E(5), supra. Defendants fail to publicly address the question of what factors encourage those "peers" to smoke, and how marketing may influence peer pressure.

4626. However, as established in the testimony of Dr. Krugman and in the Cigarette Company Defendants' internal documents and other evidence, Cigarette Company Defendants

purposefully have marketed their brands as "popular" and used "peer appeal" to encourage young people to smoke their brands. Cigarette Company Defendants researched what they deemed the "herd" instincts of young people – that young people would choose a cigarette brand that they perceived to be the most popular or "number one" among their peers – and harnessed these "herd" instincts in their marketing to encourage youth initiation and brand choice. Krugman WD, 85:11-92:18.

(a) Philip Morris

4627. In a December 12, 1984 Philip Morris report entitled "Cigarette Market History and Interpretation," John E. Tindall, Senior Scientist at Philip Morris, stated that, in order to discover why certain brands have captured the young smokers, "**[w]e need not try to understand why young people have a herd instinct. From their choices of food, clothes, transportation, entertainment, heros [sic], friends, hangouts, etc., it is clear that they do.** More important to us (and probably to many other product categories) is why they make certain choices instead of others." 2001265000-5045 at 5030 (US 20299) (A) (emphasis added).

4628. An October 7, 1987 internal Philip Morris document containing plans for marketing Parliament in 1988 and 1989 stated: "To target the 18-24 males and females, our retail focus will be on pack outlets . . . and will be trial/conversion oriented. This younger age group is more likely to make decisions based on peer pressure. To convey the idea that everyone is smoking Parliament, the brand should have continuous high levels of visibility in as many pack outlets as possible." 2045287059-7067 at 7063 (US 38408) (A).

4629. An August 7, 1990 report entitled "New Brand Opportunities in the Cigarette Industry" written by Gibbons, Voyer & Associates for Philip Morris stated that 17 to 19 year olds comprise 18.9% of smokers; the report found that "**Marlboro Dominates Young Adult Smoker**

Market: Initial Exposure, Peer Pressure, Meets Image Wants" and that "switching occurs as smokers enter their mid-20's." 2049397333-7369 at 7343, 7348 (US 20486) (A) (emphasis added).

4630. With its continuous smoker tracking survey, as stated in a November 1994 document entitled "Profile of the Young Adult Marlboro Smoker Part 1: Males, 18 to 24 Years Old," Philip Morris found that 18 to 24 year old males cite Marlboro's popularity with friends ("brand I grew up with," "an 'in' brand") and availability as factors driving their initial choice of a regular brand. The document also stated that a male Marlboro smoker 18 to 24 years old is most likely to consider his brand to be "popular" and "well established." 2048735500-5604 at 5544, 5546 (US 21971) (A).

4631. In her testimony, Nancy Lund, Philip Morris Senior Vice President of Marketing, testified that Philip Morris collected information on whether smokers perceive particular brands to be "popular" brands as part of its continuous consumer tracking survey in order to help it to "understand if the brand is remaining new and relevant and growing in the marketplace or whether the consumers think that this brand [] is washed up." When asked why this information would be important in marketing Marlboro, Lund admitted that "at least what we know about young adult smokers, for some of them, **the fact that Marlboro is a popular brand may be a factor in why they choose Marlboro.**" Philip Morris interprets a high "popularity" rating for Marlboro as positive. When asked whether she was aware that there is internal Philip Morris data from the Youth Smoking Prevention Department that shows that children ages 12 to 17 choose to smoke Marlboro because of its popularity, Lund testified: "I certainly have heard and understand that Marlboro is a popular brand among that group [12 to 17 year olds]." Lund PD, United States v. Philip Morris, 6/27/02, 137:17-140:13, 197:24-199:11 (emphasis added).

4632. Philip Morris regularly tracks through its continuous consumer tracking survey whether 18 to 24 year old smokers report that Marlboro is "growing in popularity." As Suzanne LeVan, Vice President of Marlboro, testified in this case, "if young adult smokers were saying that a brand was rapidly declining in popularity, then that might be something to be significantly -- to be concerned about." LeVan PD, United States v. Philip Morris, 6/25/02, 246:22-23, 247:13-16.

4633. In a June 23, 1995 memorandum from Philip Morris research analyst Marian Wood to Lund, Wood discussed the results of a qualitative market research study concerning the Marlboro Lights brand. This study, conducted by Marketing Perceptions, a market research contractor for Philip Morris, found that "most of the Lights smokers [in that study] chose Marlboro because of the brand's popularity. However, once they were in the franchise, many of these smokers identified with the independent image the brand conveyed." 2071580565-0566 at 0566 (US 20528) (O).

4634. Focus group research conducted by Sun Research Corporation for Philip Morris in September 1995 and contained in a report entitled "Qualitative Insights on Preliminary Ad Campaigns For a New Parliament Lights Menthol" confirmed that young people, starting at age 18, rate certain cigarette brands as "popular," including Newport, Marlboro, and sometimes Kool. 2045596130-6141 at 6133 (US 20462) (O).

4635. In a February 21, 1996 memorandum, Natalie Ellis, Marlboro Research Manager at Philip Morris USA, remarked upon the "**critical role brand popularity plays in the Marlboro core image.**" 2040837079-7080 at 7079 (US 23898) (O) (emphasis added).

4636. Philip Morris's marketing for its youth brand, Marlboro, is expressly designed to appeal to young smokers' desire for peer acceptance by emphasizing Marlboro's popularity and

status as the "number one" brand. Camisa PD, United States v. Philip Morris, 6/28/02, 107:6-109:22, 111-113, 158:7-159:8; 2071230813-0888 at 0820-0821, 0830-0832, 0838-0839, 0850, 0856, 0862, 0864 (US 40404) (A), (US 20521*) (O); 2080499829-9896 at 9859 (US 20536) (A).

4637. A November 1998 document entitled "Marlboro Worldwide Creative Brief," written by Philip Morris's advertising agency Leo Burnett for Philip Morris and produced by Philip Morris in this case, analyzed the marketplace dynamics affecting Marlboro's volume and share performance and recommended ways to market Marlboro to "young adult male smokers" who "continue to be of primary importance for the growth of Marlboro." The report opened by discussing "Key Consumer Insights," including: "**Friends/peers are more important than before**. Given increased pressure from a rapidly changing world around them, there is a growing need for 'connectedness' with this group. Young Adult Smokers today communicate with each other differently -- they care more about relationships with others." After discussing the "core values of Marlboro Country" – "Masculinity, Freedom, Adventure, Limitless Opportunities, Self-Sufficiency, Mastery of Destiny, Harmony with Nature" – the report addressed Marlboro's "Advertising Challenge":

> With more than 30 years of experience behind the Marlboro Country campaign idea, we are confident that its timeless, universal appeal will continue to build the brand's image, awareness and sales well into the future. Nevertheless, our key advertising challenge is to keep the Brand Essence and Core Values of Marlboro Country relevant and impactful in the context of changing young adult smokers and marketplace dynamics. As an evolutionary process, the advertising approach must continue to link to the historical advertising theme, while keeping the communication fresh and vital.

The report continued by addressing, under the heading of "Creative Direction," Marlboro's "Advertising Objectives":

> We need to deliver well-targeted advertising that: 1.

> Builds/maintains brand and advertising awareness. 2. **Reinforces Marlboro's position as the world's #1 cigarette** . . . .As part of these objectives we want to: Reinforce Marlboro as the brand of choice and build loyalty among Young Adult Male Smokers (YAMS). . . . **Bonding/Camaraderie[:] Images that capture aspects of camaraderie and sociability. . . .This content area is the place to reveal the social, more approachable side of the Cowboy.**

LB0092389-2414 at 2391-2394, 2396 (US 33235) (O); 2085298486-8512 at 8488-8491, 8493 (US 22906) (O) (emphasis added).

4638. A November 1998 document written by Philip Morris's advertising agency Leo Burnett for Philip Morris, entitled "Marlboro Advertising: A Strategic Perspective, Core Values Communication," shows that Philip Morris followed the recommendations of the document entitled "Marlboro Worldwide Creative Brief" discussed above by adding "camaraderie" – peer-appeal – to its list of Marlboro core values to be communicated through advertising. The document stated: "Globally, our key advertising challenge is to keep the execution of the Core Values of Marlboro Country **relevant** and impactful in the context of LA-24 adult smokers and marketplace dynamics." It discussed Marlboro's current advertising: "A mix of images worked hard to effectively communicate freedom, self confidence, respect, dignity, independence (by choice), **camaraderie**, harmony with nature, tranquility, majesty and power . . . **[r]esulting in keeping the Marlboro Man fresh** and **expanding his most aspirational qualities**." LB0092512-2522 at 2521-2522 (US 58941) (O) (emphasis added).

4639. A Philip Morris "National Market Structure Study" dated May 1999, which discussed a 1998 survey conducted to update a similar 1992 survey, examined cigarette brand popularity. The study found that respondents are not accurate in self-reporting their motivations for choosing a cigarette brand. The study reported that, despite self-reporting to the contrary, popularity of the brand is most important: "The attributes associated with brand choice are very

different from those stated to be important – popularity is key." The study concluded: "Young adults are influenced by peer popularity while 25's to 29's look to overall popularity in assessing brands." 2073785602-5662 at 5613, 5615 (US 24680) (O).

4640. In contradiction to the May 1999 study's findings, Nancy Lund, Philip Morris Senior Vice President of Marketing, testified in this case that "smokers choose Marlboro because it's the most flavorful and probably the highest quality cigarette in the marketplace." However, the May 1999 study itself reported that only "23 percent of smokers choose Marlboro for its quality tobacco." Lund PD, United States v. Philip Morris, 6/27/02, 225:20-22; LB0124583-4647 (US 33374*) (A).

4641. At her April 16, 2002 deposition in this case, Shari Teitelbaum, Philip Morris Director of Marketing and Sales Decision Support, testified that Philip Morris has used the term "herd smoker" to refer to smokers of the most popular cigarette brands, like Marlboro, Camel, and Newport, because these brands attract the largest share of young adult smokers. Teitelbaum further testified that herd brands are "the most popular, it's for smokers that would be likely to kind of follow the herd, kind of more of a group mentality type of thing." Teitelbaum PD, United States v. Philip Morris, 4/16/02, 77:22-78:25.

(b) Lorillard

4642. A November 11, 1993 presentation by McCracken Brooks for Lorillard entitled "Newport Promotional Concepts" stated that one of the "objectives" was to "[s]trengthen Newport's competitive edge as the **peer brand** among young adult smokers." 91949806-9831 at 9808 (US 57155) (A) (emphasis added).

4643. Newport's 1994 Brand Plan stated that "Newport is the leading menthol cigarette brand among younger adult smokers in the freshness segment, positioned to appeal primarily to

general market/urban center adult smokers ages 18-24" and that "Newport's creative product must strengthen Newport's competitive edge as **the 'peer' brand** among younger adult smokers." 91945017-5124 at 5033, 5045 (US 21113) (A) (emphasis added).

4644. A July 1994 report entitled "An Evaluation of the Newport 'Pleasure on Wheels' Promotion Tiers 1 and 2" prepared for Lorillard by Meyers Research Center stated that one of the "primary marketing objectives" of this promotion was to "[r]einforce Newport's image as **the 'peer brand'** among young adult smokers." This report was attached to a July 26, 1994 memorandum entitled "Final Report: Newport P.O.W. Promotion Evaluation in Tiers I and II – MPID #5543/394" from Scott Benson, Lorillard Manager of Consumer Research, to Victor Lindsley, Lorillard Senior Group Brand Director. 91840214-0311 at 0218 (US 74415) (A) (emphasis added); 94291134-1139 at 1134 (US 21119) (A).

4645. The "Newport 2000 Strategic Plan Overview," dated October 8, 1999, stated that "The Newport Family as Lorillard's core power volume brand must contribute significant volume and share growth . . ." A "Key Issue" was Newport's need to strengthen its marketing programs: "Newport's marketing programs have not been strong enough in a substantially changed marketplace to protect the brand's core business base, significantly improve volume and share trends, or defend against Marlboro Menthol's aggressive marketing initiatives." The "Creative Strategy" to increase volume and gain long term growth was: "Develop creative executions that continue to strengthen and refresh **Newport's competitive advantage as the peer brand of choice among younger adult smokers** by reinforcing the perception that Newport delivers smoking pleasure in social settings relative to their lifestyles . . . Continue to leverage the Pleasure campaign equity to reinforce the brand's fun, spontaneous, upbeat image through a variety of settings portraying social interaction, spontaneous fun, refreshment and smoking

situations." 98196660-6681 at 6661, 6665, 6671 (US 56953) (A) (emphasis added).

4646. The dated June 9, 2000, set forth that included: This plan, like the year 2000 plan discussed above, stated that Lorillard must

99310880-0893 at 0884-0885 (US 57656) (A) (Confidential) (emphasis added).

4647. According to Victor Lindsley, Lorillard's Senior Group Brand Director for Newport cigarettes, the advertising theme of "pleasure" appeals to all ages, especially the advertised "pleasure" of hanging out with friends. Lindsley PD, United States v. Philip Morris, 5/16/02, 115:7-116:3.

4648. In his modified written direct testimony, Lorillard CEO Martin Orlowsky testified that "[p]eer acceptance is an important business issue in terms of brand selection, because it is a factor affecting brand choice among younger adult smokers." Orlowsky WD, 58:3-4.

(c) B&W

4649. A 1974 B&W report above entitled "Young Adult Smoker Life Styles and Attitudes," recorded that "as part of [B&W's] investigation of the 'new' smoker, a program of consumer research was undertaken." The purpose of the research was "to gain insight into the perceptions, attitudes and behavior of younger, recently-starting smokers regarding initial product

usage, current smoking and health concerns." Included in the findings was the statement that smoking starts with younger people for four reasons: "The first factor is the desire of young people to look older than they really are. The second is peer pressure and doing what friends and authority figures do. The third reason is to rebel against parents with only modest risk. The fourth reason identified had to do with physical reaction. This physical reaction was described as a 'high' or as a challenge to be strong enough to smoke without getting sick." B&W designed its marketing campaigns around themes that would exploit these attitudes. 170040977-1001 at 0977 (US 20289) (O).

4650. On November 15, 1977, B.L. Broeker, a B&W Senior Brand Manager, wrote to Phil Weinseimer at the Bates agency attaching "exploratory advertising strategies, 'Exhilaration' and 'Confidence.'" The "Key Fact" under the Exhilaration advertising strategy was that "Kool is losing smokers to menthol competition and not attracting enough starter and switcher smokers to affect this loss." The 'Confidence' advertising was designed to address the problem that Kool "lacks an upbeat, exciting image to reinforce its youthful franchise and attract new smokers." The "Promise" of the Confidence creative strategy was "Smokers who try Kool will derive a sense of confidence and preeminence among their peers via association with this superior product." 686032807-2811 at 2808, 2810 (US 31034) (A).

(d) RJR

4651. A handwritten document produced from the files of RJR addressed to "D. Nordine and D. Burroughs," presumably Diane Burrows of RJR, stated that "important needs to FUBYAS [First Usual Brand Young Adult Smokers]" included "belonging (fitting in) to the group." 517142220-2222 at 2220, 2222 (US 20876) (O).

4652. In a February 2, 1973 RJR document entitled "Research Planning Memorandum

On Some Thoughts About New Brands Of Cigarettes For The Youth Market," Claude E. Teague, Jr., Assistant Director of Research at RJR, set forth the following strategy for appealing to young people's desires to smoke popular and peer-approved brands:

> A. Group Identification – Pre-smokers learn to smoke to identify with and participate in shared experiences of a group of associates. **If the majority of one's closest associates smoke cigarettes, then there is strong psychological pressure, particularly on the young person, to identify with the group, follow the crowd,** and avoid being out of phase with the group's value system even though, paradoxically, the group value system may esteem individuality. **This provides a large incentive to begin smoking**. If this be true, then **the same effect strongly influences the brand chosen, it likely being the popular, "in" brand** used by ones [sic] close associates. **Thus a new brand aimed at the young smoker must somehow become the "in" brand and its promotion should emphasize togetherness, belonging and group acceptance, while at the same time emphasizing individuality and "doing ones [sic] own thing.**"

502987407-502987418 at 7413 (US 20708) (A) (emphasis added).

4653. A March 12, 1986 memorandum entitled "Camel New Advertising Campaign Development," labeled "RJR Secret," sent to David Iauco, RJR Senior Vice President for Marketing and R.T. Caufield, of the RJR Brand Group, stated regarding RJR's plans for developing the Joe Camel campaign: "Overall, **CAMEL advertising will be directed toward using peer acceptance/influence to provide the motivation for target smokers to select Camel.**" 503969238-9242 at 9238 (US 79096) (A) (emphasis added).

4654. A 1988 RJR document entitled "Camel Advertising Development White Paper" discussed the importance of younger "adult" smokers and analyzed "[w]hy Camel has an opportunity to target younger adult smokers." The White Paper stated that "Marlboro's key strength relates to peer acceptability and belonging . . . . Marlboro is perceived by younger adult smokers as a brand which provides a sense of belonging to the peer group. A variety of research

studies including the Segment Description Study, the Marlboro Vulnerability Analysis, in-market perception research, as well as in-depth qualitative [research] all show this." The White Paper then discussed how Camel could reconfigure its market image in order to appeal to the "peer acceptability and belonging" themes so effectively exploited by Marlboro's advertising. 506768775-8784 at 8776, 8781-8784(US 20764) (A).

4655. In the summer of 1999, RJR developed its Red Kamel campaign which it aimed at a young, hip audience. In a June 4, 1999 email from Leslie Ip to Stephanie Harper, Ip outlined the brand personality:

> While Red Kamel also stands for "Lust for Living," the brand targets those adult smokers (21-34) who can truly be described as "cutting edge" trendsetters who are nightlife savvy and exhibit and [sic] attitude of "urban hip and coolness". . . The key drivers of Red Kamel are its unique packaging and word of mouth regarding the brand.

RJR000001499036205770028679-6780 (US 22136) (O); Beasley PD, United States v. Philip Morris, 6/25/02, 161:5-162:5; 523737919-7921 (US 87863) (O); 524095489-5724 (US 87864) (O).

4656. Through smoker research, RJR knows that first brand choice is largely based on brand popularity and "peer pressure" which can be affected and created by advertising and promotion. At his May 2, 2002 deposition in this case, Edmund Leary testified that "Just like any - any brand that's popular, people tend to pick a popular brand, and that's just the way people act . . . I think **advertising and promotion can influence an adult smoker's brand choice, and I think, you know, if it's your first brand choice, if the brand is popular, that has lot to do with it**, as well as what your friends smoke." Leary PD, United States v. Philip Morris, 5/2/02, 60:25-62:23 (emphasis added).

(6) Defendants Exploit Young People's Price Sensitivity

4657. Cigarette Company Defendants have long used price-based marketing efforts as a key marketing strategy, particularly for attracting young people. Defendant-initiated price reductions, such as the steep drop in the wholesale price of cigarettes most popular with young people that was led by Philip Morris on "Marlboro Friday," have reduced the rate of decline in overall cigarette smoking and contributed to the increases in youth smoking incidence and prevalence observed during much of the 1990s. Chaloupka WD, 86:5-87:13.

4658. Similarly, Cigarette Company Defendants' price-related marketing efforts, including coupons, multi-pack discounts, and other retail value added promotions, have partially offset the impact of higher list prices for cigarettes, historically and currently, particularly with regard to young people. Id., 61:3-6. In fact, David Beran, Executive Vice President of Strategy, Communications and Consumer Contact for Philip Morris, testified the recently decreasing rate of increase of cigarette prices at retail is attributable to price promotions. Beran TT, 4/18/05, 19377:7-10.

4659. Cigarette Company Defendants' use of price promotions to reach young people and encourage trial and initiation has increased dramatically in recent years. The FTC reported that, in 1999 (the year after the MSA went into effect), $3.54 billion, or 43% of the tobacco industry's advertising and promotion expenditures, were devoted to trade promotions, up from $856 million in 1987. 1900082-0107 (US 60663) (A) (FTC, Report to Congress for 1999 Pursuant to Federal Cigarette Labeling and Advertising Act) ("FTC Cigarette Report to Congress for 1999").

4660. Independent research confirms Cigarette Company Defendants' knowledge, as stated in their internal documents and other evidence, that youth and young adults are more

responsive to increases in cigarette and other tobacco prices, and will not try smoking or continue to smoke if cigarette prices are higher. Chaloupka WD, 94:23-124:4.

4661. Generally, young people are two to three times more sensitive to price than adults. As Dr. Chaloupka testified:

> Economic theory and econometric research clearly indicate that teenage smoking is affected by cigarette prices. Marketing activities that significantly reduce cigarette prices will increase the initiation of regular smoking and daily smoking by teenagers, and will increase the number of cigarettes smoked by teenage smokers beyond what would have been the case in the absence of these marketing activities. Based on the 2002 FTC data, marketing expenditures that directly reduced the price of cigarettes amounted to about 46 cents per pack. In November 2002, as reported in the annual Tax Burden on Tobacco, average cigarette prices, not including generic brands and not including temporary price reductions caused by the price-related marketing described above, were just under four dollars per pack. Given this, price related marketing activities reduced the average price per pack by at least 11.6 percent, which, based on the estimates described above, meant that as many as 100,000 teenagers would have initiated daily smoking in 2002 as a result of these marketing activities. Given the likelihood that Defendants' marketing activities are concentrated on their leading brands which are the brands most likely to be smoked by teenage smokers, it is likely that these price-related marketing activities result in even larger increases in teenage smoking initiation.

Id., 93:15-94:7.

4662. A June 1997 published article, "The Food and Drug Administration's Rule on Tobacco: Blending Science and Law," found that data has confirmed that children and teens are more price sensitive than adults and that pricing has an immediate and direct impact on cigarette sales to minors. HHS1202891-2895 (US 59999) (A) (David Kessler et al., "The Food and Drug Administration's Rule on Tobacco: Blending Science and Law," 99 *Pediatrics* 884, June 1997).

4663. The following examples of internal company documents and deposition testimony establish that, as early as 1956, Cigarette Company Defendants were studying young people's

price sensitivity and were offering lower priced cigarettes directly to the youth market to entice youth to start smoking and encourage them to continue smoking.

(a) Philip Morris

4664. A September 18, 1956 Philip Morris inter-office memorandum "re: College Survey" from George Weissman, Vice President of Philip Morris, to Dr. R.N. DuPuis, Philip Morris Scientific Research Director, described the results of a 1956 college survey conducted by Elmo Roper for Philip Morris. In a section of his memorandum entitled "The Economics of Cigarettes," Weissman stated: "Sixteen per cent of the students who never smoked gave 'too expensive' as a reason. Seventeen per cent who gave it up gave this as a reason. An even larger percentage suggested reduction in price. Again, this brings to mind the possibility of a less expensive unit of sale if such a unit can be controlled and strictly confined to the college market." 2022240073-0075 at 0074 (US 20359) (O).

4665. In a May 21, 1975 memorandum to Robert B. Seligman, Director of Commercial Development, Tobacco Products at Philip Morris, entitled "The Decline in the Rate of Growth of Marlboro Red," Philip Morris Senior Economist Myron E. Johnston analyzed data on "younger teenagers," including 15-17 year olds. Johnston blamed price elasticity and young peoples' price sensitivity for Marlboro's decline in sales in 1974: "I think price elasticity, like income elasticity, has a greater effect on lower income people than on those with higher incomes. As mentioned above, **Marlboro smokers, being younger, tend to have lower incomes. Thus, Marlboro sales are probably more responsive to price changes than are the sales of brands which appeal to older segments of the population**." Johnston postulated that, with any general increase in cigarette prices, "I would expect a disproportionately large number of Marlboro smokers to quit smoking or reduce daily consumption." 1003285497-5502 at 5497, 5500 (US

20160) (A) (emphasis added).

4666. In a September 17, 1981 memorandum to Harry Daniel, a Philip Morris Research and Development employee, Johnston discussed the March 1981 National Bureau of Economic Research ("NBER") working paper entitled "The Effect of Government Regulation on Teenage Smoking" which examined "the impact on teenage smoking of: (1) the excise tax on cigarettes, (2) the FCC Fairness Doctrine [which mandated equal-time anti-smoking commercials for all cigarette commercials], and (3) the cigarette advertising ban." Johnston stated that the NBER working paper was:

> the only study I know of that attempts to determine the price elasticity of cigarettes among different groups. Because of the quality of the work, the prestige (and objectivity) of the NBER . . . I think we need to take seriously their statement that 'if future reductions in youth smoking are desired, an increase in the Federal excise tax is a potent policy to accomplish this goal. . . Most researchers, myself included, have concluded that the best estimate of the price elasticity of cigarettes is about -0.4, i.e. that a ten percent increase in the retail price of cigarettes will cause a decline of about four percent in cigarette sales; . . . that the price increases would have less impact on the . . . older and therefore more habituated smokers, than on other smokers.

1003478193-8196 at 8193-8194 (US 20175) (O).

4667. In the September 17, 1981 memorandum referenced above, Johnston discussed findings by the NBER that teens and young adults are up to three times more sensitive to price increases and the inflationary loss of purchase power than are older smokers, stating that "it is clear that price has a pronounced effect on the smoking prevalence of teenagers." Anticipating a higher excise tax, Johnston predicted: "[G]iven the evidence that individuals are considerably less likely to initiate smoking after age 25, it is quite possible the cohort . . . who never begin to smoke as a result of the tax increase would never become regular smokers." 1003478193-8196 at 8195, 8196 (US 20175) (O). On September 22, 1981, Harry Daniel, Planning Coordinator at

Philip Morris, forwarded Johnston's September 17 memorandum to, among others, Myron E. Johnston. 2022249717-9721 at 9720 (US 26750) (A). Testifying at the Minnesota trial, Geoffrey Bible affirmed that Myron Johnston had characterized the March 1981 NBER finding on the effect of price elasticity among teenagers as its "most important finding, and the one of greatest significance to the company." Bible PT, Minnesota v. Philip Morris, 3/4/98, 6166:2-25.

4668. In a January 5, 1982 memorandum to Harry Daniel entitled "Cigarette Price Elasticities and the Implications for [Philip] Morris," Johnston again analyzed the effect of excise tax increases on demand for cigarettes, especially among teenagers, and concluded that "any increase in the price of cigarettes will have its greatest effect on the young, and, in particular, on young males." 1003478185-8191 at 8189 (US 35774) (A); 2049456635-6650 at 6639 (US 20487) (A).

4669. A December 6, 1982 Philip Morris report entitled "Price Elasticities, Excise Taxes, and Cigarette Sales" outlined Philip Morris's opposition to raising excise taxes on cigarettes despite studies showing that raising cigarette prices was the most effective way to reduce youth initiation and youth smoking. The report reflected Philip Morris's knowledge that "**[t]he main effect of an excise tax increase will be to reduce the number of young people who begin to smoke.**" Nonetheless, Philip Morris continued to vigorously oppose all cigarette excise tax proposals. 2049456670-6694 at 6684 (US 20489) (O) (emphasis added).

4670. In a September 3, 1987 Philip Morris memorandum to Jon Zoler and others entitled "Handling an Excise Tax Increase," Johnston stated that:

> You may recall . . . that Jeffrey Harris of MIT calculated on the basis of the Lewin and Coate data, that the 1982-83 round of price increases caused two million adults to quit smoking and prevented 600,000 teenagers from starting to smoke . . . this means that 700,000 of those adult quitters had been PM smokers and 420,000 of the non-starters would have been PM smokers. Thus, if Harris

> is right, we were hit disproportionately hard. We don't need to have that happen again.

Johnston then recommended passing on any future increase to smokers in "one fell swoop" to make it clear to smokers that the government is solely responsible for the price increase, encouraging smokers to stockpile so they will be less likely to remember what they last paid for cigarettes, and making sure the brands the retailers stockpile are Philip Morris brands. 2022216179-6180 (US 76177) (A).

4671. An August 7, 1990 report entitled "New Brand Opportunities in the Cigarette Industry" written by Gibbons, Voyer & Associates for Philip Morris found that 17 to 19 year olds comprise 18.9% of smokers, and recommended that any marketing approach must "insure that Philip Morris has a brand entry to meet the various wants of young adult smokers: image, product, price." 2049397333-7369 at 7343, 7350 (US 20486) (A).

4672. Philip Morris developed a plan to distribute coupons to counteract excise tax increases. A July 11, 1990 memorandum about the "New Jersey Tobacco Tax Plan" from Wanda Johnson of Leo Burnett U.S.A. to Sheila Spicehandler, Philip Morris Media Manager, stated: "The attached media plan provides a means of distributing coupons to P.M. smokers in the state, on an 'urgent' timetable, in order to counter any ill effects of that tax increase. The New Jersey plan is modeled after the California plan." 2060295219-5232 at 5219 (US 20502) (A).

4673. A November 1994 report entitled "Profile of the Young Adult Marlboro Smoker Part 1: Males, 18 to 24 Years Old" shows that, through its continuous smoker tracking survey, Philip Morris researched the price sensitivity of Marlboro male smokers age 18 to 24 by researching their sensitivity to promotions such as coupons and continuity give-away items (gifts such as t-shirts). The report recognized that the biggest threat to Marlboro Red's dominance of the 18 to 24 year old category was possibly discount brands which offered lower priced cigarettes

than Marlboro. The report recommended that, in order to counter this threat, Philip Morris should provide coupons and continuity items to these smokers to keep them from switching or, presumably, from quitting smoking. 2048735500-5604 at 5561 (US 21971) (A).

4674. In a 1994 speech, after "Marlboro Friday" had its intended effect of bringing hundreds of thousands of young people back to the market, Philip Morris's Tina Walls congratulated company employees for defeating 27 of 37 government attempts to increase price through excise taxes, stating: "Your batting average on state excise taxes has been outstanding." 2024252441-2562 at 2441 (US 21984) (O).

4675. On September 4, 1997, James J. Morgan, President and Chief Executive Officer of Philip Morris USA, testified that "I believe that . . . higher prices in the industry, whether by excise tax or manufacturer's price increases . . . affect industry consumption, and . . . they lower industry consumption. And I believe that there are two groups of people who are . . . impacted the most by higher prices . . . and . . . both [groups have] the least disposable income. One is what I would call young adult smokers . . . people who smoke who are arguably strapped of . . . cash, and the other [group] would be older people on fixed incomes who are also strapped of cash." Morgan PD, Minnesota v. Philip Morris, 9/4/97, 219:23-220:15.

4676. Susan Norris, a 15-year Philip Morris employee at the time, testified in this case that during her tenure as Associate Brand Manager for Discount Brands from 1994-1995, Philip Morris's premium brands, including Marlboro, were losing market share as smokers switched from brands like Marlboro to "lower priced alternatives." Norris testified that, for Philip Morris, "[t]o the extent that any of our premium brands were declining it was not good news," and that "given that Marlboro was our largest brand that people were generally concerned" about its loss of share. Norris testified that, in her experience, price was a "significant factor" in determining

purchase interest between brands. Norris PD, United States v. Philip Morris, 7/31/03, 38:5-45:9.

4677. Robert L. Mikulay, a Senior Vice President for Marketing at Philip Morris, testified that Philip Morris relied much more heavily on retail promotions in the late 1990s than it did during the mid-1980s because of the increase in the price of cigarettes and the increased presence of discount brand cigarettes. Mikulay PD, United States v. Philip Morris, 7/1/02, 145:13-146:19.

4678. Philip Morris currently admits that increased cigarette price is a variable that would lower youth smoking rates. Carolyn Levy, Senior Vice-President and Director of the Youth Smoking Prevention Department from its inception in April 1998 to approximately March 2002, testified in this case that Philip Morris was aware that "the price of cigarettes for some kids appears to be an important variable in preventing them from smoking." Levy also testified that "Philip Morris was aware that youth smoking behavior was price sensitive as a result of data in the Philip Morris TABS [Teenage Attitudes and Behavior Study] survey," which concluded that "[f]or children who do not smoke, the percentage of 11 to 14 year olds who agree that smoking is expensive is around 33 percent." Finally, Levy testified that it was "fair to say . . . that the price of cigarettes is an important variable in preventing children from smoking." Levy WD, 95:15-17.

4679. In his testimony in this case, Philip Morris Companies' CEO Geoffrey Bible testified that he "assumes that young people are sensitive to prices," so smoking incidence would decrease due to price increases caused by the MSA. Bible PD, United States v. Philip Morris, 8/22/02, 245:8-20.

(b) Liggett

4680. At the October 12, 2001 deposition of Harold Petch, Liggett's President of the Northern Strategic Business Unit, Petch testified that Liggett is aware that price affects

consumption. Petch PD, United States v. Philip Morris, 10/12/01, 101:25-102:21.

4681. Petch further testified that Liggett spent $113 million on promotional programs for its discount brands, including point of sale materials, buy downs, marketing accruals and coupons. Id., 65:12-66:16.

(c) Lorillard

4682. A February 1982 NBER report entitled "The Potential for Using Excise Taxes to Reduce Smoking" produced from the files of Lorillard examined the effect of teenagers' price sensitivity on their cigarette purchases and determined that "**price has its greatest effect on the smoking behavior of young males and that it operates primarily on the decision to smoke** rather than via adjustments in the quantity of cigarettes smoked." VXA0501915-1917 at 1915 (US 64544) (A) (emphasis added).

4683. A March 20, 1992 Lorillard memorandum from S.R. Benson to S.T. Jones, Director of Product Development and Marketing Research, regarding "Price Sensitivity By Age" stated that "there is some evidence that the younger adult smokers currently smoking a full price brand may be demonstrating a sensitivity towards price. . . it is clear that the younger adult, 18-24 smoker group, although still smoking a full price brand, 'claim' a greater sensitivity towards price than the older age groups." 82849666-9667 at 9666 (US 55569) (A).

(d) B&W

4684. In a May 10, 1983 internal memorandum to G.T. Reid, B&W Senior Brand Manager, R.P. Medicus of B&W's Brands Group discussed the impact of unemployment in 1974 and price increases on Kool's market share. Medicus wrote: "**Brands directed at segments most affected by economic adversity (youth and minorities) were affected disproportionately.** For four youth oriented brands/styles [Kool KS, Kool Milds, Kool Super Longs, and Marlboro],

there was a share trend break in the latter part of 1974, which coincided with increased unemployment." 670579615-9625 at 9616 (US 21748) (A) (emphasis added).

4685. Since approximately 2000, B&W has spent more on discounting or reducing the price of Kool cigarettes than any of its other brands, according to Paul Wessel, the Current Divisional Vice President at B&W in charge of value for money premium niche brand and new product development. Wessel PD, United States v. Philip Morris, 3/19/03, 28:17-29:1.

4686. Despite B&W's claimed sensitivity to avoiding the marketing of its products to youth, Wessel testified that he was unaware whether youths were price sensitive and whether B&W had ever taken a position on the price sensitivity of youth. Id., 3/19/03, 36:23-37:12.

(e) RJR

4687. In a September 20, 1982 memorandum entitled "Estimated Change In Industry Trend Following Federal Excise Tax Increase" to marketing employee P.E. Galyan, Diane Burrows estimated how the cigarette industry would be affected by a federal excise tax increase. The memorandum included data on "starting age patterns," "[s]tarting age," and "new smokers." Burrows estimated that an excise tax increase would result in 1,759,000 "new smokers" lost to the industry, whose potential consumption, if they had smoked 10 cigarettes a day, would amount to 605 million cigarettes, or .1% of the industry total. Burrows stated that: "Since the Industry growth rate depends on new smokers, losses in these groups can change the direction of the Industry trend." 501988846-8849 at 8846, 8846-8848 (US 20692) (A); 504630598-0702 at 0701 (US 20731) (O).

4688. In a September 20, 1982 internal memorandum to J.W. Johnston and H.J. Lees, Greg Novak, RJR Group Director of Marketing Services, stated: "**Our Forecasting Group has determined that younger adult smokers, particularly younger adult male smokers, tend to**

be very price sensitive. The effect of a price increase on younger adult male smokers could be three to four times greater than on smokers in general, in terms of negative impact on volume." 500151647-1647 (US 21785) (A) (emphasis added).

4689. In a September 27, 1982 memorandum entitled "NBER Models of Price Sensitivity by Age/Sex" to Jerry R. Moore, RJR Marketing Development Department, Burrows summarized National Bureau of Economic Research findings on the relative price sensitivity of age and sex groups, including data on "teens 12-17." She discussed the NBER findings that "teenagers and younger adult males are highly price sensitive," and that "price affects incidence; rate per day is virtually unchanged," noting that the NBER findings were "highly consistent" with internal RJR findings. Burrows' memorandum further stated: "The loss of younger adult males and teenagers is more important to the long term, drying up the supply of new smokers to replace the old. This is not a fixed loss to the industry: its importance increases with time. In ten years, increased rate per day would have been expected to raise this group's consumption by more than 50%." On October 6, 1982, Burrows sent this memorandum to L.W. Hall, Jr., Vice President of RJR's Marketing Department. 503011370-1378 at 1370-1371 (US 22347) (A); 503011368-1369 (US 20709) (A); 513318391-8392 (US 20851) (A).

4690. In an August 1986 report entitled "R.J. Reynolds Quarterly Industry Cigarette Demand Model," Data Resources updated RJR's earlier information regarding price elasticity. The report stated: "The current research effort has endeavored to test the validity of the relative price elasticity estimates and to further develop some conclusions concerning the impact of the anti-smoking campaign and changes in real income." The report applied a model to determine price elasticity estimates: "The principle output of the model is weekly average cigarette volume. The forecast is driven by : (1) transaction cigarette prices per package; (2) count of cigarette

articles appearing in the New York Times; (3) real personal disposal income in 1982 dollars; (4) consumer price index for food, 1967 = 1.0; and (5) population by 12 age/sex categories." An included chart entitled "1965 World Incidence" showed an age category of "12-17" year olds. 505611105-1138 at 1106, 1124 (US 20744) (O); 519498624-8749 (US 87844*) (A).

4691. In its Joe Camel campaign, which began in 1988, RJR relied heavily on price promotions such as coupons and "Camel Cash" to assure that teenagers would try and continue to smoke Camel cigarettes. Coupons were placed in magazines with large youth readership, such as *Rolling Stone* and *Sports Illustrated*, in order to achieve the maximum impact on the intended target of teenagers. As one example, on November 21, 1988, RJR placed Camel advertisements that included coupons for a free pack in *Sports Illustrated*. 509131376-1378(US 20822) (O).

(7) Defendants' Conduct Continues Today

4692. As set forth in US FF § III.E(2), supra, Defendants continue to deny that they market to youth. Despite Cigarette Company Defendants' public statements that they do not market to young people, and despite the prohibitions on targeting youth in the 1998 Master Settlement Agreement ("MSA"), in fact Cigarette Company Defendants have reshaped their marketing since the MSA so that they remain effective at reaching youth.

4693. As discussed in the introduction to US FF § III.E(4), supra, Cigarette Company Defendants continue to redirect their marketing activities when one form of media is disallowed. When Defendants could no longer market to youth on television, they turned to billboards; when billboards were disallowed under the MSA, they turned to retail and magazines; and since recent pressure regarding their magazine advertising has caused a public furor, they have funneled even more resources into direct mail marketing and marketing at retail. See US FF § III.E(4)(a), supra. As the documents and other evidence provided above and below establish, when one medium is

restricted or prohibited, Defendants harness other media to continue to effectively market to young people.

4694. Moreover, many of the provisions that Defendants negotiated and agreed to under the MSA were toothless because they restricted activities that Defendants were no longer or never engaged in. For example, David Beran, Executive Vice President of Strategy, Communications and Consumer Contact for Philip Morris, testified that he is responsible for overseeing Philip Morris's marketing and market information and analysis efforts. Beran testified that the MSA provisions regarding cartoons, paid product placement, brand name merchandise, and limited free samples had no effect on Philip Morris's marketing practices because they were not activities that Philip Morris engaged in before the MSA. Beran WD, 5:15-18; Beran TT, 4/18/05, 19262:7-19263:2.

(a) Defendants' Marketing Expenditures Have Dramatically Increased

4695. Statistics recently released by the FTC in its Cigarette Report for 1999 (published 2001) show that Cigarette Company Defendants' advertising and promotional expenses rose significantly **after** the Cigarette Company Defendants signed the MSA in November 1998. 1900082-0107 (US 60663) (A) (FTC Cigarette Report to Congress for 1999).

4696. In fact, from 1998 to 1999, Defendants' total advertising and promotional expenditures rose 22.3% to $8.24 billion, the most ever reported to the FTC. Id.

4697. While Cigarette Company Defendants reported substantial decreases for outdoor advertising (down 81.7% from 1998 to 1999) and transit advertising (down 86.1%) due to the restrictions of the MSA, increases in expenditures for promotional allowances and retail "value added" account for virtually all of the overall rise in spending. Id.

4698. Cigarette Company Defendants' expenditures on cigarette advertising and

promotion, historically and currently, remain high on an absolute basis and relative to other industries. For example domestic cigarette advertising and promotion in 1999 totaled $8.2 billion dollars, an increase of 22% over 1998, and a six-fold increase over 1963, after adjusting for inflation. In the nine-year period from 1991-1999, domestic cigarette advertising and promotional expenditures totaled $51.4 billion dollars (unadjusted for inflation). Promotional allowances have been the single largest category of expenditure each year since 1994. The Cigarette Company Defendants' expenditures are integrated marketing communications: they are inextricably linked and coordinated by the companies for maximum impact, particularly upon young people. Id.

4699. Philip Morris's marketing spending increased significantly in every year from 1998 to 2002. Its 1997 budget for total marketing spending, including advertising, events, price, direct mail, point of sale materials, and other marketing activities was $1.6 billion, while the total spending in 2002 was projected to triple to $5 billion. 2085298135-8136 (US 25253) (A); LeVan PD, United States v. Philip Morris, 6/25/02, 73:4-75:1.

4700. In testimony in this case, Suzanne LeVan stated that, since 1998, Philip Morris has increased the amount it has spent on price promotions for Marlboro from $806 million in 1998 to an estimated $4 billion in 2002, and on product promotions, such as free packs with a purchase, from $106 million in 1998 to $500 million in 2002. Id., 58:19-60:11, 63:14-64:12.

4701. David Beran, Executive Vice President of Strategy, Communications and Consumer Contact for Philip Morris, testified that,

Bera n TT, 4/18/05, 19417:17-19418:1 (Confidential - Under Seal). Beran also admitted that the large majority of Philip Morris's marketing funds are

for promotional activities which occur at retail locations. Beran WD, 15; 2085298135-8136 (US 25253) (A); Beran TT, 4/18/05, 19273:10-17, 4/18/05, 19274:5-10. Beran additionally testified that the large jump in Philip Morris marketing expenditures in the recent past is attributable to increases in price and product promotion. Id., 19274:11-25.

4702. According to May 16, 2002 testimony of Victor Lindsley, Lorillard's Senior Brand Manager, Lorillard has increased its marketing expenditures since Lorillard entered the MSA. Lindsley PD, United States v. Philip Morris, 5/16/02, 23:21-24:3.

4703. On cross-examination, Lynn Beasley, President and Chief Operating Officer at RJR, admitted that the MSA did not limit RJR's expenditures on advertising, or promotion, including retail value added, coupons, and direct mail. Beasley TT, 3/31/05, 17370:17-17371:13. Beasley also admitted that RJR was giving up nothing when it agreed in the MSA not to authorize or license to a third party the use of its trademarks on any item intended for children. Id., 17372:5-10. Beasley testified that marketing is extremely important to RJR, and that the company's market share will decline if it does not support its brands through marketing. Beasley TT, 3/30/05, 17309:6-8, 17310:21-17311:4.

4704. Lynn Beasley's responses to questions on cross examination before the Court demonstrated that the Court should give no weight to her testimony. First, Beasley, notwithstanding her position as President and Chief Operating Officer at RJR, and a long-serving employee of the company, incredibly denied knowing that RJR's leading cigarette brand, Camel, is the third most commonly smoked brand among 12-17 year olds. Beasley TT, 3/31/05, 17358:1-17359:16. Second, Beasley repeated before this Court her written direct testimony that in March 2001 RJR removed *Rolling Stone* and other magazines from its list of magazines approved for youth readership. She was then shown four different 2005 *Rolling Stone* magazine

editions that contained RJR cigarette brand ads for Camel. Id., 17364:11-17369:23. Third, Beasley's bias to give testimony favorable to RJR was apparent when she admitted that litigation results (such as the outcome of this case) that affect RJR stock prices can affect her personally given her position as President and Chief Operating Officer. Beasley TT, 3/30/05, 17308:1-17309:4.

(b) Defendants Continue To Market To Youth at Retail

4705. The Cigarette Company Defendants have engaged in a large post-MSA spending increase on various forms of promotion at the retail level, including coupons, value-added, and trade deals, which has helped to create relatively lower and more varied real prices for cigarettes sold at retail stores. For example, FTC data indicates that "retail value added" spending on offers such as "buy one, get one free" or "buy one and get a free lighter" grew from $1.56 billion in 1998 to $2.56 billion in 1999, accounting for 31.1% of the industry's total advertising and promotion spending. Additionally, cents-off promotions increased in prevalence after the MSA from 32% to 41% of stores in the United States. 1900082-0107 (US 60663) (A) (FTC Cigarette Report to Congress for 1999).

4706. In 2000, tobacco companies spent $9.57 billion dollars to market their products the overwhelming majority was spent on marketing aimed at retail locations such as convenience stores. In those retail locations in 2000, tobacco companies spent $4.26 billion on point of sale advertising (e.g., in-store signs) and promotional allowances (payments to retailers for prime shelf space and in-store displays, as well as volume discounts and buydowns) and $3.52 billion on retail value added items such as gifts with purchase and multi-pack discounts. Combining the figures for point of sale advertising and promotional allowances, tobacco companies spent approximately 81.2% of their marketing expenditures at retail locations. Chaloupka WD, 73:16-

91:7.

4707. Philip Morris's spending on Marlboro promotion at retail increased more than a hundred-fold between 1987 and 1997, and then doubled again from 1997 to 2000. Philip Morris's retail promotions budget for Marlboro increased from $16.7 million in 1987 to $469.4 million in 1997. By 2000, the Marlboro retail promotions budget exceeded $1 billion. Due to increased focus on price promotion, which is very costly, Philip Morris's Marlboro continuity program budget increased from $8.5 million in 1987 to $268.8 million in 1997. 2085296400-6461 at 6412 (US 45702) (A); Mahan PD, United States v. Philip Morris, 5/31/02, 146:22-154:25.

4708. According to Philip Morris's "2003-2007 Five Year Plan" dated April 3, 2003, Philip Morris's promotional strategy is

and to

PM3000540103-540118 at 0111 (US 88649) (A) (Confidential) (emphasis added).

4709. Also according to its "2003-2007 Five Year Plan" dated April 3, 2003, Philip Morris planned to "test concepts for a new wallet-sized Marlboro rewards card among young adult smokers in the fall of 2003 . . . to reinforce our equity messages and use an innovative approach to deliver incremental value that will continue to set our brands apart from those of our competitors." The proposed card would be preloaded with a fixed dollar amount that allows Marlboro smokers to make purchases wherever a major credit card is honored. Id., 0107, 0116.

4710. Post-MSA, RJR has increased its promotional spending and discounting. Leary PD, United States v. Philip Morris, 5/2/02, 16:4-17:19, 25:7-27:15, 63:3-64:17.

4711. Edmund Leary, Senior Vice President of Marketing and President of Sports Marketing for RJR, testified that, since entering the MSA, RJR has redirected its marketing funds to promotional spending and discounting because these are marketing tools that allow RJR to "gain trial from other adult competitive smokers." Leary PD, United States v. Philip Morris, 5/2/02, 25:7-27:15, 63:3-64:17; 526293849-4014 (US 87845) (O).

4712. As of May 21, 2002, Liggett was still promoting its products with "buy one get one free" programs, as well as sampling. Shipe PD, United States v. Philip Morris, 5/21/02, 86:21-87:13.

4713. The retail store has become one of Defendants' central forms of communication of brand imagery and promotional offers. At retail stores, Defendants use retail promotion techniques including "cash/rebates, free products, display cases to dealers, and special value added deals to consumers, encourage retailers to create tobacco friendly environments containing enticing displays, competitive prices, and visible point-of-sale advertising." The result of this onslaught of marketing techniques is that, as Dr. Krugman testified, "[c]onvenience stores and gas stations frequented by teenagers are more likely to be tobacco friendly environments because they contain a lot of tobacco messages. A recent Robert Wood Johnson funded study examined the use of advertising and promotion in stores. It found that retail environments (e.g. convenience/gas retailers) frequented by teenagers heavily promote tobacco use." Krugman WD, 129:17-130:11.

4714. In-store placement and signs are key methods by which Defendants communicate brand information. Presence at the retail level in the form of displays and signs are employed to communicate a brand's central message or image. Brand information at the store is coordinated with other advertising to display consistent images. Because of these synergies, advertising and

promotion messages in one medium reverberate in another medium. For example, storefront and in-store advertising can remind the consumer of an overall message or theme encountered in other media and stimulate purchase. Id., 41:7-19.

4715. Defendants compete with one another to obtain prime placement of their products in retail stores in order to achieve high consumer visibility. To ensure prime placement of their products and advertising in retail stores, tobacco companies offer a variety of incentive programs (such as volume discounts and buydowns described above) to retailers. Id., 129:17-140:2.

4716. A September 1994 Philip Morris USA document entitled "POS Visibility Strategy," produced from the files of Susan Norris, emphasized the importance of visibility at retail to drive Marlboro performance. The strategy's objective was: "To obtain & maintain leadership presence commensurate with Marlboro's market position. In other words, Marlboro should look like the 'BIGGEST BRAND' at retail on an ongoing basis." Further, "[a]s we experienced with MAT, MLP, & PRP [3 Marlboro promotions], Marlboro's increased visibility drove the brand's performance and reinforced Marlboro as the most popular brand in the mind of the consumer." 2060124885-4908 at 4888, 4896 (US 23997) (A).

4717. Using research from the 1994 "NACS State of the Industry Report" showing that tobacco accounted for 20.7% of convenience store profits, Philip Morris presented "What Does Tobacco Do For Your Store" to retailers, urging them to "[p]rominently display the leading brands . . . [and] [u]se cigarette promotions and advertising to build store traffic." 2077232243-2310 at 2250 (US 70700*) (O).

4718. Philip Morris research found that its Retail Visibility Programs, in conjunction with its Retail Masters Program, made Marlboro the leading brand in visibility at convenience stores, not only ahead of all other cigarette brands, but ahead of any other products carried at

these stores. A February 1999 "Marlboro Retail Prominence In-Store Test" stated: "Marlboro is clearly the leading brand in terms of perceived retail visibility, not only compared to other brands of cigarettes, but across categories as well. . . .**The Retail Masters program is an effective vehicle for enhancing Marlboro's perceived retail prominence. Even brands as big as Coke and Budweiser lag significantly behind Marlboro's retail visibility, as perceived by adult smokers**." The report further described that Philip Morris's product displays were most effective at driving visibility: "On counter product displays are more effective in driving visibility than signage. . . Marlboro is overwhelmingly perceived to be the most visible brand of cigarette in the store. . . . [Product] displays, more than signage, are cited for making Marlboro stand out." 2073970827-0848 at 0831, 0832, 0838 (US 43390) (A) (emphasis added).

4719. David Beran, Executive Vice President of Strategy, Communications and Consumer Contact for Philip Morris, admitted that Philip Morris's Retail Leaders 2004 Internal Presentation stated that

PM3002547761-7804

(JD-051493) (A) (Confidential); Beran TT, 4/18/05, 19412:3-19416:7 (closed court).

4720. On cross-examination, Lynn Beasley, President and Chief Operating Officer at RJR, testified that Philip Morris's Retail Leaders Program prevents RJR from getting highest visibility of its marketing at retail stores. Beasley TT, 3/30/05, 17311:5-25

4721. Howard Willard, Senior Vice President for Youth Smoking Prevention at Philip Morris, testified that Philip Morris's Retail Leaders program is a "merchandising program that helps ensure . . . visibility at retail." Willard testified that over 85% of cigarettes are sold in stores which participate in the Retail Leaders program. Willard also testified that, for retailers

who participate in this program, Marlboro will have the number one visibility spot at retail. He testified that, if a participating store plans to have cigarettes on the counter, then Marlboro cigarettes must be on the counter in the number one position. If a retailer chooses to have outdoor signage, then Marlboro signage must be in the number one position. Willard admitted that this program is a contributor to Marlboro being the number one brand Willard TT, 4/14/05, 19083:1-19086:19

4722. Under the Retail Leaders program, a suspension is authorized only after three convictions for underage sales. Philip Morris obtains information about convictions in retail stores only from about 19 states. It does not require the retailer to provide this information to it. There has been no showing that a retailer has ever been suspended by Philip Morris for underage sales. Philip Morris CEO Michael Szymanczyk knew of no retailer who had been suspended. Even was a retailer to be actually suspended, Szymanczyk testified, he would remain free to sell Philip Morris cigarettes. Permanent termination from the Retail Leaders program is never authorized under any circumstances: a suspended retailer may re-enter a Retail Leaders contract at the start of the next 12-month contract period. Szymanczyk TT, 4/12/05, 18543:6-18544:6, 18545:19-18546:4; Szymanczyk TT, 4/11/05, 18322:25-18333:4, 18338:22-18339:2, 18332:14-20; Willard TT, 4/14/05, 19130:23-19131:12.

4723. Szymanczyk's characterization of the Retail Leaders program as a Youth Smoking Prevention program was not credible given the documentary evidence and the testimony by Willard that Retail Leaders is a "merchandising program that helps ensure . . . visibility at retail." Szymanczyk WD, 137:8-19; Willard TT, 4/14/05, 19084:9-25; 19086:20-19087:8.

4724. Under Lorillard's Excel merchandising program, retailers are provided with monetary incentives in exchange for agreements to provide Lorillard cigarettes with visibility of

promotional signage equal to or exceeding that of competitors' brands. Milstein TT, 1/7/05, 9347:20-9348:11. The number of stores under the Excel program has gone up in the last several years. Milstein TT, 1/10/05, 9421:4-19.

4725. Lorillard does not require retailers to report convictions for underage sales to the company. At present, only four states report convictions to Lorillard. There are 46 states and the District of Columbia which do not report such convictions to Lorillard. Milstein TT, 1/7/05, 9356:2-16.

4726. Lorillard has approximately 79,000 retail stores which participate with its merchandising program, Excel. In just the four states reporting, more than 1,000 retailers have been convicted of underage sales. In November 2, 2001, Ron Milstein, the previous youth smoking prevention designee and Lorillard's General Counsel and Vice President, emailed Steve Watson, the executive level manager designated to reducing youth smoking and access to cigarettes under the MSA. In the email, Milstein asked Watson whether he was going to share Lorillard's information about these retailers' convictions for illegal sales with the National Association of Attorneys General or the state attorney generals. Watson responded: "Unless you think there is legal reasons [sic] to do so, I would be inclined not to share this info." Watson "was not inclined to share the information at this time with NAAG." Id., 9356:23-9361:4; 99409377-9377 (US 89183) (A).

4727. Even if a retailer is convicted of selling to a minor under Excel, that retailer need only obtain training in the We Card Program. Upon the second conviction, he is suspended for six months, and after three convictions, he can be suspended indefinitely from participating in the Excel program. Such a retailer would, however, continue to be able to sell Lorillard cigarettes. Milstein TT, 1/7/05, 9353:16-9354:24, 9363:2-6.

4728. Lorillard's Steven Watson admitted that Lorillard has opposed self-service ban legislation in the past and has not changed its position on this issue. Watson PD, United States v. Philip Morris, 4/2/02, 136:11-25. Milstein also admitted that Lorillard continues to oppose legal restrictions on self-service merchandising despite its stated support in its Corporate Principles of "further legislative efforts to curb youth access to tobacco." Milstein TT, 1/7/05, 9338:16-9342:3, 9384:15-25.

(c) Defendants Continue To Market To Youth Through Promotional Items, Events, and Sponsorships

(i) Promotional Items

4729. Defendants continue to market to youth by providing promotional items – gifts such as t-shirts, mugs, or lighters – at retail and via direct mail.

4730. A 1992 Gallup survey revealed that almost half of adolescent smokers and one quarter of nonsmoking adolescents had received promotion items from tobacco companies. Krugman WD, 107:18-20.

4731. Promotional items contribute to the initiation of smoking by adolescents. Three recent longitudinal studies indicate that getting a promotional item enhances the likelihood of later taking up smoking. One of these studies found that youth who owned or were willing to own a promotional item were nearly three times more likely to experiment with smoking or become a regular smoker three years later. Biglan WD, 67:9-68:3 (citing Pierce JP, Choi WS, Gilpin EA, Farkas AJ & Berry CC., "Tobacco Industry Promotion of Cigarettes and Adolescent Smoking," *JAMA* 279 (7):511-515, 1998); VXA0103206-3210 (US 77118) (O) (Biener. A.L. & M. Siegel, "Tobacco Marketing and Adolescent Smoking: More Support for a Causal Inference," *Journal of Public Health* 90:407-411, 2000).

4732. Defendants currently continue to provide individuals with promotional items that appeal to youth. For example, on May 7, 2003, B&W issued a press release entitled "Kool Connects Consumers with Free Motorola Pager Offer." The press release described an opportunity for consumers to purchase specially marked packs of Kool and receive coupons redeemable for a Motorola pager. The press release quoted Ledo Cremers, Divisional Vice President for Kool brand marketing, as stating: "Kool celebrates urban living . . . [t]he Motorola pager promotion fits into the lifestyle of Kool consumers who want to be connected." The press release indicated that the Motorola pager promotion would "be supported by advertising in newspapers, national magazines, and alternative media." TLT074110-0110 (US 86668) (A) (http://www.bw.com).

(ii) Events

4733. Defendants also continue to market to youth by holding and advertising events such as "Bar Nights" that appeal to young people.

4734. The Cigarette Company Defendants have increased their event budgets since signing the MSA. For example, the Philip Morris events budget was $23.3 million in 1987 and increased almost three-fold between 1987 and 1997. 2085296400-6461 at 6412 (US 45702) (A); Mahan PD, United States v. Philip Morris, 5/31/02, 148:12-149:3.

4735. Defendants often promote their events – and therefore their cigarette brands – in free newspapers available to anyone. For example, in 2002, Philip Morris continued to place advertisements for its events program Marlboro Bar Nights in "alternative" newspapers, such as the *Village Voice*, that are free and widely distributed. Camisa PD, United States v. Philip Morris, 7/11/03, 354:18-24, 356:7-18.

4736. Beginning in 1999, B&W sponsored the Kool Mixx DJ Competition. The objective of the Competition was to "contemporize the Kool image by creating grassroots programs that fuses or mixes different elements of hip-hop that will showcase artists skills and stretch the brand muscles . . . [and] [b]uild awareness, trial and image of Kool among Urban ASU 26 year old smokers, both male and females for all cultures." Competition events were scheduled in major United States cities such as New York, Chicago, Detroit, and Los Angeles. "Communication Vehicles" used to publicize the Competition included an 800 number, radio spots, pack sleeves, and retail tie-ins. B&W continued to sponsor the Kool Mixx DJ Competition in 2002 and 2003. 432210032-0067 at 0036, 0038, 0047 (US 22226) (A); ARU6432538-2543 (US78267) (A) (http://biz.yahoo.com/iw/030501/053377.html).

4737. A June 7, 2000 press release entitled "B&W Tobacco set to launch 'Band to Band' 2000 Music Competition—Over $100,000 in Cash and Prizes" described the Music Competition as "a rock-oriented, nationwide band-based talent search . . . [which] provides a unique platform for B&W to promote one of its flagship brands, Lucky Strike." B&W support for the program, which began in 1996, included "promotions, posters and media buys for the bands." In 2000, "Band to Band" program events were scheduled to take place in major cities such as Washington D.C., Chicago, Miami, Los Angeles, and Houston. 239040063-0065 (US 22201) (A).

4738. Although B&W claims to limit their event activities to "adult only establishments," internal industry documents reveal that age of individuals attending these events was not always verified. An internal Lorillard document describes how David Desandre, a Lorillard marketing employee, and Beth Crehan, an employee of a marketing promotion firm, were able to attend a Lucky Strike "Band to Band" event held at Park West Concert Hall on November 11, 2000 without being asked for any identification. Inside the Concert Hall were

"pole banners with the Lucky Strike Band to Band tag-line" as well as additional banners and signs. Desandre described how, while he was filling out a form to receive a free CD, a Lucky Strike staff member "threw me a pack of Lucky Strike cigarettes . . . she did not ask me if I was 21 or a smoker. She also did not ask for my id. Beth Crehan was also not asked if she was 21 or a smoker. Beth was also not asked for id." 98600272-0273 (US 22212) (A).

(iii) Sponsorships

4739. Defendants also continue to market to youth through their sponsorships of racing events that they know are televised to millions of viewers, and have great appeal to young people.

4740. The Cigarette Company Defendants have increased their sponsorship budgets since signing the MSA. In 1999, Defendants spent $267.4 million on sponsorships, an increase of 7.6 % from 1998. 1900082-0107 (US 60663) (A) (FTC Cigarette Report to Congress for 1999, at 5).

4741. Sponsorships allowed the Cigarette Company Defendants to garner national television exposure, despite the broadcast ban on televised cigarette advertising. Races are broadcast on television and radio, and are covered in newspapers and magazines; each of these types of media coverage mention the cigarette brand that sponsors the race itself or the racecar. For example, the Winston Cup NASCAR race series of over 30 races annually was broadcast on radio and television; race highlights were also shown on television news programs and in newspaper and were featured in magazine sports columns. 507424927-4929 (US 24261) (O). The broadcast coverage of Defendant-sponsored races that featured cigarette brands was no accident: often it was required under the broadcast contract. For example, in connection with the May 21, 1989 Winston NASCAR race in Charlotte, North Carolina, the broadcast contract called

for "a 'mid-race recap' which will air immediately after the second race segment. . . . a [60 second] length [recap] with a superslide of the Winston race logo at the top of the screen with the Nabisco logo displayed below and to the left." 507424864-4864 (US 22895) (O).

4742. Races are preceded by run-up events, including qualifying and announcement of pole positions, and followed by highlight footage or the announcement of awards, such as the Winston "No Bull" race awards. In connection with the 1989 Winston NASCAR race in Charlotte, North Carolina, RJR, through its parent RJR Nabisco and Charlotte Motor Speedway, provided pre-race events for broadcast to target markets. For example, these companies prepared six to eight driver's columns, video and audio news releases, video feed of open practice sessions, radio promotions and giveaways where "the grand prize will be a first rate weekend at The Winston," wire service stories and photographs of practice sessions and color slides of the drivers with The Winston logo, pre-race tours by drivers, as well as post-race coverage of the Winston Million. 507424862-4863 (US 51200) (O); 507424872-4874 (US 51201) (O).

4743. In addition, cigarette brand names are reinforced not only on the race cars themselves, but also on drivers' uniforms, team uniforms, hats, and the large transporters used to move cars from event to event. The events themselves offer marketing opportunities for trackside billboards, sampling, hospitality tents, and promotional giveaways, like hats, sunglasses, and progra 2072516263-6267 (US 41558) (A); 520809149-9152 (US 52643*) (O).

4744. Defendants falsely deny that the television exposure their cigarette brands garner does not motivate their continued sponsorship of racing events. As RJR asserted in its August 1994 statement before the United States House of Representatives Committee on Energy and Commerce, Subcommittee on Health and Environment: "radio and television exposure is not a motivating consideration for Reynolds in deciding whether to sponsor an event or a vehicle

participating in an event." 509321275-1290 (US 21993) (O).

4745. The television exposure garnered by Defendants' sponsorship of racing events is very valuable. For example, in 1999, for the three main tobacco-sponsored auto racing series – NASCAR Winston Cup, CART FedEx Championship (where Marlboro and Kool sponsor racing teams and Philip Morris offers the Marlboro Pole Award), and NHRA Winston Drag Racing – the tobacco industry realized over $120 million of television exposure in the United States alone. Krugman WD, 116:3-122:7.

4746. Joyce Julius and Associates provides measurement and estimates monetary values of cigarette brand exposures in independent sports and special event programs. Id.

4747. According to Joyce Julius data, Defendants' cigarette brands continue to receive considerable television coverage. For instance, in 2002 alone, across all airings of the measured televised racing events, 533,301,591 television viewers tuned in to shows where Defendants' cigarette brands were mentioned or exposed (this is a count of viewing instances and not of unique viewers). Over 11 million people attended these same races. Id.

4748. Joyce Julius values the total exposure received by Philip Morris of its cigarette brands at televised racing events during 2002 to be $197 million. Id. The Marlboro cigarette brand was exposed or mentioned to approximately 54 million television viewers and 2.4 million racing event attendees in 2002. Id.

4749. Joyce Julius values the total exposure received by B&W of its cigarette brands at televised racing events during 2002 to be $44 million. Id. The Kool cigarette brand was exposed or mentioned to approximately 136 million television viewers and over 5 million racing event attendees in 2002. Id.

4750. Joyce Julius data values the total exposure received by RJR of its cigarette brands at televised racing events during 2002 to be $1.2 billion. Id. The Winston cigarette brand was mentioned or exposed at every one of the televised racing events in 2002, reaching over 533 million television viewers and 11 million race attendees. Id.

4751. Minutes from a November 5, 1992 BATCo Management Board Meeting revealed that the company was aware of, and even calculated, the monetary value of cigarette brand exposure through the sponsorship of televised sporting events. Specifically, BATCo estimated the value of the television airtime that its brand State Express 555 would receive through its sponsorship of the Subaru International Rally Works Team in the 1993 World and Asian Specific Rallies Championship. 320010638-0640 at 0639 (US 28201) (A); 321440293-0311 at 0294 (US 85217) (A). At trial, Susan Ivey acknowledged that one of the benefits of brand sponsorship of televised sporting events is exposure of the brand name on television. Ivey WD, 48:6- 49:4.

4752. Millions of young people under the age of 18 watch Defendants' racing events. Races continue to be very popular televised programs, viewed by millions of people. In April 2000, NASCAR television ratings were double those of an NBA playoff game in a competing time slot. TLT0741089-1089 (US 88741) (O) (King, Bill, "Industry News," Speedvision.com, Apr. 26, 2000).

4753. As well as broadcast exposure, Defendants use their race sponsorships to promote their cigarette brands at retail. In 1996, RJR displayed at retail locations such as grocery or convenience stores: the Winston Motorsports simulator; the Winston or Camel show car; "well known Winston Cup or Smokin' Joe driver, surrounded by a small army of fans . . . . complete with autograph session;" extensive signage; and an inflatable Winston or Camel cigarette pack that was "an awe inspiring 15 feet tall." 514238599-8634 at 8604 (US 51832) (O).

4754. Similarly, Philip Morris's Marlboro Racing Program included various magazine, newspaper, billboard, and retail advertising components with broad reach. A Philip Morris document planning for its 1995 Marlboro Racing Program stated: "Philip Morris will implement a comprehensive advertising program to support Marlboro racing and will include the following: Outdoor advertising . . . ROP [free newspapers] . . . USA Today . . . [and] Insertions in racing enthusiast books and national magazines." Additionally, Philip Morris planned to "[d]ominate retail environment thirty days prior to the race with three tier wave promotion . . . [and] Display racing POS for 30 days prior to the race." The document also noted that the Marlboro Pole Award "provides Philip Morris with . . . Year-long visibility at all venues." 2060138575-8585 at 8577, 8580, 8581 (US 24004) (O).

4755. Today, further exposure to the Marlboro trademark occurs through media coverage in the United States of Philip Morris International sponsored races. In addition, the Internet features items for sale in dollars, available for shipment worldwide. One of the available items includes a child-sized jacket bearing the Marlboro logo. Szymanczyk TT, 4/11/05, 18372:5-18413:25.

4756. Substantial evidence was presented at trial of Philip Morris's current auto racing sponsorships to market its Marlboro brand. Philip Morris CEO and chairman Michael Szymanczyk testified that his company sponsors an auto racing team, called Marlboro Team Penske, in the Indy Racing League (IRL) series. The IRL is a racing body that sanctions a series of races in the United States, the best-known of which is the Indianapolis 500. Szymanczyk WD, 115:14-18; Szymanczyk TT, 18381:2-5.

4757. The Court has also received into evidence many exhibits and heard testimony on the Marlboro sponsorship of a Formula 1 racing team by the Altria wholly-owned subsidiary

Philip Morris International.

4758. As discussed extensively above, Philip Morris has long understood how important its use of racing imagery, and in particular its Formula 1 racing sponsorship is to attracting young smokers. In a December 1992 marketing review titled "Motorsports Sponsorship," Philip Morris evaluated its Formula 1 and other racing sponsorships and adjusted its "marketing strategy for motorsports" going forward. To the question of whether Philip Morris should remain in motorsports sponsorships, the answer was: "Yes: It enables us to reach millions of our target market with TV media coverage, and is particularly important in restricted markets." The identified objectives were: (1) to "Regain momentum in the hearts and minds of our target market - young adult smokers under 25"; and (2) "**To look at current and new program opportunities to extend our reach with starters and young adult smokers**." One specific Formula 1 marketing strategy was to create a Formula 1 "team of young talent which is not necessarily a winning team, more rebellious, fun, daredevil, more easily identifiable with the young adult target market." The team would feature "Anti-establishment gear (jeans/boots)" and a "Crazy car design." 2501058650-8680 at 8657-8658, 8661 (US 21702) (A) (emphasis added).

4759. Philip Morris International, a wholly owned subsidiary of Altria and the sister tobacco company to Philip Morris USA, sponsors a team in the Formula 1 racing league. The official team name is Scuderia Ferrari Marlboro. (no bates) (US 93343) (A). The team races two vehicles and has two drivers. The Marlboro brand name and logo are prominently displayed on both race cars and on the driver uniforms in all races except one, the United States Grand Prix. (no bates) (US 93263) (A); Myers TT, 5/19/05, 21688:6-19; 21689:14-17.

4760. The Court has received into evidence numerous exhibits showing how the Philip Morris Formula 1 sponsorship impacts audiences and viewers in the United States, particularly

when the races are broadcast in the United States and when photographs of the Marlboro race cars are printed in American magazines and newspapers. Philip Morris's sponsorship resulted in, and continues to result in, increased United States exposure of the Marlboro brand through the images in the various United States media.

4761. For example, the Formula 1 team, and specifically the lead Marlboro driver Michael Schumacher, was the focus of a lengthy article with several photographs of the Marlboro vehicles in the April 28, 2003 issue of *Sports Illustrated*. (no bates) (US 93250) (A). The Marlboro Formula 1 race car was shown in a May 28, 2004 edition of the *USA Today* newspaper. (no bates) (US 92110) (A). The vehicles and drivers, all bearing Marlboro brand names, were shown in numerous specialty magazines sold in the United States in 2003, 2004 and 2005, including *AutoWeek*, *Autosport*, and *F1 Racing*. (no bates) (US 93338) (A); (no bates) (US 93339) (A); (no bates) (US 93340) (A); (no bates) (US 93341) (A); (no bates) (US 93342) (A); (TLT1100006-0016) (US 89461) (A); (TLT1100017-0035) (US 89462) (A); (no bates) (US 92137) (A). The May 5, 2005 issue of *Autosport* magazine, for example, bore a very prominent Marlboro brand name on Michael Schumacher's helmet in the middle of the cover. (no bates) (US 92137) (A).

4762. Formula 1 races from around the world are broadcast in the United States on network and cable television. The 2005 season consists of 19 races; four races will be shown on CBS, and all the rest via cable on the Speed Channel. (no bates) (US 92110) (A); (no bates) (JD-055390) (A); Myers TT, 5/19/05, 21681:17-21682:3, 21685:20-21686:13, 21707:6-19.

4763. The Marlboro Formula 1 brand name sponsorship also impacts the United States via the Internet, where photographs of the Marlboro vehicles, drivers, and background signage are also posted. (no bates) (US 93256) (A); (no bates) (US 93274) (A); (no bates) (US 93276)

(A); (no bates) (US 93290) (A).

4764. Formula 1 apparel bearing Marlboro brand names and logos is available on the internet as well. The United States introduced evidence of one website where visitors could purchase in United States dollars Formula 1 clothing with the Marlboro brand name for both adults and children. (no bates) (US 93331) (A); (no bates) (US 93332) (A).

4765. The Philip Morris Formula 1 sponsorship expands the viewership of and the exposure to the Marlboro brand name in the United States. Myers WD, 36:6-7; Myers TT, 5/19/05, 21689:6-9. Each and every time a Formula 1 race is covered by the media in the United States, in every photograph, every newspaper or magazine article, and in every race that is broadcast on television, American youth are exposed to Marlboro brand marketing, just as they are exposed to Marlboro brand marketing through Philip Morris's sponsorship of the Marlboro IRL team.

(d) Defendants Continue To Market To Youth Through Magazine Advertising and Direct Mail Marketing

4766. After the MSA, Cigarette Company Defendants reported to the FTC significant increases in spending for newspapers (up 73%), magazines (up 34.2%), sampling – distributing free cigarette samples (up 133.5%) and direct mail (up 63.8%). 1900082-0107 (US 60663) (A) (FTC Cigarette Report to Congress for 1999).

4767. Numerous academic studies have found that Defendants increased the number of advertisements they placed in youth oriented magazines after the MSA. Dr. Krugman testified specifically regarding x such studies, including ones published in 1998, 2000, 2001, 2002, and a study that he himself conducted which was published in 2000. Krugman WD, 124:13-127:4.

4768. Mediamark Research Inc. ("MRI") is a leading United States supplier of

multimedia audience research, which offers comprehensive demographic data, lifestyle data, product usage data and data that measures exposure of people sampled to all forms of traditional media, including magazines, radio, and television. Currently, MRI measures the readership of over 300 national magazines. The sample data can be generalized to the entire population of the United States age 12 years and above. MRI's national syndicated data are widely used by advertising agencies as the basis for media and marketing plans that are written for advertised brands in the United States, particularly those that advertise in magazines. Id., 116:3-122:7.

4769. TNS Media Intelligence/CMR ("CMR") is a leading provider of marketing communication and advertising expenditure information to advertising agencies, advertisers, broadcasters and publishers. CMR measures advertising expenditures by national or regional advertisers in approximately 700 magazines. Id., 116:3-122:7.

4770. As set forth below, each Defendant has adopted and publicized a magazine policy that it claims prevents it from marketing to youth. Moreover, Defendants claim to follow the industry's Advertising Code which states that "[c]igarette advertising shall not appear . . . in publications directed primarily to those under 21 years of age." 2070557699-7702 (US 20519) (A). Over time, these policies have changed. However, the policies have been largely ineffective: Defendants have and continue to market to youth through magazine advertisements. As detailed below, MRI and CMR data over the last decade demonstrate that the Defendants continue to advertise heavily in magazines that have either, on average, over two million teen readers ages 12 to 17 per issue or over 15% of total readership, per issue, ages 12 to 17 years, hereinafter referred to as "substantial youth readership." Krugman WD, 116:3-122:7.

(i) Philip Morris's Advertising

4771. Prior to 1990 and during the early 1990s, Philip Morris's stated media policy was

to place cigarette advertisements in publications where 80% or more of a magazine's readership was 21 years and older. Philip Morris's evaluation process was not quantitative, but rather was a subjective determination by Philip Morris employees. The Philip Morris Media Department along with legal counsel made subjective determinations and recommendations for publication placements based upon their personal review of the "content" of the publication, including looking at whether the publication's editorial content was directed towards adults and whether other products advertised in the publication were adult products. Through this subjective determination process, Philip Morris's media employees and attorneys would decide whether a publication passed muster under the advertising guidelines as set forth in the industry's Cigarette Advertising and Promotion Code. **Virtually no magazines failed to qualify for placement of Philip Morris cigarette advertisements under Philip Morris's subjective review process during this period**. Camisa PD, United States v. Philip Morris, 6/28/02, 24:23-27:10, 32:19-33:11, 51:19-52:4, 81:14-82:16.

4772. In approximately 1995 or 1996, Philip Morris's stated media policy changed: cigarette advertisements were to be placed only in publications where 85% or more of a magazine's readership was 21 years and older. However, Philip Morris's evaluation process was still subjective and not quantitative, although it had some quantitative data upon which to base its decisions. At this time, Philip Morris continued to advertise in many magazines with high youth readership such as *Rolling Stone*. Id., 24:23-27-24, 51:19-52:8, 81:14-82:16.

4773. Philip Morris has purchased teen readership data from MRI on readers under the age of 18 since as early as 1995. Richard Camisa, Director of Media, became privy to such teen readership data upon his promotion to that position in 1998. Despite the fact that Philip Morris knew from this data that its magazine advertisements were read by many young people ages 12

to17, Philip Morris continued to rely upon its own internal subjective review standards under which virtually all magazines were fair game for advertising its products. Camisa PD, United States v. Philip Morris, 7/11/03, 243:17-244:23, 310:8-15; 2071239702-9705 (US 40405) (A).

4774. Beginning in 1998, Philip Morris initiated a new media placement policy that required publishers to provide a signed statement that their magazine was "primarily directed at adults" and to provide data of the percentages of adult (greater than or equal to 21 years old) plus subscription, circulation or readership as measured by the publisher's own research or by the MRI adult study. This information would determine if a magazine would be eligible for highly lucrative advertising contracts; yet it was sought from the magazine publishers themselves, who unarguably have a financial interest in maintaining their advertising sponsorships with cigarette companies. Moreover, Philip Morris accepted subscription numbers as a sole source of data providing eligibility for magazines without regard to how many magazines were sold through subscriptions as opposed to sold at newsstands. For instance, even if only 20% of a magazine's issues were sold through subscriptions, as opposed to at newsstands, Philip Morris would accept subscription data as evidence that the publication was "primarily directed at adults." With certification and publisher data in hand, Philip Morris again conducted its own "subjective review" of the publication content before determining whether to approve the placement of advertising in certain publications. Camisa PD, United States v. Philip Morris, 6/28/02, 29:4-30:19; Camisa PD, United States v. Philip Morris, 7/11/03, 266:10-267:13; 270:23-272:14.

4775. Although Philip Morris had been aware since at least 1998 that relying only on subscription data, instead of total circulation or readership data, would provide limited information about the audience of a magazine, it did not change its policies until 2000. In 2000, it adopted the policy that, if a magazine's subscriptions made up less than 60% of its total

circulation, then the publisher must provide a combination of subscription and newsstand data. Id., 270:23-272:14, 288:8-289:5; 2071228372-8378 (US 22199) (A).

4776. In 1998 and 1999, Philip Morris's stated Media Goals for Marlboro were to reinforce and maintain "Marlboro's leadership position," and "to identify new impactful opportunities that maximize visibility and brand essence with an emphasis on young adult smokers." According to Philip Morris's 1999 Media Plan, created by Leo Burnett's media-buying arm that buys magazine placement for Philip Morris advertisements, Marlboro maintained and built its leadership position in 1998 despite competitive pressure. It was recommended that Philip Morris increase its spending towards the so-called "young adult smoker" audience, focus on young adult smoker magazines, and increase the placement of Marlboro advertising in magazines that have high youth readership, including *Rolling Stone*, *Cosmopolitan*, *Vogue, Sports Illustrated*, *Entertainment Weekly, Playboy*, *ESPN*, *InStyle*, *GQ* and *Mademoiselle* magazines. Camisa PD, United States v. Philip Morris, 6/28/02, 107:6-115:11; 2071230813-0888 (US 40404) (A).

4777. Philip Morris developed a "Print Leadership Initiative" for execution in 1999 in an effort to maintain Marlboro's leadership position in magazines when billboards were not permitted after the MSA. The purpose of the initiative was to project Marlboro as being the number one brand (knowing full well that peer popularity drives youth brand choices, as discussed above). Richard Camisa, Philip Morris's Director of Media, testified that the initiative was intended to "showcase Marlboro's leadership position in print" by placing Marlboro advertisements in key locations in magazines, such as the back cover, the inside cover and the centerfold. These placements would communicate that Marlboro was "the number one brand." As Camisa described the initiative, "in a very cluttered print environment where you have so

many advertisers vying for presence in a magazine, are there things that you can do that could help your ad stand out versus others . . . not just be wallpaper and just be one of ad after ad which people see." Camisa provided examples of such placements, including: special impact units (3-4 pages units that may appear in a publication, as opposed to a single page); the "second" cover; pages one (the inside of the front cover and first page); the back cover; or, the center spread in a magazine that is stapled so that a reader naturally opens up to the magazine's center to see a showcased advertisement. Camisa PD, United States v. Philip Morris, 6/28/02, 113:6-114:24; 2080499829-9896 (US 20536) (A).

4778. Camisa further explained Philip Morris's print leadership initiative as follows:

> [L]eadership position is really, as it pertains to Marlboro, what we like to do is we like to see when we advertise in print, for example, that being the number one brand, we like to have Marlboro in the first tobacco position, which essentially is when you start reading a magazine, that of all the tobacco brands that may be advertised in that publication, we would like to have the first position. Because we think that is reflective of the brand's leadership position in the marketplace . . . showcase [Marlboro] as the first ad as you open the magazine.

Camisa PD, United States v. Philip Morris, 6/28/02, 111:22-113:5; 2071230813-0888 (US 40404) (A).

4779. Prior to the MSA and prior to the Print Leadership Initiative, Philip Morris had a leadership program in outdoor advertising which was designed to get "great locations on great expressways." After the MSA, Camisa testified, Philip Morris developed the 1999 Print Leadership Initiative in order to "try and enhance that whole leadership position for Marlboro using the only vehicle that [Philip Morris] had left at this time, which was print, given that . . . Philip Morris was exiting out-of-home [billboards] in compliance with the Master Settlement Agreement." Camisa PD, United States v. Philip Morris, 6/28/02, 114:25-117:2; 2080499829-

9896 (US 20536) (A).

4780. Under the Print Leadership Initiative, Philip Morris advertised Marlboro in leadership positions and competed for advertising with Marlboro's competitive youth brand, Camel, in the following youth publications: *Rolling Stone, Playboy, GQ, Spin, Car & Driver, Hot Rod, Penthouse, Vibe, Stereo Review, Car Craft, Cycle World, 4 Wheel, POV, Motorcyclist, Four Wheeler*, and *ESPN* through at least January 2000. Camisa PD, United States v. Philip Morris, 6/28/02, 149:2-152:6; 2080499829-9896 at 9837 (US 20536) (A).

4781. Even publishers of youth magazines pointed out that Philip Morris's advertisement placements in magazines such as *Rolling Stone* were aimed at teenagers. In a November 5, 1999 letter to Ellen Merlo, Senior Vice President at Philip Morris, *Spin* Publisher Malcolm Campbell questioned Philip Morris's decision (in fact due to external pressure) to pull advertisements from *Spin*:

> From a couple of terse phone conversations, I think our demise is based on a perception that Spin is too youthful. I respect your right to subjectively critique publications, however, to single Spin out for being too young, while continuing to support magazines, such as Rolling Stone or Details is ludicrous. I find an inconsistency in the logic that you cannot use Spin, but **you will run a centerspread in the current Rolling Stone with a 10 page cover line feature on "The Secret Life of Teenage Girls."** Only Rolling Stone has put teen phenoms Britney [Spears], Ricky Martin, The Back Street Boys and Jar Jar Binks on their cover this year, and all with pull-out posters for nifty bedroom collages. **These edit packages are clearly targeted at teens**, so comparatively, Spin's edit looks quite sophisticated.

2070748847-8852 at 8847 (US 21819*) (O) (emphasis added).

4782. Moreover, Philip Morris places its cigarette brand advertisements where they will reach the maximum number of people. Richard Camisa, Director of Media and Compliance for

Philip Morris, testified in his July 11, 2003 deposition in this case that Philip Morris advertised its Marlboro brand cigarettes on the back covers and inside front covers of magazines because "the ad awareness is much higher on a back cover as it is on the second cover page one versus any interior position. . . .So more of the readers of the publication are going to see an ad on the back cover or second cover versus inside the publication." When its advertisements were placed inside the magazine, Philip Morris sought other positioning designed to enhance awareness, such as running an advertisement adjacent to a horoscope page. Camisa PD, United States v. Philip Morris, 7/11/03, 219:23-221:5, 242:2-243:5.

4783. A document itemizing 1999 Philip Morris back covers, produced from the files of Richard Camisa, demonstrated that Philip Morris placed numerous back cover advertisements in magazines with substantial youth readership. For example: in 1999, Philip Morris had 8 (or 67%) of *Car Craft*'s back covers; 6 (or 50%) of *Hot Rod*'s back covers; 8 (or 33%) of *Rolling Stone*'s back covers; 11 (or 22%) of *Sports Illustrated*'s back covers; and 21 (or 40%) of *TV Guide*'s back covers. Advertisements that appear on the back covers of magazines are highly priced by magazines and valued by advertisers because they reach many more individuals than those placed inside magazines. 2085313542-3545 (US 88803) (O).

4784. In May 2000, Philip Morris once again changed its magazine policy to "voluntarily" incorporate a definition of "adult-oriented publication" that had been included in proposed regulation of tobacco advertising promulgated by the FDA in 1996. Camisa PD, United States v. Philip Morris, 6/28/02, 52:9-55:3; 2085314209-4215 (US 45714) (O); 2085314271-4271 (US 45716) (O). The definition described an "adult-oriented publication" as one: (i) Whose readers younger than 18 years of age constitute 15 percent or less of the total readership as measured by competent and reliable survey evidence; and (ii) That is read by fewer

than 2 million persons younger than 18 years of age as measured by competent and reliable survey evidence. 2085314271-4271 (US 45716) (O).

4785. In May 2000, when Philip Morris applied the new limit of 15% readership ages 12 to 17 or more than 2 million age 12 to 17 readers, it ceased advertising in *Sports Illustrated* because the magazine failed this standard. As Richard Camisa wrote in a May 19, 2000 letter to Fabio Freyre, the publisher of *Sports Illustrated*, "[t]he 1999 MRI Twelve Plus Study reports reach for your publication of 21.4% for persons below the age of 18 and reports readership of 17% for persons below the age of 18." 2085314266-4267 at 4267 (US 25275) (O).

4786. Similarly, application of this new standard forced Philip Morris to stop advertising in *Rolling Stone*. Application of the 1999 MRI Twelve Plus [12+] Study reported for *Rolling Stone* a "reach" of 11.1% for persons below the age of 18, and readership of 24% for persons below the age of 18. Prior to information from the MRI study confirming *Rolling Stone*'s high teen readership, Philip Morris had determined through its subjective, internal review process that *Rolling Stone* passed Philip Morris's internal requirements based upon the magazine's provision of a certification that its readership was primarily directed at individuals 21 plus, as well as its readership data. Camisa PD, United States v. Philip Morris, 6/28/02, 153:8-156:5; 2085314264-4265 at 4265 (US 45715) (O).

4787. A Philip Morris document entitled "2000 Marlboro Key Media Issues" stated that, because of the suspension of Philip Morris cigarette brand advertising in 32 magazines, its 2000 Media Plan was "less efficient due to loss of mass reach titles [such as] . . . *SI* [*Sports Illustrated*], *Rolling Stone*, *Cosmopolitan*, *People*, etc." 2085152525-2525 (US 25190) (A).

4788. Upon applying the 15% or 2 million readership standard using MRI and Simmons data in June 2000, forty of the publications in which Philip Morris had placed advertisements did

not meet the standard, including *Sports Illustrated*, *Rolling Stone*, and *Entertainment Weekly*. Between June 2000 and June 2002, the date of Camisa's deposition, another five to ten publications in which Philip Morris advertised cigarettes have failed the FDA standards. These are the same publications in which Philip Morris had continuously placed its cigarette advertisements notwithstanding its public statements – since the mid-1960s – that its cigarette advertisements "shall not appear [] in publications directed primarily to those under 21 years of age." Camisa PD, United States v. Philip Morris, 6/28/02, 62:16-76:23; 2085139972-9972 (US 25149) (O); 285139647-9649 (US 25118) (O).

4789. Camisa stated at his deposition in this case that prior to Philip Morris's adoption of its 2000 FDA standard for advertising in publications, he was not aware of the number of teens who were being reached by Philip Morris's advertisements in publications notwithstanding his position as Director of Media. However, other testimony Camisa gave suggested his department had access to, and utilized such data. According to Camisa, the Media Department created binders of "cheat sheets," similar to "Cliffs Notes," for the Philip Morris Brand Groups that contained synopses of each magazine in which Philip Morris cigarette advertisements could be published that included basic readership demographic information for the various publications in which Philip Morris cigarettes were advertised, including information on a magazine's age of readers, theme, and target audience. Camisa PD, United States v. Philip Morris, 6/28/02, 85:20-87:2, 92:2-93:15.

4790. Moreover, a September 17, 1996 draft presentation entitled "MRI and Simmons," with the handwritten notation "prepared for counsel," was developed for "internal PMUSA discussion only" and confirms Philip Morris had access at that time to MRI and Simmons data that showed the number of 12 to 17 year olds reading the magazines in which Philip Morris

advertised. Despite having these materials as early as 1996, Philip Morris did not begin to apply them until June 2000. 2071294033-4042 (US 20525) (O); 2070354075-4088 (US 21930) (O).

4791. A March 1998 draft letter from the files of Philip Morris USA, written by Corinne A. Goldstein, an attorney at Covington & Burling, to Judy Wilkenfeld, Special Advisor for Advertising Initiatives at the FDA, demonstrates that at that time Philip Morris had access to 1997 Mediamark Research Incorporated ("MRI") data showing that magazines in which Philip Morris advertised had substantial youth readership of above 2 million and/or 15% of total readership aged 12 to 17. 2069603598-3600 (US 27252) (A); 2069603601-3601 (US 27253) (A).

4792. In 1997 and 1998, Leo Burnett, Philip Morris's advertising agency, sent at least seven faxed reports to Philip Morris's Marketing Department and Media Department employees containing information derived from the MRI 12+ Studies (including data on 12 to 17 year olds) and the Simmons Studies. On January 23, 1998, Andrea Starshak, Account Manager for the Simmons Market Research Bureau, faxed a report which contained "horizontal percentage reflect[ing] the portion of each magazine that is comprised of teens age 12-17" from STARS+ 1996 data. 2071294089-4090 (US 21945) (O); 2071294011-4032 (US 20524) (O); 2071294007-4009 (US 21946) (O); 2071294086-4088 (US 20523) (O); 2071294061-4063 (US 21948) (O); 2071294004-4005 (US 20522*) (O); 20071294001-4002 (US 21951) (O); 2071294006-4006 (US 21952) (O).

4793. As recently as June 2002, Philip Morris maintained a total "consideration set" of approximately 100 publications in which it may choose to advertise its cigarettes. As of June 2002, of those 100 publications, Philip Morris was currently placing cigarette advertisements in 15 to 20 because only they had passed muster under the proposed FDA guidelines as measured by the MRI or Simmons studies. The remaining 80 to 85 publications are not measured by the

MRI or Simmons studies; according to Camisa, therefore, the FDA guidelines cannot be applied against them. Those approximately 80 publications would be measured against Philip Morris's "print certification" process which states that 85% or more of the subscription or circulation must be 21-plus. Philip Morris may in the future continue to advertise in those 80 publications, particularly for new product introductions, based upon its internal subjective review process. Camisa PD, United States v. Philip Morris, 6/28/02, 72:7-73:15, 76:24-81:4.

4794. MRI and CMR data for the years 1993 to 2003 demonstrate that Philip Morris spent almost $600 million advertising its cigarette brands in magazines with substantial youth readership, meaning that the magazines on average have either over two million readers ages 12 to 17 per issue or over 15% of total readership ages 12 to 17 years old per issue. Philip Morris's largest annual expenditure for advertising its cigarette brands in these publications was over $96 million, occurring in 1999, the first year after the MSA. Krugman WD, 116:3-122:7.

4795. Philip Morris advertised in *Sports Illustrated*, a magazine that the MRI data indicates averaged more than 4,700,000 readers ages 12 to 17 for each issue published during the time period from 1992-2002. In fact, from January 1993 to May 2003, Philip Morris USA spent a total of $133,727,300 on cigarette brand advertising in *Sports Illustrated*. In 1993 alone, Philip Morris USA spent $10,883,500 on cigarette brand advertising in *Sports Illustrated*; the MRI data indicates that, in 1993, on average more than 17% of the total readers of *Sports Illustrated* were teenagers ages 12 to 17 years old. Id.

4796. Although Philip Morris has reduced its print media profile as recently as June 2002, it has chosen to shift its spending to retail marketing which has extraordinarily broad reach. The reduction in print media advertising, and concomitant increase in retail and other promotional spending, is entirely consistent with Philip Morris's overall marketing strategy in

recent years, and is not based on a decision to stop targeting youth. Camisa PD, United States v. Philip Morris, 6/28/02, 87:3-89:13; 522642421-2433 (US 87852) (A).

4797. To this day, Philip Morris denies that it **ever** targeted youth in its advertisements. Furthermore, as of June 2002, Philip Morris was still placing cigarette advertisements in magazines with high youth readership, including *Outdoor Life* and *GQ*. Camisa PD, United States v. Philip Morris, 6/28/02, 87:1-91:25, 95:1-96:22.

(ii) Philip Morris's Direct Mail Marketing

4798. Philip Morris has stated that its policy is not to send any mailings to individuals on its Direct Mail Marketing Database who are under the age of 21. In her corrected written direct testimony, Jeanne Bonhomme, Philip Morris Director of Database Management and Direct Marketing Operations from 1998 to 2000, testified that during that period she "had general responsibility for all of the direct mail that Philip Morris USA sent to consumers" and also "responsibility for managing the Philip Morris direct mail marketing database." Bonhomme testified that "Philip Morris publicly claims that it directs its mailings to consumers 21 and older," and that, "[t]o [her] knowledge Philip Morris has never knowingly mailed brand mailings to anyone under 21 years of age." Bonhomme WD, 4:11-19, 67:9-68:10, 84:6-7, 87:9-14.

4799. *Marlboro Unlimited* is a glossy, color magazine created by Philip Morris and sent to individuals on Philip Morris's Direct Mail Marketing Database. It contains full color, glossy Marlboro advertisements which are either identical to, or are very similiar to, those that Philip Morris has placed in magazines such as *Rolling Stone* and *Sports Illustrated*. During his August 26, 2003 deposition, Leo Burnett U.S.A. corporate designee Thomas Dudreck testified on behalf of Leo Burnett that *Marlboro Unlimited* was routinely sent through the United States mail to approximately 750,000 to 800,000 people on Philip Morris's Database four times each year.

Dudreck PD, United States v. Philip Morris, 8/26/03, 458:21-460:2.

4800. Susan Norris, a 15 year Philip Morris employee and former Marlboro Brand Manager from 1995-1999, testified at her July 31, 2003 deposition in this case that Philip Morris first began distributing *Marlboro Unlimited* magazine in late 1998 or early 1999 and that it is distributed quarterly. Norris further testified that during her tenure as a Brand Manager for Marlboro, *Marlboro Unlimited* was mailed to an audience of approximately two million smokers. A memorandum on Philip Morris letterhead dated June 2, 1998 from Laura Meltzer, a then Assistant Brand Manager for Marlboro, to a distribution list of Philip Morris employees including Norris, discussed a planning meeting that had been held regarding *Marlboro Unlimited* and stated: "Team agreed that we should continue to use Unlimited as a relationship building tool geared towards YAMS 21 to 24. Primary objective is to reward loyalty and secondary objective is to create a dialogue with YAMS." Norris further testified that loyalty is important to Philip Morris because "[t]o the degree that an adult smoker selects your brand and stays with your brand . . . [it leads to] really consistent sales over a period of time." Norris PD, United States v. Philip Morris, 7/31/03, 211:12-218:2, 218:25-220:12; 2064933423-3425 at 3423 (US 39975) (O).

4801. Starting with its premiere issue in 1996, and continuing to the present day, Philip Morris has sent *Marlboro Unlimited* to tens of millions of individuals on its Direct Mail Marketing Database. PM3000196002-6092 at 6013 (US 23056) (A).

4802. Despite Philip Morris's supposed policy not to send *Marlboro Unlimited* to individuals under the age of 21, Philip Morris has sent millions of copies of its magazine to individuals for whom the company has no age information beyond the individual's own unverified representation that he or she is 21 or over. In 1999 alone, Philip Morris sent 8,264,645 copies of *Marlboro Unlimited* to individuals who had only a "signature" on record to

"verify" that they were 21 or above. Id., 6013.

4803. Despite its supposed policy which prevents it from sending mailings to individuals under age 21, Philip Morris has sent mailings to many individuals under the age of 21. In fact, Philip Morris has sent *Marlboro Unlimited* to many individuals who Philip Morris **knew** were under the age of 21 at the time they received it. For example, in 1999 alone, Philip Morris sent *Marlboro Unlimited* to 37,826 individuals who were under the age of 21, according to Philip Morris's own records. Id., 6016.

4804. Philip Morris has also sent marketing mailings other than *Marlboro Unlimited* to individuals who had only a "signature" on record – and no identification such as a drivers license – to "verify" that they were 21 or above. Between 1989 and 2003, Philip Morris sent 813,905,702 marketing mailings to such individuals. Id., 6011.

4805. Philip Morris sent products and coupons to individuals who only had a "signature" on record to "verify" that they were 21 or above. For example, in 1999 alone, Philip Morris sent 69,170,720 coupons to such individuals. Id., 6012.

4806. In 1993 alone, Philip Morris sent 2,815,036 mailings containing cigarette products to individuals who only had a "signature" on record to "verify" that they were 21 or above. Id., 6013.

4807. Philip Morris has knowledge that many individuals whose records contained on its Direct Mail Marketing Database and who had a "signature" on record to "verify" that they were age 21 or above were in fact under the age of 21 at the time they received marketing mailings from Philip Morris. Nonetheless, Philip Morris continued to send these individuals marketing mailings. In 1993 alone, Philip Morris sent 306,895 mailings to individuals who were

under the age of 21 at the time they received the mailing, despite also having a "signature" on record to "verify" that they were 21 or above. Id., 6014. Of these mailings, 173,432 were coupons, 96,906 were gifts or "continuity" items (such as t-shirts, posters, or mugs), and 18,820 were products. Id., 6016.

4808. Philip Morris has knowledge that many individuals whose records are contained on its Direct Mail Marketing Database and who had a "signature" on record to "verify" that they were age 21 or above were in fact **under the age of 18** at the time they received marketing mailings from Philip Morris. In 1993, Philip Morris sent 71,485 marketing mailings to such individuals, including 48,822 coupons and 28,335 gift or continuity ite In 1994, Philip Morris sent 94,151 marketing mailings to such individuals, including 44,919 coupons and 31,572 gift or continuity ite In 1995, Philip Morris sent 76,378 marketing mailings to such individuals, including 30,190 coupons and 34,909 gift or continuity item. Id., 6016-6018.

4809. Despite its supposed policy which prevents it from sending mailings to individuals under age 21, Philip Morris sends marketing mailings to individuals for whom it has no identification (such as a driver's license) and has no "signature" verifying their age on record. From 1989 to 2003, Philip Morris sent to mailings to 18,847,776 such individuals, including 60,973,164 marketing mailings. 3000196023-6025 at 6023 (US 61452) (O).

4810. Philip Morris continues to mail Marlboro, Parliament, Virginia Slims, Merit and Accord coupons, magazines, brochures, and other mailings directly to customers whose records are maintained on Philip Morris's Direct Mail Database. 2061162074-2077 (US 39166) (O); 2061162078-2087 (US 39167) (O); 2061162182-2187 (US 39168*) (O); 2061162512-2519 (US 39184) (O); 2061162965-2968 (US 39189) (O); 2061163206-3215 (US 39196) (O); 2061163610-3614 (US 39200) (O); 2061163783-3789 (US 39213) (O); 2061163832-3838 (US

39214) (O); 2061163996-3999 (US 39215) (O); 2061164303-4305 (US 39223) (O); 2061164581-4582 (US 39226) (O); 2061164605-4614 (US 39232) (O); 2061165008-5009 (US 39247) (O); 2061165295-5300 (US 39264) (O); 2061165311-5342 (US 39269) (O); 2061165494-5502 (US 39290) (O); 2061165503-5510 (US 39293) (O); 2061165564-5568 (US 39297) (O); 2061165569-5574 (US 39299) (O); 2061166050-6059 (US 39323) (O); 2061166097-6100 (US 39335) (O); 2061166101-6108 (US 39336) (O); 2061166109-6114 (US 39337) (O); 2061166121-6133 (US 39339) (O); 2061166134-6141 (US 39340) (O); 2061166142-6149 (US 39341) (O); 2061166275-6275 (US 39352) (O); 2061166278-6289 (US 39354) (O); 2061166301-6307 (US 39355) (O).

4811. According to Philip Morris's "2003-2007 Five Year Plan" dated April 3, 2003, Philip Morris planned to of its Direct Mail Marketing Database in 2003 with a newly launched website entitled www.smokersignup.com that currently allows people to add their names to the database over the internet. According to the Plan,

PM3000540103-540118 at 0107, 0116 (US 88649) (A) (Confidential). As further stated in its "2004 Original Budget & Five Year Plan Presentation," in order address the "Critical Issue" of the "Loss of mass marketing" that it faces ahead in 2004-2008, Philip Morris plans a short-term strategy of marketing through packaging onserts, expanded direct mail, and a rewards card that is preloaded with a fixed dollar amount for cigarette purchases, and a long-term strategy of controlled internet access, or "internet sites marketing cigarettes" to include selling cigarettes on line, or by phone, fax or mail orders. PM3000613782-3913 at 3790, 3801, 3804, 3887 (US

88647) (A).

(iii) Liggett's Advertising

4812. At his June 14, 2002 deposition in this case, James Taylor testified that Liggett Vector Brands's current print advertising policy is not to advertise in any publications with over 15% under 18 readership. Taylor PD, United States v. Philip Morris, 6/14/02, 95:8-25, 97:5-99:6.

4813. An examination of MRI and CMR data for the years 1993 to 2003 in magazines with substantial youth readership demonstrates that Liggett began advertising its cigarette brands in publications with a substantial youth readership for the first time in 2001, and that it has increased its expenditures on such advertisements in both 2002 and 2003. Since 2001, Liggett has spent over $6 million advertising its cigarette brands in magazines with substantial youth readership. Krugman WD, 116:3-122:7.

4814. The majority of Liggett's expenditures on its cigarette brand advertisements in magazines with substantial youth readership has been spent on advertisements in *People*, a magazine which had, on average, more than three million readers ages 12 to 17 years old per issue from 1992 through 2002. Id.

(iv) Lorillard's Advertising

4815. As of June 1998, it was Lorillard's policy not to advertise in publications that were primarily subscribed to by minors or distributed to minors. Lorillard's Media Services Department relied on a computer program designed by an independent outside service to identify the magazines in which it was not appropriate to place Lorillard advertisements. However, Lorillard only looked at readership information of people 18 years old and older in making its

determination. Lorillard would then use its "best judgment" based on the information provided by the publications about the readership of people 18 years of age and older to make a recommendation as to whether to advertise in a particular publication or not. The recommendations were made by Lorillard's media department in conjunction with its outside advertising agency. The recommendation was then reviewed and considered by Lorillard's brand group. Lindsley PD, Massachusetts v. Philip Morris, 6/8/98, 65:13-70:17; Lindsley PD, California v. Philip Morris, 6/9/98, 164:17-171:6.

4816. A document dated Fall 1999 entitled "Lorillard Marketing Regulation Manual (A Guide From Counsel)" stated: "Lorillard does not and will not advertise its products in publications directed primarily to persons under 21 years of age, including school, college or university media (such as athletic, theatrical or other programs), comic books or comic supplements." 83675546-5629 at 5591 (US 67506) (A).

4817. Lorillard's magazine advertising policy as of June 2002 was not to advertise in magazines that have greater than 18% youth readership (12 to 17 year olds). This advertising policy was based on the percentage, not the total number, of youth readers; therefore, Lorillard can and does place advertisements in magazines which have millions of young readers ages 12 to 17. Two syndicated services, MRI and Simmons, provided information to Lorillard on the percentage and total number of youth readership. Lindsley PD, United States v. Philip Morris, 5/16/02, 83:6-84:19; Telford PD, United States v. Philip Morris, 6/26/02, 34:8-35:4.

4818. It was also Lorillard's policy to place Newport and other brand advertisements in magazines for which there was no youth readership information available from these syndicated services. For example, Lorillard has placed its cigarettes advertisements in *ESPN* magazine although MRI and Simmons data subsequently indicated that there was greater than 18% youth

readership. Lindsley PD, United States v. Philip Morris, 5/16/02, 81:2-81:13; Telford PD, United States v. Philip Morris, 6/26/02, 35:5-35:8, 36:21-36:25. Lorillard did not make an effort to determine the youth readership level of magazines in which it placed advertisements if MRI or Simmons did not have youth readership information. For magazines that lacked MRI or Simmons youth readership data, Lorillard made its decision to place advertisements based on Lorillard's consideration of the editorial content of the magazines. Telford PD, United States v. Philip Morris, 6/26/02, 35:9-35:14.

4819. Victor Lindsley testified that Lorillard places advertisements in magazines to reach the respective brands' targeted consumers who were defined by brand marketing plans and that, in making a decision to place Newport advertisements in magazines, Lorillard considers the readership age of the magazine. Lindsley PD, United States v. Philip Morris, 5/16/02, 53:24-54:19. George Telford similarly testified that Lorillard tailors its advertising placement for different brands based on the desired demographic profile of those brands. For example, Lorillard advertises for Newport in younger publications like *Sports Illustrated*, *Playboy*, and *Penthouse*. Lorillard continues to place advertisements in these magazines: Lorillard's September 7, 2001 "Newport Brand Plan" for 2002 suggests targeting the young "adult" market through print media "to increase brand awareness and reinforce brand image." Telford PD, United States v. Philip Morris, 6/26/02, 61:9-62-2, 62:9-17, 62:22-63:1; 92278882-8951 at 8898 (US 21114) (A).

4820. MRI and CMR data for the years 1993 to 2003 demonstrate that Lorillard spent over $60 million advertising its cigarette brands in magazines with substantial youth readership, meaning that the magazines have on average either over two million teen readers ages 12 to 17 per issue or over 15% of total readership, per issue, are ages 12 to 17 years. Lorillard's

expenditures for cigarette brand advertisements in these publications almost doubled from 1997 through 2000, rising from $4.2 million in 1997 to $7.8 million in 2000, even though the MSA was enacted in 1998. Krugman WD, 116:3-122:7.

(v) Lorillard's Direct Mail Marketing

4821. A memorandum dated January 13, 2000, from H.H. Bell, Lorillard in-house counsel, to G.T. Baroody and A. Pasheluk, Lorillard employees, and copied to R.S. Milstein, Lorillard General Counsel, regarding "Database Name Compilation/Proof of Age for Continuity Programs" contained Bell's responses to a number of issues raised at a January 6, 2000 meeting. The first issue addressed was: "When soliciting or purchasing names for inclusion on Lorillard's consumer database, is it necessary to request/receive a 'photo I.D.' from the consumer?" Bell concluded: "It is not. The MSA requires an age-verified identification only when providing 'any item in exchange for the purchase of Tobacco Products.' See Section III(h) [page 26]. Since we are merely compiling a database rather than conducting a continuity program, the obligation to secure proof that the person is an adult is inapplicable. . . . [T]he mere accumulation of names on our database, without more, would not violate these principles." The second issue that Bell addressed was: "When soliciting or purchasing names for inclusion on Lorillard's consumer database, is it necessary to request/receive the consumer's signature?" Again, Bell concluded: "The MSA does not require that we have signatures on file." Another issue addressed by Bell was: "Is it desirable to maximize the number of consumers on our database who have supplied Lorillard with photo I.D. and signature?" Bell responded: "Ideally, yes. To do so creates a larger pool of already qualified consumers who can be communicated with in a variety of ways without having to take further steps to do so. However, it is a management call as to whether we maintain only a database of pre-qualified consumers or additional database(s) on non-qualified

consumers." 82093356-3358 at 3357-3358 (US 22198) (A).

4822. Orlowsky also testified that Lorillard currently maintains two databases, both of which contain names of smokers whose ages have not been verified through a copy of identification or public records database:

> The database . . . Epiphany . . . contains information on smokers who have certified they are 21 years of age or older and want to receive information on our products. Some of the smokers on Epiphany are verified, meaning it has been verified either through a copy of a Government identification or a public records database that they are at lest 21 years of age. Smokers whose age is verified are qualified to receive continuity goods. A second database, Suppression, contains a list of individuals who for a number of reasons are not eligible to participate in our direct mail program. The purpose of the Suppression list is to ensure that these people cannot get on the Epiphany database.

Orlowsky WD, 60:22-63:22; 82093356-3358 at 3357-3358 (US 22198) (A).

4823. At trial, Orlowsky admitted that "at times" Lorillard sent mailings to individuals for whom Lorillard has no government-issued identification, and that Lorillard does not have third party verification for every person to whom it mails, stating "[t]here's third party verification related to certain types of mailings that we make, not in every instance." Orlowsky TT, 10/13/04, 2277:25-2278:25.

4824. In 2000, Lorillard sent 4,181,593 mailings that included coupons for cigarettes to 2.6 million individuals for whom Lorillard has no third party age verification and no government-issued identification on file. 94945731-94945736 at 5734 (US 90002) (A).

4825. In 2003, Lorillard sent promotional mail to 2,261,881 unique (different) individuals for whom Lorillard had no third party age verification and no government-issued identification on file. In 2003, a total of 8.8 million mailings were sent to more than 2.2 million

individuals for whom Lorillard has no third party age verification and no government-issued identification on file. Id., 5734.

4826. As of August 16th of 2004, Lorillard had sent promotional mailings to more than 1.7 individuals for whom Lorillard has no third party age verification and no government-issued identification on file. These 1.7 million persons were sent 4.9 million total mailings. Id.

4827. As of August 10, 2004, Lorillard's direct mail marketing database, Epiphany, contained the names of 11,077,551 individuals. Orlowsky, Lorillard's Vice-President, testified that Lorillard limits its direct mail marketing to individuals who, at a minimum, self-certify that they are smokers of legal age. As of August 16, 2004, Lorillard had no government-issued identification age verification or third party age verification for approximately 2,341,622 individuals contained in its direct mail database. Orlowsky TT, 10/13/04, 2279:14-22; 94945731-94945736 at 5732 (US 90002) (A).

(vi) B&W's Advertising

4828. On September 1, 1998, B&W conducted a review of its marketing policies and guidelines. Instead of increasing the age of its models in advertisements, B&W lowered the age of models in its advertisements from 30 to 25 years of age. Susan Ivey testified that she was satisfied with the 25 year-old age requirement, and that she did not recommend that the company go back to the requiring models to be at least 30. Ivey WD, 10:2-22.

4829. In December 1999, after receiving a complaint from the National Association of Attorneys General (NAAG), B&W agreed to agreed to restrict the placement of the company's cigarette advertisements to magazines whose under-21 readership did not exceed 15% of the magazine's total readership. B&W initially relied on information provided by the publishers of

the magazines in which it advertised in order to determine whether the under-21 readership of a magazine exceeded 15%. B&W also examined the editorial content of the magazines in which it advertised. Id., 16:7-16; Ivey TT, 11/16/04, 6118:3-10.

4830. Sharon Smith, B&W's designated witness regarding the "B Kool" campaign, testified that B&W continued its "B Kool" campaign through the year 2000. Further, during this period, the "B Kool" campaign appeared in magazines, such as *Rolling Stone*, whose readership exceeded the 15% threshold. Smith WD, 7:3-10; 282300205-0207 (US 20574) (A).

4831. It was not until November of 2000 that B&W revised its magazine placement policy to rely on MRI and Simmons data to determine whether the youth readership of a magazine exceeded 15%. However, as early as 1996, B&W had magazine readership data from the Simmons Market Research Bureau including demographic groups of 12 to 17, 18+, 12-20 and 21+. B&W, prior to November 2000, also relied in part on MRI and Simmons data in developing its media plans. Furthermore, B&W in revising its magazine placement did not agree to only advertise in magazines included in the Simmons and MRI studies. Ivey TT, 11/17/04, 6313:18-6314:3; Ivey WD, 20:5-8; 210210020-0022 (US 20540*) (O).

4832. In an August 15, 2001 press release, B&W announced a revision to its magazine placement policy. Under the new policy, the company placed its advertisements only in certain editions of magazines sent to subscribers over the age of 21. Under this policy, B&W would advertise in magazines such as *Rolling Stone* regardless of whether the magazine had over 15% youth readership according to MRI or Simmons if the magazine was able to ensure that the company's advertisements only ran in those editions of the magazine sent to subscribers over 21. B&W received letters from the Attorneys General of Pennsylvania, Maine, and California expressing their concern about this new policy and requesting data on the "pass along" readership

among youth of magazines which are sent directly to subscribers 21 years of age and older but are passed along with a household to younger readers. B&W did not change its policy in response to these letters and never provided the requested "pass along" readership data. Ivey WD, 21:1- 25:7; 525022464-2464 (US 20918) (A); 282402351-0352 (US 89163) (A); 28250050-0051 (JD-012711) (A); 282500100-0102 (JD-012842) (A); (US 90060) (A).

4833. When B&W adopted its 15% limitation, it did not impose upon itself any limitation on advertising in magazines with a certain number of readers ages 12 to 17. B&W never adopted a limitation on its magazine advertising placement based on the actual number of young readers per issue. At trial, Susan Ivey testified that she does not favor a limitation on magazine advertising based on an absolute number of young readers per issue. Ivey WD, 16:17-17:10.

4834. Paul Wessel, B&W Divisional Vice President, testified at his March 19, 2003 deposition that it is the policy of B&W only to advertise in magazines where 85% of the readership is over the age of 21, and that the company does not "use any celebrities, any cartoons, any characters that would have specific appeal to youth." Additionally, he testified that models appearing in any advertising must be, and appear to be, 25 or older. Wessel PD, United States v. Philip Morris, 3/19/03, 57:20-58:18.

4835. Yet, Brown and Williamson continues to advertise its brands in general circulation magazines that it knows reach over 2 million readers under the age of 18. Newton PD, United States v. Philip Morris, 5/15/02, 138:25-146:18. In fact, B&W itself, in a July 9, 1985 document, described *Rolling Stone*, *Record*, and *Spin* as "young targeted music books." 670661599-1665 at 1628 (US 23054) (A).

4836. MRI and CMR data for the years 1993 to 2003 demonstrate that B&W spent $223

million advertising its cigarette brands in magazines with substantial youth readership, meaning that the magazines have on average either over two million teen readers ages 12 to 17 per issue or over 15% of total readership, per issue, ages 12 to 17 years old. B&W's largest annual expenditure for advertising its cigarette brands in these publications was over $38 million, occurring in 1999, the first year after the enactment of the MSA. Krugman WD, 116:3-122:7.

4837. In 1999, B&W placed in newspapers and magazines nationwide the "B Kool" advertising campaign for Kool cigarettes captioned "B Kool." In one "B Kool" advertisement, an attractive young woman gazed longingly back at a partially visible man in the foreground holding a lighted cigarette and a pack of Kools. ADV0480239-0241 (US 11642) (A); ADV0480299-0301 (US 11662) (A); ADV0840152-0154 (US 14522) (A); ADV0840164-0166 (US 14526) (A); ADV0840185-0187 (US 14533) (A); ADV0840208-0210 (US 14540) (A); ADV0840249-0251 (US 14553) (A).

4838. In 2000, B&W placed advertisements for Lucky Strike in *InStyle* and *Spin* magazines. MRI data indicates that in 2000, over 22% of the readers of *InStyle* were between the ages of 12 and 17, and 24% of the readers of *Spin* were between the ages of 12 and 17. ADV0850271-0273 (US 14659) (A); ADV0850308-0312 (US 14670) (A); ADV0500461-0463 (US 12225) (A); ADV0500493-0495 (US 12233) (A); ADV0500499-0501 (US 12235) (A); ADV0500511-0515 (US 12239) (A); ADV0500537-0539 (US 12245) (A); ADV0500549-0551 (US 12249) (A); ADV0500569-0571 (US 12255) (A); ADV0500590-0592 (US 12262) (A); ADV0500602-0604 (US 12266) (A); Krugman WD, 116:3-122:7.

4839. Currently, B&W continues to advertise in well known youth magazines such as *Rolling Stone* and *Sports Illustrated*. Moreover, B&W itself recognizes the power and influence of such advertising. In her testimony in this case, Claudia Newton, B&W Vice President for

Corporate Responsibility and Youth Smoking Prevention from November 1997 to January 2001, who was experienced in media placement, stated that advertising is effective through repetitive viewing and that effective campaigns can be had by placing numerous advertisements in several small circulation magazines where it is cheaper to advertise. Newton PD, United States v. Philip Morris, 5/15/02, 127:25-128:11, 139:25-146:18.

4840. Numerous public officials, including the former Governor of Florida and several State Attorneys Generals, have expressed their dismay at B&W's "B Kool" advertising campaign because of its appeal to youth. On October 22, 1997, Governor Lawton Chiles of Florida wrote to B&W regarding its "B Kool" advertising campaign. Governor Chiles stated in his letter: "I am very disturbed by B&W's most recent advertising campaign for Kool menthol cigarettes. This so-called "B Kool" campaign appears to be yet another flagrant attempt by Big Tobacco to hook another generation of teens. In addition, it clearly violates the spirit of the settlement agreement reached between the State of Florida and Big Tobacco." The letter criticized the use of a young female model in the campaign who "looks like a teenager from head to toe" and the use of billboards. The Governor concluded his letter by requesting that B&W remove "these offensive billboards immediately . . . and immediately halt this campaign." 282208267-8267 (US 22099) (A).

4841. On October 22, 1999, Attorney General of Indiana Jeffrey Modisett wrote a letter to B&W summarizing his impressions of a meeting he attended with the company on October 4, 1999. In response to representations made at the meeting that B&W only intended to target smokers between the ages of 21 and 30 with its "B Kool" campaign, Attorney General Modisett stated: "While your intentions have been clearly stated, to outside observers it is hard to believe that your company does not use advertising to entice non-smokers to begin smoking your

products." He also stated: "I find it amazing that no one would agree that kids age 10-14 are more interested in 'being cool' than the older, more mature 21-30 age group. So, while your intentions with the 'B Kool' advertising campaign seem clear internally, you have a long way to go to convince outside observers that this advertising campaign does not have an undesired impact on both younger smoking an non-smoking teens." 282204359-4361 at 4359-4360 (US 22211) (A).

4842. On December 3, 1999, the Attorney General of Oklahoma, Drew Edmonson, wrote to B&W on behalf of the NAAG Tobacco Enforcement Committee to express the Committee's concerns about the content of the "B Kool" advertising campaign and the placement of "B Kool" advertisements in magazines with significant youth readership according to data contained in the 1999 MRI Twelve Plus Study. B&W had placed "B Kool" advertisements in such magazines as *Vibe* and *Sport*, which had youth readership (readers between the ages of 12 and 17) above 35% based on the 1999 MRI Twelve Plus Study. Edmonson wrote that "[t]he placement of ads in magazines with a significant youth readership is especially problematic because the content of the B Kool ads has such high youth appeal." Attorney General Edmonson expressed concern that "the content of the B Kool ads has such a high youth appeal. Research over many years has shown that adolescents emulate youth adults who strongly desire to be seen as 'cool' in the eyes of their peers." He noted that "[s]ome of the ads include visual cues, e.g. tattoos which are currently in vogue among teens. This imagery is likely to appeal to male adolescents." Edmonson also stated that the "B Kool" slogan was more likely to "resonate" with young adolescents than with smokers 21 to 30 years old. In response to B&W's contention that the advertising campaign was intended to target 21 to 30 year olds, Edmonson stated "it is foreseeable and inevitable that a marketing strategy directed at young adults which employs

themes with particular appeal to adolescents (e.g. independence, desire to appear older, desire to be cool), . . . will, in fact, both appeal to and reach a large number of youth." B&W did not change the content of the B Kool campaign in response in response to the concerns expressed by NAAG. 282300205-0207 at 0205-0206 (US 20574) (A); Smith WD, 32:20-33:8.

4843. In March 2004, B&W issued a press release announcing the launch of the Kool Mixx campaign. As part of the campaign, a series of "Kool Mixx" advertisements appeared in the April 2004 edition of *Rolling Stone* magazine sent to subscribers over 21. The advertisements featured cartoon like images of DJs spinning CDs and young people dancing. The text of the advertisements included statements that "Kool recognizes DJs as the center of Hip Hop, inspired by the real feel and energy of the streets . . . DJ's are the Masters of the Hip Hop like Kool is the Master of Menthol. Kool Mixx special Edition Packs are our mark of respect for these Hip Hop Players." The special edition packs referenced in the advertisements featured the same images of DJs and young people dancing. Also included in the April 2004 edition of *Rolling Stone* was a Kool Mixx CD/CD-Rom, described in the advertisements as "Your way to experience the sights and sounds of the Soundtrack to the Streets." The CD-Rom contained, among other things, soundtracks by various hip-hip artists, interviews with DJs, and a link to the website www.houseofmenthol.com, which the press release described as a "comprehensive, age-verified website for adult smokers" created as part of the KOOL Mixx campaign. Ivey WD, 28:4- 29:27, 33:1-34:20; ADV1150001-0117 (US 88094) (A); Krugman WD, 116:3-122:7; USX5420003-0008 (US 89164) (A).

4844. Public heath organizations and Attorneys General of several states criticized B&W's Kool Mixx campaign for targeting youth. The African American Tobacco Prevention Network issued a statement "denounc[ing] a plan by Kool brand cigarettes to escalate its

targeting of black youth and urban hip-hop culture by sponsoring a nationwide Hip-Hop DJ Competition, and creating a special cigarette package to market that event which by design appeals to youth." G. Steven Rowe, Attorney General of Maine and the Chair of the Tobacco Enforcement Committee, in a March 25, 2004 letter to Neil Mellon, wrote, "[t]he advertising images used in this campaign [hip-hop artists, DJ's, art, and culture] appear to us to hold particular appeal for teenagers." In addition, it was brought to B&W's attention that individuals were able to gain access to www.houseofmenthol.com, its supposedly "age-verified" website, by providing false information. The Attorneys General of New York, Illinois, and Maryland filed lawsuits against B&W alleging that the Kool Mixx campaign violated the MSA's provision against youth targeting. An affidavit filed in the New York litigation by Dr. Michael Kamins, Associate Professor of marketing at the Marshall School of Business, concluded that "the Kool Mixx Campaign targets youth, particularly African/American youth." On October 5, 2004, B&W and RJR reached a settlement with the state Attorneys General resolving these lawsuits. As part of the settlement, B&W and RJR agreed to pay $1.46 million to the CDC Foundation, the National African American Tobacco Prevention Network, the American Lung Association of Metropolitan Chicago, and the Bobby E. Wright Community Health center to support youth smoking reduction and prevention programs. Ivey WD, 35:13-41:11; Ivey TT, 11/16/04, 6153:11-6168:1; TLT1050314-0316 (US 86683) (A); USX5430001-0004 (US 89167) (A); USX5430005-0006 (US 89168) (A); USX5430007-0008 (US 89169) (A); USX5560025-0026 (US 90057) (A); USX5560018-0024 (US 90056) (A); USX5560031-0034 (US 90059) (A); USX5560095-0114 (US 92037) (A); USX5560035-0050 (US 90061) (A).

(vii) B&W's Direct Mail Marketing

4845.

Ivey WD, 44:1-45:17; Ivey TT, 11/17/04, 6224:8-6225:25; 469100116-0136 (US 89166) (A) (Confidential); USX5560116-0119 (US 92039) (A).

4846.

Ivey WD, 45:9-46:8; Ivey TT, 11/17/04, 6233:20-6236:22; 469100116-0136 (US 89166) (A) (Confidential); USX5560116-0119 (US 92039) (A).

4847. Ivey testified that, although the company would send advertisements and coupons to individuals whose age had not been independently verified, third party age verification was required in order for individuals to receive premium items or cigarettes through the mail. Ivey WD, 44:1-45:17; Ivey TT, 11/17/04, 6224:8-6225:25. Contrary to Ivey's testimony that third party age verification was required in order for individuals to receive premium items or cigarettes through the mail, B&W in 2004 did send premium items to individuals whose age had not been verified either through government-issued identification or third party verification. B&W in 2004 also sent cigarettes through the mail to individuals whose age had not been verified through government-issued identification or third party verification. Ivey TT, 11/17/04, 6241:1-6243:11;

469100116-0136 (US 89166) (A) (Confidential)

(viii) RJR's Advertising

4848. Between the 1998 execution of the MSA and June 2000, RJR's print policy did not change. Beasley PD, United States v. Philip Morris, 6/25/02, 42:8-15. In the years preceding 2000, RJR's print placement policy reflected its interpretation of the Cigarette Advertising Code that prohibited cigarette advertising in any magazine that was primarily directed to underage people. RJR limited its advertising to magazines whose readership was at least 50% adult, adult being defined as 18 or 21 depending on whether it was before or after May 1992, if it had 18 plus readership data available. Id., 55:20-58:3.

4849. According to RJR's Media Director, Patti Ittermann, RJR did not look at data that measured youth readership under 18 years (or 12+ "teen data") in magazines until after January 2000, and the only reason it started to review the youth readership data for magazines was the concerns raised by the public and the government. Ittermann PD, United States v. Philip Morris, 5/17/01, 52:19-25, 53:1-14, 58:20-22.

4850. In June 2000, RJR revised its advertising policy from placing its advertisements in magazines that had at least 50% adult readership to advertising in magazines having at least two-thirds readership 18 years or older, if the magazine measured readership data among audiences 12 years old and older. The revised policy permitted the placement of advertisements in publications where no readership data was available. Id., 34:2-35:19, 43:9-44:15, 58:10-58:18, 81:1-82:18; 522040903-0903 (US 20907) (O); 522041398-1402 at 1399 (US 52796*) (O).

4851. Prior to the written June 2000 print placement policy, Itterman was not sure whether there was a written policy regarding advertising placement. She testified that she was

involved in formulating the prior policy, but could not specifically remember whether it was written. Itterman PD, United States v. Philip Morris, 5/17/01, 76:25-77:14.

4852. A June 19, 2000 memorandum from Itterman to various RJR employees demonstrates that RJR sought to take immediate advantage of Philip Morris's June 2000 magazine policy adjustment, as described above. RJR researched which magazines Philip Morris was no longer advertising in, with the intent of placing RJR advertisements where Philip Morris had previously advertised. The memorandum discussed obtaining magazine cover spaces that Philip Morris had previously occupied. 522765629-5634 (US 22141) (O); 522642421-2433 (US 88035) (O); Itterman PD, United States v. Philip Morris, 5/17/01, 95:21-102:23; 522041457-1460 (US 20908) (O).

4853. After RJR modified its magazine placement policy, its corporate website still contained the old policy. Rather than immediately changing the website to reflect the change in policy, RJR executives debated whether the shift had to be noted. Patricia Itterman sent an email to Jan Fulton Smith on June 21, 2000 inquiring: "[d]o we need to amend this (what is out there on the web site), given our 2/3 over 18 policy? Are we sending mixed signals? Seems that we need to be consistent . . ." Smith replied that "I've been waiting for the 'dust to settle' on [RJR's position on advertising issues]." 522041369-1369 (US 87865) (O).

4854. As of March 2001, RJR's stated new youth magazine policy was that 75% of the readership of a given magazine must be 18 years old or older, for publications in which audience measurement data existed for total readership ages 12 years and older. As of June 2002, this was still the current print placement policy. Beasley PD, United States v. Philip Morris, 6/25/02, 42:4-6, 44:9-15. RJR used both Simmons and MRI data to evaluate magazine placement. Additionally, it considered other factors, specifically editorial content, the other categories of

products advertised, and distribution. Blixt PD, United States v. Philip Morris, 10/31/02, 131:24-132:10, 137:7-15.

4855. Andrew Schindler, CEO of RJR, testified that he made the decision to shift from a two-thirds 18 plus standard to a "75% 18 plus standard" during the same time frame in which RJR was being sued by the State of California for MSA violations. Schindler testified that he did not consider the issue of "pass along" readership, whereby one reader passes the magazine to another, exposing additional adolescents to RJR's advertisements. Specifically, Schindler testified that, when RJR advertised in the 2003 swimsuit issue of *Sports Illustrated*, it did not occur to him that "the Swimsuit issue, might garner a very high absolute number of adolescent boys looking at it, even if the 25% threshold was not breached" or that "even if actual sales figures for this issues were not astronomically higher for adolescents, this is the one issue that has a huge potential for one 10th grade boy who did buy it to take it to school and share around with all of his pals." Schindler WD, 214:13-215:8.

4856. RJR asserts on its website that, "Reynolds Tobacco does not and will not advertise in publications for youth. And, that's why we adhere to a policy that restricts placement of our ads to publications that are predominately adult-oriented." ARU6432629-2633 (US 78283) (O) (http://www.rjrt.com /IN/COHowWeThink_smokinghealth.asp#Pageaddress).

4857. Despite all these policies discussed above, RJR magazine advertisements reached millions of young people ages 12 to 17. MRI and CMR data for the years 1993 to 2003 demonstrate that RJR advertised its cigarette brands in magazines with substantial youth readership, meaning that the magazines have on average either over two million teen readers ages 12 to 17 per issue or over 15% of total readership, per issue, ages 12 to 17 years old. Krugman WD, 116:3-122:7. In fact, in 1999, the first year after the enactment of the MSA, RJR increased

its media spending on advertising in such magazines. 524941712-1722 (US 87804) (A).

4858. As an example of the extraordinary number of youth reached by RJR advertising, according to CMR and MRI data, RJR advertised in *Rolling Stone* in 1993, during a year in which more than 20% of the readers of *Rolling Stone* were ages 12 to 17. From 1992 to 2002, RJR consistently advertised in *Rolling Stone*, during which time it had, on average, more than two million readers ages 12 to 17 years old per issue. Krugman WD, 116:3-122:7.

4859. RJR has continued to create advertisements directed at youth, including a1999 campaign, "Viewer Discretion Advised"; a 2001 campaign,"Pleasure to Burn;" and the 2001 campaign, "No Bull." Ittermann PD, United States v. Philip Morris, 5/17/01, 17:2-17:18, 28:8-28:14; 522678810-8810 (US 20008) (O); 520577527-7590 (US 87859) (O); 526196441-6512 (US 87860) (O); 524721458-1462 (US 87861) (O); 524723562-3564 (US 87862) (O).

4860. A document entitled "1999 Camel Media Recommendation Print Categories" recommended that Camel 'Core' magazines should include *Bikini*, *Jane*, and *Gear*, because of their younger reader profiles. 522694030-4038 at 4037 (US 20914) (A); 524726445-6455 (US 88161) (A); 524722990-3002 (US 87858) (A).

4861. The "Camel/Kamel 1999 vs 2000 Comparison" stated that the core "target" were "'cutting edge' trendsetters who are nightlife savvy and exhibit an attitude of 'urban hip and coolness.'" 522668813-8821 at 8816 (US 20910) (O).

4862. As recently as November 1999, internal RJR documents show that it advertised Camel in magazines with substantial 12 to 17 year old readership percentages. These magazines include: *Sports Illustrated* (22%), *Rolling Stone* (28%), *Spin* (34%), *Cosmopolitan* (13%), *Glamour* (20%), *Mademoiselle* (23%), *Car and Driver* (17%), *Hot Rod* (30%), *Motor Trend*

(21%), *Popular Mechanics* (17%), *Cycle World* (37%), *Four Wheel and Off Road* (32%), *Guns and Ammo* (23%), *Motorcyclist* (37%), *Road and Track* (22%), and *Sport* (39%). 520417937-7939 (US 20883) (A); 524723156-3167 (US 87866) (A); 524723279-3280 (US 87867) (A).

4863. As of May 17, 2001, RJR was still advertising in approximately 100 publications, many of which have significant youth readership, as shown by the MRI and Simmons' studies. Ittermann PD, United States v. Philip Morris, 5/17/01, 46:1-48:24.

4864. While RJR publicly states that its advertising it targeted at "adults," the company knows that its advertisements continue to have broad reach. In this case, Diane Burrows testified that if an advertisement is targeted to 18 to 20 year olds, it will likely do well among 21 to 24 year olds. She testified that the reverse is also true because there is only a few years' difference in the individuals' ages. Burrows PD, United States v. Philip Morris, 6/27/01, 31:5-32:9.

(ix) RJR's Direct Mail Marketing

4865. A June 29, 1998 internal RJR document entitled "Draft Response to Inquire Re: Salem Mailing List" indicated that "[a]s part of its test market of a Salem repositioning in New York City . . . RJR has been building a database of smokers of competitor's menthol brands and styles, so that we might mail information to them to convince them to try, and hopefully switch, to Salem." An unusually high number of individuals (1%) requested to be removed from the mailing list, and the document stated that RJR's "procedures in place . . . designed to ensure that only smokers 21+ who wanted to receive cigarette information ever got placed on the database" had not been followed. RJR5002724700034912-4914 at 4912 (US 54425) (O). RJR is aware that a large percentage of names on its direct mail marketing database are underage people claiming to be above 21, yet does not require age verification before mailing consumers.

4866. A January 25, 2002 RJR internal memorandum from Chris Gunzenhauser of Database Marketing to Peggy Carter of the Personal Relations department describes RJR's process of age verification for names on its database and states:

> We historically match about 41% of names we send for age verification. Our matching pattern looks for an exact match on names and address. **Approximately 90% of the underage names report to be between 21 and 24.** While we are requiring a signature and DOB, we are not currently requiring age verification before mailing to consumers. The underage status does not allow any verified underage smokers to be included in a mailfile.

RJR000000000800117870019055l-0551 (US 22140*) (O) (emphasis added).

(8) Defendants' Youth Smoking Prevention Efforts Are Ineffective

4867. Cigarette Company Defendants' "youth programs" and so-called youth smoking prevention efforts fall far short of what they could be. Biglan WD, 381:5-17.

4868. Evidence indicates four strategies that have proven effective in preventing adolescent smoking: a) increase the cost of cigarettes; b) eliminate marketing practices that make smoking appealing; c) implement empirically validated school-based prevention programs; and d) conduct media campaigns directed at youth, using spots that have been shown to influence adolescent smoking. Defendants have not effectively implemented any of these four strategies. Id., 386:7-398:16, 401:12-411:8; Chaloupka WD, 30:15-32:20.

4869. Cigarette Company Defendants could significantly reduce adolescent smoking by withdrawing their opposition to tax increases and stopping all price related marketing (i.e., discounting and value added offers of cigarettes), especially in convenience stores, where their offers are concentrated and where young people are more likely to purchase cigarettes. Chaloupka WD, 124:7-136:20; 250025505-5505 (US 25343) (A); 2041787758-7815 at 7795

(US 38236) (A).

4870. Indeed, when she was head of Philip Morris's Youth Smoking Prevention department, Carolyn Levy testified that she took the position that the company should not oppose taxes on cigarettes because tax increases reduced teenage smoking, due to of the price-sensitivity of teenagers. Further, Levy testified that although she "told Mike Szymanczyk [Philip Morris CEO] that [she] thought that Philip Morris should stop fighting excise tax increases or take a neutral position," she did not know if Philip Morris took "any action as a result of [her] recommendation." Levy WD, 96:1-97:23.

4871. Although Defendants have increased the list price of their cigarettes after the MSA, their enormous promotional expenses consistently decrease the real price of cigarettes to consumers. Moreover, Defendants continue to oppose cigarette taxes that would raise cigarette prices and deny that such increases will affect youth initiation. Chaloupka WD, 124:7-136:20. In fact, the tobacco companies have significantly **increased** expenditures on discounts and value added offers since the MSA. According to the FTC 2001 Report, in the year after the MSA was implemented, spending on retail value added offers (e.g., buy one, get one free) rose 64.6% to $2.56 billion. Chaloupka WD, 82-84.

4872. Cigarette Company Defendants continue to market to young people. According to their representatives' testimony in this case, Cigarette Company Defendants have not even considered the role of advertising in smoking initiation or the smoking behavior of teenagers. For example, in her deposition in this case, B&W's Claudia Newton described a meeting of those responsible for prevention from each company and indicated that "it was the agreed belief among all the task force members that cigarette advertising was not a significant factor in influencing kids to smoke." Newton PD, United States v. Philip Morris, 4/17/02, 147:20-23.

4873. By failing to identify marketing as a factor that influences the decision of young people to smoke and falsely stating to the public that marketing does not play a role in the decision of young people to smoke, the Cigarette Company Defendants imply that there is no need for them to modify their marketing practices, thereby deceiving the public. USX6400001-0527 at 0454-0456 (US 89561) (O) (Philip Morris Response to Interrogatory No. 3).

4874. Philip Morris continues to increase its marketing expenditures in grossly disproportionate amounts to its spending on youth smoking prevention.

PM3000172220-2256 at 2234-2235, 2242 (US 88646) (O) (Confidential). According to Philip Morris's 2004 Original Budget and 2004-2008 Five Year Plan Presentation dated December 2, 2003, Philip Morris's spending on youth smoking prevention advertising and corporate responsibility advertising alignment actually saved Philip Morris an estimated $30 million annually. Not surprisingly, in the "four critical drivers for our success," Philip Morris does not include preventing youth smoking. PM3000613782-3913 at 3788, 3789 (US 88647) (A) (emphasis added).

4875. Although Philip Morris and B&W have each supported the implementation of a school-based youth program, dissemination of an empirically-supported program does not guarantee that it will be effective because the program is often not implemented as carefully or completely as it was in the research study. While Philip Morris is studying the implementation of the school-based program it supports, the Philip Morris study as designed and implemented will not provide interpretable information about the effects of the program. Moreover, RJR has

promoted a school-based program for which there is no evidence and little reason to believe that it will be effective in preventing youth smoking. Lorillard's program, "Making it H.I.P. Not to Smoke" consists of scholarship programs and other cash awards. There is no empirical evidence that contests of this sort contribute to reducing the prevalence of adolescent smoking. Biglan WD, 382:18-396:17.

4876. Philip Morris, RJR, Lorillard, and B&W direct their youth smoking prevention efforts towards early adolescents and ignore older adolescents. The Philip Morris media campaign targeted youth 10 to 14 years old. Levy WD, 71:17-72:4. Lorillard targets 10 to 15 year olds. Watson PD, United States v. Philip Morris, 4/2/02, 160:22-162:11. RJR targets 12 to 15 year olds. 520877431-7484 (US 87873) (A) (www.rightdecisionsrightnow.com/facttex.htm). Several of B&W's activities target children and early adolescents. Biglan WD, 401:18-402:9.

4877. Gilpin, Choi, Berry, and Pierce estimate that each day, more than 1,600 young people ages 15 through 17 begin experimenting with cigarettes, and about 3,158 begin experimenting between the ages 11 and 14. Thus, about a third of experimentation begins during these later years. Id., 402:16-23.

4878. About 1,250 young people per day become established smokers (more than 100 cigarettes lifetime) at ages 15 through 17, while about 725 per day become established smokers at ages 11 through 14. Thus, nearly two thirds of adolescents who smoke become established smokers in the later age range. These numbers are far from insignificant. Id., 403:1-5.

4879. The Cigarette Company Defendants' failure to direct their youth smoking prevention programs and media campaigns to teenagers ages 15 to 17 misses a huge opportunity to prevent adolescent smoking. Id., 403:6-7.

4880. Lorillard and Philip Morris have run national youth smoking prevention media campaigns. Both Lorillard and Philip Morris's media campaigns promote the message that smoking is an adult decision. Emphasizing that smoking is an adult activity underscores the desirability of an adult behavior for adolescents who are particularly motivated to appear mature. Id., 409:20-21; 433:15-22.

4881. Cigarette Company Defendants have not evaluated whether their media campaigns are effective in reducing adolescent smoking and most of their youth smoking prevention advertisements do not promote the social disapproval of youthful smoking, which available evidence indicates is critical to their effectiveness. Id., 403:21-412:8.

4882. In its corporate principles promulgated pursuant to the MSA, Lorillard stated that Lorillard "strongly supports the efforts of the Foundation to be established pursuant to the MSA." Milstein TT, 1/7/05, 9378:13-9382:4. However, Lorillard sued the American Legacy Foundation in Wake County, North Carolina Superior Court on February 19, 2002, alleging that it has engaged in vilification and personal attack, and making misrepresentations to the public and the media. Milstein TT, 1/7/05 9368:16-9370:10.

4883. Lorillard's Watson admitted at his deposition in the American Legacy Foundation case that he was aware that Legacy ran advertisements to prevent youth from smoking and admitted that "there has been a continuous and steady decline in youth smoking rates . . . beginning back about 1996." However, when asked whether the decline in youth smoking rates could be attributed to Legacy's advertisements, Watson stated "I don't know." Watson PD, American Legacy Foundation v. Lorillard, 12/8/04, 59:3-6; 61:10-62:16, 66:8-21.

4884. On October 26, 1998, Fox Broadcasting Company reviewed Philip Morris's first round of YSP ads and concluded that they did not send a strong enough anti-smoking message to

children. Szymanczyk TT, 4/07/05, 18256:9-18258:20, 18262:3-19; 2069512311-2311 (JD-053821) (A).

4885. California Attorney General Lockyer wrote a letter to Denise Keane, Philip Morris Senior Vice President and General Counsel, on April 13, 2001, requesting immediate discontinuation of the "Think, Don't Smoke" campaign on the basis of research and on the grounds that this message was ineffective and diluted the effective anti-smoking messages of the states and the American Legacy Foundation. Philip Morris continued to air the "Think, Don't Smoke" advertisements for nine months after receiving this letter. Szymanczyk TT, 4/07/05, 18264:3-18272:17

4886. Lorillard utilized the slogan "Tobacco Is Whacko–If You're a Teen" in its youth smoking prevention media campaign. According to a February 2000 Lorillard report on the results of focus groups that were done with 10-15 year olds to get their reactions to Lorillard's youth smoking prevention advertisements:

> • Respondents remembered the tag line, but had negative responses to it.
>
> • They complained that it was very young (younger than they are) and 'cheesy.'
>
> • They particularly disliked the if you're a teen part of 'Tobacco is Whacko–If You're a Teen.' They complained that this singled them out and that they believe it should apply to all ages.

94691840-1858 (US 87874) (A); Biglan WD, 409:5-18.

4887. Despite these results, Lorillard continued to use this slogan. In addition, Victor Lindsley, Lorillard's group brand director who was involved in developing Lorillard's youth smoking prevention media campaign, by email dated April 4, 2000, indicated to Milstein that he was "very uncomfortable" about the tag line. In response, Milstein stated that Orlowsky,

Lorillard's president's "only comment to me [Milstein] was that he [Orlowsky] did not want to hear again about the tag line ever, and that I [Milstein] should not be influenced by the creative complainers." Lorillard did not remove this line until 2001. Lorillard's youth smoking prevention campaign was silent about the health risk of cigarettes or their addictive qualities. Milstein TT, 1/10/05, 9399:25-9410:6; 97011359-1359 (US 89287) (A); 99282955-2955 (US 89288) (A).

4888. Rather than using techniques to reduce youth smoking that might be effective, Defendants have chosen to direct most of their efforts and spending towards campaigns to reduce adolescent access to tobacco and to media campaigns aimed at parents. All of the companies support the We Card Program to reduce illegal sales of tobacco to young people at the retail level, but there is no evidence that such an education campaign can bring about reductions in illegal sales that might affect adolescent smoking prevalence, and recent evidence calls into question whether reducing sales will reduce adolescent smoking prevalence. In any case, no evidence could be found that the companies are evaluating the effectiveness of the program in reducing the sale of cigarettes at the retail level, or reducing the overall adolescent smoking prevalence rate. Biglan WD, 439:11-443:26.

4889. One of Lorillard's Corporate Principles provides that "Lorillard strongly supports the enforcement of laws which requires retailers to check the age of potential purchasers of cigarettes." Milstein TT, 1/7/05, 9382:5-10. Yet, Lorillard's expenditures for the We Card program decreased significantly in 1999 and 2000 over its pre-MSA funding levels. The expenditures went from 9.5 million in 1996 to just 6.1 million in 1997 and then 5.05 million in 1998. In 1999, the total program spending went down to 4.2 million. This is so despite warnings from Reed deButts that this funding budget would limit distribution of We Card materials and training sessions significantly. Id., 9327:6-9331:14; 2085092888-2894 (US 89180) (A).

4890. Research published in the *American Journal of Public Health* in November 2000 concluded that illegal sales at stores that displayed tobacco industry signs were no lower than at stores with no signs. Milstein TT, 1/7/05, 9322:4-9326:18; DXA0130196-0197 (US 77457) (O).

4891. According to the Philip Morris commissioned 2003 TABS (Teenage Attitude and Behavior Survey), almost 70% of adolescents 11 to 17 year old smokers who had bought cigarettes in the previous month purchased their cigarettes directly from the retail clerk where the clerk handed them the pack of cigarettes. Specifically, 43.8% of these 11 to 14 year-olds, and 72.9% of these 15 to 17 year-old smokers purchased their cigarettes from a retail clerk who handed them cigarettes. Howard Willard admitted that such figures are "very unacceptably high." Willard TT, 4/12/05, 18694:9-18697:7; UCX0280450-0807 (US 93349) (A).

4892. The Cigarette Company Defendants have directed a variety of communications concerning youth smoking prevention to parents, including television advertisements, brochures, and workshops. There is currently no evidence that these efforts will result in reduced rates of adolescent smoking and no evidence could be found that the Cigarette Company Defendants are evaluating the effectiveness of their youth smoking prevention efforts directed to parents. Biglan WD,412:9-436:3.

4893. Philip Morris has distributed youth smoking prevention brochures to approximately one million parents who were on the Philip Morris mailing list. Levy WD, 74:4-6; 87:10-89:20. The RJR website describes, and includes the text of, three youth smoking prevention brochures intended for parents. 520877431-7484 (US 87873) (A) (www.rightdecisionsrightnow.com/facttex.htm); Biglan WD, 433:1-434:6. Lorillard has placed youth smoking prevention print advertisements directed at parents in a number of magazines. The advertisements emphasize that by the teenage years, young people are alienated from their

parents and encourage parents to talk to their children. Id., 424:14-425:23. In fact, Lorillard's current YSP program is aimed exclusively at parents and not youth. Milstein TT, 1/10/05, 9435:16-21. Although premised on the idea that parents have influence on kids' behavior, Lorillard does not advise parents to quit smoking. Id., 9490:6-9491:5.

4894. No evidence currently exists to suggest that such efforts to mobilize parents actually affect adolescent smoking prevalence. For example, one study randomly assigned parents to receive or not receive a set of four messages designed to encourage parents to set rules about tobacco use. There was no evidence that the messages deterred smoking. Moreover, research has found that flooding a community with pamphlets urging parents to talk to their children about not using tobacco had no discernible effect. Thus, advertisements directed at parents are unlikely to prompt them to talk to their children about not smoking and should not be assumed to be effective in preventing smoking. Biglan WD, 412:9-413:19.

4895. Youth smoking prevention campaigns targeting parents should be routinely evaluated in terms of: (a) their efficacy in getting parents to talk to their children about not using tobacco or otherwise set limits around smoking; and (b) their actual impact on youth smoking. Defendants have not done so. Id., 434:19-435:5

4896. Defendants have not placed individuals with any experience or background in smoking prevention, prevention generally, or even youth issues, in charge of their various youth smoking prevention activities. For example, Carolyn Levy, former Director of Youth Smoking Prevention at Philip Morris, testified that she had no experience or background in prevention or youth smoking or youth issues and was unaware of even the basic prevention journals relied upon by prevention experts. Levy testified that when she left her employment with Philip Morris, her successor and the current Senior Vice President for Youth Smoking Prevention,

Howard Willard, also did not "have a background in youth smoking prevention," but had served previously as Senior Vice President of Quality and Compliance for Philip Morris. Levy WD, 55:16-19; 57:14-59:24; 63:13-64:19.

4897. Neither Claudia Newton, B&W Tobacco Corporation's Vice President, Corporate Responsibility and Youth Smoking Prevention, nor Theresa Burch, the head of B&W Tobacco Corporation's youth smoking prevention programs, had any background in youth smoking prevention. Newton PD, United States v. Philip Morris, 4/17/02, 70:23-71:2, 78:10-81:12, 192:24-193:9.

4898. Brennan Dawson had been B&W's Vice President for External Affairs and MSA Section III(1) designee, taking over from Newton. Dawson admitted in her modified written direct testimony that she does not have a college degree and has no formal educational background in science or medicine. Dawson WD, 4:10-20.

4899. Steven Watson, Vice President of External Affairs for Lorillard, testified in his deposition that prior to joining Lorillard in that position with responsibility for the oversight of Lorillard's Youth Smoking Prevention Program, he had never done any research on risk perception or any work that required him to develop programs for youth. Watson also testified that no one at Lorillard asked him if he had such experience when he was interviewing for the position at Lorillard. Watson PD, United States v. Philip Morris, 4/2/02, 24:18-26:1. Watson also testified that not only did he not apply for the position of Vice President of External Affairs, but he did not know anyone at Lorillard before Lorillard contacted him regarding the position. Id., 21:6-19. Lorillard's Ronald Milstein also lacked expertise in youth smoking prevention. Milstein TT, 1/7/05, 9349:2- 99351:22.

4900. Cigarette Company Defendants' youth smoking prevention efforts should be

evaluated in the context of their long history of extensive public relations efforts to convince the public that they do not market to young people. As internal documents show, Cigarette Company Defendants' supposed youth smoking prevention efforts and public statements that they do not market to youth enable them to give the appearance of being concerned about young people, improve their public images, and prevent the imposition of restrictions on their marketing practices. Biglan WD, 381:5-382:17; MNAT00280070-0070 (US 21724) (O).

4901. Defendants have long treated youth smoking as a public relations issue and have publicly disseminated materials boasting of their policies not to market to youth and their supposed concerns about youth smoking. Id.

4902. Brennan Dawson admitted in her modified written direct testimony that Defendants' supposed youth smoking prevention programs had the strategy of preventing restrictions on cigarette advertising; she testified that "part of the context was to prevent some of the legislative proposals we were seeing." Dawson WD, 91:11-13.

4903. A 1991 discussion paper from the Tobacco Institute explained why a "youth program" is important to the industry and described precisely the things that the tobacco company Defendants have been doing. According to this paper, a youth program will: "support the Institute's objective of discouraging unfair and counterproductive federal, state, and local restrictions on cigarette advertising, by: (1) providing on-going and persuasive evidence that the industry is actively discouraging youth smoking and independent verification that the industry's efforts are valid. (2) Reinforcing the belief that peer pressure–not advertising–is the cause of youth smoking [and] (3) Seizing the political center and forcing the anti-smokers to an extreme." TIMN0164421-4424 at 4423 (US 34445*) (A).

4904. The Tobacco Institute's 1991 discussion paper further stated that the strategy will

involve heavily promoting industry opposition to youth smoking and aligning the industry with a "broader, more sophisticated view of the problem, i.e., parental inability to offset peer pressure." The strategy also involved working "with and through credible child welfare professionals and educators . . ." The paper also recommended that the industry "bait anti-tobacco forces to criticize industry efforts" and "establish the sense of a growing, well-accepted program by encouraging a proliferation of small, local projects; and appropriate co-ventures with other TI allies." TIMN0164421-4424 at 4422 (US 34445*) (A).

4905. A 1995 Philip Morris document stated: "If we can frame proactive legislation or other kinds of action on the Youth Access issue. . . we will be protecting our industry on into the future." Additionally, the document stated: "if we don't do something fast to project that sense of industry responsibility regarding the youth access issue, we are going to be looking at severe marketing restrictions in a very short time. Those restrictions will pave the way for equally severe legislation or regulation on where adults are allowed to smoke." 2044046017-6022 at 6021-6022 (US 66716) (O).

4906. Defendants have done exactly what the 1991 Tobacco Institute document recommended. They are using youth prevention activities to give the appearance of concern about youth smoking in order to prevent further restrictions on their marketing activities. The strategy was not new in 1991. It could be seen in their creation of the advertising code in 1964 and it was clearly articulated in a Tobacco Institute strategy document created around 1981. Biglan WD, 381:5-382:17.

4907. The tobacco company youth smoking prevention activities since 1998 benefit the Cigarette Company Defendants in ways that have nothing to do with preventing youth smoking. Id.

4908. Cigarette Company Defendants' supposed youth smoking prevention efforts also serve to reposition the public perception of smoking as something less dangerous than it actually is. For example, despite the fact that most smokers want to quit, RJR advises parents who smoke that, "[i]f you are like most smokers, you smoke because you enjoy it." The B&W website advises, "[t]ell your children that laws exist to enforce smoking as a choice made by informed adults." Defendants never recommend that parents inform their children that smoking kills more than 400,000 people each year, involves an addiction that most smokers desire to end, and will harm those around the smoker. VXA1240104-0567 (US 64316) (A).

(9) Conclusion

4909. The actions of Defendants substantially contributed to widespread initiation of smoking behavior among children and adolescents and to the persistence of cigarette smoking among adolescents and adults in the United States. Defendants intend that their actions have this effect.

F. Suppression and Concealment of Information; Destruction of Documents

(1) Introduction

4910. From at least 1954 to the present, Defendants engaged in parallel efforts to destroy and conceal documents and information in furtherance of the Enterprise's goals of (1) preventing the public from learning the truth about smoking's adverse impact on health; (2) preventing the public from learning the truth about the addictiveness of nicotine; (3) avoiding or, at a minimum, limiting liability for smoking and health related claims in litigation; and (4) avoiding statutory and regulatory limitations on the cigarette industry, including limitations on advertising. These activities occurred despite the promises of the Cigarette Company Defendants that (a) they did not conceal, suppress or destroy evidence, and that (b) they shared with the American people all pertinent information regarding the true health effects of smoking, including research findings related to smoking and health.

(a) Promises To Share Smoking and Health Information With the American People

4911. As detailed in US FF § III.A(1), supra, for decades Defendants maintained that there was an "open question" as to whether smoking cigarettes caused disease and other adverse effects. Because of this alleged "open question," Defendants pledged an obligation to fund independent research on the issues of smoking and health and to share the results of that research with the public.

4912. As recently as 1996, Martin Broughton, Chief Executive of BAT Industries, the then ultimate parent company of BATCo and B&W, made a statement to the *Wall Street Journal* denying that BAT Industries and its subsidiaries had concealed research linking smoking and disease. Broughton stated: "We haven't concealed, we do not conceal and we will never conceal. We have no internal research which proves that smoking causes lung cancer or other diseases or,

indeed, that smoking is addictive." 321224327 (US 88680) (O); see also 322269293-9297 (US 88331*) (O) (JD-012603) (O); 321677122-7133 at 7124 (US 88332) (O); 700351757-1758 (US 88681) (O); 800113810-3812 (US 85343) (O).

(b) Ongoing Litigation

4913. Defendants' destruction of documents, and suppression and concealment of information, was driven, in part, by their objective to avoid disclosure of information in ongoing litigation and thereby avoid liability for smoking and health related claims.

4914. Litigation involving the Cigarette Company Defendants began in March 1954 when the smoking and health lawsuit, Lowe v. R.J. Reynolds, Docket No. 9673 (E.D. Mo. Mar. 10, 1954) was filed.

4915. In 1964, the first smoking and health lawsuit involving CTR and the Tobacco Institute as co-defendants, Fine v. Philip Morris, (M.D. Pa. Feb. 3, 1964), was filed.

4916. Since 1954, smoking and health litigation has been pending continuously against one or more of the Defendants. Such litigation has raised recurring factual and legal issues common to Defendants, including allegations of injury from smoking and the use of false statements in cigarette advertising, among others. 82406903-7158, 6905, 7098-7158 (US 86990) (A).

4917. In his testimony at trial, J. Kendrick Wells, B&W Assistant General Counsel for Product Litigation, confirmed that "[s]ince 1954 the tobacco companies have been in continual litigation; not just imminent, but actual pending product cases." Wells WD, 5:5-8.

(c) Statutory and Regulatory Oversight

4918. Defendants' destruction of documents, and suppression and concealment of information was also driven, in part, by their objective to avoid statutory and regulatory

limitations on the cigarette industry.

4919. In the 1950s, regulatory oversight (apart from continuing antitrust scrutiny) affecting the cigarette industry as a whole began to accelerate and have continued to the present on federal, state, local and international levels. This oversight has involved a wide variety of federal regulatory agencies including the Federal Trade Commission ("FTC"), the Federal Communications Commission ("FCC"), the Food and Drug Administration ("FDA"), the Civil Aeronautics Board ("CAB"), and the Environmental Protection Agency ("EPA"), among others. The oversight has covered a wide range of issues, including cigarette advertising; placement and use of health warning notices on cigarette packages and in cigarette advertising; placement and use of tar and nicotine yields on cigarette packages and in cigarette advertising; testing of cigarettes for tar, nicotine and carbon monoxide yields; reporting of ingredients used in cigarette manufacturing; restriction and prohibition of smoking aboard commercial aircraft, interstate buses and interstate trains; and smoking in public places, among others.

4920. Legislative activities on the federal level affecting Defendants began in at least 1957 with the "Blatnik hearings," which addressed the disclosure of tar and nicotine yields in advertising and raised issues of common interest to Defendants. Representatives of Defendants have attended and testified at hearings regarding a wide variety of proposed and existing legislation. (JD-011816) (A).

(2) Destruction, Suppression, and Concealment of Information

4921. Defendants RJR, Philip Morris, BATCo, B&W, Liggett, Lorillard, and CTR worked both collectively and individually to destroy, suppress, and conceal information to further the goals of the Enterprise of limiting liability in lawsuits, avoiding statutory and regulatory limitations, and suppressing evidence of the truth about the adverse health effects of smoking and

its addictiveness. Indeed, that conduct continues today. In this very lawsuit, BATCo, Liggett, Philip Morris, and Altria have all violated this Court's Orders in efforts to avoid discovery of sensitive information. Altria and Philip Morris have been found in contempt for spoliation of evidence. BATCo has twice been found in contempt, once for failure to produce documents and once for twice producing unprepared 30(b)(6) witnessed on the issue of document management and document destruction. Liggett was sanctioned for its deficient privilege logs. See US FF § V.A(4).

(a) Defendants' Collective Efforts to Destroy, Suppress, and Conceal Information

4922. On July 3, 1963, Addison Yeaman, B&W in-house counsel, sent a wire cable to A.D. McCormick, a lawyer for BATCo, regarding B&W's attempt to keep the results of legitimate research projects, Project Hippo and the Griffith Filter, from the Surgeon General despite Yeaman's knowledge that the Surgeon General was preparing the first comprehensive report on smoking and health. Yeaman informed McCormick that "Hoyt of TIRC agreed to withhold disclosure Battelle report to TIRC or SAB until further notice from me. Finch agrees submission Battelle or Griffith developments to Surgeon General undesirable and we agree continuance of Battelle work useful but disturbed at its implications re cardiovascular disorders. . . . We believe combination Battelle work and Griffith's developments have implication which increase desirability reevaluation TIRC and reassessment fundamental policy re health." 689033422-3422 (US 22734) (A); Brookes PD, United States v. Philip Morris, 05/02/02, 171:25-173:4.

4923. On May 23, 1964 Abe Kresh, a tobacco industry lawyer at what was then Arnold, Fortas & Porter, sent a letter to the members of the Committee of Counsel following up on the Committee's previous discussion regarding a possible survey to determine the level of public

awareness of the health issue related to smoking. In an attached memorandum prepared by Kresh's colleague, the law firm discussed the Committee's concern regarding adverse use of the results if the survey was not favorable:

> The question has been raised of possible use of a survey. Specifically, Mr. Austern [attorney with Covington & Burling] has suggested that should the results of the survey prove unfavorable, they may be subpoenaed or otherwise fall into the hands of the FTC, a Congressional Committee, or a plaintiff in pending cancer litigation. There is no question that some risk exists. We have been assured by both Elrich & Lavidge [the proposed survey firm] and by Professor Steiner [a University of Chicago marketing professor who was to lead the survey] that they would transmit to us every interview and every copy of the analysis. Thus, when it is completed, there will be nothing in the records of Elrich & Lavidge or Professor Steiner to subpoena. The danger of a successful subpoena would be reduced (though not entirely eliminated) if the survey were in an attorney's files. In any event, if the returns were unfavorable they could be destroyed and there would be no record in any office of the nature of the returns. The possibility of compelling oral testimony from Steiner, of course, always exists.

The lawyers at Arnold, Fortas & Porter also assured the Committee of Counsel members that "[t]he questionnaire [for the survey] has been revised to eliminate questions that might upset an otherwise favorable return." LG 2006318-6330 at 6323 (US 21203) (O).

4924. Notes of a November 5, 1975 CTR "group meeting" of a subcommittee of the Research Liaison Committee detail that Ed Jacobs of Jacobs & Medinger stated that "no further formal minutes be made - also all should remove notes and previous minutes from corporate files." 1003294811-4811 (US 20171) (O).

4925. In a February 9, 1978 letter to the Committee of Counsel, William W. Shinn of Shook, Hardy & Bacon wrote that he enclosed with the letter a memo and report regarding the funding of projects through Special Account No. 4, and that "[t]here is probably no need for you to retain those notes once you have satisfied yourself of the current situation." 503655086-5088

at 5086 (US 20720) (A).

4926. During a December 13, 1978 meeting at Chadbourne & Parke's offices in New York City of the Research Liaison Committee, the committee members discussed industry organization and the relationship of the industry to the CTR. In discussing the industry needs, it was determined to "send a few written ideas through lawyers to committee." "No titles/simply a piece of paper. Colorless & non attributable." 1000041870-1876 (US 35102) (O).

4927. The Defendants did indeed collectively work to suppress or otherwise conceal harmful documents and information from disclosure. In 1981, Robert Northrip, a Shook, Hardy & Bacon attorney who at various times represented Philip Morris and B&W, explained at a Committee of Counsel meeting that lawyers' special project funding was used to allow adverse research findings to be hidden from the public. In a 1981 memorandum Kendrick Wells, Assistant General Counsel for Defendant B&W, quotes Northrip as having said: "[i]f company testing began to show adverse results pertaining to a particular additive, the company control would enable the company to terminate the research, remove the additive, and destroy the data." 521038287-8291 at 8289 (US 30481) (A); 682764441-4461 at 4458 (US 21030) (A).

4928. On December 8, 1982, representatives from BAT, Philip Morris, and RJR attended a meeting of the VdC Scientific Commission in Hamburg, Germany. Among the issues discussed was research related to passive smoking. It was stated that "it is sometimes important to do projects 'under the table,' otherwise an uncontrollable situation like in the U.S. could occur." 503246354-6358 at 6357 (US 86993) (O).

4929. On November 22, 1988, the National Public Relations Subcommittee met to discuss "proactive" public relations projects that could be implemented. One project discussed was publicly refuting the claim that tobacco litigation was similar to asbestos litigation. A reason

given to explain the difference between tobacco and asbestos litigation was "there are no smoking guns in the [tobacco] documents." Allen Purvis, an attorney from Shook, Hardy & Bacon in attendance at this meeting, cautioned the group "about emphasizing the absence of a 'smoking gun' in the documents since the second wave of litigation may require the production of additional documents that might not be helpful." Purvis noted that "this topic was not pushed as one of the primary projects." 92347613-7621 at 7616 (US 88334) (A).

4930. A November 21, 1991 e-mail regarding the International Committee of Counsel demonstrates that the Cigarette Company Defendants sought to agree on a common position regarding the primary issue of whether smoking causes disease. The email inquires as to whether the companies would agree to take the position taken by BAT and Rothmans -- that there is a "statistical association" between smoking and disease, but that causation had not been established. The email also raises the concern that the companies are memorializing too much information, advocating "**the need for prudent document creation and retention procedures among all the companies.**" The email noted that "**people in the U.K. companies put too much on paper and then copy too many people.**" 2023237575-7575 (US 23048) (A) (emphasis added); Bible PD, United States v. Philip Morris, 8/22/02, 256:17-257:3, 260:17-268:4.

4931. Following a meeting with TI's counsel, Bill Adams, TI's controller, drafted a May 22, 1995 memorandum to the file noting that with respect to purging emails, "If you keep old Email files they are subject to discovery and therefore can get you into trouble." TI13801721-1721 (US 87020) (O).

4932. Shook, Hardy & Bacon attorney Donald Hoel testified that correspondence with "an institute or an individual" regarding special projects was not turned over to CTR, but was instead kept at the law firm. Hoel further testified that he believed that such correspondence was

never provided to CTR nor produced in any litigation. Donald Hoel PD, United States v. Philip Morris, 06/27/02, 81:10-82:9.

(b) R.J. Reynolds

(i) Document Destruction

4933. Defendant RJR destroyed documents, including scientific research documents, to prevent the disclosure of documents that it believed would likely be sought in litigation and in federal regulatory proceedings and would provide information to the public on the adverse impact of smoking on health.

4934. In 1969, RJR's research department confirmed to the legal department that it would destroy documents to protect the company's position in smoking and health litigation. The research department indicated that it did "not foresee any difficulty in the event a decision is reached to remove certain reports from Research files. Once it becomes clear that such action is necessary for the successful defense of our present and future suits, we will promptly remove all such reports from our files . . . ." 500284499-4499 (US 21677) (O).

4935. This RJR document also describes an alternative effort to "invalidate" harmful records. The document, entitled "Invalidation of Some Reports in the Research Department" states:

> As to reports which you are recommending be invalidated, we can cite misinterpreting of data as reason for invalidation. A further reason is that many of these are needless repetitions and are being removed to alleviate overcrowding of our files.
>
> As an alternative to invalidation, we can have the authors rewrite those sections of the reports which appear objectionable.

500284499-4499 (US 21677) (O).

4936. An August 14, 1979 memorandum notes that "RJR material which should be

shredded per A. Rodgman. 8/14/79: Quarterly Reports Performance Plans Drafts of RDR, RDM, CIM." 503558840-8840 (US 88336) (O).

4937. In 1991, at the same time or shortly before the FTC initiated proceedings against RJR's Joe Camel advertising campaign, RJR persuaded employees of the advertising agency of Young & Rubicam to destroy documents concerning the Joe Camel advertising campaign with the intent to prevent the documents from being available for use in the FTC's proceedings. This plan was confirmed in a November 1, 1991 facsimile cover sheet and letter sent from Young & Rubicam to RJR stating "[a]s we discussed . . . [t]his is what I'm going to destroy. . . . Also, under our current scrutiny, a wise move to rid ourselves of developmental work!!" The letter set forth a list of documents related to the Joe Camel campaign that were destroyed. 507647971-7975 at 7971 (US 51232*) (O).

(ii) Information Suppression and Concealment

4938. RJR suppressed scientific research pertaining to smoking and health and distribution of documents related to such research. Indeed, there was a "general, informal policy" at RJR against the "publication of anything that bears on the smoking and health issue." 515873805-3929 at 3907 (US 21922*) (O).

4939. A 1986 Reynolds draft training manual for marketing assistants stated that "Documents should be written as if, because the prospect is likely in many instances, they will be subpoenaed and reviewed by an opposing attorney." In his testimony in this case, Andrew Schindler, Executive Chairman of Reynolds American, agreed that this language meant that those in the marketing department should take care in drafting documents because they could fall into the hands of opposing attorneys. Schindler TT, 01/25/05, 10904:6-25; 515787126-7129 (US 20868) (A).

(c) Philip Morris

(i) Suppression and Concealment of Smoking and Health Research

4940. Defendant Philip Morris concealed documents, including scientific research documents, by secreting the documents at a foreign affiliate in order to prevent the disclosure of documents that it believed would likely be sought in litigation and in federal regulatory proceedings and would provide information to the public on the adverse impact of smoking on health.

4941. In 1970, Helmut Wakeham, Philip Morris's Vice President for Research & Development, recommended that Philip Morris purchase INBIFO, a research facility in Cologne Germany, arguing that Germany "is a locale where we might do some of the things which we are reluctant to do in this country." 2022244451-4453 at 4451 (US 20361) (O).

4942. Philip Morris did in fact purchase INBIFO to conduct its smoking and health research. A 1970 memorandum from Joseph Cullman, President of Philip Morris, discusses the benefits of conducting research overseas: "The possibility of getting answers to certain problems on a contractual basis in Europe appeals to me and I feel presents an opportunity that is relatively lacking in risk and unattractive repercussions in this country." 1000216742-6742 (US 20081) (A).

4943. One perceived value of INBIFO was that Philip Morris could control the results: "Experiments can be terminated at will as required without delay." 1003123055-3094 at 3058 (US 20154) (O).

4944. After acquiring INBIFO, Philip Morris tried to avoid any direct contact with the research results that emanated from this research facility. To prevent documents housed at INBIFO from being produced in litigation in the United States, Philip Morris attempted to

eliminate written contact between INBIFO and Philip Morris in the United States. Handwritten notes of Thomas Osdene, a senior Philip Morris research official who acted as a primary conduit for information from INBIFO, laid out the method for handling documents related to health and smoking, going as far as to direct that sensitive information be sent to his home where he would review and destroy it. His notes state as follows:

> (1) Ship all documents to Cologne . . .
> (2) Keep in Cologne.
> (3) OK to phone & telex (these will be destroyed).
> (4) Please make available file cabinet. Jim will put into shape by end of August or beginning of Sept.
> (5) We will monitor in person every 2-3 months.
> (6) If important letters have to be sent please send to home – I will act on them and destroy.

1000130803-0803 (US 34424) (A).

4945. William Farone, former Director of Applied Research at Philip Morris, testified at trial concerning Osdene's handwritten notes quoted immediately above. He confirmed that Philip Morris attempted to keep its relationship with INBIFO a secret; that Philip Morris imposed restrictions on the transfer of information between Philip Morris and INBIFO; and that Osdene received particularly sensitive documents (i.e., those that related to smoking and health and were unfavorable to the company) from INBIFO at his home and kept those documents in his home safe. At trial, Farone further confirmed that Osdene's handwritten notes concerning the treatment of unfavorable and sensitive documents and information comported with company policy. Farone further testified that Philip Morris restricted access to smoking and health research even within the company itself, allowing only very limited access to unfavorable research results. This policy was based upon Philip Morris's recognition that the unfavorable data itself was an admission of liability. The restrictions on access to the research results and data were imposed on advice of Philip Morris counsel. Farone WD, 21:16-22:9, 147:11-152:15;

Farone TT, 10/07/04, 1938:2-1939:16; see also 2023223372-3383 at 3376-3378 (US 22337) (A); 2023222878-2879 (US 20382) (A).

4946. In 1977, in a letter to Max Hausermann, a Philip Morris Research & Development Vice President in Switzerland, Robert Seligman, a Philip Morris Vice President of Research & Development in the United States, confirmed Philip Morris's company policy of prohibiting direct contact between INBIFO, Philip Morris's research center in Cologne, Germany, and Philip Morris in the United States. Seligman wrote:

> We have gone to great pains to eliminate any written contact with INBIFO and I would like to maintain that structure.
> . . .
> Therefore, I am advising Jerry Osmalov to continue sending samples to Neuchatel for transshipment to INBIFO. If this procedure is unacceptable to you, perhaps we should consider a "dummy" mailing address in Koln for the receipt of samples. The written analytical data will still have to be routed through FTR if we are to avoid direct contact with INBIFO and Philip Morris U.S.A.

2000512794-2795 (US 20295) (A).

4947. In the 1977, letter from Robert Seligman to Max Hausermann, Seligman discusses a letter that had breached the Philip Morris policy. Seligman suggested to Hausermann that he "retrieve [and presumably destroy] the March 24 letter Helmut Gaisch sent to Jerry, including all copies. My copy is returned herewith." 2000512794-2795 (US 20295) (A).

4948. At trial, William Farone, former Director of Applied Research at Philip Morris, testified that the 1977 Seligman letter "support[ed] my opinion about Philip Morris not wanting to have results of animal research in its domestic facilities – particularly research conducted at a Philip Morris-owned lab – lest that information get out and undercut Philip Morris' public position that cigarettes were not a health threat." Farone WD, 149:10-152:15.

4949. In a December 12, 1978 memorandum from J. M. Hartogh to A. E. Bellot

regarding Philip Morris's involvement in ICOSI, Hartogh stated that, with respect to the "very important" Social Acceptability Working Party, "the show is being run by Reynolds/Jacobs who, in my opinion, tend to steer a very dangerous course (see verbal explanation Social Acceptability 11 country study which has to be locked-up. Unusable, we have to hide). [sic]" 2501018326-8327 (US 21505) (O).

4950. In a February 12, 1981 memorandum from Robert B. Seligman, Philip Morris's Vice President of Research and Development, to Philip Morris's President, another Vice President, the Assistant General Counsel, and several high-level Philip Morris scientists, Seligman concludes that as a result of recent Surgeon Generals' reports, the tobacco industry needs to begin supporting and publishing studies that would "reverse the ground swell of public opinion which has emerged as a result of antismoking activity." Seligman suggests that it would be best to conduct the studies overseas away from the fray of American litigation:

> It is our opinion that Philip Morris (or the tobacco industry) take a more aggressive posture to counterattack the antismoking movement. We're suggesting funding studies (primarily outside the United States) with the intent to publish data which refutes specific assertions by the antismoking forces.

1000119926-9933 at 9926 (US 87226) (A).

4951. Victor DeNoble, former Associate Senior Scientist at Philip Morris, testified at trial concerning the great lengths to which Philip Morris went to prevent disclosure of unfavorable research results that it feared might jeopardize its positions that cigarette smoking was not injurious to health and that nicotine was not addictive. When research done by DeNoble and his fellow researcher, Paul Mele, performed research on rats that confirmed that nicotine was addictive, initially they received Philip Morris' approval to publish those research results. However, following DeNoble's presentation to Philip Morris senior management in New York

City concerning those results, the approval to publish abruptly was withdrawn. DeNoble testified that it was clear from a comment made to him at the presentation that Philip Morris senior management would not allow the research results to be disclosed. Ross Millhiser, a Philip Morris executive stated: "Why should I risk a billion-dollar industry on rats pressing a lever to get nicotine?". DeNoble WD, 13:20-15:7, 22:6-25:12; Mele WD, 14:2-14:14, 20:3-22:12.

4952. Other witnesses, both from within and outside of Philip Morris, confirmed at trial that Philip Morris prevented publication of DeNoble's and Mele's research results which were unfavorable to Philip Morris.

4953. William Farone, former Director of Applied Research at Philip Morris, testified that, in connection with Philip Morris' policy of suppressing research results that showed that its products were harmful, the company prevented publication of DeNoble's research that showed that nicotine was addictive and that it could be made even more addictive. Farone TT, 10/7/04, 1947:19-1950:20; Farone WD, 156:3-15.

4954. Peter Rowell, an expert witness testifying for the defendant tobacco companies, admitted that DeNoble and Mele were not allowed to publish their work concerning nicotine addiction. Rowell TT, 3/23/05, 16645:15-16646:1, 16654:12-16655:15.

4955. DeNoble and Mele initially submitted their research results for publication to Jack Henningfield, who believed the results were significant and should have been disclosed publicly. Henningfield confirmed that Philip Morris forced DeNoble and Mele to withdraw their paper from publication. Henningfield WD, 161:23-165:15.

4956. David Kessler, former Commissioner of the Food and Drug Administration, testified that, during the course of a two year investigation of the tobacco industry, the FDA learned that "on repeated occasions, Philip Morris company officials prevented DeNoble and

Mele from publishing their work," which demonstrated that rats self-administer nicotine when given the opportunity. "Demonstration of self-administration is one of the hallmark properties of addictive substances." Kessler WD, 40:8-23. This information was provided to the FDA directly by DeNoble and Mele, and the FDA was able to confirm the information. As Kessler testified:

> We [the FDA] were able to obtain information about the manuscripts that Drs. DeNoble and Mele submitted to the Journal of Psychopharmacology, from the Journal's editor, Dr. Herbet Barry. That information documents that it was Philip Morris that was having them withdraw the manuscripts before they were published. We subsequently obtained the manuscripts themselves.

Kessler WD, 41:9-41:15.

4957. On the other hand, when the research conducted by DeNoble and Mele yielded what Philip Morris considered to be favorable results, Philip Morris wanted those research results to be published. Mele WD, 15:6-15:16; DeNoble TT, 01/06/05, 9074:11-9075:24, 9076:10-9076:24.

4958. When Philip Morris became concerned that the research being conducted by DeNoble and Mele was yielding results that, if disclosed outside of Philip Morris, would hamper the company's efforts to defend itself against cigarette smoking and health claims, Philip Morris officials discussed moving DeNoble's research laboratory either to Switzerland or outside of Philip Morris property in Richmond. In the event that the second option was chosen, Philip Morris would "fire" the researchers, including DeNoble and Mele, and set up their group in an "independent" lab in Richmond. DeNoble WD, 35:23-36:20; Mele WD, 22:13-22:23.

4959. Ultimately, in 1983 Philip Morris did abruptly (and without any warning to DeNoble or Mele) shut down DeNoble's laboratory, ordering the researchers to terminate their research immediately and to kill the remaining rats that were the subjects of the ongoing

research. DeNoble was informed that the lab was closed because of the threat their work posed in litigation against Philip Morris. DeNoble WD, 25:2-25:12, 38:1-39:11. William Farone, former Director of Applied Research, testified that Fred Newman, Philip Morris' Assistant General Counsel, told him that the DeNoble laboratory was shut down because Philip Morris wanted to bury "any research that showed smoke caused disease or nicotine was addictive." Farone TT, 10/12/04, 2091:23-2092:14; Farone WD, 156:3-15.

4960. After DeNoble and Mele left Philip Morris in 1984, they continued to believe that it was important to make the public aware of certain of the research results that they had wanted to publish at Philip Morris but had been prohibited from publishing. Therefore, they renewed their attempts to publish their research results concerning nicotine addiction. In 1985, Philip Morris denied DeNoble the permission to publish. Notwithstanding that denial, and because he felt it was very important for his research results to be published (because the public was not otherwise aware of these research results), DeNoble and Mele submitted two papers concerning nicotine addiction for publication. After the first paper was published, DeNoble in April 1986 received a threatening letter from Philip Morris attorneys. This letter caused him to be fearful of retribution by Philip Morris. In August 1986, DeNoble and Mele spoke at an American Psychological Association convention concerning other work that they had done at Philip Morris. Thereafter, in September 1986, DeNoble received a second threatening letter from Altria in-house counsel Eric Tausig. Following the letter, DeNoble called Taussig who reacted very angrily to the call. The letters and the telephone call having increased DeNoble's fear of retribution by Philip Morris and Altria, he called the journal to which he had submitted two papers for publication and sought to have them withdrawn from publication. He was able to pull back only one of the papers. To the present day, his paper on nicotine self-administration in rats

has never been published in a scientific or medical journal. DeNoble WD, 39:12-45:19; DeNoble TT, 01/06/05, 9081:20-9082:14.

4961. According to Jack Henningfield, at the time that DeNoble and Mele were conducting and seeking to publish the results of their research on nicotine addiction, the National Institute on Drug Abuse (NIDA) could have benefitted greatly from access to the research results. The information was important because the tobacco companies were publicly denying that nicotine was addictive in contradiction to their internal knowledge. As Henningfield states, "[t]he [tobacco] industry was years ahead of NIDA in its understanding of nicotine and addiction." The research that DeNoble and Mele were conducting in 1982 and 1983 was significant and important research. It was not until 1989, seven years after DeNoble's rat study, that other researchers were able to successfully develop a rat model for nicotine intravenous self-administration. Henningfield WD, 102:21-104:22, 161:23-167:6.

4962. As recently as 1993, Philip Morris maintained a system whereby research documents were "sent to Richmond for a review and [ ] then returned to INBIFO" with all "[s]upporting data and documents . . . kept at INBIFO." 2043725390-5391 (US 20449) (A).

4963. As part of her research, Carolyn Levy, a Philip Morris scientist before she became Philip Morris's Senior Vice President of Youth Smoking Prevention, looked at whether individuals regulated the amount of nicotine they obtained from smoke, including how smokers inhaled smoke from cigarettes with varying tar and nicotine deliveries. Levy was able to gather evidence that some people change their smoking behavior in response to cigarettes with differing tar and nicotine deliveries. Yet when Levy requested that this research be published outside of PM, she was told "not to publish or was not given approval to publish by the manuscript review board." Levy WD, 10:16-11:15.

4964. In Minnesota v. Philip Morris, Judge Fitzpatrick ruled that these unusual arrangements for handling scientific research at INBIFO had an effect in thwarting the discovery proceedings in that case. The judge concluded that Philip Morris's failure to search the files of Philip Morris International, Inc. and other subsidiaries (which included INBIFO) was "an egregious attempt to hide information relevant to this action . . . ." Judge Fitzpatrick further stated that Philip Morris's "attempts at hiding documents in the morass of interlocking related organizations shall not be tolerated by this court." Order Granting Plaintiffs' Motion to Compel Regarding Philip Morris International, Minnesota v. Philip Morris, No. C1-94-8565, filed March 25, 1997, at 9 and 16.

(ii) Suppression and Concealment of Information

4965. To prevent potentially damaging information from becoming publicly available, Philip Morris also suppressed and concealed information by (1) limiting the number of copies of memoranda that discussed the destruction or concealment of documents or information, thereby enhancing Defendants' ability to destroy any incriminating evidence of destruction plans, and (2) instituting a company policy that encouraged employees not to create documents.

4966. Philip Morris limited the number and circulation of documents containing harmful information so they could be easily destroyed if necessary. In 1970, William Dunn, Philip Morris Principal Scientist, wrote to Thomas Osdene, Director of Research for Philip Morris, indicating that he had approved research by a subordinate named Carolyn Levy. Dunn wrote:

> I have given Carolyn approval to proceed with this study. If she is able to demonstrate, as she anticipates, no withdrawal effect of nicotine, we will want to pursue this avenue with some vigor. If, however, the results with nicotine are similar to those gotten with morphine and caffeine, **we will want to bury it. Accordingly, there are only two copies of this memo, the one attached and the original which I have**.

1003293588-3588 (US 20168) (O) (emphasis added); 1003293589-3591 (US 21421) (A).

4967. In 1991, Philip Morris further attempted to prevent the creation of any documentation that could be adverse to any position it took in litigation. Matthew Winokur, Philip Morris's Director of Regulatory Affairs, complained to Charles Wall, a Philip Morris Companies in-house attorney, that tobacco industry "people in the U.K. companies put too much on paper and then copy too many people." He suggested that Wall raise this issue at the International Committee of Counsel and "reiterate the need for prudent document creation and retention procedures among all the companies." Wall responded by confirming that he would raise the issue of document creation and retention at the next meeting, apparently in an attempt to convince the foreign corporations to alter their ways. 2023237575-7575 (US 23048) (A).

4968. As part of its efforts to prevent disclosure of potentially damaging documents, Philip Morris repeatedly preached to its employees that they should refrain from creating documents unless they really needed to do so. As part of this company-wide effort, Philip Morris instructed employees to "get rid of rough drafts after the final version in prepared." 2082451796-1797 (US 87002*) (O). Philip Morris employees were also instructed to "avoid excess distribution of documents." 2082451799-1813 at 1809 (US 87003) (O).

4969. In its oft-published "A Guide to Effective Information Management," Philip Morris implored its employees to recognize that "any communication other than a private face-to-face conversation may create a record." 2077609734-9756 at 9737 (US 87006*) (O).

4970. Philip Morris repeatedly instructed its employees not to create documents that could damage Philip Morris if disclosed during litigation. In its June 20, 1995 manual entitled "Documents: Creation and Retention," Philip Morris instructed its employees not to create documents that would be damaging to the company if shown to a newspaper or competitor, or if

later shown to the employee "while sitting in a witness chair in a court room in a lawsuit." 2082451799-1813 at 1805-1806 (US 87003) (O).

4971. In its document entitled "Why You Should Care About the 'Documents' You Create," Philip Morris cautioned its employees that "almost every bit of information you record on the job can become evidence in a legal proceeding," and that if careless, an employee could "expose the company to needless liability." Philip Morris therefore instructed its employees to ask, before sending a document, "would you be comfortable reading it in a courtroom from a witness chair." 2082451796-1797 (US 87002*) (O).

4972. Philip Morris instructed its employees that if documents had to be created, they should avoid discussing "potentially damaging statements of fact and exaggeration," "incriminating or adverse" opinions or conclusions, and legal matters or conclusions. 2082451799-1813 at 1807-1808, 1812 (US 87003) (O). Employees were also instructed to avoid drafting documents containing "an evil motive or intent," "damaging statements of fact," and "negative or incriminating conclusions or opinions." 2082451796-1797 (US 87002) (O).

4973. In a December 14, 1995 slide presentation entitled "Document Management: Document Retention, Document Creation," Philip Morris encouraged its employees to "think before writing - every document is fair game." 2070691815-1829 at 1817 (US 87010) (O).

(d) The BAT Group: BATCo, Brown & Williamson and Their Affiliates

4974. BAT Industries was the parent company of Defendant B&W in the United States and Defendant BATCo in the United Kingdom throughout the 1980s and most of the 1990s. BATCo is the former parent of B&W and until 2004 was a sister corporation. BATUS is also a former parent company of B&W. These companies along with numerous other operating companies owned by BAT Industries, including British American Tobacco Australia Services

Limited ("BATAS"), operated together to prevent documents from being discovered in litigation in the United States and in federal regulatory proceedings and from being disclosed to the American public.

4975. BATAS was formerly known as W.D. & H.O. Wills (Australia) Limited ("Wills"). "Prior to August 23, 1999, BATCo, through intermediate holding companies, held approximately 67% of the shares of W.D. & H.O. Wills Holdings Limited ("Wills"). The remaining shares were publicly traded." R &R #102 at 25 (citing to Affidavit of BATCo Assistant Company Secretary, Geoffrey C.W. Cunnington at ¶ 2). "In 1999, the British American Tobacco Group merged with Rothmans, another international cigarette manufacturer. . . . On or about August 23, 1999, . . . Wills in a 'buy back' acquired the shares held ultimately by BATCo (67%) and Rothmans Holdings Limited then acquired the 33% of the Wills shares that had been publicly traded." Id. at 26. "A subsidiary of Wills, WD & HO Wills (Australia) Limited was renamed British American Tobacco (Australia) Services Limited ("BATAS")." Id. "In the spring of 2001, a new intermediate holding company was created called British American Tobacco (Australasia Holdings) Pty Limited ('Australasia Holdings'), which acquired all outstanding shares of British American Tobacco Australasia Limited and thus became the Australasian resident holding company of BATAS. Australasia Holdings is owned 68.06% by BAT Holdings (Australia) BV (formerly known as Rothmans Australia BV) and 31.94% by BATCo through another holding company." Id.

(i) BATCo and B&W Were Motivated To Implement Suppressive Document Management Policies By Their Concern Over Production of Documents in Smoking and Health Litigation in The United States

4976. As the result of BATCo's and B&W's knowledge of the danger facing their industry from company documents, these Defendants pursued tactics to prevent the disclosure of

damaging information. As early as July 21, 1970, in a letter to DeBaun Bryant, B&W General Counsel, from outside counsel David R. Hardy of Shook, Hardy, & Bacon, Hardy discussed "our opinion with respect to health litigation risk exposure of British-American Tobacco Company Limited [(BATCo)] and Brown & Williamson Tobacco Corporation (B&W)." In that letter, Hardy wrote that "a plaintiff would be greatly benefitted by evidence which tended to establish actual knowledge on the part of the defendant that smoking is generally dangerous to health, that certain ingredients are dangerous and should removed, or that smoking causes a particular disease." Such evidence would not only entitle a plaintiff to compensatory damages, wrote Hardy, "but could well be considered as evidence of willfulness or recklessness sufficient to support a claim for punitive damages," and would have a "psychological effect . . . devastating to the defendant." Ultimately, Hardy concluded that "the effect of testimony or documentary evidence that cigarettes cause cancer or other diseases, coming from a cigarette company's own people **(or those of its parent corporation and research collaborator)** would likely be fatal to the defense." 681805313-5319 at 5314-5315, 5319 (US 30935) (O) (emphasis added). At the time of this document BATCo was B&W's parent corporation.

4977. BAT Group documents demonstrate that the document management policies throughout the BAT Group were motivated, in part, by this concern that BATCo and other BAT Group research might be attributed to B&W in smoking and health litigation in the United States. As early as 1970, attorneys at Shook, Hardy & Bacon wrote a seven page letter to B&W's general counsel expressing concern that BAT Group research documents would be subject to discovery and that these documents "constitute a real threat to the continued success in the defense of smoking and health litigation." 301097079-7085 at 7081 (US 46580) (A); see also Cannar TT, 06/17/04, 260:10-262:30, 263:4-15, 264:26-265:3.

4978. Kendrick Wells, B&W Assistant General Counsel for Product Litigation, testified that throughout his 30 year tenure at B&W, the company was concerned that documents created by other BAT Group companies and statements made by employees of other BAT Group companies could adversely affect B&W's position in litigation in the United States. Wells WD, 5:15-6:18.

4979. In an August 1980 memorandum, Wells listed numerous edits that would be required before Lionel Blackman, a BATCo scientists, could publish "Change of Stance on Public Smoking and Health," which Blackman had drafted. In justifying the edits, Wells wrote:

> The successful defense of product liability litigation and opposition to adverse legislation in the United States depends upon two essential arguments: (1) The scientific evidence does not prove a causal relationship between smoking and health and (2) the smoker voluntarily encounters the known risks of smoking.
>
> A concession by a cigarette manufacturer to the charge that cigarettes cause human disease or a statement which contradicts the concept of voluntary choice or smoking by the consumer could cripple or destroy B&W's defense to smoking and health lawsuits and opposition to legislative attacks. This would be true even though the statements were made by BAT.

680050985-1001 at 0986 (JD-053700) (A). Wells admitted at trial that "Change of Stance on Public Smoking and Health" as originally drafted by Blackman was never released to the public. Wells WD, 21:6-8.

4980. At the behest of B&W attorneys, Blackman also removed the statement that "cigarettes are harmful to health in proportion to delivery" from a document he authored in 1981 called "Basic Approach to Government and Medical Authorities." 680585041-4042 (US 21006) (A). Blackman removed the statement after Wells noted that such a statement would "abandon, in effect, all substantive arguments that the relationship of smoking and health is unproven." After speaking directly to Wells, Blackman removed that language based on the legal advice.

680585063-5064 (US 21007) (A); Read TT, 3/22/05, 16419:21-16420:2.

4981. Wells was often called upon to edit scientific documents to remove material that might be damaging to B&W in litigation. 680583045-3045 (US 85395) (A); 690128746-8921 (US 25461) (A); 680858743-8743 (US 21723) (A); 682000188-0188 (US 89376) (A); see also 680585135-5135 (US 22976) (A).

4982. Wells attempted to downplay his role in the editing of scientific documents, but his testimony seems strained given the overwhelming written evidence that he was closely involved the drafting and editing of scientific documents. Moreover, Wells was a 30 year veteran of B&W, he was a well paid corporate lawyer, and he admitted that his counsel was being paid for by B&W. Wells WD, 1:8-4:1.

4983. B&W became increasingly concerned in the mid-1980s that BAT Group research could be discovered in American litigation in which B&W might be a defendant, and that, once produced, the material in such research documents could be attributed to B&W. 680800858-0865 (US 30917) (A); Wells WD, 64:17-65:16.

4984. To address this concern, on May 29-30, 1984, Wells, Robert Northrip of Shook, Hardy & Bacon, David Schechter, BATUS General Counsel, BAT executives and in house attorneys, and trial counsel met in New York to discuss the United States product liability litigation. 521015673-5675 (US 52687) (A). The group noted that "developments have rendered products liability actions against tobacco manufacturers more difficult to defend in the 1980's and that adverse evidence which could be attributed to the defendants is a serious problem." 521015673-5675 at 5673 (US 52687) (A).

4985. At that meeting, trial counsel concluded that it "is likely that statements by a tobacco affiliate of B&W would be admitted and smoking and health research done in-house or

by contract by any company owned by the BAT certainly would be admissible." 521015673-5675 at 5673 (US 52687) (A); Schechter WD, 10:3-10:9.

4986. To lessen the potential consequences of such discovery, it was also decided that "[d]irect lawyer involvement is needed in all BAT activities pertaining to smoking and health from conception through every step of the activity." 521015673-5675 at 5674 (US 52687) (A); Schechter WD, 12:4-12:8.

4987. In February 1985, BAT Industries directed BATUS general counsel David Schechter to investigate the "attribution issue" - whether statements and positions of affiliates of B&W could be attributable to it in litigation. Schechter WD, 12:20-14:17; 680582454-2462 (US 54049*) (A); see also 516003172-3172 (US 21732) (O).

4988. Schechter retained the firm of Simpson, Thatcher & Bartlett, which explored at length the bases by which BAT Group research could be discovered in litigation in the United States against B&W, and by which knowledge of such research could be attributed to B&W. Schechter WD, 20:12-22:5; 301060827-0855 (US 28152) (A).

4989. Later that year, Schechter also asked the New York firm Paul Weiss to "consider hypothetically whether documents in the possession of B.A.T. Industries or its United Kingdom subsidiary, BATCo, could be discovered by a plaintiff in a lawsuit in the United States against Brown & Williamson." Schechter WD, 28:15-29:17; 521015579-5582 at 5579 (US 52686) (A); see also Wells WD, 6:19-8:4.

4990. Paul Weiss concluded in a memo that "[y]ou should act on the assumption that discovery of the documents would be available." Schechter WD, 29:18-30:2; 521015579-5582 at 5579 (US 52686) (A).

4991. By 1985, outside counsel from Paul Weiss and Simpson Thacher both concluded

that research reports in the possession of BAT Industries and BATCO could be discovered in litigation brought in the United States against B&W, and the same year the legal departments of BAT Industries, BATCo, and B&W were all made aware of these conclusions. Schechter WD, 30:18-32:5, 32:9-33:3, 33:14-20, 38:16-39:3; 521015578-5578 (US 52685) (A).

4992. In a February 26, 1986 document entitled "Litigation Against BAT Companies: Research," Schechter confirmed his understanding that one of the purposes behind BATCo's document management policies was to address the concern that documents would end up in the hands of a plaintiff in the United States. 109870594-0596 (US 34873) (O).

4993. Jeffrey Wigand, B&W's Vice President of Research and Development from 1989 to 1993, confirmed that avoidance of production of damaging information in litigation remained a concern in the 1990s. Wigand testified that "[t]he vetting of scientific documents by lawyers was to prevent or remove any reference to smoking and health issues from documents that might be discovered by adversaries during litigation." Wigand WD, 78:1-9. Documents were sanitized by B&W lawyers to remove "contentious" or "sensitive" issues including

> anything related to smoking and health, addiction, fire safe cigarettes, ETS, biological activity, additives (particularly those that dealt with liberating free nicotine from tobacco), compensation, free nicotine, elasticity, smoker behavior, and certainly safer cigarettes. In short, anything that could arguably suggest that nicotine or cigarettes were addictive, and anything related to the negative health consequences of smoking.

Wigand WD, 78:12-79:9; see also id., 26:3-17; 680277658-7659 (US 89371) (A); 100505210-5210 (US 78246) (A).

4994. Wigand also explained that, in addition to the concern over litigation, "[t]he company wanted to avoid any documents from becoming public that were contrary to the company's stated public positions on smoking and health and the addictiveness of nicotine."

Wigand WD, 80:24-81:5. Ray Pritchard, the B&W Chairman and Chief Executive Officer, and Tommie Sandefur, the Chief Operating Officer, fully supported the lawyer suppression and editing of scientific information. In fact, when Wigand complained, he was told by Sandefur that the lawyer suppression and editing of scientific information was necessary to protect B&W's position in litigation and its sales. Sandefur told Wigand that "if science affected sales, then science would take the back seat." Id., 81:12-20.

(ii) Document Destruction

4995. Defendants BATCo and B&W established and implemented policies to destroy documents to prevent the disclosure of information that they believed would likely be sought in smoking and health litigation and in federal regulatory proceedings, and would provide information to the public on the adverse impact of smoking on health.

4996. On May 15, 1986, at a meeting at its research facility in Millbank, England, BATCo legal personnel instructed the leadership of the Group Research & Development Centre ("GR&DC") to dispose of documents under the rubric of "spring cleaning" before the GR&DC files were copied for possible production in health and smoking litigation in the United States.

> [Nick Cannar of the BAT legal department] said that Mr. [Patrick] Sheehy [Chairman of BAT Industries] did not wish it to be seen that BATCO had instituted a destruction policy only when the possibility of their being involved in litigation became real and after they had instructed solicitors. Thus, it was decided that no destruction policy should be adopted, rather that R&DC [Research & Development Centre] would tidy up the loose papers held by individuals, which "spring clean" could involve the destruction of documents such as previous drafts.
> . . .
> It was agreed that such a "spring clean" of all of the loose papers held outside the official filing systems is essential to enable L.W.&K.'s [BATCo's lawyers Lovell, White & King] "task force" to carry out stages I and III (the listing and reviewing of the files).

107443680-3689 at 3682 (US 34839) (A).

4997. In a 1990 memorandum to Jeffrey Wigand, B&W's then Vice President of Research and Development, from Kendrick Wells, B&W's Assistant General Counsel for Product Litigation, Wells wrote, "Tommy asked me to collect this memo when read, so I would appreciate it if you returned it to me at your convenience. It should not be distributed. . . ." 682809346-9347 (US 89372) (A). When asked about this comment, Wigand indicated that it was an instruction from B&W Chief Operating Officer Tommy Sandefur and that:

> Well, this is one of the usual ways of circulating documents, retrieving them and sequestering them and/or destroying them, particularly if the attachment had anything about smoking and health in it. It was one way of managing documents so that internal company documents would not contain any information that was contradictory to what the company was saying publicly.

Wigand WD, 69:69:17-70:2. Wigand testified that being asked to return documents without copying so they could be destroyed was a common practice, particularly after a crackdown on scientific documents by company lawyers at a meeting in New York City in January 1990. Id., 70:3-5; see also 562401761-1761 (US 89361) (A) (a July 27, 1992 letter from Patrick Sheehy, BAT Industries Chairman, to Ray Pritchard, B&W Chairman, with notes from Earl Kohnhorst instructing Jeffrey Wigand to "Destroy" the document after reading it); Wigand WD, 21:12-20.

4998. At the January, 1990, meeting in New York City, which included representatives from various BAT Group components, including B&W and BATCo, the participants were encouraged to establish document retention policies that would purge company files of any documents not currently subject to a document request in ongoing litigation because of the "[d]ifficulties faced by author company in explaining documents in a foreign court. . . ." Each company was expected to "[t]ighten the document retention policy . . . to the extent permitted by current litigation/discovery requests." 202347085-7086 (US 22032)(A); see also Blackie WD, 145:2-146:1 (testifying that a July 1992 document she wrote to B&W attorney J. Kendrick Wells

enclosing a copy of "Smoking Issues Claim and Response" file and instructed Wells to "destroy any previous copies you may have"); 536489722-9722 (US 79172) (A).

4999. On June 29, 1992, Sharon Boyse, a BATCo scientist, sent a facsimile to Jorge Basso Dastugue, a manager at BATCo's Argentine company Nobleza-Piccardo. The facsimile included a price quote from Healthy Buildings International ("HBI") to prepare information and materials for a public relations program on Indoor Air Quality in Buenos Aires, which was intended to encourage continued smoking in office buildings. In the facsimile cover sheet, Boyse instructed Dastugue to keep HBI's involvement in the project quiet:

> Please also note, more importantly, that this an extremely sensitive document! HBI are currently under a considerable amount of investigation in the US about their connections with the industry. All references to companies in the quote has [sic] therefore been removed. **Please do not copy or circulate this in any way and please destroy this fax cover sheet after reading!** I know this sounds a little like James Bond, but this is an extremely serious issue for HBI.

304058260-8263 at 8260 (US 85632) (A) (emphasis in original).

5000. In the summer of 1992, Simon Potter, an attorney with the law firm Ogilvy Renault in Montreal, which represented BAT's Canadian affiliate, Imperial Tobacco Limited, sent a letter to Stuart Chalfen, Solicitor of BAT Industries [the equivalent of General Counsel]; David Schechter, General Counsel of BATUS; and John Meltzer, a lawyer at BAT's outside counsel Lovell, White, Durrant. The letter indicates that unless he received instructions to the contrary, Imperial Tobacco Limited planned to destroy 60 documents, including scientific studies. The letter includes a list of documents to be destroyed, including one document with the notation "not destroyed because never received by Imperial." Listing a document that the company never had received on a list of documents to be destroyed indicates that Imperial had been instructed to destroy specific documents. 202313423-3425 (US 20377) (A); Schechter WD,

60:9-62:14; 202313418-3421 (US 92072) (A).

5001. In an August 7, 1992 letter again to Chalfen, Schechter, and Meltzer, Simmon Potter confirmed that "the documents mentioned in my letter of July 30 have indeed been destroyed." 202313429-3429 (US 20378) (A); Schechter WD, 62:15-63:15.

5002. The destruction of the BATCo research reports by Imperial followed a similar attempt in 1990 by BATCo to have scientific documents sent back to Southampton from Imperial. 202313503-3503 (US 92071) (O); 202313504-3504 (US 92073) (O); 202313481-3481 (US 92075) (O); 202313468-3469 (US 92076) (O).

5003. David Schechter, BATUS General Counsel, believed that Imperial Tobacco Limited (B&W's sister company in Canada) destroyed scientific documents in part to protect B&W in litigation. 202313423-3425 (US 20377) (A); 202313429-3429 (US 20378) (A).

5004. Following the summer 1992 purge of scientific records at Imperial Tobacco Limited, Graham Read, Head of Research and Development at BATCo, reported to Peter Clarke, BATCo's Solicitor, on "Imperial's access to R&D reports." Read stated that "[w]hether a requested report is faxed or couriered [from BATCo to Imperial], we attach an accompanying form seeking confirmation that it has been destroyed after use." 600232153-2154 (US 53322) (O); Read PD, United States v. Philip Morris, 06/13/02, 59:14-67:11.

5005. On September 4, 1998, British-American Tobacco (Holdings) Limited held a management board meeting. The extract from that meeting was labeled "CONFIDENTIAL - PLEASE DESTROY BY 22ND OCTOBER 1998," and contained reference to scientific position papers "noted by the Board," including papers on "Smoking and Lung Cancer," "Environmental Tobacco Smoke," "Smoking and Addiction," "British American Tobacco Research and the 'Safer Cigarette,'" "Cigarette Tobacco Ingredients," "Smoking and Coronary Heart Disease," and

"Smoking and Respiratory Disease." 321144744-4746 (US 88342) (O); see also 321215567-5568 (US 88343) (O).

(iii) Early Attempts By BATCo and B&W To Suppress and Conceal Information

5006. Beginning in at least 1965, B&W and BATCo began their efforts to conceal information. One of the first maneuvers to conceal information relied on attempts to improperly cloak scientific research in the attorney client privilege. See US FF § F(3)(b), infra.

5007. BATCO and B&W, with the assistance of other BAT Group companies, also concealed documents, including scientific research documents, by secreting documents outside the United States at foreign affiliates to prevent the disclosure of the documents which they believed would likely be sought in the United States in litigation and in federal regulatory proceedings, and would provide information to the public on the adverse impact of smoking on health. The affiliates were also instructed to destroy or "spring clean" the documents to prevent the disclosure of the documents in the United States. 107443680-3689 at 3682 (US 34839) (A).

5008. In 1965, industry lawyers, including Addison Yeaman, general counsel at B&W, sought to "slant" the findings from BATCo's Harrogate laboratory, which performed mouse skin painting research. 680204115-4117 (US 20990) (A); 680204125-4125 (US 54022) (A) (B&W general counsel seeking to review Harrogate report before it was put in draft form, "on the basis that it is considerably easier to be of persuasive influence before such a report is crystallized in draft form"); 680204121-4122 (US 30825) (A) (discussion of a meeting between the Tobacco Research Council and members of the American tobacco industry, "on the very simple proposition that it would be far easier to influence the tone and even the context of the report (if a report must be published) before it is written, than it would be to rewrite a completed report").

5009. In a January 17, 1985 memorandum entitled, "Document Retention," Kendrick

Wells directed members of the Research & Development Center to collect certain documents he had identified on an attached list relating to the behavioral and biological studies area for shipment to BATCo once all such documents had been gathered. Wells directed Earl Kohnhorst, Vice President of Research, Development and Engineering, to tell the research personnel that the removal of the documents "was part of an effort to remove deadwood from the files and that **neither he nor anyone else in the department should make notes, memos, or lists**." Wells specifically explained to Kohnhorst that "the B series are 'Janus' series studies [a secret program of biological research on the effects of smoking, which showed tumor growth in animals] and should also be considered deadwood." 680530888-0890 at 0889 (US 21772) (A) (emphasis added); see also Wells WD, 40:1-41:15.

5010. On February 17, 1986, Wells again authored a memorandum related to the concealment of BATCo scientific information, this time to Ernest Pepples, the B&W General Counsel. The memorandum established procedures to limit records relating to health and science research conducted by B&W's sister companies from entering the country despite the fact that the BAT Group operating companies, including Defendants B&W and BATCo, were part of a cost-sharing agreement that funded the research. The established policy limited the documentation sent to the United States to "concise reports, estimated to be about one-half page in length, twice each year. . . . [T]he brevity of the reports will reduce the potential for receipt by B&W of information useful to a plaintiff. . . . " This memorandum indicated that the B&W lawyers did a detailed analysis of each of the projects and ultimately either approved or disapproved of receipt of information related to each project. Whenever the lawyers feared that the project might result in information that may be "helpful to plaintiffs" they either dissuaded or precluded Research, Development & Engineering from receiving information related to that project. 680582253-2257

at 2253 (US 21004) (A).

5011. At the same time that Wells was chronicling B&W's efforts to limit sensitive BAT research materials from coming to the United States, BATCo lawyers Anne Johnson and Nicholas Cannar were reporting the same sensitive issues to BATCo executive Eric Bruell. In a February 26, 1986 memorandum to Bruell, Johnson and Cannar stated that B&W was urging BATCo to adopt the position that "decisions to undertake research should be managerial decisions not scientific decisions;" that "smoking and health research should not be undertaken" (with an exception that is not written out); and that "**information/document management distribution should be kept to a minimum to avoid documents becoming available to [a] plaintiff in litigation.**" 109870594-0596 at 0594 (US 34873) (O) (emphasis added); see also 682003345-3360 (US 88344*) (A).

5012. On May 15, 1986, at a meeting at its research facility in Millbank, England, BATCo legal personnel instructed the leadership of the GR&DC to dispose of documents under the rubric of "spring clean[ing]" before the GR&DC files were copied for possible production in health and smoking litigation in the United States. 107443680-3689 at 3682 (US 34839) (A).

(iv) BAT Group Lawyers Undertake Concerted Effort To Control The Content of Scientific Documents and Files

5013. In September 1989 the Brown & Wiliamson Research Policy Group (RPG) met for several days in Vancouver British Columbia. Wigand WD, 35:21-23; see also 901096811-6811 (US 89367) (A) (memorandum from Jeffrey Wigand to Alan Heard listing recommended agenda items for the meeting); 620202422-2432 (US 89368) (A) (meeting agenda). The RPG was comprised of the top scientists from each of the BAT Group's Cigarette Affiliated Companies, including B&W, BATCo, Imperial Tobacco of Canada, W.D. & H.O. Wills of Australia and others. Wigand WD, 36:1-17.

5014. Jeffrey Wigand, Vice President of Research and Development for B&W from 1989 to 1993, testified that several "sensitive issues" were discussed at the Vancouver meeting including "nicotine analogues, biological assays and biological testing methodologies (including NTP protocal), environmental tobacco smoke (ETS), Y-1 genetically enhanced tobacco, how to reduce selectively the particular noxae that were in tobacco smoke, fire safe cigarettes, and FDA regulation." Wigand WD, 39:3-40:13; see also 620202422-2432 (US 89368) (A) (meeting agenda, which identifies the "sensitive issues"). Following the meeting, a BATCo scientist by the name of Ray Thornton prepared a detailed 12 page set of minutes, "which summarized the discussion and the actions of the meeting." Wigand WD, 41:9-18; 401034784-4796 (JD-011303) (A).

5015. Wigand circulated the draft minutes to Ray Pritchard, the Chairman and CEO of B&W, and Tommie Sandefur, the President and Chief Operating Officer of B&W. After circulating the draft minutes Wigand was summoned to a meeting with Pritchard and Sandefur, and B&W General Counsel Mick McGraw. Wigand WD, 41:22-42:13. As Wigand testified:

> When I arrived [at the meeting] it was immediately apparent that Tommie Sandefur was exercised. He was angry that I had been involved in conversations regarding things like addiction, reduced noxae, biological testing, and safer cigarettes. He indicated that the text of the minutes was full of "contentious material" that should never have been memorialized and that it represented a legal liability for Brown & Williamson if discovered.

Wigand WD, 42:14-19. Sandefur expressed specific concern

> with the information related to biological testing and the discussion of Y-1 genetically enhanced tobacco. But, more than anything, he was unhappy with the discussion of safer cigarettes and addiction. He said that if statements about safer cigarettes became public, then it would become clear that Brown & Williamson's current products were unsafe.

Id., 43:3-8.

5016. Sandefur then summoned Kendrick Wells, B&W's lead in-house products liability lawyer, to the meeting and told Wells to "re-write the minutes to 'get rid of all the controversial stuff that Wigand got involved with.'" Id., 43:9-18. The minutes were then re-written by Wells, a lawyer who did not attend the meeting, to eliminate references to the "controversial" material. Id., 43:19-44:22. The removal of the contentious material is confirmed by a comparison of the two versions of the minutes before and after being re-written by the company lawyer. See 401034784-4796 (JD-011303) (A) and AA0374-0374 (JD-011304) (A).

5017. After numerous evasive answers by Wells during his examination he finally admitted that he had, in fact, "produced an entirely different document" to take the place of the minutes drafted by the British scientist Ray Thornton. Wells TT, 02/02/05, 11963:20-11964:19. During Wells examination, in denying a defense motion, the Court noted "it seems difficult to get a clear and straight and fairly timely answer from this witness." Id., 11966:22-25; see also 682004630-4633 (US 89369) (A) (November 1989 memorandum from Wells to Wigand attaching the minutes as re-written by Wells); 401096400-6400 (US 90132) (A) (memorandum from Wells to Wigand a year later indicating that he had again reviewed and made changes to the minutes of the 1999 RPG meeting and that he was "pleased with the attention which the author has given the language in this draft."). The lack of clarity and evasiveness during Wells' testimony is in sharp contrast to the very clear and direct testimony provided by Wigand. Moreover, Wells, a high-paid corporate counsel claimed that in re-writing the minutes, he was acting as nothing more than a secretary to Wigand. At trial he testified as follows:

Q. So, if I understand it, then. You were providing secretarial services to Dr. Wigand?
A. Essentially, that's correct.
Q. That's your testimony to this court?
A. Yes.

Wells TT, 02/02/05, 11967:9-13. This testimony is not only farcical, but also does not mesh with the fact that he reviewed and edited the RPG minutes again the next year. Id., 11969:13-11971:12; 401096400-6400 (US 90132) (A). Wells' testimony is also inconsistent with the fact that lawyer review and vetting of minutes from scientific meetings was an agenda item in a BAT Group meeting held in New York City just months after Wells re-wrote the minutes from the Vancouver meeting. In addition, in notes Wells made of a meeting in the mid-1980s he identified minutes from "R&D No. 1's meetings" as a potential "problem area" in the context of smoking and health litigation. Wells WD, 35:4-37:7; 685092972-2974 (US 31031)(A).

5018. Among the "sensitive" material removed from the official minutes of the scientific meeting in Vancouver is a discussion of the development of a safer cigarette. The following specific language was removed from the minutes by Wells:

> Based upon lessons learned from the failure of Premier and Favor (both of which attempted to make a huge leap in product modifications) it was proposed that BAT pursue an evolutionary route to a Premier-like product by year 2000; our approach will be responsive to regulatory concern and will be founded upon delivery reduction, e.g. it will gradually reduce tar/nic, biological activity, "Other Noxa", CO and sidestream but avoiding overtly technological product designs. Paramount will be the requirement of retaining consumer satisfaction in organoleptic terms.
>
> Nicotine is seen as a key to our evolving products and the meeting agreed to taking steps to establish proposed further nicotine-related projects (SRG projects will reflect this).
>
> The broad aims of the Product Innovation Strategy were agreed and our current new product technology portfolio of (Greendot (I-III), Day, Coaxial, and Nova) was considered appropriate to realizing the aims of the proposed strategy. JW asked that ignition propensity be included in the overall Innovation Strategy.

Wigand WD, 48:12-49:16; cf. 401034784-4796 (JD-011303) (A) and AA0374-0374 (JD-011304) (A). The term noxae refers to "toxic substances and poisons." Wigand WD, 49:17-23.

5019. According to Wigand, the safer cigarette information in the original draft minutes

was removed because

> an admission that Brown & Williamson's cigarettes contained poison was certainly seen as potentially damaging to the company's position in product liability litigation and would be harmful to the company's public relations if it became public knowledge. The same was true for an admission of biological activity. Mr. Sandefur had expressed to me [Dr. Wigand] several times his concern that any discussion of safer cigarettes would imply that Brown & Williamson's cigarettes as sold at the time were not safe, and that would expose the company to liability. Any discussion that suggested that carcinogens and reproductive toxicants could be removed from tobacco smoke suggested that the products as produced caused disease and could be made safer.

Wigand WD, 49:24-50:3.

5020. In addition to material related to safer cigarettes, the lawyers removed information related to "biological assays and biological testing methodologies and selective reduction of noxae." Wigand WD, 53:15-22.

5021. The Vancouver minutes set off an "alarmed reaction" within the BAT Group of companies all the way up the chain of command to Sir Patrick Sheehy, the Chairman and CEO of BAT Industries, the number one executive in the entire BAT Group of companies. There was a growing concern that "the scientists would put the BAT Group in harm's way in litigation. There was concern that scientists' statements would contradict the public statements and legal positions being taken by the company." As a result, Patrick Sheehy ordered BAT Group lawyers to bring the scientists together for a meeting to "solidify a method by which records related to scientific meetings and scientific research would be handled in the future." Id., 54:2-55:16; 202347085-7086 (US 22032) (A).

5022. The meeting was convened by Stuart Chalfen, the Chief Solicitor of BAT Industries. The meeting was held in New York City in January 1990 (the "NYC meeting"). The NYC meeting was run by Nick Cannar, head of BATCo's legal department and a persistent

player in the BAT Group effort to control scientific documents around the world, including Australia. Indeed, the NYC meeting agenda indicates that it was prepared by Cannar. 202347085-7086 (US 22032) (A); Wigand WD, 55:8-21.

5023. The agenda identifies litigation concerns created by scientific documents as a primary focus of the meeting. The introduction lays the "concern" out very plainly: "Concern about volume of research documentation spread around the Group; Discovery; Difficulties faced by author company in explaining documents in a foreign court particularly if it is not even a party to the proceedings in which those documents are to be produced." 202347085-7086 (US 22032) (A).

5024. At trial Wigand confirmed that the "'concern' refers to the concern that scientific documents[,] containing potentially damaging information[,] were finding their way to the United States, and that might lead to the documents being produced in litigation." Wigand WD, 55:22-57:17. Wells confirmed that the NYC meeting included "a discussion oriented toward the scientists about the handling of scientific documents in the R&D Departments." Wells WD, 46:1-5.

5025. The NYC meeting agenda also set forth procedures to ensure that minutes from future scientific meetings would not contain "contentious" material. The agenda states:

> 2. Improve quality of [scientific] documents by:
>
> a) Educating scientists in each research centre about document writing/document creation.
>
> b) Regular **lawyer reviews** and audits of scientific documents produced in each company.
>
> c) Arrange a system to ensure that all research related conference minutes involving representatives of more than one Group company are **vetted by the lawyer** for the company issuing the minutes before the minutes are sent out.

202347085-7086 (US 22032) (A) (emphasis added).

5026. The education of scientists about document writing and creation – set forth in the agenda as item 2.(a) – was implemented as a series of mandatory training sessions for company scientists. "The sessions were called 'caution in writing' seminars and at Brown & Williamson they were presented by lawyers, predominantly from Shook, Hardy & Bacon." Wigand WD, 59:13-23. At the seminars, scientists were instructed by lawyers "on how to sanitize the documents they created." Id., 60:1-6. The scientists were told "how to avoid writing documents with contentious words and topics." The contentious words included words like "safer," "addictive," "disease," and "cancer." Id., 64:15-23.

5027. The "lawyers reviews" noted in the NYC meeting agenda at item 2.(b) refers "to a policy that was discussed at the meeting and subsequently implemented." Pursuant to the policy, company scientists could only send documents containing sensitive information to sister companies if the document was first "reviewed and approved by a company lawyer." Id., 60:7-14.

5028. Finally, NYC meeting agenda item 2.(c) is an exact replica of the procedure employed by B&W when it had Kendrick Wells re-write the minutes from the Vancouver meeting just months prior to the NYC meeting outlined in this agenda. The word vetting as used within the BAT Group of companies meant "[d]eliberately and consciously removing contentious and controversial information from company documents that would benefit an adversary in litigation." Wigand WD, 35:15-20. As Wigand testified:

> Nick Cannar told us that before meeting minutes could be circulated, they would be reviewed by the lawyers and, if necessary, the lawyers would remove contentious information before the minutes could be circulated.

Id., 61:3-6.

5029. The procedure of lawyers review of scientific documents after the NYC meeting

– particularly at B&W by chief products liability lawyer Kendrick Wells – is confirmed in a May memorandum from Wells to Mick McGraw, B&W General Counsel. In the memorandum Wells writes:

> Jeff believes that he now sends me a copy of all documents from BATCo in the nature of meeting reports and scientific memos. He also sends appropriate scientific research reports. I told him that it was important that we had an opportunity to review the BATCo. materials. As a case in point, I recommended that we should follow up with BATCo. on statements made in a set of studies done for BATCo. at Harwell. They include statements that means are available which will remove minute foreign materials from tobacco. B&W R&D looked at this question a year or so ago and decided that no such means existed. The question could be involved in a safer product claim. Thus, we should communicate with BATCo. to discuss their assertion that such means are available.

680901663-1665 at 1664 (US 79219) (A); see also Wigand WD, 76:25-77:28.

5030. Also, as a result of the NYC meeting, the BAT Group companies' cost-sharing agreements were to be re-written to "recognize [each] company's claim to ownership/confidentiality of its research reports" and to provide for the "return of all copies of these [research] documents upon demand." 202347085-7086 (US 22032) (A). "[T]he cost sharing agreement set forth an arrangement by which the various Cigarette Affiliated Companies (CAC) shared the cost for the Fundamental Research Center in Southampton, England." Wigand WD, 27:5-8, 27:9-18.

5031. Prior to the NYC meeting, information regarding the basic research done at Southampton was freely shared between all BAT's Cigarette Affiliated Companies. Wigand WD, 27:19-23.

5032. At the NYC meeting, however, lawyers Nick Cannar and Kendrick Wells:

> agreed that the cost sharing agreement would be revised to specifically state that BATCo owned the documents that it created

> and that it could demand them back at any time. So, for example, the thought was that if lawsuits in the United States were seeking documents created by the Fundamental Research Center, then BATCo could demand all copies of the documents back from the United States and Brown & Williamson would be saved from having to produce them in litigation.

Id., 28:14-29:4.

5033. Thus, following the NYC meeting the agreement was changed "so that now documents were the property of BATCo and BATCo could demand the return of the documents at any time." Id., 27:23-28:2. A comparison of the cost sharing agreement in place at the time of the NYC meeting and the cost sharing agreement as revised following the NYC meeting demonstrates that such revisions were, indeed, made to the agreement. Cf. 682000546-0547 (JD-011368) (A) to 800036654-6657 (US 56544) (A) (see language at item 5.(3), which states "B&W will upon request immediately return to BATCo all BATCo Documents").

5034. Wigand summarized the NYC meeting by stating that:

> Basically the meeting was to order that scientific documents be reviewed by lawyers, that creation of documents should be limited and done in a way so as to avoid including any damaging statements in documents, and to develop a distribution policy that would, to the greatest extent possible, keep documents that contain contentious language or that contradicted the public position of the company out of the United States.

Wigand WD, 61:25-62:5.

(v) The BAT Group Implements A Worldwide "Document Management Programme"

5035. Coinciding with the lawyer control of scientific documents at the Cigarette Affiliated Companies (CAC) in the late 1980s and early 1990s, the BAT Group, including B&W, BATCo and W.D.& H.O. Wills, began an elaborate plan of document management and control to prevent adverse scientific documents from coming to the United States or to otherwise control

the documents so as to prevent discovery of the documents in ongoing litigation. 202313482-3483 (US 92077) (O). The companies used the law firm of Lovell, White and King and Kay Comer (later Kinnard), a long-time BATCo addiction scientist, to catalogue BAT Group smoking and health documents located at BATCo's Southampton, England research and development facility.

5036. Beginning in the 1980s, Kay Kinnard (previously Kay Comer) became involved in the design and management of BATCo's worldwide document management programs, which were designed and continue to be used to destroy documents in countries in which BAT is operating, before the documents could be discovered in both domestic and international litigation. 325351561-1562 (US 29245)(O).

5037. Kinnard received input from individuals at B&W, including individuals in B&W's legal department, who assisted her in developing BATCo's document management program. Kinnard PD, United States v. Philip Morris, 05/31/02, 90:20-91:1.

5038. Then, also beginning in the late 1980s, the BAT Group added a series of document management policies in response to the concerns that BAT Group research might be used in litigation against BAT or B&W in the United States. 202347085-7086 (US 22032) (A); Schechter WD, 45:11-48:10; Kinnard PD, United States v. Philip Morris, 05/31/02, 81:14-82:10, 86:3-89:13.

5039. To implement the new policies, in the early 1990s David Schechter was directed by Stuart Chalfen, the General Counsel of BAT Industries, the then-ultimate parent company of B&W and BATCo, to devise a BATCo document management program and train BATCo operating company "record managers" to implement the program. Schechter WD, 45:11-46:46:6. To implement the document management program, Schechter taught a series of seminars at

various BAT companies around the world. Schechter WD, 46:7-17.

5040. The document management program taught employees that "retained documents could have an effect on litigation, potentially the outcome of the litigation." Schechter WD, 53:7-10.

5041. In fact, the thrust of this program was to "limit the creation of documents" and to "avoid retaining any document longer than was needed for the operation of the business." Schechter WD, 53:11-14.

5042. Schechter testified that the purpose of both the document management program, as well as the "mental copy rule" was to limit the documents that would end up in the hands of a plaintiff, or the public, or the news media. Schechter WD, 53:17-19. This purpose was taught as part of the document management training program. Schechter WD, 53:20-54:2; 1080-1187 (US 34350) (A); 402184157-4192 (US 67858) (A).

5043. A training manual used at the Kuala Lumpur training seminar in 1992 taught that a benefit of the program was "reduced potential for legal and PR problems." Schechter WD, 54:3-9; 1080-1187 at 1083 (US 34350) (A). It also advised that "[f]ewer records being kept for shorter periods reduces the potential for the type of problems which can arise if poorly written Company documents are made public, either in court or in the media." 1080-1187 at 1085 (US 34350) (A).

5044. In 1990, similar training sessions were also mandated at B&W. See 681000002-0002 (US 88651) (A) (a memorandum from B&W President Tommie Sandefur to all B&W employees telling the employees that "[d]uring the fourth quarter of 1990, employee meetings will be held to discuss records management in B&W and your role in the process."). "The dominant message [at these meetings] was don't write anything down that could be considered

contentious or controversial as it relates to smoking and health and that might make its way into the public domain through litigation or otherwise." Wigand WD, 66:29-67:3.

5045. The training materials used at the document handling sessions encouraged company employees to use oral rather than written communications. Wigand WD, 67:8-23; 503119213-9241 at 9216 (US 29646*) (A) ("Another aspect is the 'sensitivity' of what we need to communicate. This is not just a matter of sensitivity from a legal point of view but there's also a matter of commercial sensitivity. Only put it on paper if you really need to. If you are in doubt, verbal communication is likely to be best.").

(vi) The Mental Copy Rule Is Implemented As Part of The BAT Group Document Management Programme To Prevent Creation of Documents

5046. As part of its efforts to conceal information and reduce its litigation exposure, BATCo sought to reduce the amount of documents its employees generated. As described in its "Records Management: Creation Retention" manual, BATCo repeatedly preached to its employees to use the "mental copy" rule. The "mental copy" rule asks employees to "imagine that the memo, note or letter you are about to write will be seen by the person that you would least like to read it." The employee is then to "send a 'mental copy' of your document to a newspaper, one of your competitors, a government agency, or potential plaintiff. Now: would you still write the memo? If so - would you still write it in the same way?" 325274431-4448 at 4434 (US 87012) (A). That same document asked employees to "Think *before* you write," and to question "does it *really* need to be in writing to do the job?" 325274431-4448 at 4432 (US 87012) (A) (emphasis in original); see also 321667716-7716 (US 88345) (A). "Memos and notes can be barriers to effective communications and often need additional verbal explanation. Talking to someone face-to-face or on the phone is often the better way." 325274431-4448 at

4433 (US 87012) (A). "Remember that verbal communication is best if you are dealing with a sensitive subject." 325274431-4448 at 4435 (US 87012)(A); see also 503119213-9241 at 9230 (US 29646*) (A) ("In order to help your [sic] decided how to write something, having decided it really needs to be a writing, we suggest that you use what we call the 'mental copy rule.' Imagine that what you are about to write will be seen by the person you would least like to see it. Send a mental copy (not to the real one of course!) of your record to the newspaper, to Philip Morris, to the Government or to a potential opponent in a court case."); Wigand WD, 67:24-68:14.

5047. In a presentation to "No.1/Senior Executives," BATCo cautioned that employees should "think before you write," and that "oral communication is best if the subject is sensitive." Employees were also cautioned: "document creation - write less, talk more," because such a practice "reduce[s] potential for legal, pr problems." BATCo noted that there were "legal benefits" to such an approach, as an "opposing party in lawsuit obtains company documents through 'discovery' process," and the creation of documents could lead to "documents taken out of context," "potential adverse judgment," and "potential adverse precedent," and could also result in "damage to company reputation," and "governmental investigations." 402156731-6784 at 6750, 6762, 6765, 6767, 6771 (US 87013) (O).

5048. In response to the question whether BATCO wants its employees to "cut out all memos?" BATCo replied "of course not," but to "be careful." 325274392-4422 at 4393 (US 87014) (O). In extolling its employees to "write less, talk more," BATCo stated that a benefit from such an approach was to "reduce potential for legal, pr problems." 325274392-4422 at 4406 (US 87014) (O). BATCo noted that the "types of cases where documents can be a problem" include "product liability cases and governmental investigations." 325274392-4422 at 4412 (US 87014)(O).

5049. In a 1990 B&W records management video, Tommy Sandefur states that before writing a memo or letter, an employee should ask "is it necessary," "where will that piece of paper end up? Would you feel comfortable if a competitor, the government or the news media saw a copy of your document?" and "does it really need to be in writing? A phone call or face-to-face meting is usually more effective." "Verbal communication is also the best way to share sensitive or confidential information." 632150212-0222 at 0214-0215 (US 87019) (O).

5050. In its November 27, 1995 Records Management Programme Staff Handbook, BATCo wrote that benefits of the records program included "reductions in the quantity of long-term records and improvement in the quality of those produced will mean there is a lower risk that records, which may have to be produced during a court case or which may fall into the hands of the press, will cause problems for the Company." 325110343-0363 at 0347 (US 87017) (O). This document again asked employees to "Think before you write," "ask yourself if it really needs to be in writing to do the job," and "remember the mental copy rule. Always ask yourself if you would be happy to see your document copied to the news media, a competitor, the Government, or an opponent in a court case." 325110343-0363 at 0349 (US 87017)(O).

(vii) BAT Group Documents Are Destroyed in Australia to Protect BATCo and B&W

5051. In early 1985, BATCo's legal department became concerned that the circulation of documents from its Group Research and Development Centre ("GR&DC") to B&W, might expose those documents to production in United States litigation. B&W had expressed the concern that ". . . some of the broad-ranging research initiatives being pursued in [GR&DC] might be misinterpreted . . . in a way which would require [B&W] to explain why they didn't think that research was relevant" to litigation in the United States. As a result of this concern, Nicholas Cannar, testified that since early 1985, when he took over as head of the BATCo legal

department, the legal department had been considerably involved with the GR&DC. That involvement stemmed from this "... major issue that I was aware of . . . which was Brown & Williamson's concern that the group's research effort might be misinterpreted in the context of litigation in the United States." Cannar TT, 06/21/04, 386:40-387:2; 412:35-413:12; 415:27-416:34.

5052. Richard Baker, the BAT Industries Chief Solicitor asked Cannar to implement a document management policy for BAT Industries. As Fred Gulson testified, "Nick Cannar was responsible for document retention policies for BAT companies worldwide." Gulson WD, 22:22-24. Broadly speaking, the policy required that all BAT Group operating companies institute a records management policy requiring destruction of documents, including research and development documents, if they had already been retained for a certain period of time. Cannar TT, 06/21/04, 340:35-341:4, 356:77-358:27, 360:1-364:6.

5053. In the process of constructing the 1985 document management policy, Cannar concluded that BATCo research and development documents might be responsive to legal proceedings overseas. As a result, Cannar asked Lovell White and King ("Lovell") to undertake a review of all BATCo scientific documents. Id. The impact that sensitive documents might have on smoking and health litigation in the United States was a primary concern driving BAT Group document retention policies. As such, B&W actually paid for the massive document review at BATCo. 301156374-6374 (US 16004) (O); 301157557-7557 (US 16005) (O); 301156376-6376 (US 16006) (O).

5054. A March 1990 memorandum authored by Andrew Foyle, a solicitor at Lovell (the "Foyle Memorandum"), confirmed that, in fact, W.D. & H.O. Wills (Australia) Limited ("Wills"), now known as BATAS, a subsidiary of both BAT plc and BATCo, had adopted a

document retention policy in December 1985 after Cannar had issued his instructions to the BAT operating companies. Foyle wrote:

> Wills current document retention policy was introduced on the 30th December 1985 at a time when the tobacco companies in Australia anticipated the possibility of product liability litigation, although no case had actually been brought against any company. Clayton Utz [Wills' counsel] had previously been instructed to take steps to prepare the Industry, and Wills in particular, for litigation. One of their first actions was to review the document retention policy of the Company, hence the new policy.

(3/1990 Foyle Memorandum excerpted in McCabe v. British American Tobacco Australia (Services) Ltd., [2002] VSC 73 (Supr. Ct. of Victoria at Melbourne Mar. 22, 2002) (Austl.), reversed on appeal; subsequent history omitted at ¶ 23 ("McCabe (US 75779)").[1] Fred Gulson, Wills In-house Solicitor and Company Secretary from 1989-1990, was the original recipient of the Foyle Memorandum. At trial he testified that this statement from the Foyle Memorandum accords with his understanding of the genesis of the Wills document retention policy. Gulson WD, 14:14-21.

5055. Gulson first received a copy of the 1985 document management policy from either Wills chief executive Gordon Watson or from Foyle. When Gulson began as in-house Solicitor at Wills, Foyle "was in Australia at the time and gave [Gulson] an induction to smoking and health litigation and the document retention policy. Foyle had a great deal of experience with BAT-style document retention." Gulson WD, 16:9-14.

5056. Gulson explained that the Wills document retention policy was comprised of two

[1]The United States understands that the Court has ruled that the McCabe decision will not be admitted as an exhibit at trial, but that the Court can take notice of this decision by another court. Nonetheless, for ease of reference for the Court, the United States will include the exhibit citation each time the case is referenced and has included the McCabe decision on the compact discs that accompany these Findings of Fact.

components, the written policy and the un-written purpose and application of the policy which was not reduced to paper for fear of discovery. Regarding the two distinct components of the document management policy, Gulson testified:

> The written document's primary purpose was to provide cover for the actual document destruction enterprise, to ascribe an innocent housekeeping justification for the widespread destruction of sensitive documents. The Document Retention Policy wasn't simply the written policy itself, but the corporate knowledge of how the Policy was to be applied apart from the written language. My recollection of the Document Retention Policy comes not from the written document, but how it was explained to me by Nick Cannar, Andrew Foyle, Brian Wilson, a partner at Clayton Utz, and others, rather than from the document itself, since the written document was incomplete in terms of describing the actual workings and purpose of the Document Retention Policy.

Gulson WD, 16:21-17:7; 17:24-18:6.

5057. Foyle, in his memorandum, identified the Australian law firm of Clayton Utz as the legal force behind establishing the document management program in Australia in 1985. Foyle wrote that what was required from Clayton Utz was "a strategy for handling the documents issue in litigation." McCabe (US 75779) at ¶¶ 24, 20.

5058. Andrew Foyle, had become involved in tobacco industry document management issues long before drafting his infamous memorandum in March 1990. As part of Cannars' hiring of Lovell in 1985, Foyle supervised an extensive five stage discovery exercise on behalf of BATCo, which involved "... an evaluation of lawyers of the relevance of that file to the smoking and health issues..." and a resulting "... sensitivity rating." Foyle TT, 04/26/04, 12:8-20; 25:3-27:15. As Foyle testified, the discovery exercise was conducted at a time when BATCo was concerned about "... the litigation climate in the United States..." as well as a concern that BATCo documents could end up in litigation against B&W. Id., 38:4-20. Foyle's testimony was corroborated by Cannar. The concern led Cannar to further investigate whether litigation in the

United States would lead to potential or actual discovery orders, and to find a U.K. solicitor to conduct a document review to determine the contents of the documents at the Southampton GR&DC to understand possible claims that may be made and potential defences. The lawyer he retained was Andrew Foyle. Cannar TT, 06/17/04, 260:10-262:30, 263:4-15, 264:26-265:3.

5059. Again in 1988, Foyle appeared at the center of the BAT Group's document management. This time, he was offering advice to scientists regarding how to create attorney-client privilege for a document that was purely scientific. On March 21, 1988, Foyle wrote to Ray Thornton, head of research at BATCo, regarding a collection of scientific evidence related to Buerger's disease. In an attempt to create privilege, Foyle wrote that "[b]ecause correspondence on the subject of Buerger's disease exchanged between you and your colleagues in other companies might not be privileged, it is important that the contact between the scientists should be routed through the lawyers." 300517039-7040 (US 16025) (O); 300517039-7040 (US 16118) (O). Foyle admitted that, in fact, "...if Ray Thornton wanted information from another company, or if he wanted to approach or if he identified an expert, that he would tell us, and Lovells would make the necessary enquiries." Foyle TT, 04/27/04, 89:2-8, 100:8-105:7. Cannar again confirmed Foyle's testimony that the routing of BATCo scientific evidence relating to Buerger's disease through lawyers to cloak evidence with legal professional privilege at the request of Foyle "... seemed to me to be a perfectly normal way to gather evidence for a piece of litigation and to help prepare a defence to litigation." Cannar TT, 06/23/04, 526:20-527:23.

5060. Finally, on June 23, 1989, Foyle wrote to Steven Parrish, in-house counsel at Philip Morris regarding a memorandum prepared by Lovell. Foyle requested that since the memorandum "was produced in a hurry at a fairly early stage of the exercise I would appreciate it if you would destroy the note after you have read it and made notes on it." 2501474069-4069

(US 16015) (O); Foyle TT, 04/27/04, 53:17-54:2, 55:5-56:7.

5061. Indeed, as Cannar testified, between 1985 and 1989, he regularly sought advice from Foyle regarding document handling and product litigation issues. Cannar TT, 6/17/04, 218:46-220:10.

5062. When posed with more substantive and specific questions, Cannar, whose legal representation was paid for by the BAT Group, repeatedly could not remember or refused to answer on the grounds that the answer might incriminate him. Indeed, Justice Brownie, the Australian court official overseeing the Cannar testimony made specific findings regarding Cannar's credibility in the context of a motion to treat Cannar as a hostile witness. In general, with respect to Cannar's testimony, Justice Brownie stated:

> I think it is abundantly clear that Mr Cannar may reasonably be supposed to have knowledge about a wide range of matters . . . listed in the letter of request and that, generally speaking, **he has not been making a genuine attempt to give evidence** about them.
> ...
> He gave evidence, in a fragmented way, over four days last week . . . looking back now, and considering the transcript, **it is noteworthy that he really has not said very much at all**. . . .

Cannar TT, 06/21/04 order (US 16236),[2] 3:16-21, 4:9-14. With respect to Cannar's repeated assertions against self-incrimination, Justice Brownie found the assertions "spectacularly" suspect given that when the self-incrimination claim was overruled, Cannar would simply assert a lack of memory. In this regard, Justice Brownie stated:

> **some of the objections can scarcely be regarded as reasonably taken**. For example, he did not commence to work for any tobacco company until 1981, but he claimed privilege against

[2]The orders of the Australian Court were rendered in open court and are recorded as separate volumes of the Cannar Trial Transcript. For ease of reference for the Court, however, the United States has assigned them U.S. Exhibit numbers, will include the exhibit citation each time an order is referenced, and has included the orders decision on the compact discs that accompany these Findings of Fact.

> self-incrimination in respect of such matters as his graduating in law in 1969 and the details of his legal career before 1981. **These are merely the most spectacularly unimpressive claims for privilege.**
> . . .
> He repeatedly claimed privilege and then, upon being directed to answer, said that he could not remember. It was not just his asserted lack of memory that seemed to me to be significant, but rather the combination of the claim for privilege followed by a ruling that he should answer the question, followed immediately by an assertion of non-recollection.
> There was also the manner in which this happened repeatedly, as if he was fencing for time or delaying the inevitable or both.

Cannar TT, 06/21/04 order (US 16236), 5:1-7, 5:20-30.

5063. During his trial testimony in Australia, Cannar invoked the Australian self-incrimination statute (referred to in the Cannar transcript as "Section 128") to avoid answering over one hundred questions relevant to his role in document management polices of BAT Group companies, including BATCo, B&W, and Wills. Cannar invoked the self-incrimination statute when asked to comment on the accuracy of paragraphs cited in the McCabe decision. Independently of the facts and conclusions set forth in the McCabe decision, Cannar also asserted self-incrimination privilege to numerous questions concerning the importance of document retention policies to BATCo and the BAT Group, the purpose of Wills' document retention policy, the circumstances leading to the preparation of the Foyle Memorandum, as well as many other related topics. Among Mr. Cannar's refusals to answer are the following exchanges (italics in original):

> Q: May I next ask you this: in the second sentence of paragraph 128 of Justice Eames' judgment [in McCabe], he said this: *Cannar said to Nicholson, "Now is a good opportunity to dispose of the documents if we no longer need to keep them. That should be done outside the legal department."* What do you say about the accuracy of that comment?

* * *

A: Your Honour, I should make it clear that I object under Section 128.

Cannar TT, 06/16/04, 150:11-21, 151:14-15.

Q: Next, in paragraph 129 of Justice Eames' judgment, in the first sentence, his Honour states this factual finding: *The actual task of destruction was performed by an external service provider.* What do you say about the accuracy of that sentence?

A: I object on the same basis, your Honour.

Q: The same basis being privilege against self-incrimination?

A: The same basis being under Section 128.

Cannar TT, 06/16/04, 151:37-152: 1.

Q: Could I take you, please, back to what Justice Eames said in the McCabe judgment. In paragraph 140 of his Honour's judgment, in the first sentence, he said this: *Maher was concerned about the proposal to reinstate the document retention policy and he discussed the proposal with his superior, Cannar.* What is your view as to the accuracy of what is there stated by his Honour?

A: I object under section 128.

Cannar TT, 06/16/04 at 167:29-168:8.

Q: In paragraph 156, in the last sentence of that paragraph, Justice Eames says this: *Mr. Maher was instructed by Cannar that the document retention policy was to be implemented.* What was your view, as at the conclusion of the Harrison and Cremona proceedings, about the implementation of the document retention policy?

A: Your Honour, I object to that under Section 128.

* * *

Q: What steps, if any, Mr. Cannar, did you take at the conclusion of the Harrison and Cremona proceedings to reinstate the document retention policy?

A: Your Honour, I object under section 128.

Cannar TT, 06/17/04, 194:47-195:39.

Q: In the second sentence of paragraph 19, his Honour says that he is satisfied that the primary purpose of the development of the new policy in 1985 and subsequently was to provide a means of destroying documents under the cover of an apparently innocent housekeeping arrangement. What comments, if any, do you have on the accuracy of that statement?

A: Your Honour, I object under section 128.

* * *

Q: In the last sentence of paragraph 19 his Honour says: *It is clear that the post-1985 policy . . . reflects the acute consciousness of their authors that and explain their attempts to disguise the fact that the document retention policy was primarily directed towards the risks of litigation.* What comments do you have on the accuracy of that statement?

A: Your Honour, I object under section 128.

Cannar TT, 06/17/04, at 202:5-39.

Q: As a director of legal services while at BAT did you ever take a view regarding the importance of records management to the company overall?

A: Your Honour, I think we're in the area of privilege again.

Cannar TT, 06/24/04, 619:15-19.

5064. As the 1980s came to a close, the issue of document retention was again of central concern to the BAT Group companies around the world. In the United States, executives at B&W became concerned over statements being written by company scientists in minutes of scientific meetings. At the same time that the formal minutes of the Vancouver RPG meeting were being issued in November 1989, Andrew Foyle was again at the center of document handling issues. This time he was meeting with Wills' chief scientists Graham McGregor and

Tas Wilson in Australia to learn how the Wills 1985 document management policy had been implemented by the Wills Research Department. McCabe (US 75779) at ¶ 25.

5065. In his testimony, Foyle confirmed the meeting with Graham McGregor and Tas Wilson in November 1989. At the meeting, Wilson and McGregor informed Foyle that unpublished enclosures to letters distributed by BAT's Scientific Research Group had been destroyed and that "... the 1985 retention policy, had been applied and, consistent with that policy, documents would be destroyed when they reached the end of their retention period." Foyle TT, 04/28/04, 22:1-23:6, 24:9-25:11, 49:11-50:18, 57:9-20.

5066. Following the meeting in Australia and after being instructed by Nick Cannar, Foyle prepared the Foyle Memorandum, and sent it to Fred Gulson in Australia. Foyle TT, 04/28/04, 17:10-14, 18:7-19:4. The Foyle Memorandum included a review of Wills' Document Retention Policy in light of ongoing product liability litigation. McCabe (US 75779) at ¶ 22. While BATCo and BATAS have gone to great lengths to prevent the release of the Foyle Memorandum, many excerpts from the Memorandum have been quoted in an Australian smoking and health case. McCabe (US 75779). Fred Gulson, the original recipient of the Foyle Memorandum and the Wills Solicitor and Company Secretary from 1989-1990 testified – that with respect to the McCabe decision – "the facts relating to my tenure at Wills are set forth accurately." Gulson WD, 13:19-23, 26:5-11.

5067. At the same time in 1990, Foyle recalls numerous discussions regarding document retention issues as a result of discovery requests against B&W and the possibility that the document requests might be extended to BATCo's documents. Foyle TT, 04/27/04, 35:13-36:8.

5068. In his memorandum, Foyle expressed numerous problems with Wills' 1985 document retention policy in light of anticipated litigation. His first concern was that: "(a) The

wording of policy (coupled with timing of its introduction) might lead to the inference that the real purpose of the policy was to destroy sensitive smoking and health documents. McCabe (US 75779) at ¶ 27. Gulson confirmed this concern as "particularly pressing. . . since the real purpose of the Policy was, in fact to destroy sensitive smoking and health documents." Gulson WD, 27:2-9.

5069. Foyle next expressed the concern that:

> (b) Aspects of the implementation of the policy might support that inference, for example the immediate destruction of the unpublished enclosures to the SRG (Wills' Scientific Research Group) letters.
>
> (c) The retention of a set of the BATCO research reports means that a plaintiff will have access to much sensitive BATCO research. The information in the reports is enough to prompt searching questions about the underlying research policy and also questions about what follow up action was taken by BATCO in the light of the research results.
>
> (d) The retention of the BATCO reports might encourage a plaintiff to seek discovery of BATCO's documents, either by asserting that Wills has control over documents in the possession of BATCO, or by using the Hague Convention. The research reports might enable a plaintiff to frame a Hague Convention request for documents with the requisite degree of specificity and/or to identify the BATCO employee from whom oral testimony is required.
>
> (e) Wills access to the BATCO computer gives them the de facto right to details of results of BATCO's research. The summaries of the reports which are on the database are sufficiently informative to be of real interest to a plaintiff's lawyer.
>
> (f) The knowledge that Wills' senior scientists have of BATCO research could rule them out as a witness at any trial in Australia.

McCabe (US 75779) at ¶ 27. These additional concerns expressed by Foyle in his memorandum,

were also confirmed by Gulson, who testified that the computer link with Southampton was actually severed because of BATCo's concern that its scientific documents might be made available to plaintiffs in Australian litigation. Gulson WD, 27:3-28:15.

5070. As a result of the concerns he expressed, Foyle went on to lay the groundwork for tightening the Wills document management policy in light of anticipated litigation. In this context he made the following observations:

> 1. It is understood that the destruction of documents now or in the past by Wills contravenes no law or rule in Australia and that, in that sense, Wills can do what it likes with its documents. Presumably, if a court disapproved strongly of the destruction of the documents, then it might draw adverse inferences from that fact.
>
> 2. It should be assumed that Wills' documents (what is in them and what has happened to them) will be a matter of great interest to a plaintiff's lawyer in a product liability action. How Wills responds to questions about its documents will require careful thought, especially because of the implications which the answers may have for the BAT group as a whole. It would be sensible, therefore, to assess the nature and extent of any problems which the current document retention policy may pose and to take appropriate remedial action now, rather than wait for the litigation to begin. Generally, what is needed is a strategy for handling the documents issue in litigation.

McCabe (US 75779) at ¶ 28; Gulson WD, 28:17-19:9. Gulson explained in his testimony to the Court that when Foyle wrote in his Memorandum – that "Wills' documents (what is in them and what has happened to them) will be a matter of great interest to a plaintiff's lawyer in a product liability action" – he was referring to the fact that some documents would be harmful to the BAT Group, if produced in litigation, because the "documents may raise questions regarding what happened to the other, **destroyed** documents." Id., 29:1-9 (emphasis added). In short, "BATCo was concerned that the destruction of some scientific documents, accompanied by the retention of others, would enable a plaintiff or court to determine that Wills was selectively destroying documents." Id., 31:11-32:6. This testimony confirms both that documents had been destroyed by Wills and that Wills' legal team was attempting to find means to hide this fact in any future

litigation.

5071. When he received the Foyle Memorandum, Gulson sent it to Brian Wilson, a lawyer at the Australian law firm of Clayton Utz for answers to the questions raised by Foyle regarding the use and implementation of the Document Retention Policy. Gulson WD, 32:18-33:9; McCabe (US 75779) at ¶ 22.

5072. In the Memorandum, Foyle seeks advice from Clayton Utz on the issue of whether the destruction of documents by Wills could result in a finding of adverse inference if litigation did actually commence. In the Memorandum he wrote:

> 1. To what extent is there a risk that the destruction of documents in accordance with the 1985 retention policy will cause the Court to apply the adverse inference principle, taking into account:
>
> (a) the wording of the policy,
>
> (b) the circumstances prevailing at the time it was introduced (e.g. whether product liability actions had been threatened against Wills or the industry generally),
>
> (c) the extent to which Wills will need to claim privilege for documents produced in 1985 and later, on the grounds that the documents were produced in contemplation of anticipated proceedings.

McCabe (US 75779) at ¶ 29.

5073. Foyle was also concerned about BATCo research destroyed by Wills: "Might BATCO's documents be more at risk? For example might the Court order Wills to retrieve from BATCO copies of the BATCO documents destroyed by Wills?" McCabe (US 75779) at ¶ 31.

5074. Finally, Foyle posed the following numerous questions to Clayton Utz regarding the specifics of how a revised document management policy might be crafted and implemented:

> 3. Should changes be made to the way in which the policy is currently being applied, for example, in relation to the SRG documents?

> 4. What should be done about the copies of the BATCO research reports held by Wills? In this connection:
>
> (a) Would the continued retention of these reports compromise Wills position via a vis the destruction of its other documents? This question should be answered on the basis of the information given in this memorandum on the content of the reports. If more information is needed it can be supplied by LWD. It would be undesirable for Clayton UTZ to seek information from Wills about the reports.
>
> (b) Is there any reason why Wills should not now destroy its copies of most of the reports, if the motive for doing so were that the information in the reports is not relevant to Wills' Current "research mission"?
>
> (c) Would the termination, or the restriction, of Wills' access to the reports database on the BATCO computer cause any problems?
>
> (d) Does the Caudwell threat affect the position?
>
> 5. Would implementation of the proposed new retention policy hinder or help Will's position on the documents issue?

McCabe (US 75779) at ¶ 32; Gulson WD, 29:10-32:17.

5075. Gulson confirmed at trial that the Foyle Memorandum contains these questions and that both Foyle and Cannar wanted Gulson to direct the questions to Brian Wilson a lawyer at Clayton Utz. Gulson WD, 29:10-19, 33:2-9. Gulson further explained that Foyle was posing the questions because

> There were serious concerns at BATCo that Wills' Document Retention Policy might leave the BAT Group vulnerable. Foyle was trying to strike the proper balance between **destroying more documents**, thereby risking an adverse inference against the companies; and not destroying more documents, thereby risking their discovery and use against the companies in litigation.

Id., 29:20-30:5 (emphasis added).

5076. Foyle confirmed in his memorandum that most scientific documents received by Wills from BATCo had already been destroyed. Foyle wrote:

> For purposes of this exercise it can be assumed that, over the years, Wills has received copies of most of the sensitive documents generated by BATCO **but that most of these** (with the exception of the research reports) **will have been destroyed as a result of the [1985] retention policy**. It should also be assumed that a number of Wills employees have a detailed knowledge of the subjects to which many of the sensitive documents referred.

McCabe (US 75779) at ¶ 98.

5077. In a March 29, 1990 letter responding to the questions raised in the Foyle Memorandum, Clayton Utz attorney Brian Wilson wrote to Gulson. He confirmed that document destruction had occurred at Wills, but that because no litigation was pending (but was anticipated) and because an alternative explanation for the destruction could be created, Wills might be able to avoid an adverse inference. Wilson wrote:

> **Wills' destruction of documents** has not occurred during litigation in relation to which those documents might be relevant. If it had, that would be extremely strong evidence of an intention "to do something likely to interfere with the course of justice": Lane's case above.
>
> The destruction has occurred, instead, in a situation where litigation has been, and still is, contemplated. But it can be said that it has not occurred only because of that fact and in order adversely to affect the litigation. This is where the wording of the 1985 retention policy statement [for which Clayton Utz had been the architect] becomes very important.

McCabe (US 75779) at ¶ 38 (excerpted 3/29/90 Wilson Letter); see also Gulson WD, 33:10-20 (indicating that the text of the Wilson letter was accurately reproduced in the McCabe decision). Wilson followed this statement with a list of benign excuses from the 1985 document management policy – cost efficiency, litigation support, and sabotage prevention – which he suggested could be offered as "clear evidence of an intention which is the complete opposite of an intention 'to do something likely to interfere with the course of justice.' This positive intention cancels out the negative impression created by destruction per se." Id. The thrust of Wilson's

advice was that as long as an excuse for destruction could be found, then they could destroy documents without fear of an adverse inference in future litigation. Gulson WD, 33:25-34:2. In reality, Gulson confirmed that the documents were actually being destroyed "due to litigation concerns." Id., 34:3-6.

5078. In early April 1990, Gulson arranged a meeting with Brian Wilson, John Oxland, and other lawyers from Clayton Utz to discuss their advice. "Because of the importance of the issue Nick Cannar himself came from London to attend." Gulson WD, 34:7-20; 501582007-2008 (US 89419) (A). In a letter pre-dating the meeting, Nick Cannar wrote to Gulson with a list of items to discuss during his visit including the following item: "2. Document retention policy – We have developed a draft research document retention policy for the B.A.T. Industries Group and a copy is enclosed. I would like to discuss this proposed policy with you and how it might be applied in Australia." 501582007-2008 (US 89419) (A).

5079. At the meeting, Cannar, Wilson, Oxland and Gulson discussed Wills' Document Retention Policy in the context "of a larger, BAT Group wide review of the document retention policy. All of the BAT Group companies' document retention polices were kept in lock step as much as possible, to ensure that no company would leave an opening through which damaging documents could be discovered and used against the rest of the BAT Group." Gulson WD, 35:11-22.

5080. John Oxland took minutes of the April 1990 meeting, where he reports that Wilson advised Wills and BATCo that Wills should "[k]eep all research docs which became part of the public domain and discover them. As to other documents, get rid of them, and let the other side rely on verbal evidence of people who used to handle such documents. McCabe (US 75779) at ¶ 42 (excerpted 4/1990 Oxland minutes). Gulson recalls Wilson offering the advice chronicled

in Oxland's minutes at the meeting: "to keep research documents that were in the public domain, and to destroy adverse research documents that the public or plaintiff's counsel would not be aware of." Gulson WD, 36:7-16.

5081. Wilson's recommendation was accepted and implemented by Wills. Id., 36:16-18. In short, it was determined that the existing "Wills Document Retention Policy should be continued, that potentially **damaging documents should continue to be destroyed**, and that an innocent explanation should be provided for destruction." Id., 36:18-23 (emphasis added).

5082. Another meeting between Cannar, Gulson and the Clayton Utz lawyers took place later that same day in April 1990. At the meeting, the lawyers discussed the ability of potential plaintiffs to discover a database maintained by Clayton Utz for the Tobacco Institute of Australia, which included "scientific documents from [TIA] member companies, profiles of likely witnesses, [and] information on judges." It was determined that because this database was maintained by a law firm the documents could be withheld on grounds of privilege and that the member companies could destroy their copies to avoid production in litigation. Id., 38:3-43:23; 304003742-3742 (US89400) (A); 304003686-3690 (US 89418) (A).

5083. Following the meetings in April 1990 with Clayton Utz, Gulson wrote to S.J. Walker, a lawyer at the Australian law firm of Allen Allen & Hemsley, to seek a second opinion. Gulson sought the second opinion "[b]ecause the Document Retention Policy was a ruse." Gulson WD, 44:10-20, 32:20-24.

5084. Gulson was particularly concerned that the selective destruction of documents, which had occurred, could ultimately provide a roadmap to Wills destruction of documents for future plaintiffs. Gulson expressed this concern in a May 16, 1990 letter to Walker: "The retention by Wills on a selective basis of certain reports may highlight the fact that other

documents have been destroyed and could well compromise the position of Wills with respect to the practice and operation of the Document Retention Policy." McCabe (US 75779) at ¶ 46 (excerpted 5/16/90 Gulson letter); see also Gulson WD, 45:14-46:2.

5085. The discussion of document destruction at Wills continued long after Gulson left the company in 1990. For example, in February 1992, Foyle participated in a telephone conference with Robyn Chalmers of Mallesons, Bob Northrip of Shook Hardy & Bacon, Stuart Chalfen, head of BAT Industries Legal, and David Schechter, in which the participants discussed the subject of destruction of documents, and "... what are the nature of the obligations imposed on a party to proceedings in relation to the retention of its documents." Foyle TT, 04/28/04, 61:4-66:19.

5086. The clear purpose of the Wills Document Retention Policy was to destroy sensitive documents under the guise of good business practices. As Wills' in-house counsel, Frederick Gulson states: "When I arrived at Wills the Document Retention Policy had been to destroy damaging documents while keeping those that were beneficial to the company, and that remained the Policy at the time I departed Wills." Gulson WD, 47:15-17. "The Policy was a program to ensure that all sensitive documents, all documents that if made public or discovered in litigation could potentially damage Wills, or Wills' affiliate companies in the BAT group, were sanitized." Gulson WD, 9:18-21.

5087. To "sanitize" Wills' documents meant to destroy them or otherwise make them undiscoverable. Id., 9:22-23.

5088. When questioned very directly on the subject of the document retention policy, Gulson confirmed that pursuant to its Document Retention Policy, "Wills was in fact destroying potentially damaging reports, while retaining favorable ones." Gulson WD, 45:24-46:2.

5089. While the intent of the Wills' Document Retention Policy was to destroy documents to prevent their production in litigation a more benign excuse was required to prevent adverse findings in litigation. Thus, "[t]he Document Retention Policy was a contrivance designed to eliminate potentially damaging documents while claiming an innocent 'housekeeping' intent." Gulson WD, 19:18-19.

5090. Indeed, after the flurry of advice received by Gulson in 1990 regarding the Wills Document Retention Policy from Foyle, Wilson, and Allen Allen & Hemsley, the written Document Retention Policy at Wills was only revised slightly "to ensure that from the outside the Document Retention Policy appeared to be an innocuous housekeeping process . . . ." Gulson WD, 47:3-18.

5091. A primary focus of Wills Document Retention Policy, and the related policies at other BAT Group operating companies was to prevent any weak links in terms of the production of scientific documents in litigation by one BAT Group company that would come back to haunt another BAT Group company. The concern was explained by Wills in-house counsel, Frederick Gulson as follows:

> The central research facility for the various BAT Group operating companies around the world was located at Southampton in England. Research from Southampton would be distributed to the other BAT Group companies around the world, including Wills. In addition, other BAT operating companies had their own research departments and facilities of varying sizes. The facility at Wills was not particularly big, but there were more significant research facilities at some of the larger operating companies, including Brown & Williamson in the United States, and BAT Germany's operating company in Hamburg. The companies all shared research. If incriminating smoking and health research documents were discovered by the public or a plaintiff in Australia, not only would the documents have been shared with the rest of the BAT Group companies, it probably came from one of the other BAT Group companies. As a result, a failure by Wills to safeguard sensitive documents in Australia, would threaten BAT operating

> companies across the globe. It was for this reason that the Document Retention Policy received such attention.

Gulson WD, 6:4-24; see also Id., 9:24-10:16.

5092. Andrew Foyle explained this concern to Gulson in both conversations and in the Foyle Memorandum. Foyle told Gulson that

> the importance of having and strictly adhering to the Document Retention Policy was to prevent potentially damaging documents from being discovered that could damage not only Wills, but also its parent and sister companies, in light of Will's possession and access to documents from Southampton and elsewhere in the BAT Group. There was a particular concern that Brown & Williamson would be vulnerable in litigation in the United States, and that the documents could be very damaging for it.

Gulson WD, 26:12-17:1.

5093. This concern was echoed in a contemporaneous letter prepared by Gulson and sent to S.J. Walker a lawyer at the Allen Allen & Hemsley. At the time Gulson wrote:

> The potential and substantial problem that would face our major shareholder in the event that any discovery made in Australia of BATCo's research could be used by future plaintiff in other jurisdictions especially in the USA.

Gulson WD, 44:23-45:5.

5094. Because scientific documents were shared throughout the BAT Group of companies, Cannar and Foyle had a "grave concern" that "if a document were discovered from Wills it could be used against BATCo or Brown & Williamson or another operating company." Id., 45:5-13.

5095. The flurry of activity to sanitize the research files within the BAT Group of companies in 1990 was not limited to Wills in Australia. Also in 1990, Cannar instructed Kay Kinnard (previously Kay Comer) to put together a program to administer document management policies at BATCo. Though he was uncertain about the destruction of documents resulting from

this program, Cannar stated that it probably occurred because "... that was the path we went down." Cannar TT, 06/21/04, 340:35-341:4, 356:77-358:27, 360:1-364:6.

5096. Also in January 1990, the heads of all research facilities throughout the BAT Group were called together in New York City to implement policies designed to prevent the creation of sensitive research documents by inserting legal approval over the issuance of minutes from scientific minutes as well as other research documents.

5097. Cannar followed this meeting on March 7, 1990, with a new proposed policy specifically for "research document retention." 202313484-3487 (JD-039222) (A).

5098. Also, beginning in 1991 and lasting until his retirement, David Schechter, General Counsel of BATUS, was sent to Australia at the request of BAT Industries' general counsel to manage document issues in Australia. Schechter WD, 39:9-43:4. The trips were paid for by BATCo, and BATCo also paid for lawyers from Shook, Hardy & Bacon to accompany Schechter to Australia. Id.

5099. As part of his role managing Australia litigation, Schechter had discussions with Wills' general counsel regarding whether Wills' documents - including smoking and health documents Wills received from other BAT Group companies - could be destroyed during or after trial. Schechter WD, 42:15-43:4.

5100. Gulson confirms that David Schechter, counsel for B&W's immediate holding company, BATUS, played an important role in monitoring Wills's document retention policy on behalf of B&W and other BAT Group entities. Indeed, a letter from Schechter to Sir Patrick Sheehy, the Chairman of BAT Industries, indicates with respect to document management issues, Schechter has access to the highest ranking official in the entire BAT Group of companies. Gulson WD, 49:23-4, 50:17-51:15; 202215750-5750 (US 89404) (A).

5101. John Welch, chief executive officer of the Tobacco Institute of Australia - the Australian corollary to the Tobacco Institute - from 1991 to 1992, confirms Gulson's recollection of document destruction in Australia in the early 1990s. Speaking of a policy required of TIA by its member companies, Welch states:

> The primary purpose of the Document Retention Policy was to keep documents that were potentially damaging to the member companies or the TIA [Tobacco Institute Australia] out of litigation and out of the hands of those that could use the information to attack the industry. The view was, why leave a loaded gun on the table that could be used against you? The Document Retention Policy was primarily a document destruction policy designed to make sure that potential "guns" were destroyed. The name "Document Retention Policy" was a misnomer. It's purpose was to minimise the TIA library.

Welch WD, 2:20-2:21; 3:1-3:5; 9:3-9:14; see also, 7:18-7:23. The TIA "member companies" included the Australian affiliates of BATCo, B&W, Reynolds and Philip Morris. Welch WD, 4:10-4:14.

5102. In applying the TIA Document Retention Policy, Welch testified that the primary factor in determining whether a document should be destroyed was "[w]hether the document would be damaging in litigation positions, legislative positions, or public affairs positions." The policy was implemented through a number of steps:

> Some documents from the member companies would explicitly say "read and destroy" . . . . In [more difficult] instances, one would consult with the government and public affairs officers of the member companies or others such as [the lawyers from] Clayton Utz. . . . There also would be occasions where I would get instructions from a member company to determine whether the TIA possessed a certain document, and if so, to destroy it. . . . [S]ometimes whether a document should or shouldn't be destroyed would be put on the agenda for meetings with the member companies, then raised at meetings, where the potential danger of the document would be discussed and a decision made on whether or not the document should be destroyed. At the conclusion of the meeting, the agenda that mentioned the document would be

destroyed.

Welch WD, 10:3-10:16, 11:5-11:12; see also 20:15-20:21.

5103. Welch confirmed that the same lawyers involved in devising document destruction practices for BATCo and B&W were closely involved with TIA and its legal and document management issues, including the Clayton Utz law firm in Australia, and Don Hoel and Robert Northrip from Shook, Hardy & Bacon in St. Louis. Welch WD, 6:15-6:18; 11:2-4; 17:22-18:15; 25:22-26:4; see also, 26:10-26:17. Indeed, the Document Retention Policy "was a constant subject with Clayton Utz [because] there was great concern that the TIA was a 'weak link' and that discovery at the TIA could become a problem for the member companies." Welch WD, 20:2-20:5, see also, 19:17-19:20.

5104. The document handling policies applied at TIA were similar to the document handling policies at the TIA member companies; "[t]he purpose of each of the policies was the same, to prevent potentially damaging documents from being discovered. . . ." Welch WD, 20:9-20:14. The importance of a unified policy between TIA and its member companies – because the "same concerns that motivated the companies motivated the TIA" – was confirmed by Frederick Gulson, in-house solicitor for W.D. & H.O. Wills from 1989-1990. Gulson WD, 15:20-16:6.

5105. Welch further disclosed that "the largest class of documents destroyed under the Policy were scientific documents considered potentially harmful to the member companies." This included scientific reports addressing whether smoking causes disease, whether passive smoking causes disease, and whether nicotine is addictive. Welch WD 11:13-12:3. "Most of the scientific documents came from the member companies' overseas affiliate or parent companies," including U.S. affiliates. Welch WD, 12:17-21, 13:2-4

(viii) BATAS's Efforts To Purge Its Files of Potentially Damaging Documents Led To The Destruction of A Database of Thousands of Documents

5106. From 1990 to 1996, a number of plaintiffs brought proceedings against Wills, the last being Phyllis Cremona in 1996. In conjunction with this litigation, Wills undertook a review of its scientific documents in 1995 that lead to the creation of a database of scientific documents known as the "Cremona database." McCabe (US 75779) at ¶¶ 59, 116. In 1996, Graham Maher, an attorney with the Australian law firm Mallesons, began "to review documents which might become relevant in any future litigation… . Together with others, he summarized documents and had them scanned." Id., ¶ 109; (US 16226) (O) (Affidavit of Graham Franklin Maher, 01/28/02, at ¶ 2) ("Maher Affidavit"). As part of the effort to create the Cremona database, virtually all of the 30,000 documents identified by Wills as being potentially responsive to the Cremona litigation were imaged on computer discs, indexed, and summarized. McCabe (US 75779) at ¶ 112; (US 16226) (O) (Maher Affidavit at ¶ 11). The document review also entailed attorneys rating each document on a scale of 1 to 5, according to how damaging each was likely to be to the company in any litigation, with a rating of 5 meaning the document was a "knockout" blow against the company. McCabe (US 75779) at ¶ 114.

5107. After Cremona and Harrison (another pending case) were discontinued in March 1998, an existing litigation hold order requiring the preservation of documents was revoked. Id., at ¶ 128; see also 1226-1249 (US 16217) (O); 1066-1066 (US 16218) (O); 1294-1294 (US 16219) (O); 1296-1296 (US 16220)(O). Following the revocation of the hold order, Cannar concluded that "now is a good opportunity to dispose of documents if we no longer need to keep them. That should be done outside the legal department." McCabe (US 75779) at ¶ 128; (US 16225) (O) (Affidavit of Malcolm Nicholas Nicholson, 01/29/02, at ¶ 36) ("Nicholson

Affidavit"). Cannar instructed longtime Wills employee Mal Nicholson to take the position of Records Manager and entrusted him with responsibility for implementation of the policy. McCabe (US 75779) at ¶ 128; (US 16225) (O) ("Nicholson Affidavit at ¶ 36). "For the next three months, Nicholson was engaged in the implementation process. The process did, in fact, involve lawyers, but they were lawyers from Mallesons, who reviewed all documents which had been collected for Cremona and Harrison, and once they confirmed that documents had passed the retention dates then they were destroyed." McCabe (US 75779) at ¶ 129.

5108. During this time, Robyn Chalmers, outside counsel for Wills with the firm Mallesons, advised Wills:

> I confirm that there is no specific obligation of you to retain documents for the purposes of legal proceedings where no such proceedings have been commenced. You are entitled to destroy any documents subject to the legislative requirements but as you have been advised previously, the court may draw an adverse inference from the destruction of such documents, depending on the circumstances of the destruction. Moreover, you may be required to produce any copies retained where originals are destroyed or to give oral evidence regarding the nature and content of the original documents. Arguments in your defence where records have been destroyed would include compliance with the legislative retention periods and a necessity to maintain your archives within responsible limits, given the administrative and storage costs of keeping a large quantity of data."

McCabe (US 75779) at ¶ 137; PMV0010213-0214 (US 88753) (O). Despite Chalmers's advice, the document destruction went forward. McCabe (US 75779) at ¶ 139.

5109. Testifying in McCabe, Maher admitted that the effect of the policy was not only to get rid of the documents but to obliterate knowledge of the fact of the existence of the documents. McCabe (US 75779) at ¶ 160. Maher's testimony confirmed that "[t]here was a sense of urgency" and that "the department managers were told they had to confirm compliance with the policy by 15 April 1998." McCabe (US 75779) at ¶ 154; 1066-1066 (US 16218) (O);

1296-1296 (US 16220) (O). "The process of destruction of documents in which the defendant engaged included destruction of CD Roms on which they were all imaged." McCabe (US 75779) at ¶ 160. Chalmers confirmed that the only copies of the Cremona database (one held at Wills and one at Mallesons) were destroyed." McCabe (US 75779) at ¶ 163.

5110. As a result of this document destruction, thousands of potentially relevant smoking and health documents were kept from the courts and the public. By way of example, one document indicates that a search of the Cremona database for "Wills knowledge of the risks of lung cancer" during the period from 1962 to 1988 identified 949 relevant documents. McCabe (US 75779) at ¶ 121.

5111. Consistent with BATCo's attempts to protect documents from its Australian subsidiary BATAS from being made available for litigation in the United States, on August 30, 2000, Kristina Whiteman a BATAS lawyer sent a memorandum to Mal Nicholson, BATAS Audit Services Manager, and copied the note to Kay Kinnard of BATCo who was responsible for directing BATCo's worldwide document destruction program. The memorandum indicates that BATAS was waiting for litigation to cease so that "we can apply the Document Retention Policy." 325351264-1267 at 1267 (US 29241) (O).

(ix) B&W Continues To Instruct Affiliate Companies To Keep Scientific Research Documents Out of The United States

5112. In 1992, while B&W was a party to a BAT Group cost-sharing agreement that funded BAT Group research, B&W telegraphed to other BAT Group companies that it did not want to receive any research documentation that might be damaging in ongoing litigation. B&W only accepted scientific research documents from other BAT Group companies "to the extent [it was] able to do so consistent with the status of pending litigation in the United States." 682508295-8295 (JE-21689) (A).

5113. Indeed, in the few instances when "sensitive" scientific reports were sent to Jeffrey Wigand, Vice President of Research and Development at B&W, from other BAT research facilities they were first reviewed by chief products liability lawyer Kendrick Wells.

> If [the document] contained contentious information. . . Ray Thornton would travel to the United States and meet with Kendrick Wells. During those meetings Mr. Wells would review documents that Thornton had brought. Wells would either approve a document for delivery to the scientists, edit the document and then allow it to be delivered to the scientists, or send the document back to the U.K. because it contained information that was too contentious.

Wigand WD, 62:20-63:2. Ultimately, some scientists at the BAT research facility in Southampton resorted to faxing reports to Wigand at his home to try to circumvent the company's attempt to control scientific work by lawyers. Wigand WD, 63:19-64:12.

5114. In 1994 and 1995, at the direction of B&W CEO Tommy Sandefur, B&W again directed BATCo and other BAT Group companies not to send documents to B&W so that B&W could avoid being called upon to explain the documents in court, in Congressional testimony, or otherwise. In a September 15, 1994 memorandum summarizing a meeting of the BAT Group research heads in Rio de Janeiro, Graham Read, head of BATCo research, recorded that "B&W have instructed Group members not to undertake written communication with them until further notice. Alternative communication vehicles are being considered." When asked about this instruction Read explained as follows:

> Q. Who instructed the group members on behalf of B&W?
>
> Mr. Browdy: Objection.
>
> A. Well, it's clearly with the summary points that I created, as a consequence it could only have come from Tilford Real [sic] who's the only member of B&W to the best of my knowledge who was in attendance at this meeting, the head of R&D for B&W at that time. . . .

Q. In what context did he give this instruction?

Mr. Browdy: Objection.

A. Again, my best recall, Tilford was an excellent scientist, and certainly was not giving legal opinion, **it would have been somewhere in the consideration of production of documents into some litigation**, and simply suggesting here that a written communication would fall into that category but still requiring to find some means of communication such that they are kept informed of group activities. That's the best guess I can overlay on that.

Read PD, United States v. Philip Morris, 05/01/02, 178:5-16, 179:2-181:4 (emphasis added); 403680929-0930 (US 47616) (A); Read PD, United States v. Philip Morris, 05/1/02, 178:5-16, 179:2-181:4; Read TT, 03/22/05, 16437:22-16441:12.

5115. On September 21, 1994, BATCo attorney H.A. Morini sent a note to Lionel Blackman, Director of Research at BATCo, regarding a conversation with Ernest Pepples about the procedure for communications between B&W and the BATCo research department. Morini instructed Blackman that "'[c]ontentious' items emanating from GR&DC, particularly in regard to biological activity should be given legal clearance before dissemination" and that "transmission to B&W should be through me to Pepples thus maintaining the legal privilege - 'attorney work product.'" Morini also advised that "'[n]on contentious' issues can be sent direct from GR&DC to B&W care of Gil Esterle." Esterle was a B&W scientist. 503114322-4322 (US 21695) (A).

(x) Scientific Efforts Driven By Legal Concerns and Controlled By Company Lawyers

5116. In 1984 Kendrick Wells, a B&W in-house lawyer, wrote to H.A. Morini, BATCo's corporate counsel, regarding an article proposed by BATCo scientist Lionel Blackman. Wells's letter instructed that all references or citations to scientists who had concluded that smoking caused disease, including lung cancer and heart disease, or articles that referred to

cigarettes as a drug, be removed from the article. The references to be removed included references to a publication by Doll and Peto, who Wells admits were "two of the most highly respected and widely published and widely regarded researchers on the cause of smoking and health. . . ." Wells WD, 26:18-28:1; 680582499-2507 at 2500 (US 86881) (A); see also 107317952-7953 (US 20249) (O).

5117. Graham Read, head of research and development at BATCo from 1992 to 1998 and employed by BATCo in its research area since 1976, testified that, at least twice during his tenure with the company, scientists were required to clear their documents through the legal function before the documents could be circulated or distributed. According to Read, the reason for the clearance process was the "clearly very substantial legal environment, legal issues occurring in the US." Read PD, United States v. Philip Morris, 07/25/03, 82:19-88:2, 93:21-95:1, 103:9-106:4, 107:20-108:10; 109870722-0723 (US 34874) (A); 516003171-3171 (US 20872) (A); 516003172-3172 (US 21,732) (O); 516003173-3174 (US 22076) (A).

5118. Read's careful parsing of words in his frequent testimony on behalf of BATCo belies his long history and allegiance to the company. He is BATCo's Global Head of R&D, and is a long-time tobacco industry employee, having been employed at BATCo for nearly thirty years. Read WD, 3:20-22; Read TT, 03/21/05, 16281:19-16282:1. While documents may refer to him as "Dr. Read," he is not a doctor. He did not obtain his Ph.D. because his thesis advisor "found it very, very difficult to accept that [Read's] findings were valid." Read TT, 03/21/05, 16322:4-16324:4. Read has testified on numerous occasions on behalf of BATCo, and his abilities as a witness in cases such as this have been evaluated as part of his performance review as a BATCo employee. Id., 16301:9-16303:12, 16306:1-18.

5119. This process of legal clearance of scientific documents was confirmed in a March

5, 1985 memorandum from Anne Johnson, a BATCo in-house lawyer, to Eric Bruell and Ray Pritchard, two of the top executives at BATCo at the time. 503128498-8499 (US 50315) (A); Read PD, United States v. Philip Morris, 07/25/03, 146:16-152:13, 154:4-157:2.

5120. At trial, Cannar confirmed the legal clearance of scientific documents. Anne Johnson, an attorney who reported to Cannar at the legal department, reviewed the language of BATCo scientific documents prior to disseminating them to other companies, because lawyers review documents "[i]n circumstances where [they] know documents are potentially likely to be looked at in litigation, then it is always helpful if the document is clear and unambiguous in the way it expresses itself." Cannar TT, 06/21/04, 383:41-384:4; Cannar TT, 06/23/04, 541:26-32, 548:11-550:26, 562:9-563:23, 578:42-579:5, 580:28-36.

5121. Indeed, Richard Binns, the former Manager of BATCo's Group Research & Development Centre at Southampton, complained of the expansive role of lawyers in BATCO's science, writing that:

> I am being asked to make significant and sometimes swingeing changes in documents produced recently by R&D staff. It is suggested that this must be done by finding a "managerial explanation" for the changes, without reference to the involvement of Legal Department. I will find this impossible to do. Senior R&D staff will not be so easily deceived. Personally, I am not prepared to lie to staff for very doubtful reasons. Therefore, the current lack of clarity about the relationship between R&D and Legal Dept. has raised questions which for me are ethically disturbing, particularly if extended beyond the present localized situation.

109878083-8089 at 8089 (US 21767) (A); Read PD, United States v. Philip Morris, 07/25/03, 157:20-159:3.

5122. As discussed earlier, Wigand has provided testimony related to a specific instance of lawyer control of scientific activity and reporting emanating from a meeting in the fall of 1989

of the leading scientists for all of the BAT companies, including B&W and BATCo, in Vancouver, British Columbia. Wigand WD, 27:5-28:2, 28:14-29:4, 35:15-20, 61:3-6, 61:25-62:5, 76:25-77:28.

5123. When asked whether lawyers involved themselves in the scientific work at B&W, Jeffrey Wigand, Vice President of Research and Development for B&W from 1989 to 1993, responded that the lawyers "were more than just involved; they really played a significant role in boxing-in the scientific process and the sharing of scientific information." Wigand WD, 29:27-30:3.

5124. Wigand further testified that shortly after joining B&W as Vice President of Research and Development in 1989, as part of his orientation, he was required to go to Kansas City, Missouri to meet for three days with lawyers from the law firm of Shook Hardy & Bacon. Id., 30:16-31:2. The background scientific reading that Wigand was expected to complete for the orientation session was not provided by a fellow company scientist, but by Kendrick Wells, the chief B&W in-house products liability lawyer. Id. 31:9-32:4; 682627640-7640 (US 89366) (A).

5125. At the orientation session Wigand was "coached by lawyers regarding the company line on smoking and health, and addiction." The company line was "[t]hat causation had not been proven and that nicotine had not been shown to be addictive." Id., 30:10-30:15. Wigand described the orientation session as follows:

> Lawyers were instructing me, a scientist, how to interpret epidemiological studies. In every instance, I was instructed that the evidence in the public health domain had not satisfactorily proven causation. I was told that studies that demonstrated a link between smoking and cancer were fraught with errors. Moreover, I was told that epidemiology could not be relied upon because it was just statisticians doing guess work.

Id., 32:5-33:6.

5126. Scott Appleton, a scientist who specialized in toxicology and was hired by Wigand while he was head of Research and Development at B&W, was also required to attend a lawyer training session at Shook Hardy & Bacon. Wigand WD, 34:11-35:10; 680901663-1665 (US 79219) (A).

5127. On September 18, 1991, Sharon Boyse, a senior scientist at BATCo, wrote to G. Symmes of W.D. & H.O. Wills in Australia instructing him that, until he made changes to the scientific content of a document prepared by the Tobacco Institute of Australia, the document was "NOT acceptable to BAT until those changes are made!" The letter demonstrates BATCo's control over public statements and document production by its sister companies, and that it suppressed knowledge related to the true health effects of cigarette smoke from being made available to the public. In the letter, Boyse instructed scientists at W.D. & H.O. Wills to remove any suggestion from a document that scientific articles had "claimed a statistical association between ETS exposure and the development of lung cancer." The letter went on to require removal of any suggestion that tobacco smoke contained carcinogens because the studies that suggested that tobacco smoked contained carcinogens "are animal studies . . ." 750075351-5352 (US 16182) (O); 304002839-2840 (US16183) (O); 304002839-2840 (US 79027) (O).

(xi) Efforts By B&W To Obstruct The 1994-1996 Investigation of The Tobacco Industry By The Food and Drug Administration

5128. David Kessler, former Commissioner of the Food and Drug Administration, testified that B&W lied to the FDA during its investigation of the tobacco industry from 1994 to 1996. Kessler testified that during a discussion with representatives of B&W in May 1994, they denied that B&W was or had been involved in researching or breeding tobacco with high nicotine content:

> We [the FDA] specifically asked whether the company had engaged in any breeding of tobacco to control nicotine levels. Brown & Williamson representatives told us the answer was no, they had not. . . . We also asked them whether it was feasible to do that, and they said that it wasn't feasible to increase nicotine levels in tobacco because of certain voluntary agreements the industry had entered into that would not allow them to grow or sell higher nicotine tobaccos in the United States.

Kessler WD, 28:10-28:19. Kessler further testified that B&W lawyer J. Kendrick Wells further attempted to obfuscate the truth by saying only that "they might have provided some money for university studies." Id.

5129. In actuality in May 1994, when B&W representatives made these statements to the FDA, B&W had already obtained a patent in Brazil for "Y-1 high-nicotine tobacco plant" and had filed an application for a patent for Y-1in the United States. Kessler WD, 26:17-27:18, 27:19-28:9; 2072566619-6619 (US 88087) (A); 682515783-5803 (US 88089) (A).

5130. When confronted with evidence of the existence and use of Y-1 in B&W products, the company admitted that they had previously provided false information. As Kessler testified:

> When confronted with evidence that we [the FDA] knew that Y-1 high nicotine tobacco was grown in Brazil and shipped into the Untied States, company representatives admitted in a meeting at FDA headquarters in June 1994, that they had engaged in growing, breeding and genetic testing of high nicotine tobacco plants. Furthermore, they told us that they were specifically interested in maintaining the nicotine levels in tobacco while lowering tar levels. They admitted to manipulating nicotine levels in Y-1.

Kessler WD, 28:22-29:3.

5131. In fact, the FDA learned that "Brown & Williamson had an inventory of between 3.5 and 4 million pounds of Y-1 tobacco [in the United States] with more Y-1 tobacco in inventory in Brazil. We also learned that it was used in some five varieties of American

cigarettes that were sold commercially." Kessler WD, 29:4-12.

5132. Information related to Y-1 had already been removed from the official minutes of the 1989 RPG meeting in Vancouver. As Wigand testified, the following information related to Y-1 was removed from the minutes by B&W products liability lawyer J. Kendrick Wells:

> Brown & Williamson's programme for introducing new varieties of nicotiana were described. Both genetic breeding and the use of molecular biology had been used: there were advantages and disadvantages with both techniques, although molecular biology, with the possibility for specific gene identification, showed the greater potential. So far the programme had produced Y-1, a high nicotine flue-cured tobacco, which was now being grown in commercial quantities. However, there were some problems in producing in the U.S.A. and it was necessary to grow off-shore to maintain proprietary control. Regulatory problems might occur with genetically altered material.

401034784-4796 (JD-011303) (A); Wigand WD, 47:5-48:8.

5133. Despite requests to B&W by the FDA for documents related to the manipulation of nicotine in cigarettes, B&W failed to provide to the FDA a July 16, 1985 memorandum from one B&W scientist, B.B. Chakraborty to another B&W scientist, M.L. Reynolds, which was titled: "Status of High Nicotine Tobacco Evaluation/377." Kessler WD, 30:7-14; 510003880-3882 (US 20831) (A).

5134. Based upon this and other interactions with the tobacco companies during the course of the FDA investigation, Kessler concluded that "it is fair to say that some in the industry, at times, were not forthcoming with the Agency. Beyond that, there were times, through the course of our investigation, where we felt that we were misled by statements of cigarette company officials about significant issues that we were investigating." Kessler WD, 65:20-66:2.

(e) Lorillard

5135. In 1977, Alexander Spears of Lorillard advised a scientist who was to deliver a research paper that he must delete data from a study related to human smoking habits or he would not be permitted to deliver the paper. 01416267-6267 (US 20287) (O); Spears PD, Texas v. American Tobacco, 07/24/97, 216:11-218:23.

(3) Improper Use of Attorney-Client Privilege

5136. One method by which the Defendants, through their lawyers, concealed research was through maneuvers intended to artificially and improperly "create" privileges and other legal protections. These maneuvers were intended to and did further the enterprise's goals of (1) avoiding or, at a minimum, limiting liability for smoking and health related claims in litigation; (2) avoiding statutory and regulatory limitations on the cigarette industry, including limitations on advertising; and (3) preventing the public from learning the truth about smoking's adverse impact on health.

5137. In this and other litigation, Defendants have claimed attorney-client privilege for, and refused to produce, thousands of documents that appear to be scientific in nature and specifically relate to health issues.

5138. During the period in which litigation and federal regulatory activities were pending, Defendants destroyed and sequestered documents and improperly sought to conceal research material behind the attorney-client privilege and the work product doctrine so as to avoid discovery. An element of the Defendants' scheme to "create" attorney-client privilege or work product protection was the near complete control that Defendants' lawyers exerted over joint industry and individual company scientific research. See US FF § III.B, supra.

(a) Findings of Abuse of "Privilege"

5139. Several courts, including the Special Master in this case, have ruled that Defendants have attempted to designate documents as privileged despite a complete lack of a valid basis for privilege, that the claimed privilege is inapplicable due to the crime-fraud exception, or that the claimed privilege has been lost as a result of abuse of the privilege.

5140. In United States v. Philip Morris, in Report & Recommendation #114, Special Master Richard Levie found that the United States had proven a prima facie case of crime fraud against BATCo sufficient to warrant an in camera review of documents and ultimately recommended that the Court apply the crime fraud exception to the attorney-client privilege. While the Court ultimately overruled the Special Master's finding that the "documents were created in furtherance of the fraud alleged," the Court implicitly accepted that there was a prima facie showing of crime fraud by progressing from the prima facie showing, which is the first prong of the crime-fraud test, to the second prong: the question of whether the challenged document was in furtherance of a crime, fraud, or other misconduct. Order #397, Mem. Op at 8, R&R #114.

5141. Also, in United States v. Philip Morris, the Court adopted in its entirety the findings of Report & Recommendation #146, in which the Special Master found that "Brown & Williamson made efforts not to physically receive smoking and health research of which it was otherwise aware in order not to have to disclose such information and threaten its litigation." Order #499. The Special Master further noted BATCo's participation in this fraud by routing documents to B&W through outside attorneys rather than to B&W itself. R&R #146 at 79, adopted by Order #449.

5142. Finally, in United States v. Philip Morris, the Special Master, in Report &

Recommendation #155, again concluded that there was a prima facie showing of crime-fraud with respect to the Foyle Memorandum. The Special Master concluded that:

> legal advice was sought ("Foyle . . . wrote a memorandum about the Document Retention Policy describing what he found, and effectively inviting Clayton Utz to go back to the drawing board and destroy more documents"), legal advice was given ("Wilson . . . proposed a strategy for handling the documents issue . . . its purpose was to get rid of all the sensitive documents, but do so under the guise of an innocent house keeping arrangement . . ."), and legal advice was followed ("Cannar ordered that Wills adopt the strategy proposed by Wilson").

R&R #155 at 40-41 (quoting Gulson Aff. at ¶¶ 20, 21, 27). The Special Master further concluded that there was "credible evidence to show that counsel was consulted with the intent 'to destroy, create privilege over, or remove from the company's control, documents belonging to [Wills'] overseas affiliates' in order 'to get rid of everything that was damaging in a way that would not rebound on the company or the BAT group as a whole.'" Id., 41 (quoting Gulson Aff. at ¶¶ 24, 25).

5143. The Special Master recommended in Report & Recommendation #155 that BATCo's assertions of privilege be overturned for both procedural reasons and under the crime-fraud exception to the attorney-client privilege; all quotes herein are from the crime-fraud portion of R&R #155. The procedural recommendations in R&R #155 were adopted in Order #557, (published as United States v. Philip Morris, 321 F. Supp.2d 87 (D.D.C. 2004), which was later reversed and remanded by United States v. British American Tobacco (Investments) Ltd., 387 F.3d 884 (D.C. Cir. 2004)). Following remand, in Order #879, the Court ordered further briefing and expedited consideration on the crime-fraud recommendations of R&R #155; to date, the recommendations quoted in the previous paragraph have not been further reviewed by the Court.

5144. Other courts have repeatedly found that B&W's and BATCo's conduct regarding

smoking and health research documents was designed to suppress information from the American public including cigarette consumers. In adopting the Report and Recommendation of the Minnesota Special Master, Judge Kenneth J. Fitzpatrick ruled that BATCo and B&W (among other defendants) "have been found to have committed numerous abuses of privilege and certain violations of Court Orders and the Rules of Court. . . . The record supports the factual findings of the Special Master. Application of the law of privilege, and the crime-fraud exception were properly applied by the Special Master." State of Minnesota v. Philip Morris, No. C1-94-8565, 1998 WL 257214, at *9 (Minn. Dist. Ct. Mar. 7, 1998), mandamus denied sub nom., State by Humphrey v. Philip Morris, No. CX-98-414 (Minn. App. Mar. 17, 1998), petitions for further review denied sub nom., State v. Philip Morris, Nos. CX-98-414, CX-98-431, 1998 WL 154543 (Minn. Mar. 27, 1998), stay denied, 523 U.S. 1056 (1998) ("Minnesota v. Philip Morris"). Similarly, in the Florida litigation, in findings adopted by the trial court and affirmed on appeal, "[t]he special master found that there was evidence that the defendants [including B&W] **hid from and misrepresented to the public the health risks of smoking and that their conduct constituted fraud on the public**." American Tobacco v. Florida, 697 So. 2d 1249, 1257 (Fla. Dist. Ct. App. 1997) (emphasis added).

5145. In Minnesota v. Philip Morris, the court found that Defendants Philip Morris, RJR, B&W, BATCo, American, Lorillard, CTR, and the Tobacco Institute "claimed privilege for documents which are clearly and inarguably not entitled to protections of privilege;" "that many documents examined contained nothing of a privileged nature, establishing a pattern of abuse;" and that these Defendants "have been found to have committed numerous abuses of privilege." Based upon the "intentional and repeated misuse of claims of privilege [which are] intolerable in a court of law," the court found that "an appropriate sanction for such abuse is release of all

documents for which privilege is improperly claimed." The court also adopted the special master's findings that for several categories of documents, including scientific reports, the crime-fraud exception to the attorney-client privilege applied. Minnesota v. Philip Morris, at *9.

5146. In April 1997, the Florida Circuit Court upheld a special master's ruling that lawyers for Defendants American, Reynolds, B&W, BATCo, Philip Morris, Liggett, Lorillard, CTR, and the Tobacco Institute "undertook to misuse the attorney/client relationship to keep secret research and other activities related to the true health dangers of smoking." Florida v. American Tobacco, Civ. Action No. CL 95-1466 AH (Palm Beach Cty., Fla., filed Feb. 21, 1995).

5147. In Minnesota v. Philip Morris, the court struck claims of attorney-client privilege as a result of continued and blatant disregard of court orders, the authority of the court, and the judicial process by B&W and American. Minnesota v. Philip Morris, No. C1-94-8565 (Minn. Dist. Ct. Dec. 30, 1997).

5148. In Washington v. American Tobacco, the court issued several rulings in which it determined that numerous documents for which Defendants American, B&W, Liggett, Lorillard, Philip Morris, Reynolds, CTR, and the Tobacco Institute had asserted privilege were subject to the crime/fraud exception and were therefore "de-privileged." The bases for the findings included "that defendants attempted to misuse legal privileges to hide research documents;" "that attorneys controlled corporate research and/or supported the results of research regarding smoking and health;" "that the industry, contrary to its public statements, was suppressing information about smoking and health;" "that CTR was neither created nor used to discover and disseminate the 'truth,' contrary to defendants' representations to the public;" "that Special Account #4 was used to conceal problematic research;" and "that CTR and the SAB [Scientific

Advisory Board] were not independent and that the industry's use of CTR was misleading to the public." Washington v. American Tobacco, No. 96-2-15056-8 SEA (King Cty. Sup. Ct. 1998).

5149. In Sackman v. Liggett Group, the court found that attempts by Liggett, Philip Morris, B&W, Reynolds, Lorillard, and CTR to designate CTR Special Project documents as privileged was inappropriate. 173 F.R.D. 358, 362-364 (E.D.N.Y. 1997). The court concluded that, despite lawyer involvement in Special Projects, the documents were not privileged because they were prepared to further the public relations position of the tobacco manufacturers and that any usefulness in litigation "was merely an incidental benefit." 173 F.R.D. 358, 363.

5150. The court in Burton v. R.J.Reynolds, found that plaintiffs had made a prima facie showing that the crime-fraud exception applied to documents withheld by Reynolds and American. 167 F.R.D. 134, 142 (D. Kan. 1996). In a separate later opinion, the court found that numerous documents identified as privileged by Reynolds and American were in fact not privileged, including memoranda relating to research and development, letters from outside counsel on scientific research, literature reviews prepared by scientists at the direction of counsel, minutes of research-related meeting, and notes made by employees at industry meetings on smoking and health research. 170 F.R.D. 481, 490 (D. Kan. 1997). Burton v. R.J. Reynolds Tobacco, 167 F.R.D. 134, 142 (D. Kan. 1996); Burton v. R.J.Reynolds Tobacco, 170 F.R.D. 481, 490 (D. Kan. 1997).

5151. In Carter v. Brown & Williamson, the court found that even if a privilege existed, an issue that the court did not reach, the crime-fraud exception applied to certain B&W documents (the Merrell Williams documents). Carter v. Brown & Williamson, Case No. 95-00934 CA (Duval Cty. Cir. Ct., Fla., Transcript July 26, 1996, at 1329-1332).

5152. In Haines v. Liggett Group, 140 F.R.D. 681, 689 (D.N.J. 1992), vacated on

procedural grounds, 975 F.2d 81 (3rd Cir. 1992), the court, following an in camera review of 1,500 documents, confirmed "plaintiff's contentions of the explicit and pervasive nature of the alleged fraud by defendants [Liggett, Lorillard, Reynolds, Philip Morris, and the Tobacco Institute] and defendants' abuse of the attorney-client privilege as a means of effectuating that fraud." Specifically, the court found "that the attorney-client privilege was intentionally employed to guard against . . . unwanted disclosure." 140 F.R.D. 681, 684. Finally, the court stated that defendants and their lawyers "abused the attorney-client privilege in their efforts to effectuate their allegedly fraudulent schemes." 140 F.R.D. 681, 695.

(b) B&W and BATCo

5153. Defendants B&W and BATCo, jointly and individually, created mechanisms by which improper and false attorney-client privilege or work product protection were invoked for non-privileged documents not created in anticipation of litigation, including scientific and research documents, in order to prevent the disclosure of documents which they believed would likely be sought in litigation and in federal regulatory proceedings, and would provide information to the public on the adverse impact of smoking on health.

5154. B&W and BATCo attempted to create the improper attorney-client privilege or work product protection over documents through various means, including routing them through lawyers, maintaining scientific materials in lawyers' files, and indiscriminately marking them as "privileged and confidential" or other such similar designations.

5155. In 1975, BATCo Secretary P.J. Ricketts issued a document encouraging employees to give documents and information to attorneys in an attempt to create privilege where none exists. Ricketts advised:

> In most cases information which has been given and papers and documents which have been physically handed over to the

> Company Solicitor will be privileged: a result of which he will not be forced to disclose any documents etc., to these authorities unless in exceptional circumstances, he is required to do so by Court Order. Privilege extends only to the documents, papers etc., actually in the possession of the Solicitor and not to any copies.
> . . .
> Legal Department should, therefore, be informed and all relevant papers handed over to the Company Solicitor immediately if interest is shown by an outside authority in any matter which has been the subject of these special procedures.

Documents subject to these "special procedures" included "questions of product liability." 107468159-8160 (US 34847) (O).

5156. In the late 1970s, B&W developed a mechanism to prevent smoking and health documents from its research facility in Southampton, England from becoming discoverable in litigation in the United States. The mechanism involved utilizing a blanket designation that all scientific documents were created "for defense of potential litigation"; maintaining control of the documents by the legal department; and disseminating the documents to scientists only after prior approval by the legal department. In a June 1979 memorandum, B&W Assistant General Counsel for Product Litigation Kendrick Wells stated that "[c]ontinued Law Department control is essential for the best argument for privilege. . . . The general policy should be clearly stated that access to the documents and storage of the documents is under control of the Law Department and access is granted only upon approval of request." 680585391-5392 (US 21526)(A).

5157. At the time this memorandum was written a scientist at B&W by the name of Jim Rosene was already holding "sensitive" materials in his office rather than sharing them with other scientists at B&W. Among the materials sequestered by Rosene were the Janus materials. Kendrick Wells testified at trial that the Janus studies demonstrated tumor growth in animals as a result of exposure to cigarette condensate. Id.; Wells WD, 8:18-10:13.

5158. At trial Wells admitted authoring the June 1979 memorandum as well as a second memorandum outlining a plan to "afford protection against discovery" of scientific documents that demonstrated a link between smoking and health problems by falsely designating them as work product prepared in anticipation of litigation. In the November 1979 memorandum to Ernest Pepples, B&W's Vice President of Law, Wells outlined a plan for routing all scientific documents from BATCo through a B&W scientist designated as an agent of the general counsel. The scientist would "separate reports which were relevant to smoking and health, or otherwise sensitive for special handling" and the documents "designated as sensitive" would be "sequestered." Moreover, the plan specifically provided that "in the operational context BAT would send documents without attempting to distinguish which were and which were not litigation documents." 521016231-6232 (US 20886) (A), 680585389-5392 (US 21008) (A). Ernest Pepples, B&W Vice President for Law, responded to Wells' memorandum by writing the word "agreed" on the memorandum along with his initials ("E.P.") and the date ("11-19-79"). 521016231-6232 (US 20886) (A); Wells WD 13:15-14:4.

5159. In September 1984, BATCo personnel were instructed to route "contentious" items from the research department through counsel "thus maintaining the legal privilege – 'attorney work product'." 503114322-4322 (US 21695)(A).

5160. In January 1985, at the request of Pepples, BATCo instituted a new policy that incorporated the use of external lawyers in an attempt to further enhance the attempt to "create" privilege protection for sensitive scientific documents. The policy required that BATCo send "contentious" research and development reports to Robert Maddox, an attorney in private practice in Louisville, Kentucky, where B&W's headquarters is located, rather than to scientists at B&W. The instructions stated that "[t]he recipient list must not contain the name of any B&W

person, not that of Maddox or of his company." The process was instituted to attempt to have attorney-client or work product privilege improperly attach to documents that were prepared in the normal course of BATCo's research and development activities, not in anticipation of litigation. 107444869-4869 (US 34840) (A); 107444871-4871 (US 20002) (A); 107620309-0310 (US 34853) (A); 503128498-8499 (US 50315) (A); 109745204-5206 at 5206 (US 26342) (O); 109745207-5207 (US 26343) (O); 109745208-5208 (US 26344) (A); 109745211-5212 (US 26345) (O); 109745213-5213 (US 26346) (O); 109745214-5215 (US 26347) (O); Brookes PD, United States v. Philip Morris, 05/02/02, 120:12-121:7; Wells WD, 38:10-39:22; 685092972-2974 (US 31031) (A); 521015673-5675 (US 52687) (A).

5161. This procedure – designed to keep scientific evidence and information away from the public and out of the courts – has also been confirmed by a document released by BATCo for the first time in this case and only after the Untied States filed its Third Motion to Compel BATCo to Produce Documents Withheld Based on Assertions of Privilege or Protection. One of the previously withheld documents was part of a handwritten letter attributed to Richard Binns, the former Manager of BATCo's Group Research & Development Centre at Southampton. The letter discusses BATCo's practice of routing scientific research to B&W through attorney Robert Maddox: "Report – stopped sending direct to B&W in Jan. Maddox farce. B&W withdrawn from circulation lists (but get 2 copies)." 109878083-8089 (US 21767) (A); Read PD, United States v. Philip Morris, 07/25/03, 181:22-184:11, 186:8-189:21; Read WD, 57:3-11; Read TT, 03/22/05, 16442:22-16443:17, 16445:13-16447:2, 16448:11-16453:1. Another document – from a Research & Development file used by Binns at the Southampton facility – addresses document circulation and states that:

> 2) Circulation of documents
> . . .

> B&W – Specific
> . . .
> Generally, during the Barclay investigation some years age we sent all correspondence to E. Pepples marked "attorney privileged" Today, we seem to have a "mail drop" which is only slightly less obvious than Russians leaving microdots in matchboxes on Hampstead Heath. Why not continue the "Attorney privileged" route.

102880241-0259 at 0253, 0255-0259 (US 26242) (O).

(c) RJR

5162. Defendant RJ. created mechanisms by which improper and false attorney-client privilege or work product protection were invoked for non-privileged documents not created in anticipation of litigation, including scientific and research documents, to prevent the disclosure of documents that it believed would likely be sought in litigation and in federal regulatory proceedings, and would provide information to the public on the adverse impact of smoking on health.

5163. In an attempt to create attorney-client privilege over records received by RJR from CTR in the normal course of its business, in 1983, RJR decided to "remove CTR related smoking and health materials from our premises for legal reasons." They were sent to the law firm of Jacob, Medinger & Finnegan via a former RJR scientist Frank Colby, who was leaving the company to work at the law firm. Horrigan PD, United States v. Philip Morris, 10/25/01, 36:11-40:13; Long PD, United States v. Philip Morris, 10/18/01, 46:6-47:19; 506050931-0935 (US 77438) (O).

5164. RJR lawyers also concealed unfavorable scientific research. A "fact memorandum" from RJR's outside counsel, Jones, Day, Reavis & Pogue, described RJR's research and development activities. The Law Department and R&D Management exerted "control" to "prevent the distribution or production of certain reports," including a 1953 literature

survey by Claude Teague that "indicted" cigarette smoking. 515873805-3929 at 3896-3897 (US 21922) (O). Another company scientist, Jim Fredrickson, who was working on identifying nitrosamines (carcinogens) in smoke in approximately 1965-67, was told "not to prepare a final report on his research but merely to record the work in his laboratory notebook." 515873805-3929 at 3898-3899 (US 21922) (O).

(d) Liggett

5165. Liggett created mechanisms by which improper and false attorney-client privilege or work product protection were invoked for non-privileged documents not created in anticipation of litigation, including scientific and research documents, to prevent the disclosure of documents that it believed would likely be sought in litigation and in federal regulatory proceedings and would provide information to the public on the adverse impact of smoking on health.

5166. In 1978, Liggett first began its efforts to hide documents, including scientific documents, related to Project XA behind the attorney-client privilege. Project XA was an important less hazardous scientific research project. Despite the scientific nature of the project Joseph H. Greer, Liggett's General Counsel, ordered that all documents regarding the project be sent to him or a legal department staff member. To enhance the potential for hiding the documents behind the attorney-client privilege, the project was put under the control of the Legal Department. In 1979, Liggett's attempt to hide documents related to the XA project behind the attorney-client privilege became clear when a Liggett Vice President, R.B. Seidensticker, followed up on Greer's earlier directive related to Project XA. By this time the project had become formally known as the "Law Department's XA Project." Seidensticker asked Greer to "please issue a memorandum to those concerned requesting that any materials which have not

already been turned over to the Law Department related to XA, be it financial, scientific, production or marketing, should be transferred to the Law Department no later than Thursday, June 28." LG2005942-5942 (US 21527) (O).

5167. During the 1990s, Liggett scientists were directed to label their work as privileged and confidential in order to prevent its discovery in civil litigation. As stated by Liggett's Manager of Science Issues, "we had become sensitized to labeling a lot of documents privileged and confidence [sic] without thinking[,] it was kind of just a matter of fact thing to do. . . . [M]ost of the documents that we put out, I think, are always subject to discovery. And not knowing exactly where – where this was gonna go, it was just considered almost standard practice to do that." Dietz PD, United States v. Philip Morris, 07/01/02, 150:3-155:12. See, e.g., LWDOJ9290576-0582 at 0576 (US 21217) (O); see also Dietz PD, United States v. Philip Morris, 05/29/03, 96:24-107:16.

5168. Dennis Dietz was formerly Manager of Scientific Issues for Liggett from 1990-1999. Dietz testified that in one of his first meetings with Liggett's outside counsel, Francis Decker and James Kearney of Webster & Sheffield, the focus of the meeting was the protection of Liggett's documents in the context of product liability litigation because Liggett was intimately involved in the "real world of product liability litigation" and subject to "the negative pressures that [are] currently focused on tobacco products by outside interests." Dietz, TT, 171157:8-17160:18.

5169. Despite Dietz's testimony that the labeling of Liggett's documents was because of the need to protect trade secret or proprietary information, the minutes of the meeting drafted by Dietz memorializing this meeting do not reference proprietary or trade secret information at all. Dietz, TT, 17161:8-17163:3; LWDOJ 00002067-2070 (US 93217) (A). Dietz could not explain

why no similar memorandum existed providing guidance regarding the protection of trade secret or proprietary information if that was, in fact, the primary reason he was alerted to the idea of labeling documents privileged and confidential as a new Liggett employee. Dietz, TT 17163:4-10.

5170. Bennett S. LeBow testified that after his attorneys had reviewed internal tobacco industry documents and had discussed them with him, he generally agreed with his attorneys' conclusions that the documents contained issues regarding the addictive nature of smoking and adverse health consequences as well as issues of crime and fraud. The documents were "devastating" and LeBow concluded that he had to release the documents because the documents showed that the truth had not been told, and that the addictive nature and adverse health consequences of smoking was known by the industry for all those years. LeBow, TT, 12251:13-12253:13.

5171. However, contrary to Liggett's claims that it has waived attorney-client privilege and work-product protection with respect to internal Liggett-only privileged documents relevant to smoking and health, and that Liggett was a "whistle blower" and the only tobacco company to break with the culture of the tobacco industry, LeBow testified that he was unaware that Liggett has continued to assert privileges over internal Liggett-only privileged documents relevant to smoking and health in this litigation. LeBow, TT, 17561:16-1569:22.

(e) Lawyer Involvement in Science to Improperly and Falsely Attempt to Create Privilege

5172. Attorneys for the tobacco industry, not scientists, directed the scientific research and other scientific matters of the industry. Defendants' lawyers were the driving force behind both the direction and suppression of scientific research. Lawyer control was used in large part in an improper attempt to "create" attorney-client privilege or work product protection for

scientific documents and information where no such privilege or protection existed.

5173. In 1964, after an extensive examination of the United States tobacco industry regarding the issue of smoking and health, a group of British scientists reported that a committee of lawyers (the Committee of Counsel) was given the authority for "clearing papers (e.g. Little's annual report)." Clarence Cook Little was the first Scientific Director of TIRC/CTR. Thus, lawyers had the responsibility for "clearing" CTR's annual reports on scientific research. For a discussion of TIRC/CTR Annual Reports, see US FF § I., supra; 1003119099-9135 (US 20152) (A).

5174. In a letter dated March 5, 1975, from David Hardy, a lawyer at the firm Shook, Hardy & Bacon, to Cyril F. Hetsko, Vice President and General Counsel for American Brands, Hardy explains that Hetsko hasn't received written annual reports related to Gary Huber's work at Harvard because the Committee of Counsel had instructed scientists to forgo written reports that are discoverable and instead had been scheduled to meet with industry representatives to provide oral presentations. Hardy explained that the Committee of Counsel agreed to avoid having "the independent scientists" submit written reports, in part because:

> As you know, it is our constant concern in grants such as this that the cigarette industry exercise no control over the work of the independent scientists. . . . Likewise, if there are undesirable results, we would be free to have them checked by others and to raise any legitimate questions that might exist as to their authenticity.
>
> As you also know, quite often **the scientist who has no legal training and who does not fully understand some of our problems and concerns, exercises little care in his form of expression in written communications.** For this reason, it was decided by counsel that **site visits and oral reports at such site visits** would be preferable to written reports in satisfying the requirement of an annual report. It was felt that such site visits would be more informative and **would involve far fewer problems.**

961016507-6508 (US 25854) (O) (emphasis added).

5175. The research jointly funded by the Defendants through CTR Special Projects and lawyers' special accounts was admittedly not intended to get to the truth about smoking and health. As explained by Lorillard's Research Director in a 1974 memorandum to Curtis H. Judge, Lorillard's Chief Executive Officer:

> Historically, the joint industry funded smoking and health research programs have not been selected against specific scientific goals, but rather for purposes such as public relations, political relations, **position for litigation**, etc. . . . In general, these programs have provided some buffer to public and political attack of the industry, as well as **background for litigious strategy** (emphasis added).

01421596-1600 at 1598 (US 20049)(A).

5176. As explained in notes of a Committee of Counsel meeting in 1981, Special Projects were used to allow Defendants' lawyers to categorize research depending on whether the outcome was or might be adverse to the Defendants, allowing the lawyers to prevent publication of adverse scientific findings. The minutes of this meeting discuss the distinction between CTR Special Projects and Lawyers' Special Projects. The later were intended to further Defendants' improper attempts to hide adverse findings behind the attorney-client privilege when the lawyers "were afraid of discovery." The notes reflect a discussion at the meeting between Arthur Stevens, Lorillard General Counsel, and Ed Jacob, outside counsel to the industry:

Stevens:	I need to know what the historical reasons were for the difference between the criteria for lawyers' special projects and CTR special projects. . . .
Jacob:	When we started the CTR Special Projects, the idea was that the scientific director of CTR would review a project. If he liked it, it was a CTR Special Project. If he did not like it, then it became a lawyers' special project.
Stevens:	He took offense re scientific embarrassment to us, but not to CTR.
Jacobs:	With Spielberger, we were afraid of discovery for

> FTC and Aviado, we wanted to protect it under the lawyers. We did not want it out in the open.

LG 2000741-0750 at 0745-0746 (US 36269) (A).

5177. Defendants' lawyers had exclusive control over funding decisions related to the Special Projects. See US FF §§ I.D and III.B, supra, for a discussion of evidence showing the control that Defendants' lawyers had regarding the funding decisions regarding CTR Special Projects.

5178. One important reason for the existence of Special Projects was Defendants' belief that such projects could be protected through the attorney-client privilege and work product doctrine. Special Projects were sponsored and approved by the Defendants' attorneys. Attorneys would approve the Defendants' funding of specific Special Projects, monitor the project, and request that CTR assign each project a number. As explained by one internal document discussing a lawsuit in which "Special Projects" were "at issue," "[l]awyer involvement cannot be denied or minimized, it was simply too pervasive." 515772203-2211 at 2210 (US 87024) (A).

5179. On July 20, 1987, Arthur Stevens, Senior Vice President and General Counsel for Lorillard, wrote to the generals counsel of B&W, Philip Morris, RJR, Liggett and lawyers at Shook, Hardy & Bacon advising them that Burson-Marsteller, a public relations firm, "is to be engaged for PM, RJR, B&W and Lorillard" for litigation public relations. . . . [D]iscretion by Burston-Marsteller is of the essence and they are not to announce or otherwise allow to be published or known that they are acting for us. That may have to change, but I see no purpose in them disclosing themselves at this time as our agents. I have also told them that they are being hired, not by a company, but by litigating counsel and that they have a dual reporting responsibility. . . . [I] believe that we ought to get Burson-Marsteller coached and humming well before the Horton and Cipollone trials are upon us." 92347154-7157 (US 87037) (A).

(4) Intentional Discovery Avoidance and Delay

5180. Defendants have long engaged in obstructive and "dump truck" discovery tactics to thwart discovery. As J. Michael Jordan, an attorney who successfully represented RJR during the 1980s, wrote, "The aggressive posture we have taken regarding depositions and discovery in general continues to make these cases extremely burdensome and expensive for plaintiffs' lawyers. ... To paraphrase General Patton, the way we won these cases was not by spending all of [RJR's] money, but by making that other son a bitch spend all of his." Haines v. Liggett Group, 814 F. Supp. 414, 421 (D.N.J. 1993) (internal quotation marks and citation omitted).

5181. These tactics are confirmed by a March 20, 1985 memorandum written by Charles Wall, who is now Altria's General Counsel and Senior Vice President, and previously was an attorney at Shook Hardy & Bacon for 20 years. Shook Hardy & Bacon has represented all Defendants in this action other than CTR and possibly Liggett. Northrip WD, 5-1:17 to 6-1:11. The memorandum shows that Defendants deliberately engaged in "dump truck" litigation tactics: **"We have long since recognized that the strategy behind our document production should be to place as big a burden on the plaintiffs as possible** and yet make sure that we do not isolate any particularly harmful or bad documents." Wall acknowledged that the tobacco industry deliberately designated **all** documents not previously in the public domain as "confidential" without making any attempt "to determine whether in fact the documents were treated as confidential or could be defined as confidential by the federal rules and case law," but his assertion that this was done to speed making documents available for review is belied by his delight, just pages later, at describing how many hundreds of thousands of pages behind the plaintiff's lawyer was falling in reviewing the documents. 503140888-0907 at 0899, 0902-03 (US 29670) (O) (emphasis added).

5182. BATCo's practice of delaying production of scientific documents was further developed in May 1986. As BATCo was becoming increasingly involved in health and smoking litigation in the United States, BATCo in-house counsel requested that lawyers at the British law firm Lovell, White & King provide guidance on "delaying tactics." BATCo counsel specifically requested a memorandum on "how BATCo may be able to delay or deny" production of documents. 107443680-3689 at 3686 (US 34839) (A).

5183. In 1989, B&W corporate counsel authored a memorandum to Ray Pritchard, Director of BATCo, discussing the "import[ance] to avoid production of documents as long as possible" and citing B&W's success in avoiding document production in litigation thus far. 682004589-4590 (US 54116) (A).

(5) Lawyer Control of Scientific Affairs

(a) Lawyer Control of Domestic and International Research Efforts

5184. On February 14, 1967, A.W.H. Stewart-Moore – managing director of Gallaher Ltd. and a member of the U.K.'s Tobacco Research Council's (TRC) Executive Committee – sent a letter to Virgil D. Heger, executive vice president of American Tobacco, notifying him that the following month the TRC would be sending a delegation of scientists to the United States to discuss nicotine with scientists designated by CTR. Despite the purely scientific nature of the meetings, Stewart-Moore indicated that the meetings would include "the lawyers from the major American tobacco manufacturers." ATC2680863-0863 (US 85326) (O).

5185. In the summer of 1973, Ragnar Rylander, a German researcher who oversaw the biological laboratory work at INBIFO through a contract with Philip Morris, sought to hold a "Workshop on Effects of Tobacco Smoke on Nonsmokers." Approval for the scientific workshop was controlled by industry lawyers, particularly David Hardy, a long time industry

lawyer with Shook, Hardy & Bacon. In a letter on August 10, 1973, Helmut Wakeham, Philip Morris's Vice President and Director of Research, reported to Rylander that Hardy had concluded "that there were sufficient publications to support the industry position that smoking is harmless to nonsmokers. He argued that there was no need for additional support, so why should the industry run the risk of sponsoring a workshop which might find that there is a hazard to the nonsmoker. Not everyone agrees with this position so there is hope of convincing Hardy, as an influential advocate among the industry lawyers, of the potential benefits from holding the workshop as you proposed. That is what we will try to do on the 29th." 1000259790-9790 (US 87036) (O).

5186. Rylander organized a symposium on the effects of tobacco smoke on non-smokers in Bermuda from March, 27 to 29, 1974. Prior to the symposium, Rylander met with a lawyer who represented the tobacco industry in lawsuits dealing with smoking and health. Rylander was of the opinion that there were sufficient elements to support the view that smoke was harmless to non-smokers; the lawyer was worried that the proposed conference might present a risk to the tobacco industry. As required by the industry, in September 1973, Rylander submitted a preliminary list of participants to Donald Hoel, a long-time industry lawyer at Shook, Hardy & Bacon, for his comments and proposals concerning new participants. Finally, in an October 5, 1973 letter, Rylander asked Hoel whether a Dublin would be a suitable participant, stating however that although the person in question appeared to be somewhat biased, it was advisable to balance the list of participants so as not to be accused of having selected only one category of people. TLT1050091-0101 (US 88744) (A).

5187. Following the Bermuda symposium, on April 1, 1974 Ragnar Rylander wrote to Donald Hoel, submitting the table of contents, the conclusions and recommendations, and a draft

report on the criteria determining the effects of environmental tobacco smoke for discussion and approval. TLT1050091-0101 (US 88744) (A).

5188. In 1981 Ragnar Rylander was put in charge of organizing a second conference on environmental tobacco smoke. In an August 31, 1981 memorandum, Donald Hoel reported on a discussion with Rylander who was of the opinion that the seminar would not be able to give environmental tobacco smoke "a clean bill of health." Rylander had prepared a memorandum strictly for internal use, but was going to work on it further in order to provide a global overview of the subject that could be used as the introduction to the conference. The prospective sponsor proposed by him was the Council for Tobacco Research (CTR), which could not be suspected of having made prior arrangements relating to any research proposals resulting from the symposium. On January 27, 1982 Hoel wrote to Thomas Osdene, director of Research for Philip Morris, informing him of his meeting with Rylander two weeks previously. On May 25 and again on August 13, 1982, Rylander wrote to Osdene regarding the conference. In the first letter he submitted the list of topics to be discussed at the symposium, mentioning that he had already sent them to Donald Hoel and was awaiting his comments. In the second, he explained that he had established the plans for the conference and received the **go-ahead from Donald Hoel**. The symposium was held in Geneva from March 15 to 17, 1983. Rylander later met with Donald Hoel on several occasions to discuss the conference proceedings. TLT1050091-0101 (US 88744) (A).

5189. On January 15, 2003, in an appeal from a criminal defamation conviction, a Swiss court sustained two allegations of fraud against Ragnar Rylander, based upon the above facts and concluded that he was a covert consultant for Philip Morris and that he had suppressed research findings that were adverse to the tobacco industry. In its findings, the court stated:

Concerning the allegation that the respondent was "secretly employed by Philip Morris", exhibits show that he had entered into a consulting agreement with Philip Morris in 1972 and that he had not made this fact public. Indeed, the "Thorn" episode, which took place in 1977, shows that the respondent did everything not to let his ties to Philip Morris become publicly known in order to, in his own words, "retain as far as possible the image as an independent scientist". In addition, following the publication of an article in the "European Journal of Public Health", he attempted to conceal the existence of a formal contract with Philip Morris, and this led the journal's Committee on Publication Ethics to take an unfavourable decision in his regard.

The Tribunal de Police therefore rightly considered this fact as proven.

As regards the allegation that the respondent was "one of Philip Morris's most highly paid consultants", it should not be forgotten that the work he carried out in connection with smoking represented only 10% of his research and publications; this is important in determining whether the amounts he received from the tobacco industry are high. Several documents show the respondent to be among Philip Morris's most highly paid consultants, not counting FTR, a subsidiary of Philip Morris, the American Health Foundation and HRW Associates, none of them physical persons. It is therefore true that the respondent was one of Philip Morris's most highly paid consultants. The sums he received – fees amounting sometimes to USD 85,000 a year, plus the funds received for various research activities – were substantial, especially in view of the fact that the respondent devoted no more than 10% of his activities to research dealing with the effects of smoking.

The fact that the respondent was one of Philip Morris's most highly paid consultants has therefore been proven.

Finally, as regards the allegation that the respondent is responsible for an "unprecedented scientific fraud", the Court wishes to point out first of all that the press release at issue does not use the term "responsibility" as such. It merely highlights the respondent's conduct as being part of the unprecedented scientific fraud described by the appellants.

The respondent has had frequent contacts with Philip Morris for many years. These contacts are troubling for several reasons. In 1991, within the framework of a study on respiratory diseases in children, the respondent modified a data base so that no link could be made between passive smoking and the frequency of respiratory

> infections. At an international conference in May 1992 he affirmed that no relation had been found between respiratory infections in children and their exposure to smoke but that there was a strong negative correlation with the consumption of eggs and chicken meat; two months earlier, however, he had agreed to have his name on a document distributed to participants in a meeting of epidemiologists and indicating that a correlation had been found between passive smoking and the frequency of bronchitis in children. In 1997, the respondent expressed his unease about meeting a scientist together with FTR representatives, for until then he had made every effort not to be seen by people from outside Philip Morris in the presence of the latter's executives so as to "retain as far as possible the image as an independent scientist"; such a remark implies that the respondent was precisely not an independent scientist. Moreover, the correspondence exchanged by Philip Morris representatives and the respondent before and after the conferences he organised, notably on the subject of invitations, reports to be submitted to participants and summaries to be published, seriously calls into question his independence vis-à- vis Philip Morris. In this respect, the testimony of Richard Carchman, vice-president of the Philip Morris research centre in Richmond, should be treated with circumspection, given his ties with the tobacco industry. Finally, the conviction expressed by the president of Reynolds Tobacco in 1984 that the "Rylander symposium" was a useful tool for combating the recognition of the harmfulness of passive smoking, is troubling to say the least; indeed, it implies that the "Rylander symposium" was favourable to the tobacco industry.

TLT1050091-0101 at 0099-0100 (US 88744) (A).

5190. At the July 28, 1976 meeting of the Research Liaison Committee, in connection with a discussion of whether to approve studies relating to the benefits of smoking, it was noted that the "[d]ecision for action [on the study] should be made by lawyers, not CTR or Organizing Committee," and it was suggested that "Dr. Gardner present his program for review by all the lawyers. No records of such a review are to be kept." 1000255997-6001 at 6000 (US 20086) (O).

5191. Philip Morris's lawyers exerted control over research into nicotine. William L. Dunn, a Philip Morris scientist, wrote in a 1980 document entitled "The Nicotine Receptor

Program" that, while the "psychopharmacology of nicotine" is "where the action is for those doing fundamental research on smoking," and where "most likely will come significant scientific developments profoundly influencing the industry," "it is where our attorneys least want us to be." According to Dunn, there were two reasons why Philip Morris's lawyers did not want nicotine research conducted. The first reason was so the tobacco companies could claim ignorance "of any relationship between smoking and disease." Such an approach was "implicit in the legal strategy employed over the years in defending corporations within the industry from the claims of heirs and estates of deceased smokers." The second reason for not engaging in nicotine research was that any action by the tobacco industry, including research, that treated nicotine as a drug "could well be viewed as a tacit acknowledgment that nicotine is a drug," which could impact any future regulation of tobacco by the government. 1000127789-7790 at 7789 (US 34422) (A). While nicotine research was permitted, "we must not be visible about it." 1000127789-7790 at 7789 (US 34422) (A). Because of the commercial necessity of research into nicotine, Dunn acknowledged that "our attorneys ... will likely continue to insist upon a clandestine effort in order to keep nicotine the drug in low profile." 1000127789-7790 at 7790 (US 34422) (A).

5192. While his laboratory was in operation at Philip Morris in Richmond, Victor DeNoble, former Associate Senior Scientist, was visited by Shep Pollack, Philip Morris' President, and Fred Newman, a top attorney at Philip Morris. DeNoble and his staff set up a demonstration for them, showing them how rats in a controlled experiment would press a lever to self-administer nicotine. Pollack thereupon asked DeNoble, "Does this mean that it's addicting?" Before DeNoble could answer, Newman told him "Don't answer that question." Newman asked if DeNoble's test procedure was the same as the government was using to demonstrate addiction

and, when he was told that it was, he became very upset, he stated to DeNoble that "you've made us into a pharmaceutical company!", and pulled Pollack from the lab. DeNoble WD, 36:21-37:23.

5193. In 1984, Philip Morris attorneys shut down its Nicotine Program. Patrick Sirridge of Shook, Hardy & Bacon wrote to Philip Morris's Assistant General Counsel Fredric Newman transmitting an analysis of DeNoble's published literature, unpublished manuscripts, and in-press manuscripts. DeNoble researched nicotine and nicotine analogues at Philip Morris. The analysis concluded that "research engaged in, as well as some possibly under consideration, by Philip Morris has undesirable and dangerous implications for litigation positions the industry takes in regards to smoking behavior . . . In the final analysis, the performing and publishing of nicotine related research seems ill-advised from a litigation point of view. . . ." 2021423403-3461 at 3422 (US 87038*) (A). The Nicotine Program was discontinued and DeNoble was terminated. DeNoble WD, 25:2-25:12, 38:1-39:11.

5194. In December 1982, RJR attorneys (both those within the company and outside) became very concerned about positions taken and statements made by Robert DiMarco, the head of RJR's Research Department. Those concerns are discussed in detail in a December 13, 1982 memorandum from Wayne Juchatz, who later would become RJR's General Counsel, to Sam Witt, who was then RJR's General Counsel. The memorandum discusses a lengthy meeting between Juchatz and DiMarco in which DiMarco stated that it was "essential" that RJR try to develop a "less mutagenic cigarette," but said that he had been told by Ed Jacob, an outside counsel, that he could not do that. When Juchatz explained to DiMarco his concerns from a product liability standpoint, DiMarco "refused to accept it as a rationale for not doing what he felt [RJR] had an obligation to do (as a responsible manufacturer)." Juchatz stressed the need for

"close cooperation" between the R&D Department and counsel. 505741150-1153 at 1150 (US 23009) (A).

5195. At that meeting, DiMarco, readily acknowledging that his scientific views were in "direct[ ] contradiction" to RJR's legal positions and stated that over the prior 20 years knowledge about "cancer causation . . . had developed to the point where . . . [RJR's] legal defense [that there was no causation] had been rendered (or was perilously close to being rendered) obsolete." DiMarco further told Juchatz that RJR's medical/scientific witnesses "lacked credibility and integrity. 505741150-1153 at 1151 (US 23009) (A).

5196. DiMarco also told Juchatz that he was so concerned about the "rigid legal positions" taken by RJR outside legal counsel – "which had restricted the proper functioning of the R&D Department" – he would seek "'second opinions' [either from RJR's Legal Department or, if necessary, from outside counsel of his own choosing] on past legal advice restricting R&D activities." 505741150-1153 at 1151 (US 23009) (A).

5197. Finally, at the meeting DiMarco advised Juchatz that [contrary to RJR's official legal position] he would not oppose FDA regulation of the tobacco industry. Juchatz, in his memorandum, concluded that "This statement reflected an insensitivity to the legal and political issues inherent in FDA regulation of our business." DiMarco also contested the Legal Department's efforts to remove ammonia from the list of ingredients supplied to the Department of Health and Human Services. After further pressure from the Legal Department, DiMarco "reluctantly" agreed to the proposed removal. 505741150-1153 at 1151 (US 23009) (A).

5198. Following the December 1982 meeting between DiMarco and Juchatz, RJR attorneys, principally its outside counsel, became so concerned about DiMarco and the possibility that his views, if made known outside of RJR, would create great litigation risk for RJR, that the

lawyers discussed the possibility of terminating DiMarco. The Legal Department met for a full day with outside counsel to discuss how to handle DiMarco. The lawyers concluded that "We [counsel] will, therefore, be required to maintain close surveillance of [DiMarco's] R&D work in order to minimize the risk that [DiMarco's] 'beliefs' find their way into documents or projects which create unnecessary legal risks." 50574 1143-1147 at 1146 (US 20747) (A); Juchatz TT, 11/18/04, 6611:12-6611:22. In a subsequent memorandum on the same issue, the lawyers reiterated that DiMarco's beliefs created legal risks for RJR:

> **we have advised management based upon our own and outside counsel's opinion that there are substantial litigative risks associated with having an individual as head of R&d who believes that smoking causes disease. . . . We have further advised management that while this risk can be reduced, it cannot be eliminated.**

They reiterated that they would be required to "closely [monitor] what is in fact going on in the R&D department." 50574 5988-5992 at 5991 (US 20748) (A) (emphasis added).

5199. When he testified at trial, Juchatz sought, unsuccessfully, to downplay the significance of the clearly-stated revelations in the above-cited documents: (i) RJR's attorneys – both the Legal Department and, especially, outside counsel – exerted substantial control over RJR's Research & Development. Indeed, Juchatz was forced to concede that outside counsel Ed Jacob had advised RJR and its Research & Development Department that RJR could not make a "safer" cigarette, as that would create substantial legal concerns; (ii) Research & Development would have to work closely with the Legal Department if RJR were to allow Research & Development to try to develop a safer cigarette; and (iii) One of the serious legal concerns that RJR had was that any work on a safer cigarette would amount to an implicit admission that existing RJR products are unsafe. Juchatz TT, 11/18/04, 6575:18-6576:25, 6583:4-6584:14, 6585:4-6586:5, 6590:19-6591:20, 6592:23-6593:21, 6594:25-6595:23, 6597:6-6598:1, 6599:8-

6599:19.

5200. A December 31, 1985 memo from Jones Day Womble Carlyle, RJR's outside legal counsel, describes the extent to which RJR's lawyers – both inside and outside – influenced research conducted by that company. First, the memorandum makes clear that "[a]fter the 1964 Surgeon General's report came out, the Law Department, according to Ralph Rowland, did influence research objectives to a degree, because the lawyers did not want anyone performing research that would appear to acknowledge that cigarettes or cigarette smoke contained harmful constituents or posed a health problem." Second, "the Law Department did participate in setting the guidelines for testing of additives." Third, "[s]ince Sam Witt became General Counsel of RJRT in 1981, the Company lawyers played a major role in reviewing research protocols relating to smoking and health and drafting R&D mission statements. ... it was understood that the lawyers controlled things in this area." Fourth, "the Law Department through the years has had a great deal of influence over RJRT-sponsored outside research." Fifth, "Jacob, Medinger has played a major role in reviewing and choosing foreign research projects to be funded by RJRT." Sixth, "Peter Van Every, an attorney in the Law Department, had a 'New York Times principle,' by which he meant that 'things should not be written that could not be published in the New York Times.'" 515873805-3929 at 3870, 3875, 3878, 3879, 3886, 3893 (US 21922) (O).

5201. B&W intervened to edit adverse references to addiction out of a BAT report, entitled "The Controversy on Smoking and Health - Some Facts and Anomalies" by BAT scientist Lionel Blackman. By letter dated October 25, 1984, B&W attorney J. Kendrick Wells wrote BAT counsel Alec Morini that "review" of BAT publications by B&W was necessary in light of ongoing smoking and health litigation; Wells went on to provide 45 paragraphs of revisions to Blackman's draft report and a marked-up report, including:

> 2. Delete Donald Gould reference. The article identifies cigarettes as a drug.
> 3. Delete reference to Dr. W.S. Cain. The article identifies short terms and longer term pharmacological and physiological factors as important in the derivation of "habitual cigarette smoking" ...
> 5. Delete. The point made here might be said to run counter to arguments that cigarette smoking is not addictive ...

680582499-2507 at 2500 (US 54052) (A).

5202. Wells attached a marked-up copy of Blackman's report to his October 25 cover letter, where he indicated his edits and the corresponding paragraph numbers from his letter. The marked-up report was produced by BATCo in this litigation, with additional comments and markings from BATCo showing that BATCo acted on Wells's letter. Specifically, the three paragraphs quoted above bearing adversely on the company's position on addiction were ultimately stricken from the report. 680582512-2512 (US 85396) (A).

5203. On May 29 and 30, 1984, attorneys from B&W and BATCo held a conference on U.S. products liability litigation. During the course of that conference, "Project Rio," a biological testing program to develop cigarettes with less "biological activity," was discussed. According to a memo authored by Kendrick Wells, in-house counsel for B&W, the attorneys "were able to hold significant discussions about implications for U.S. products liability litigation ... regarding Project Rio. BAT Legal acknowledged the needs for lawyer involvement in the project and for possible restructuring, but there was not enough time to plot a course of action." Wells considered follow-up and further summarized the meetings in a June 12, 1984 file note:

> we should arrange a meeting in London with BAT Legal ... to delineate more specific counsel to the BAT, including proposals for the structure and organization of BAT programs and statements which would hold to the minimum feasible level their potential impact upon U.S. products liability litigation. Topics would include proposals for organizing programs already on the table and general procedural guides for lawyer counseling of ongoing and future programs. For example, if Project Rio must continue,

> restructuring probably will be required to control the risk of generating adverse evidence admissible in U.S. lawsuits.
> ...
> Direct lawyer involvement is needed on all BAT activities pertaining to smoking and health from conception through every step of the activity.
>
> The problem posed by BAT scientists and frequently used consultants, who believe cause is proven [i.e., that smoking causes disease] is difficult.

685092972-2974 at 2973 (US 31031) (A).

5204. In his capacity as a tobacco industry attorney at Shook, Hardy & Bacon, Robert Northrip reviewed scientific documents prior to their circulation or dissemination. In reviewing those document, he does not recall "ever being assisted by an independent or a company scientist." Northrip WD, 40-1:11-40-2:23. Kendrick Wells, B&W Assistant General Counsel for Product Litigation, also testified that the Legal Department at B&W generally reviewed scientists statements on smoking and health before they were made public. The review was conducted in part so that the Law Department could tell the scientists that these sorts of statements could have averse consequences for the company in product litigation. Wells WD, 16:4-19.

5205. From October 23 to 25, 1986, the German Society of Occupational Medicine hosted a scientific symposium in Essen, Germany, run by Professor Karl Norpoth of the Institute of Hygiene and Occupational Medicine at the University of Essen (the "Essen symposium"). Researchers for Philip Morris sought approval to present research findings regarding environmental tobacco smoke at the Essen symposium, but ultimately lawyer review and opposition prevented their attempts to publicly present their findings. A leading board of German physicians, the German Society for Smoking and Health, ultimately concluded that the Essen symposium was so attached to the tobacco manufacturers that the proceedings were

irretrievably tainted. In a formal statement, the German Society stated: "Apparently the symposium in Essen will once again serve as an organ for marketing manipulation by the tobacco industry. This conclusion is in no way minimized by the fact that a handful of eminent, independent scientists have also been invited to participate; In public they shall serve as an alibi." 2025989595-9596 at 9595 (US 22833) (A).

5206. Beginning in February, 1986, prior to the Essen symposium, scientists at INBIFO, Philip Morris's research facility in Cologne Germany, requested approval from Philip Morris to present three studies at the Essen symposium related to environmental tobacco smoke. 2501666835-6837 at 6835 (US 87027) (O). On May 6, 1986, at least one of the studies was forwarded by Phillip Morris scientist Robert Pages to Donald Hoel, an industry lawyer at Shook, Hardy & Bacon for review and approval to present the paper. 2021654043-4045 at 4045 (US 87032) (O). On May 20, 1986, Thomas Osdene, Director of Research for Philip Morris, sought approval from Philip Morris management to present the three studies at the Essen symposium. 2001225907-5908 at 5907 (US 87033)(A). On May 28, 1986, Robert Pages reported back to the INBIFO scientists that, despite his efforts and the efforts of Osdene to gain approval, Philip Morris management would not allow the studies to be presented because a Philip Morris in-house lawyer, Frederic Newman, "said no." According to Pages, "that was the end of that." 2501459823-9823 (US 87034)(A); see also 2501459834-9834 (US 87035) (A).

5207. When Scott Appleton started as a toxicologist at B&W, B&W attorney J. Kendrick Wells wrote to B&W General Counsel Mick McGraw that "because of [Appleton's] credentials, any unfortunate statements he makes on key issues have the potential to be particularly troublesome in the hands of an adversary." For that reason, Wells wrote that "Scott should work especially closely with me for some time and that Jeff [Wigand] should be wary in

how he manages Scott in terms of areas and types of assignments and authority given to Scott." Appleton TT, 3/24/05, 16899:14-16900:9; 680901663-1665 at 1663 (US 79219) (A).

5208. Wells counseled Appleton on issues related to additives and new scientific research prior to his attending Scientific Research Group meetings. Appleton TT, 3/24/05, 16901:9-16902:2; 681100149-0151 at 0150 (US 93214) (A).

5209. Jeffrey Wigand, the B&W Vice President of Research and Development from 1989-1993, confirmed that company lawyers, particularly Wells, closely monitored and controlled Appleton from the time he was hired in 1991. Wigand WD, 71:21-72:4. Appleton is a toxicologist. As such, the law Department was concerned because "[i]n 1991, every toxicologist knew that nicotine was addictive and that smoking caused disease and death; so Kendrick [Wells] had a great concern regarding what any toxicologist would say that might contradict the position that the company was taking publicly and in litigation." Id., 75:20-76:10. Indeed, the law department was so concerned that it demanded the right to approve the candidate for the toxicologist position before Wigand could make an offer of employment. Id., 75:7-9.

5210. Unbeknownst to Appleton, Wells on at least one occasion edited an article drafted by Appleton. When confronted with those edits at trial, Appleton testified that "I apparently wasn't in the loop." Appleton TT, 03/24/05, 16936:16-16937:19; 16938:20-16939:2; 536200200-0210 at 0200-0201 (US 90150) (A).

5211. In 1991, the Board of INFOTAB and CECCM, European cigarette trade associations, retained Lovell, White, Durrant to provide legal clearance for all documents related to "smoking and health matters." Chadbourne & Parke was also retained to review the documents with an eye toward making sure that "due consideration is given to the legal position in the United States," even though these trade associations allegedly had no connection to the

United States, thus demonstrating the broad reach of Defendants' enterprise. 2023237649-7650 at 7649 (US 87025) (O).

(b) Admissions and Internal Complaints Regarding Lawyer Involvement in and Manipulation of Research

5212. During the 1970s, an Industry Research Committee – comprised of attorneys and public relations employees of the Cigarette Company Defendants – considered what type of research CTR should conduct and helped develop these projects. A memorandum dated November 4, 1978, from Janet C. Brown, an attorney for American Tobacco, explained "the industry thus moved closer to becoming the arbiter of the amount of CTR research done (by reason of its control of CTR's budget) and the type of research done (by reason of the changes in scope and direction of research, as dictated by Yeaman's [a lawyer's] letter)." BWX0007531-7548 at 7545 (US 36238) (O).

5213. As early as 1969, Defendants' scientists began complaining that Defendant-funded science had become compromised because of the use of science to support litigation. In a Philip Morris memorandum, Helmut Wakeham, Philip Morris's Vice President and Director of Research, lamented the fact that despite the scientific expertise of the tobacco industry to conduct smoking and health research, this expertise was not being utilized because of the legal situation: "Unfortunately . . . the scientific expertise of the industry, because of the liability suit situation, has not been permitted to make a contribution to the problem, a contribution which I believe was and is vital . . . ." 1001609594-9595 (US 21437) (O); (US 76162) (O).

5214. In a meeting in 1970, Wakeham, again complaining about the litigation and lawyer control of science, told D.G. Felton, BATCo's then Manager of Research Planning and later Manager of Smoking & Health Issues, "that the replacement for Dr. Little as Scientific Director of CTR is being sought by the lawyers committee and the Tobacco Institute without

reference to the scientists." 110315968-5971 at 5969 (US 26378) (A).

5215. In the same 1970 document, Felton noted how he explained to Wakeham that lawyer control of science was the reason why TRC, the British counterpart to CTR, was unwilling to cooperate with and include among its ranks American scientists. Felton stated that TRC members feared "scientific co-operation [with American scientists] as the thin end of a wedge which might lead to undue influence in TRC affairs by American lawyers." 110315968-5971 at 5968 (US 26378) (A).

5216. A June 24, 1974 Lorillard memorandum explained how CTR was used by lawyers not for scientific research but for litigation ends:

> Historically, the joint industry funded smoking and health research programs have not been selected against specific scientific goals, but rather for various purposes such as public relations, political relations, position for litigation, etc. Thus, it seems obvious that reviews of such programs for scientific relevance and merit in the smoking and health field are not likely to produce high ratings. In general, these programs have provided some buffer to public and political attack of the industry, as well as background for litigious strategy.

01421596-1600 at 1598 (US 20049) (A).

5217. In 1978, Sheldon Sommers, Chairman of the CTR Scientific Advisory Board, complained to William Gardner, the Scientific Director of CTR, that he (Sommers) was unable to understand the legal counsel he was being given. The clear import of Sommers' letter was that the CTR lawyers were controlling tobacco research by CTR based upon legal considerations. Sommers stated: "I think CTR should be renamed Council for Legally Permitted Tobacco Research, CLIPT for short." Indeed, the lawyer control of CTR had become so pervasive that Sommers concluded that "[m]y considered opinion is that the time for me to sever connections with CTR is near." 11319256-9256 (US 20281) (A).

5218. Sommers's sentiment that CTR was being used to further the legal interests of the company is confirmed by the B&W general counsel who explained in 1978 that "CTR helps protect the industry from potential 'smoking pistol(s) in a lawsuit' should research go wrong," and a later analysis of Defendants' documents by their lawyers in which they concluded that numerous internal company documents discussed "ways in which CTR can be used to protect the industry through defensive research." 680260940-0941 (US 20995) (A); 682764441-4461 (US 21030) (A).

5219. Richard Binns, the Manager of BATCo's Group Research & Development Centre at Southampton, complained of the expansive role of lawyers in BATCO's science when he wrote in the late 1980s that he "was being asked to make significant and sometimes swingeing changes in documents produced recently by R&D staff. . . Therefore, the current lack of clarity about the relationship between R&D and legal Dept. has raised questions which for me are extremely disturbing, particularly if extended beyond the present localized situation." 109878083-8089 at 8089 (US 21767) (A). As Jeffrey Wigand testified at trial, Binns' "written words capture very well what he told me during conversations that followed the implementation of the policies [requiring legal review of scientific documents] established at the New York City meeting." Wigand WD, 83:4-84:3.

5220. In a May 11, 1993 letter from K. Wells, B&W's associate general counsel, to S.P. Chalfen, BAT Industries solicitor, Peter L. Clarke, BATCO general counsel, and Andrew Foyle of Lovell, White, Durrant, Wells stated that while the "CTR story, including SP [special project] grants, is a positive story which can be told and defended," "it should not be told to the public during the pendency of litigation in the U.S. involving assertions of fraud in connection with CTR's operations." 536300013-0014 (US 53132) (A).

5221. In a 1978 handwritten note related to the industry's Scientific Liaison Research Committee, Curtis Judge, Lorillard's Chief Executive Officer, complained that "[w]e have again abdicated the scientific research directional management of the Industry to the 'lawyers' with virtually no involvement on the part of the scientific or business management side of the business" (emphasis in original). The note further argued that a reconstituted scientific and policy leadership committee should not "report to the Committee of Counsel." 01346204-6205 (US 34532) (A).

IV

DEFENDANTS CAUSED THE CHARGED MAILINGS AND WIRE TRANSMISSIONS IN FURTHERANCE OF THE SCHEME TO DEFRAUD

A. The Charged Defendants Caused the Mailings and Wire Transmissions

1. The Court finds that, consistent with the allegations set forth in the descriptions of the Racketeering Acts below, the charged Defendants performed or caused the mailings or wire transmissions described in each of those respective Racketeering Acts to be sent, delivered, or received by the requisite means of transmission consistent with 18 U.S.C. §§ 1341 and 1343.

2. B&W has stipulated that the requirements of 18 U.S.C. § 1341 or § 1343 have been met for the following Racketeering Acts: 8, 17, 31-32, 38, 44-45, 50-52, 54, 57, 60, 63, 66-67, 77, 88, 98, 103, 106, 115-116, 118, 124-125, 127, 129, and 144.

3. BATCo has stipulated that the requirements of 18 U.S.C. § 1341 or § 1343 have been met for the following Racketeering Acts: 11, 30, 50, 51, 53, 54, 57, 60, 63, 103, and 108.

4. In their responses to Requests for Admission, various Defendants have admitted that certain of the Racketeering Acts were transmitted by the requisite means of transmission (mail or wire), including the following Racketeering Acts: 11, 26, 30, 32, 38, 44-46, 50-55, 57, 60, 63, 66-67, 70, 73, 77, 79, 81-82, 86, 88-90, 94, 96, 98-99, 103-106, 108-110, 114, and 116. USX6390001-0400 at 0062-0098 (US 89555) (O) (B&W Responses); ARU0892192-2230 (US 86709) (A) (Philip Morris Responses); WAX0022020-2135 (US 77413) (A) (Reynolds Responses); USX6390001-0400 at 0330-0367 (US 89555) (O) (Tobacco Institute Responses).

5. In their Opposition to the United States' Motion For Partial Summary Judgment On Element That Defendants Have Caused Mailings And Wire Transmissions, Defendants admitted that the mailings and wire transmissions underlying Racketeering Acts 3-7, 10, 12, 18,

21, 23-25, 27, 33-35, 46, 49, 79, 81, 117, 121-122, 132-133, 143, and 145-146 have been established. See JD Rule 7.1/56.1 Statement Mailings ¶¶ 120-124, 127, 129, 135, 138, 140-142, 144, 150-152, 163, 166, 194, 196, 231, 235-236, 246-247, 257 and 259-260.

6. Thirty-three of the forty-one Racketeering Acts that Defendants challenged in their Opposition involve correspondence mailed from one city to another. They are Racketeering Acts 2-3, 6-7, 9-10, 12-16, 19-22, 27, 33, 40-41, 58, 62, 69, 71-72, 74-75, 79-81, 85, 117 and 132-133.

7. Twenty of the forty-one Racketeering Acts that Defendants challenged in their Opposition involve mailings prior to September 14, 1974, during the period that the United States Mails were virtually the only authorized means of mailing. They are Racketeering Acts 2-3, 6-7, 9-10, 12-16, 19-22, 27-29, 33, and 117. Based upon the aforementioned mailings from one city to another, and the aforementioned mailings that preceded September 14, 1974, the Court finds that such mailings more likely than not occurred via the United States Mails.

8. Prior to 1974, private carrier mailing was permissible only by "opinion letter" permission of the Postal Department. In 1974, the United States Postal Service (previously Postal Department) set forth most of 39 C.F.R. Part 310, which dealt with enforcement of the Private Express statutes (39 U.S.C. § 601 et seq.). Section 310.3 of 39 C.F.R., promulgated September 14, 1974, set forth certain exceptions, but the largest exception, which listed various suspensions of the Private Express statute, occurred in 1979. That exception included, on October 24, 1979, the "extremely urgent letter" suspension (39 C.F.R. § 320.6), under which most courier services now operate. 18 U.S.C. §§ 1341, 1343; 39 C.F.R. Part 310 and Part 320; 39 U.S.C. § 601 et seq.

9. No Defendant has indicated in written or documentary discovery, or otherwise

indicated to the Court, that it possessed such "opinion letter" permission. Therefore, because of the virtual "Postal monopoly" that existed prior to October 1979, Racketeering Acts 1 through 43 were almost certainly sent by the United States Mails.

10. The Court takes judicial notice that since 1954, the following newspapers have been routinely sent to subscribers via the United States Mails, and that this practice was reasonably foreseeable to each Defendant: *Atlanta Constitution; Atlanta Journal; Boston Globe; Charlotte Observer; Chicago Tribune; Los Angeles Times; Miami Herald; New York Times; San Diego Union-Tribune; Washington Post.* Order #616.

11. The Court takes judicial notice that the following newspapers have been routinely sent to subscribers via the United States Mails since the following years, and that this practice was reasonably foreseeable to each Defendant: *Atlanta Journal-Constitution - 2001; New York Post - 1993; Philadelphia Inquirer - 1970; Village Voice* - 1959. Order #616.

12. The Court takes judicial notice that since 1954, the following magazines have been routinely sent to subscribers via the United States Mails, and that this practice was reasonably foreseeable to each Defendant: *Car Craft; 4-Wheel & Off-Road; Glamour; Hot Rod; Mademoiselle* (through 2001); *Motorcyclist; Playboy; Vogue.* Order #616.

13. The Court takes judicial notice that the following magazines have been routinely sent to subscribers via the United States Mails since the following years, and that this practice was reasonably foreseeable to each Defendant: *Allure* - 1991; *ESPN The Magazine* - 1998; *GQ-Gentlemen's Quarterly* - 1957; *Maxim* - 1997. Order #616.

14. The Court finds the following carrier services to be "private or commercial interstate carriers": Fedex (formerly Federal Express); DHL; United Parcel Service; and Airborne Express.

15. Certain documents, on their face, indicate that they have been transmitted by the United States Mails. For instance, in Racketeering Act 74, Altria's in-house counsel, Eric A. Taussig, sent a letter to Paul Mele, which alleged that Mele had violated his confidentiality agreement with Philip Morris and stated that "The Company cannot tolerate this kind of conduct. . . . Any further breach of your agreement will result in action being taken." Racketeering Act 75 is an identical letter to Victor DeNoble from Taussig. Across the top of the letter is the legend "CERTIFIED MAIL RETURN RECEIPT REQUESTED," indicating Post Office delivery. 2043724074-4075 (US 21916) (A).

16. Similarly, where a letter or other mailing has been sent to a post office box, such indication provides sufficient evidence that the mailing was sent by United States Mails, as private courier services cannot deliver to post office boxes. See, e.g., Racketeering Acts 11, 30, 41, 50- 51, 55, 57, 60, and 63. 680204115-4117 (US 20990) (A); 680248768-8769 (US 20993) (A); 2000512794-2795 (US 20295) (A); 680585135-5135 (US 22976) (A); 680584974-4985 (US 21382) (A); 680583674-3674 (US 21383) (A); 103498901-8902 (US 21384) (O); 521016787-6788 (US 22129) (A).

17. Certain Racketeering Acts, on their face, have been transmitted by wires and radio and television signals. For instance, various statements from Defendants' internet websites are or were published on the worldwide web, a global network of computers which employ telephone, fiberoptic, and other wire and wireless infrastructures. Similarly, telephone communications, telexes, cable letters, telegrams, e-mails, facsimile transmissions, and television and radio involve the use of wire and radio/television signals in interstate and/or foreign commerce. Therefore, Racketeering Acts 103-116, 130, 134, 137, and 143-147 were transmitted by use of the wires, radio, and television signals in interstate and/or foreign commerce. 689033421-3421

(US 31045) (O); 508293416-3416 (US 21514) (O); 1002605545-5564 (US 35622) (A); 680273641-3643 (US 20998) (A); 504331775-1776 (US 22738) (O); 301030943-0944 (US 46577) (A); 2029200293-0294 (US 21537) (O); 450010016-0019 (US 21539) (O); 690149518-9531 at 9520 (US 21046) (A); 690149518-9531 (US 78732) (A); TLT0770044-0049 (US 86656) (A); TLT0770095-0128 (US 72410) (A).

18. Furthermore, various Defendants' routine business practices demonstrate sufficient use of the mails and/or wires. For instance, on January 12, 2005, Brennan Dawson, former Senior Vice President for Public Affairs of the Tobacco Institute, testified at trial in this case that on behalf of the Tobacco Institute she made public statements intended for millions of American television viewers to believe concerning smoking and health, on television programs that included CNN's Newsmaker Sunday, CNN's Crossfire, Good Morning America, and CBS News Night Watch. Dawson TT, 1/12/05, 9925:17-9930:16. CTR provided funding to Special Projects recipients via checks processed through the interstate banking system, and delivered via the United States Mail. McAllister PD, United States v. Philip Morris, 5/24/02, 98:3-99:2, 102:13-22, 103:7-19.

19. In 1986, as part of a "targeted mass-mailing outreach campaign," the Tobacco Institute began circulating *Tobacco Update*, a one sheet, double-sided summary of Tobacco Institute positions. The Tobacco Merchant's Association originally published a newsletter called *Tobacco Update* which was a lengthier summary of issues facing tobacco. The Tobacco Institute sent copies of *Tobacco Update* to op-ed page managers, columnists, and business editors of every daily newspaper with a circulation of 10,000 or more. TIMN 339121-9128 at 9121 (US 86127) (O).

20. Certain of the mail fraud Racketeering Acts involve mailings sent by Defendants

themselves. For those Racketeering Acts that were not directly sent by Defendants or their employees, the Court finds that those Defendants nevertheless "caused" the transmissions. See, e.g., Racketeering Acts 2, 5, 6-7, 10, 13-15, 31, 38, 44, 47-48, 66-67, 70, 73, 77, 88, 98, 117-118, and 120. It was reasonably foreseeable that such transmissions would occur by the requisite means of transmission. For instance, where Hill & Knowlton, a public relations firm working for and on behalf of the Defendants, issued a press release, and that press release was then sent via the mails, the charged Defendants "caused" that mailing. 11313243-3244 (US 20280) (O); TIMN0127723-7724 (US 21318) (O); TIMN0098597-8598 (US 21270) (A); (US 77055) (O); TPRE0000159-0162 (US 85511) (O); 2015059690-9697 (US 20309) (O); 1005154472-4479 (US 20229) (O); 1005083882-3882 (US 20204) (O); 521030439-0441 (US 23019) (O); 1005118752-8753 (US 21805) (O); 1002325022-5022 (US 21510) (A); 2015047161-7163 (US 21809) (A); 507876416-6417 (US 21810) (A); (US 21709) (O); 507875961-5962 (US 20796) (A); 2015006928-6929 (US 21811) (A); 521100179-0180 (US 21812) (A); 512678470-8473 (US 22979 (A); MNAT00280070-0070 (US 21724) (O); 2025345360-5362 (US 20414) (A); 500015901-5905 (US 47778) (A).

21. As described above, certain Defendants created, controlled, and funded Defendants CTR and the Tobacco Institute, in large part for the purpose of having those entities disseminate false and fraudulent information. Accordingly, when the Tobacco Institute and CTR perform a mailing or wire communication, the other charged Defendants, along with the Tobacco Institute and CTR, have "caused" the transmissions by mail or wire. See, e.g., Racketeering Acts 3, 5-7, 10, 12, 18, 21, 23-24, 27, 29, 33-35, 42-43, 46, 49, 56, 79, 81, 87, 91, 93, 117, 118, 130, 132, and 133. TIMN0110091-0091 (US 21319) (A); TIMN0127723-7724 (US 21318) (O); TIMN0098597-8598 (US 21270) (A); TIMN0118245-8246 (US 77055) (O); TPRE0000159-

0162 (US 85511) (O); TIMN462375-2380 (US 21660) (O); 680264942-4943 (US 22978) (O); TIMN0120574-0575 (US 21678) (O); TIMN0100469-0470 (US 21687) (O); TIMN0120596-0597 (US 21321) (O); TIMN0120638-0639 (US 21698) (O); 680263421-3422 (US 22345) (A); (US 78780) (A); TIFL0522279-2280 (US 21424) (O); TIMN0074006-4006 (US 21303) (O); TIMN0133740-3798 (US 21280) (A); TIMN0102493-2494 (US 21271) (O); TNWL0019638-9640 (US 21703) (O); TIMN0125189-5189 (US 77065) (A); TIMN0020530-0531 (US 62795) (O); TIMN0015615-5617 (US 21265) (A); TIMN0019059-9060 (US 21266) (A); TIMN0019059-9060 (US 62790) (O); MNAT00280070-0070 (US 21724) (O); 2025345360-5362 (US 20414) (A); 690149518-9531 at 9520 (US 21046) (A); 690149518-9531 (US 78732) (A); TIMN0019963-9963 (US 21239) (A); TIMN0019963-9963 (US 22727) (A).

22. Similarly, where a Defendant issues a public statement, and that public statement is then carried by a news agency, wire service, newspaper, television broadcast or other method of dissemination, such transmission by mail or wire is "caused" by the charged Defendant or Defendants. See, e.g., Racketeering Acts 1-3, 5-8, 10, 12, 18, 21, 23-24, 27, 29, 33-37, 39, 42-43, 46-49, 56, 61, 64, 70, 76, 79, 81, 83-84, 87, 93, 97, 100-102, 105, 109-113, 117-118, 120, 130, 132-133, 135-142, and 147-148. For example, when the Tobacco Institute issued a press release, it was reasonably foreseeable (and probably intended) that such press release was disseminated by news outlets and other media. Therefore, the Tobacco Institute (and the other Defendants charged in said acts) have "caused" such dissemination. 11313243-3244 (US 20280) (O); TIMN0110091-0091 (US 21319) (A); TIMN0127723-7724 (US 21318) (O); TIMN0098597-8598 (US 21270) (A); TIMN0118245-8246 (US 77055) (O); 508775085-5088 (US 20815) (O); TPRE0000159-0162 (US 85511) (O); TPRE0000163-0164 (US 21551) (O); TIMN462375-2380 (US 21660) (O); 680264942-4943 (US 22978) (O); TIMN0120574-0575

(US 21678) (O); TIMN0100469-0470 (US 21687) (O); TIMN0120596-0597 (US 21321) (O); TIMN0120638-0639 (US 21698) (O); 680263421-3422 (US 22345) (A); 680263421-3422 (US 78780) (A); 500713769-3769 (US 48351) (O); 03061394-1394 (US 21700) (A); 500713420-3420 (US 48350) (O); TIFL0522279-2280 (US 21424) (O); TIMN0074006-4006 (US 21303) (O); TIMN0133740-3798 (US 21280) (A); 1002325022-5022 (US 21510) (A); TIMN0102493-2494 (US 21271) (O); TNWL0019638-9640 (US 21703) (O); 505302573-2573 (US 21627) (O); 513943434-3434 (US 50268) (A); 507731656-1656 (US 21709) (O); 509131846-1847 (US 20823) (O); TIMN0125189-5189 (US 77065) (A); 509131376-1378 (US 20822) (O); 506876715-6718 (US 21712) (O); TIMN0020530-0531 (US 62795) (O); TIMN0019059-9060 (US 21266) (A); TIMN0019059-9060 (US 62790) (O); 509131534-1534 (US 21717) (O); 2500050140-0141 (US 21804) (A); IRA0011362-1362 (US 33060) (O); 1002605545-5564 (US 35622) (A); MNAT00280070-0070 (US 21724) (O); 2025345360-5362 (US 20414) (A); 500015901-5905 (US 47778) (A); 690149518-9531 at 9520 (US 21046) (A); 690149518-9531 (US 78732) (A); TIMN0019963-9963 (US 21239) (A); TIMN0019963-9963 (US 22727) (A); 98402886-2888 (US 57307) (O); 524649701-9712 (US 21750) (O); 517509202-9211 (US 21752) (O).

23. For instance, Racketeering Act 1, Defendants' "A Frank Statement to Smokers," was carried by various newspapers and other journals throughout the United States, including the *Washington Post* and the *New York Times*. Those publications were and are carried not only by newspaper delivery services (for home delivery), periodical outlets, and newspaper machines, but also to subscribers by means of the United States Mail. Similarly, where a press release or other public statement was carried by *Time* magazine, *Newsweek*, or another such publication, as the periodicals themselves indicate, those periodicals were also sent to subscribers by the United

States Mails. As with mailings sent by third parties, as described in this Section, such mailings are "caused" by Defendants, as charged. 86017454 (US 21418) (A).

B. Defendants Control the Content of Their Respective Websites

24. Defendants Philip Morris USA (with Altria), Reynolds, B&W, and Lorillard control the content of their respective websites. Szymanczyk WD, 51:1-53:7; Beasley WD, 63:16-64:9, 65:15-21; Orlowsky WD, 16:12-17:7, 110:19-113:1.

C. Defendants Control the Content of Their Cigarette Advertising

25. Defendants Philip Morris USA (with Altria), Reynolds, B&W, Lorillard and Liggett control the content of their advertising. Szymanczyk WD, 98:8-100:21; Beasley WD, 97:17-98:5, 98:19-100:2; Orlowsky WD, 23:6-30:13; LeBow WD, 63:10-12.

D. The 145 Alleged Racketeering Acts Were Undertaken for the Purpose of Executing the Scheme to Defraud

26. The Court finds that all of the mailings and wire transmissions alleged in the charged 145 Racketeering Acts were undertaken for the purpose of executing the scheme to defraud found by the Court.

27. In Section III above, the Court determined that Defendants devised a scheme to defraud that was executed through seven principal means involving the mailing and/or wire transmission of numerous material false, deceptive, misleading, or otherwise fraudulent statements, representations, or promises, half-truths, and omissions of material facts, as well as other statements which, although not false or misleading (such as internal communications which admitted that smoking causes cancer) were nonetheless in furtherance of Defendants' scheme to defraud. The Court finds that all of the alleged 145 Racketeering Acts were undertaken for the purpose of executing the scheme to defraud because they furthered Defendants' continuing efforts to deceive consumers and potential consumers into starting and continuing to smoke cigarettes by

attempting to misrepresent and conceal the adverse health effects caused by smoking cigarettes and exposure to cigarette smoke and other related matters, and by maintaining that there was an "open question" as to whether smoking cigarettes, or exposure to cigarette smoke, causes disease and other adverse effects. Such false statements, misrepresentations, and concealments had a natural tendency to influence the decisions of consumers and potential consumers to initiate, continue, or quit smoking, and to influence the decisions of others to initiate, forgo, or otherwise affect efforts to address smoking and health issues, including youth smoking. Moreover, each Racketeering Act[2] was undertaken to execute the scheme to defraud on additional grounds, including, but not limited to, the grounds set forth below:

28. **Racketeering Act No. 1:** On or about January 4, 1954, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, AMERICAN, and co-conspirators caused to be placed in numerous newspapers nationwide, including *The Washington Post*, a daily newspaper, an advertisement entitled "A Frank Statement To Smokers," which newspaper was then sent and delivered by the United States Mails to subscribers and others. In this advertisement, defendants promised to safeguard the health of smokers, support disinterested research into smoking and health, and reveal to the public the results of research into the effects of smoking on smokers' health.

29. This communication contained false promises and misrepresentations regarding: safeguarding the health of smokers; fraudulent promises regarding Defendants' support of independent, disinterested research into smoking and health; and fraudulent promises to reveal to the public the results of research into the effects of smoking on smokers' health. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud.

---

[2]Racketeering Acts 8, 13-15, 44, 73, 98, 100, 134, and 140 have been modified to conform to the evidence.

86017454 (US 21418) (A).

30. Defendants Philip Morris, RJR, B&W, Lorillard, American, and co-conspirators, caused Racketeering Act 1, the 1954 "Frank Statement To Smokers," to be transmitted by the United States Mails. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

31. **Racketeering Act No. 2:** On or about July 15, 1957, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through the TOBACCO INDUSTRY RESEARCH COMMITTEE (predecessor to defendant COUNCIL FOR TOBACCO RESEARCH), did knowingly cause a press release entitled "Scientist Comments on Benzypyrene Report" to be sent and delivered by the United States Mails to newspapers and news outlets. This press release disputed the United States Surgeon General's report that Benzypyrene had been identified in cigarette smoke, and stated that scientists had "generally concluded" that Benzypyrene in cigarette smoke cannot be a cause of cancer in smokers.

32. This communication contained the misrepresentation that scientists had generally concluded that Benzypyrene in cigarette smoke could not cause cancer. Moreover, this communication sought to discredit the Surgeon General's Report with false and misleading statements. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 11313243-3244 (US 20280) (O); TLT0681330-*1330* (US 65226) (O) (*Pittsburgh Press*, July 16, 1957 (UP article)); TLT 0370075-0075 (US 76446) (A) (*Washington Post,* July 16, 1957).

33. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through the TIRC (predecessor to Defendant CTR), caused Racketeering Act 2, a press release to be transmitted by wire, on or about July 15, 1957. McAllister PD, Philip Morris, 5/24/02, 80:7-18; Order #616.

34. **Racketeering Act No. 3:** On or about November 27, 1959, defendants PHILIP

MORRIS, R.J. REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained statements attacking an article written by then-United States Surgeon General Leroy Burney about the hazards of smoking.

35. This communication misrepresented and concealed the link between smoking and disease. Moreover, this communication sought to discredit the Surgeon General's Report with false and misleading statements. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0110091-0091 (US 21319) (A).

36. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 3, a press release, to be transmitted by wire on or about November 27, 1959. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

37. **Racketeering Act No. 4:** On or about December 9, 1959, defendant REYNOLDS did knowingly receive from the mails a letter addressed to W.A. Sugg, R.J. Reynolds Tobacco Company, Winston-Salem, North Carolina, from George McGovern of William Esty Company, 100 East 42nd Street, New York, New York. The letter included a marketing study of the smoking habits of high school and college students.

38. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to Defendants' efforts to target the youth market, which they publicly denied. 501113723-3730 (US 22366) (A).

39. Defendant RJR caused Racketeering Act 4, a letter addressed to W.A. Sugg, to be transmitted by mail from New York, New York to Winston-Salem, North Carolina, on or about December 9, 1959.

40. **Racketeering Act No. 5:** On or about July 6, 1961, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and

AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release was titled "Allen Gives Tobacco Institute Position on 'Health Scares'" and stated that "[t]he tobacco industry itself is more interested than anyone else in finding out and making public the true facts about tobacco and health" and that "research in recent years has produced findings that weaken rather than support the claim that smoking is a major contributor to lung cancer."

41. This communication falsely promised and misrepresented that Defendants wanted to and would conduct independent, disinterested research regarding smoking and disease and make the results of such research public, and misrepresented and concealed the link between smoking and disease. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0127723-7724 (US 21318) (O); ARU5770395-0395 (US 75862) (O) (*Ft. Lauderdale News*, July 7, 1961).

42. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 5, a press release, to be transmitted by mail on or about July 6, 1961. USX6390001-0400 at 0395 (US 89555) (O) (Amended Supplemental Response Number 279 of Tobacco Institute to United States' First Set of Requests for Admission); Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

43. **Racketeering Act No. 6:** On or about July 9, 1963, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release stated "the tobacco industry's position that smoking is a custom for adults and that it is not the intent of the industry to promote or encourage smoking among youth" and "[t]he industry wants to make it demonstrably clear that it does not wish to promote or encourage smoking among youth."

44. This communication falsely stated and misrepresented that Defendants did not promote or encourage smoking among youth when, in fact, they did. This communication was

for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0098597-8598 (US 21270) (A); TIMN280366 (US 21559) (O) (*The Wall Street Journal*, July 10, 1963); TIMN280367 (US 21560) (O) (*Washington Post*, July 10, 1963); CW000526989 (US 87228) (O) (AP article published July 10, 1963 in *Times-Union, Humboldt Times, Tribune, Express,* and *Call*).

45. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 6, a press release, to be transmitted by mail on or about July 9, 1963. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

46. **Racketeering Act No. 7:** On or about November 3, 1963, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. Through this press release, defendants stated that they were on a "crusade" to find answers to the "questions about smoking and health," and that it "should be a crusade neither for nor against tobacco. It is a crusade for research . . . ." Defendants asserted the position that the question of causation was still unresolved.

47. This communication falsely promised and misrepresented that Defendants wanted to and would conduct independent, disinterested research regarding smoking and disease and would make the results of such research public, and misrepresented and concealed the link between smoking and disease. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0118245-8246 (US 77055) (O); ATC2493739-3739 (US 87229) (O) (AP article published November 3, 1963 in *News and Observer*, *Durham Morning Herald,*

Journal & Sentinel).

48. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 7, a press release, to be transmitted by mail on or about November 3, 1963. Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

49. **Racketeering Act No. 8:** On or about March 6, 1964, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant COUNCIL FOR TOBACCO RESEARCH, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release announced the reorganization of the Tobacco Industry Research Committee into the Council for Tobacco Research and represented that CTR's research policy would be set by doctors and scientists independent of the tobacco industry.

50. This communication falsely misrepresented that CTR's research would be independent and disinterested, and concealed that CTR's research policy would be controlled by Defendants. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 508775085-5088 (US 20815) (O); CTRMN010781-0783 (US 85514) (O); TLT0370112-0113 (US 88639) (O) (*The New York Times*, March 11, 1964).

51. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through Defendant CTR, caused Racketeering Act 8, a press release, to be transmitted by mail on or about March 6, 1964. See ARU6460266-0268 (US 86699) (O) (B&W Stipulation at ¶ 1).

52. **Racketeering Act No. 9:** On or about November 23, 1965, defendant COUNCIL FOR TOBACCO RESEARCH did knowingly receive from the mails a letter addressed to Edwin J. Jacob, Esq., Cabell Medinger Forsyth & Decker, 51 West 51st Street, Rockefeller Center, New York, New York, counsel to CTR, from Alvan R. Feinstein, Associate Professor of Medicine, Yale School of Medicine, New Haven, Connecticut, requesting funding for research on data indicating that the clinical effects of cancers were no worse in smokers than in nonsmokers.

53. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to Defendants' fraudulent efforts regarding self-interested research and their fraudulent denials regarding smoking and health issues, including the issue of whether the link between smoking and disease was an open question. 01124436-4437 (US 21491) (O).

54. Defendant CTR caused Racketeering Act 9, a letter, to be transmitted by mail on or about November 23, 1965. McAllister PD, Philip Morris, 5/24/02, 57:10-22; 69:9-19.

55. **Racketeering Act No. 10:** On or about December 29, 1965, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. Through this press release, defendants stated that research had not established whether smoking causes disease and this was still an "open question." "If there is something in tobacco that is causally related to cancer or any other disease, the tobacco industry wants to find out what it is, and the sooner the better."

56. This communication misrepresented that smoking was not causally related to cancer or any other disease; concealed that these Defendants' own research suggested that smoking was causally related to cancer and other diseases; and misrepresented that Defendants wanted to and would conduct independent, disinterested research regarding the link between smoking and disease. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TPRE0000159-0162 (US 85511) (O); 1003042646-2646B (US 87230) (O) (AP article published December 29, 1965 in *Easton Express* and *The Baltimore Sun*); 1003042648A-2648 (US 21647) (O) (AP article published December 29, 1965 in *Cincinnati Inquirer*).

57. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 10, a press release, to be transmitted by mail on or about December 29, 1965. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

58. **Racketeering Act No. 11:** On or about February 28, 1966, defendants BROWN & WILLIAMSON did knowingly cause to be sent and delivered by the United States Mails, and BRITISH-AMERICAN TOBACCO COMPANY (predecessor to BAT INVESTMENTS) thereafter received, a letter addressed to A. D. McCormick, Esq., BAT Co., P.O. Box 482, 7 Millbank, London, SW1, England, from Addison Yeaman, Esq., General Counsel of Brown & Williamson, promoting cooperation among defendants in resisting regulation by Congress and by the Federal Trade Commission by attacking existing scientific studies linking smoking to disease, by making representations to governmental regulators that defendants were engaged in accelerated research, and by suppressing information unfavorable to defendants.

59. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 680204115-4117 (US 20990) (A).

60. Defendant B&W caused Racketeering Act 11, a letter, to be transmitted by mail on or about February 28, 1966. USX6390001-0400 (US 89555) (O) (B&W Response to Request No. 285); USX6390001-0400 at 0053 (US 89555) (O) (BATCo Response to Request No. 285); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶1, citing Exhibit A); ARU1290012-0022 (US 86700) (O) (BATCo Stipulation at ¶ 1, citing Exhibit A).

61. **Racketeering Act No. 12:** On or about October 21, 1966, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers

and news outlets. Through this press release, defendants stated that they knew "of no valid scientific evidence demonstrating that either 'tar' or nicotine is responsible for any human illness."

62. This communication misrepresented that there was no valid scientific evidence demonstrating that tar or nicotine was responsible for human illnesses, and concealed that Defendants knew of valid scientific evidence demonstrating that tar or nicotine was responsible for human illnesses. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TPRE0000163-0164 (US 21551) (O); ATC3061484-1487 (US 86701) (O) (*The New York Times*, October 22, 1966).

63. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 12, a press release, to be transmitted by mail on or about October 21, 1966. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

64. **Racketeering Act No. 13**: On or about January 12, 1967, defendants PHILIP MORRIS, R.J. REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, AMERICAN, and COUNCIL FOR TOBACCO RESEARCH, did knowingly cause to be sent and delivered by the United States Mails letters addressed separately to each member of Ad Hoc Committee: Miss Janet Brown, Esq., Chadbourne Park, Whiteside & Wolff, 25 Broadway, New York, New York 10004, counsel to American; Kevin L. Carroll, Esq., Donald J. Cohn, Esq., and Francis K. Decker, Esq., Webster Sheffield Fleischmann Hitchcock & Chrystie, 1 Rockefeller Plaza, New York, New York 10020, counsel to Liggett; Edward J. Cooke, Jr., Esq., Davis, Polk, Wardwell, Sunderland, & Kiendl, 1 Chase Manhattan Plaza, New York, New York 10005, counsel to Reynolds; Alexander Holtzman, Esq., Conboy, Hewitt, O'Brien & Boardman, 20 Exchange Place, New York, New York 10005, counsel to Philip Morris; Edwin J. Jacob, Esq., Cabell Medinger Forsyth & Decker, 51 W. 51st Street, New York, NY 10019, counsel to CTR; William W. Shinn, Esq., Shook, Hardy, Ottman, Mitchell & Bacon, 915 Grand Avenue, Kansas City, MS 64106; and Edward DeHart, Hill & Knowlton, 1735 K Street, NW, Washington, DC 20006, each of which was from David R. Hardy, Esq., counsel to Ad Hoc Committee, requesting the recipients to recommend persons who could act as witnesses before Congressional hearings to perpetuate defendants' "open question" position, and assigning the members of the

Ad Hoc Committee oversight of CTR "special projects" designed to be of "practical use" for defendants during congressional hearings.

65. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 2015059690-9697 (US 20309) (O).

66. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, American, and CTR, caused Racketeering Act 13, letters, to be transmitted by mail interstate on or about January 12, 1967.

67. **Racketeering Act No. 14:** On or about February 2, 1967, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN did knowingly cause to be sent and delivered by the United States Mails a letter addressed to David R. Hardy, Esq., counsel to Ad Hoc Committee, from William W. Shinn, Esq., Shook, Hardy, Ottman, Mitchell & Bacon, 915 Grand Avenue, Kansas City, Missouri 64106, a member of Ad Hoc Committee, and copied the Ad Hoc Committee and Ed DeHart of Hill & Knowlton. The letter responded to Hardy's request for recommendations of persons who could act as witnesses before congressional hearings to perpetuate defendants' "open question" position.

68. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 1005154472-4479 (US 20229) (O).

69. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American caused Racketeering Act 14, a letter, a copy of which was sent from Kansas City, Missouri to Ed DeHart

of Hill & Knowlton, New York, New York, to be transmitted by mail on or about February 2, 1967. McAllister PD, Philip Morris, 5/24/02, 57:10-22; 69:9-19.

70. **Racketeering Act No. 15:** On or about May 19, 1967, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN did knowingly cause to be sent and delivered by the United States Mails a letter addressed to Alexander Holtzman, Esq., Conboy, Hewitt, O' Brien & Boardman, 20 Exchange Place, New York, New York 10005, counsel to Philip Morris, from William W. Shinn, Esq., regarding CTR Special Projects, outlining a proposal to support and publicize research advancing the theory of smoking as beneficial to health as a stress reducer, even for "coronary prone" persons; representing that stress (rather than nicotine addiction), explains why smoking clinics fail; and proposing to publicize the "image of smoking as 'right' for many people . . . as a scientifically approved 'diversion' to avoid disease causing stress."

71. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and to deny the addictiveness of nicotine, and Defendants' fraudulent promise to conduct independent, disinterested research. 1005083882-3882 (US 20204) (O).

72. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American caused Racketeering Act 15, a letter, to be transmitted by mail from Kansas City, Missouri, to New York, New York, on or about May 19, 1967. McAllister PD, Philip Morris, 5/24/02, 57:10-22; 69:9-19.

73. **Racketeering Act No. 16:** On or about October 3, 1968, defendant PHILIP MORRIS did knowingly cause to be sent and delivered by the United States Mails a letter addressed to David R. Hardy, Esq., Shook, Hardy, Ottman, Mitchell, and Bacon, 915 Grand Avenue, Kansas City, Missouri from Philip Morris Assistant General Counsel Alexander Holtzman, proposing "Special Project" funding for a scientist whose application to CTR for funding was

previously turned down but who was likely to produce data useful to defendants.

74. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 1005084784-4786 (US 22988) (O).

75. Defendant Philip Morris caused Racketeering Act 16, a letter, to be transmitted by mail from New York, New York, to Kansas City, Missouri, on or about October 3, 1968.

76. **Racketeering Act No. 17**: On or about October 21, 1968, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN, through defendant COUNCIL FOR TOBACCO RESEARCH, did knowingly cause to be sent and delivered by the United States Mails letters separately addressed to Liggett General Counsel Frederick P. Haas, Esq.; American General Counsel Cyril Hetsko, Esq.; Reynolds General Counsel H. Henry Ramm, Esq.; Philip Morris General Counsel Paul D. Smith, Esq.; and Brown & Williamson General Counsel Addison Yeaman, Esq., from David R. Hardy, Esq., Shook, Hardy & Bacon, 915 Grand Avenue, Kansas City, Missouri, counsel to CTR' s Committee of Counsel. The letter proposed "Special Project" funding for a scientist whose application to CTR for funding was previously turned down but who was likely to produce data useful to defendants.

77. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 1005084799-4800 (US 20206) (O).

78. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American, through Defendant CTR, caused Racketeering Act 17, letters, to be transmitted by mail on or about

October 21, 1968. See ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

79. **Racketeering Act No. 18:** In or about 1968, the exact date being unknown, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, AMERICAN, and co-conspirators, through defendant TOBACCO INSTITUTE, did knowingly distribute reprints of an article written by Stanley Frank and originally published in True magazine, and caused copies of said document to be sent and delivered by the United States Mails, addressed to various physicians and civic leaders. This article disputed the link between smoking and disease, and was distributed anonymously.

80. This communication misrepresented and concealed the link between smoking and disease; concealed the relationship between the author of the article and Defendants; and concealed that Defendants caused the article to be reprinted and distributed. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN462375-2380 (US 21660) (O); 85872281-2281 (US 21618) (O); 2017002404-2410 (US 21619) (O); 85872282-2282 (US 21622) (O); 85872283-2283 (US 21624) (O); 85872284-2286 (US 21626) (O); TIMN0123336-3336 (US 21628) (O).

81. Defendants Philip Morris, RJR, B&W, Lorillard, American, and co-conspirators, through defendant Tobacco Institute, caused Racketeering Act 18, an article, to be transmitted by mail in or about 1968. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3,¶ 10); Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

82. **Racketeering Act No. 19:** On or about May 27, 1969, defendant PHILIP MORRIS did knowingly cause to be sent by the United States Mails a letter from Philip Morris Vice President for Corporate Research and Development, Helmut Wakeham, to defendant Dr. M. Hausermann, Director of Research and Quality Control, Fabriques de Tabacs, Reunies S.A., Neuchatel-Serrieres, Switzerland. The letter communicated the approval of Paul Smith,

Philip Morris' General Counsel, for the publication by Dr. Hausermann of a paper describing the Smoke Exposure Machine developed at Philip Morris' Cologne, Germany, Institute for Biological Research, known as INBIFO. The letter clarified the scope of the article, and stated that "[t]he paper should not include any statements with regard to the effect of smoke on the rats in terms of initiation of disease, etc."

83. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, Defendants' fraudulent promise to conduct independent, disinterested research, and to their concealment and suppression of material information relating to the link between smoking and disease. 1000321560-1560 (US 21884) (A).

84. Defendant Philip Morris caused Racketeering Act 19, a letter, to be transmitted by air mail to Switzerland on or about May 27, 1969. 1000321560-1560 (US 21884) (A).

85. **Racketeering Act No. 20:** On or about September 10, 1969, defendant PHILIP MORRIS did receive from the United States Mails a letter from M. Hausermann, Fabriques de Tabacs, Reunies S.A., Neuchatel Switzerland, addressed to Philip Morris Vice President for Corporate Research and Development, Dr. Helmut Wakeham, in which Dr. Hausermann reported that he had, following consultation with Alex Holtzman, Esq., in-house counsel at Philip Morris, decided not to submit for presentation a paper entitled "Cigarette Consumption Related to Cigarette 'Strength.'" Dr. Hausermann reported that Mr. Holtzman felt "that this paper should not be presented, because it might be used as an argument for tar-and-nicotine delivery indication on the pack and in ads."

86. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, Defendants' manipulation of nicotine

and nicotine delivery, Defendants' fraudulent promise to conduct independent, disinterested research, and their concealment and suppression of material information relating to the link between smoking and disease. 1001807341-7343 (US 22729) (A).

87. Defendant Philip Morris caused Racketeering Act 20, a letter, to be transmitted by mail from Switzerland to Richmond, Virginia, on or about September 10, 1969. 1001807341-7343 (US 22729) (A).

88. **Racketeering Act No. 21:** On or about April 30, 1970, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release falsely stated that the American Cancer Society had refused to release experimental data underlying the Auerbach/ Hammond "smoking beagles" study.

89. This communication contained the false statement that the American Cancer Society had refused to release experimental data underlying the Auerbach/Hammond "smoking beagles" study, when in fact, the American Cancer Society had offered to release it. This communication was in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and health was an open question, and attempted to discredit the American Cancer Society. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 680264942-4943 (US 22978) (O); 1005124927-4927 (US 87219) (O) (*The Wall Street Journal*, May 1, 1970).

90. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 21, a press release, to be transmitted by mail, on or about April 30, 1970. Declaration of Patricia A. Tobin, United States v. Philip

Morris, October 2, 2003 at 3 ¶ 10 (US 75490) (O); Order #616; Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

91. **Racketeering Act No. 22:** On or about July 22, 1970, defendants REYNOLDS, PHILIP MORRIS, BROWN & WILLIAMSON, AMERICAN, LIGGETT, and LORILLARD did knowingly cause to be sent and delivered by the United States Mails, and defendant COUNCIL FOR TOBACCO RESEARCH thereafter received, a letter from H.H. Ramm, Esq., General Counsel for R.J. REYNOLDS, addressed to Dr. Robert C. Hockett, Associate Scientific Director, CTR, 110 E. 59th Street, New York, New York. The letter states that "counsel representing Philip Morris, Brown & Williamson, American Brands, Liggett & Myers and Lorillard which companies together with R.J. REYNOLDS participate in Special Projects have advised that if the Scientific Advisory Board does not approve this project the same can be treated as an approved Special Project."

92. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. CTRSP-FILES009810-09810 (US 21696) (O).

93. Defendants RJR, Philip Morris, B&W, American, Liggett, and Lorillard, through defendant Counsel For Tobacco Research, caused Racketeering Act 22, a letter, to be transmitted by mail, on or about July 22, 1970. McAllister PD, Philip Morris, 5/24/02, 95:14-96:10.

94. **Racketeering Act No. 23:** On or about December 1, 1970, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause to be placed in *The Washington Post*, a daily newspaper, an advertisement entitled "The question about smoking and health is still a question," which newspaper was then sent and delivered by the United States Mails to subscribers and others. In this advertisement, the Tobacco Institute discredited the causal link between smoking and disease, stated that "in the interest of absolute objectivity" defendants "ha[ve] supported totally

independent research efforts with completely non-restrictive funding," and deliberately created the false impression that all research results have been freely published.

95. This communication misrepresented that the link between smoking and health was still an open question; misrepresented that there was no evidence supporting a causal link between smoking and disease; misrepresented that Defendants had supported independent, disinterested research efforts with non-restrictive funding; and misrepresented that all research results had been freely published. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0081352-1352 (US 21305) (A) *(Washington Post*, December 1, 1970).

96. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 23, an advertisement, to be transmitted by mail, on or about December 1, 1970. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616; Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

97. **Racketeering Act No. 24:** On or about May 25, 1971, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained statements indicating that "many eminent scientists" believe that "the question of smoking and health is still very much a question."

98. This communication concealed that many of the scientists who believed that the question of smoking and health was still an open question were conducting research that was funded, controlled, and managed by the Defendants; misrepresented the link between smoking and disease; and furthered Defendants' fraudulent position that the link between smoking and

disease was an open question. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0120574-0575 (US 21678) (O).

99. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 24, a press release, to be transmitted by mail, on or about May 25, 1971. Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

100. **Racketeering Act No. 25:** On or about July 1, 1971, defendant COUNCIL FOR TOBACCO RESEARCH did knowingly cause to be sent and delivered by the United States Mails a letter from CTR Associate Scientific Director Robert C. Hockett, to REYNOLDS Vice President and General Counsel Henry H. Ramm, Esq., in which Hockett endorsed and passed along to Ramm a suggestion from two employees of Philip Morris that CTR sponsor a scientific conference on the "benefits" of smoking, in the wake of a private conference on the effects of nicotine and smoking on the central nervous system. Dr. Hockett also requested that the Committee of General Counsel guarantee the financing of the conference.

101. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, Defendants' false claim that nicotine was not addictive, and Defendants' fraudulent promise to conduct independent, disinterested research. 503654893-4894 (US 20719) (O).

102. Defendant CTR caused Racketeering Act 25, a letter, to be transmitted by mail, on or about July 1, 1971. USX6390001-0400 at 0020 (US 89555) (O) (CTR Response to Request No. 299); McAllister PD, Philip Morris, 5/24/02, 96:12-97:6.

103. **Racketeering Act No. 26:** On or about August 20, 1971, defendant REYNOLDS did knowingly cause to be sent and delivered by the United States Mails, and defendant PHILIP MORRIS did receive, a letter addressed to Joseph F. Cullman, III,

Chairman of the Board, Philip Morris Inc., 100 Park Avenue, New York, New York 10017, from Alexander H. Galloway, Chairman, R.J. Reynolds Industries, Inc., Winston-Salem, North Carolina, discussing defendants' joint position with respect to smoking and health research.

104. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 2015023268-3268 (US 21727) (O).

105. Defendant RJR caused Racketeering Act 26, a letter, to be transmitted by mail on or about August 20, 1971. USX6390215-0329 at 0308 (US 77413) (A) (RJR Response to Request No. 300).

106. **Racketeering Act No. 27:** On or about November 15, 1971, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained statements suggesting that smoking is not harmful to pregnant women or their babies and indicating that many doctors and scientists believe that "the question of smoking and health is an open one."

107. This communication falsely stated that smoking was not harmful to pregnant women or their babies, and concealed that many of the doctors and scientists who believed that the question of smoking and health was still an open question were conducting research that was funded, controlled, and managed by Defendants; and furthered Defendants' fraudulent position that the link between smoking and disease was an open question. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0100469-

0470 (US 21687) (O).

108. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 27, a press release, to be transmitted by mail on or about November 15, 1971. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

109. **Racketeering Act No. 28:** On or about December 22, 1971, defendant PHILIP MORRIS did knowingly cause to be sent and delivered by the United States Mails, and defendants LIGGETT, LORILLARD, REYNOLDS, and BROWN & WILLIAMSON did thereafter receive, copies of a memorandum separately addressed to Liggett employee Dr. W.W. Bates, Reynolds employee Dr. Murray Senkus, Lorillard employee Dr. Alexander W. Spears, and Brown & Williamson employee Dr. Iver W. Hughes, from Philip Morris employee Dr. Helmut Wakeham, describing a research proposal of Drs. Auerbach and Hammond concerning the effects of smoking on health, indicating that the National Cancer Institute's likely funding of the research "is a matter of considerable concern to the tobacco industry," and discussing defendants' plan to have lawyers and scientists meet with [the National Cancer Institute ("NCI")] to discourage NCI from funding the research.

110. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, Defendants' fraudulent promise to conduct independent, disinterested research, and to their concealment and suppression of material information relating to the link between smoking and disease. 1000299103-9104 (US 21735) (O).

111. Defendant Philip Morris caused Racketeering Act 28, a memorandum, to be transmitted by mail on or about December 22, 1971.

112. **Racketeering Act No. 29:** On or about February 1, 1972, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press

release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained the statement that "[t]he cigarette industry is as vitally concerned or more so than any other group in determining whether cigarette smoking causes human disease, whether there is some ingredient as found in cigarette smoke that can be shown to be responsible, and if so, what it is," and that "despite this effort the answers to the critical questions about smoking and health are still unknown."

113. This communication misrepresented and concealed the link between smoking and disease; misrepresented that Defendants were vitally concerned or more so than any other group about determining whether cigarette smoking caused human disease; and misrepresented that Defendants supported independent, disinterested research efforts with non-restrictive funding. This communication also furthered Defendants' fraudulent efforts to exploit smokers' desire for less hazardous cigarettes. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0120596-0597 (US 21321) (O).

114. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 29, a press release, to be transmitted by mail, on or about February 1, 1972. Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

115. **Racketeering Act No. 30:** On or about May 19, 1972, defendant BROWN & WILLIAMSON did knowingly cause to be sent by the United States Mails, and defendant BRITISH-AMERICAN TOBACCO COMPANY (predecessor to BAT INVESTMENTS) thereafter received, a letter addressed to A.D. McCormick, Esq., BAT Co., P.O. Box 482, 7 Millbank, London SW1P 3JE, England, from Addison Yeaman, Esq., General Counsel, Brown & Williamson, in which Yeaman provided comments on a statement BAT Co. proposed to make in response to a statement anticipated from a British government minister. Yeaman referred to a cablegram sent to him by McCormick on May 17, 1972, and to a telephone conversation in which McCormick and Yeaman had participated on May 18, 1972. Yeaman commented that BATCo.'s

> proposed statement concerning the causal relationship between cigarette smoking and disease "is somewhat less affirmative in tone than would be welcome on this side." He gave his approval to alternative versions that described the controversy on this issue. Finally, Yeaman stated in a postscript, "In the penultimate sentence of the B.A.T. draft statement would you object to changing the word 'habit' to 'practice?'"

116. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 680248768-8769 (US 20993) (A).

117. Defendant B&W caused Racketeering Act 30, a letter, to be transmitted by mail, on or about May 19, 1972. USX6390001-0400 at 0084 (US 89555) (O) (B&W Response to Request No. 304); USX6390001-0400 at 0054 (US 89555) (O) (BATCo Response to Request No. 304); ARU1290012-0022 (US 86700) (O) (BATCo Stipulation at ¶ 1, citing Exhibit A); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

118. **Racketeering Act No. 31:** On or about November 7, 1973, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN, through defendant COUNCIL FOR TOBACCO RESEARCH, did knowingly cause to be sent and delivered by the United States Mails letters separately addressed to Thomas F. Ahrensfeld, Esq., Philip Morris; DeBaun Bryant, Esq., Brown & Williamson; Frederick P. Haas, Esq., Liggett; Cyril F. Hetsko, Esq., American; Henry C. Roemer, Esq., Reynolds, and Arthur J. Stevens, Esq., Lorillard, from Donald K. Hoel, Esq., Shook, Hardy & Bacon, 915 Grand Avenue, Kansas City, Missouri. The letter recommends approval to fund research by Dr. Richard J. Hickey as a CTR Special Project for two years, beginning September 1973, and cites Hickey's efforts to show that air pollution is primarily responsible for many chronic diseases attributed to smoking.

119. This communication was for the purpose of executing the scheme to defraud

because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 521030439-0441 (US 23019) (O).

120. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American, through Defendant CTR, caused Racketeering Act 31, letters, to be transmitted by mail, on or about November 7, 1973. USX6390215-0329 at 0308 (US 77413) (A) (RJR Response to Request No. 305); see also ARU6460266-0288 (US 86699) (O) (B&W Stipulation ¶ 1, citing Exhibit A).

121. **Racketeering Act No. 32:** On or about November 26, 1973, defendant BROWN & WILLIAMSON did knowingly cause to be sent and delivered by the United States Mails a letter from DeBaun Bryant, Esq., counsel to Brown & Williamson, addressed to Donald K. Hoel, Esq., Shook, Hardy & Bacon, 915 Grand Avenue, Kansas City, Missouri. The letter conveys Brown & Williamson's approval to fund research by Dr. Richard J. Hickey as a CTR Special Project, beginning September 1973, while noting that "[a]s is usual our support is contingent upon the participation in this project by the other companies."

122. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 521030438-0438 (US 21504) (O).

123. Defendant B&W caused Racketeering Act 32, a letter, to be transmitted by mail, on or about November 26, 1973. USX6390001-0400 at 0084-0085 (US 89555) (O) (B&W Response to Request No. 306); see also ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

124. **Racketeering Act No. 33:** On or about January 11, 1974,

defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release attacked the 1964 U. S. Surgeon General's Report on smoking and health and dismissed scientific research linking smoking to lung cancer, emphysema, and low birth weight in babies born to women who smoked during pregnancy.

125. This communication misrepresented and concealed the link between smoking and disease. Moreover, this communication sought to discredit the Surgeon General's Report with false and misleading statements. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 2016004923-4929 (US 36676) (O).

126. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 33, a press release, to be transmitted by mail, on or about January 11, 1974. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

127. **Racketeering Act No. 34:** On or about January 14, 1975, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained the statement that "domestic tobacco companies . . . have committed some $50 million to help support researchers who are seeking the truth."

128. This communication misrepresented and concealed the link between smoking and disease; concealed the fact that Defendants were funding, controlling, and managing research that they maintained was independent and disinterested; and furthered Defendants' fraudulent position that the link between smoking and disease was an open question. This communication was for

the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0120638-0639 (US 21698) (O).

129. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 34, a press release, to be transmitted by mail, on or about January 14, 1975. Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

130. **Racketeering Act No. 35:** In or about September 1975, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained statements noting that, as early as 1963, the Tobacco Institute had issued statements denying that the Cigarette Companies targeted youth smokers. The press release also noted that in July 1969, the Chairman of the Tobacco Institute, Joseph F. Cullman, III, testified before a Senate Commerce subcommittee that the Cigarette Companies intended to avoid advertising representing cigarette smoking as essential to social prominence, success, or sexual attraction or depicting smokers engaged in sports or other activities requiring exceptional stamina or conditioning.

131. This communication contained false statements and misrepresentations denying that Defendants targeted youth, and false promises and misrepresentations that Defendants avoided advertising representing cigarette smoking as essential to social prominence, success, or sexual attraction. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 680263421-3422 (US 22345) (A); 680263421-3422 (US 78780) (A).

132. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 35, a press release, to be transmitted by

mail, in or about September 1975. Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

133. **Racketeering Act No. 36:** During 1975, the exact dates being unknown, defendant REYNOLDS caused to be placed in various print media, including Newsweek, a weekly magazine, an advertisement for Vantage cigarettes, which magazine was then sent and delivered by the United States Mails to subscribers and others. This text included the language, "If you're like a lot of smokers these days, it probably isn't smoking that you want to give up. It's some of that 'tar' and nicotine you've been hearing about."

134. This communication concealed the Defendants' knowledge that smokers compensate by changing how they smoke to obtain sufficient delivery of nicotine and that "low tar/low nicotine" cigarettes such as Vantage were designed so that smokers could obtain variable levels of tar and nicotine; and falsely implied that "low tar/low nicotine" cigarettes such as Vantage were less hazardous. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 500713769-3769 (US 48351) (O).

135. Defendant RJR caused Racketeering Act 36, an advertisement, to be transmitted by mail during 1975. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

136. **Racketeering Act No. 37:** During 1975, the exact dates being unknown, defendant LORILLARD caused to be placed in various print media, including Family Circle magazine, an advertisement for True cigarettes, which magazine was then sent and delivered by the United States Mails to subscribers and others. This advertisement depicted a young woman and contained text stating, "I thought about all I'd read and said to myself, either quit or smoke True. I smoke True."

137. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts

to deny that there was a link between smoking and disease, and Defendants' false claims that nicotine was not addictive. This communication also furthered Defendants' fraudulent efforts to exploit smokers' desire for less hazardous cigarettes. 03061394-1394 (US 21700) (A).

138. Defendant Lorillard caused Racketeering Act 37, an advertisement, to be transmitted by mail during 1975. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

139. **Racketeering Act No. 38:** On or about January 4, 1976, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN, through defendant COUNCIL FOR TOBACCO RESEARCH, did knowingly cause to be sent and delivered by the United States Mails letters separately addressed to Thomas F. Ahrensfeld, Esq., Philip Morris, Joseph Greer, Esq., Liggett, Cyril F. Hetsko, Esq., American, Ernest Pepples, Esq., Brown & Williamson, Henry C. Roemer, Esq., Reynolds, and Arthur J. Stevens, Esq., Lorillard, from Donald K. Hoel, Esq., Shook, Hardy & Bacon, Mercantile Bank Tower, 1101 Walnut, Kansas City, Missouri. The letter recommends funding Dr. Richard J. Hickey as a CTR Special Project during 1977, noting a report of Dr. Hickey that states, "Our findings for lung cancer appear to raise doubt concerning claims . . . that cigarette smoking is the primary cause of lung cancer, particularly in males."

140. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 1005118752-8753 (US 21805) (O).

141. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American, through Defendant CTR, caused Racketeering Act 38, letters, to be transmitted by mail on or about January 4, 1976. USX6390001-0400 at 0085 (US 89555) (O) (B&W Response to Request No. 312); see also ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

142. **Racketeering Act No. 39:** During 1976, the exact dates being unknown, defendant REYNOLDS caused to be placed in various print media an advertisement for Vantage cigarettes, which newspapers and magazines were then sent and delivered by the United States Mails to subscribers and others. The advertisement included text stating, "Vantage cuts down substantially on the 'tar' and nicotine you may have become concerned about."

143. This communication concealed Defendants' knowledge that smokers compensate by changing how they smoke to obtain sufficient delivery of nicotine and that"low tar/low nicotine" cigarettes like Vantage were designed so that smokers could obtain variable levels of tar and nicotine, and falsely implied that "low tar/low nicotine" cigarettes like Vantage were less hazardous. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute principal gravamen of the scheme to defraud. 500713420-3420 (US 48350) (O).

144. Defendant RJR caused Racketeering Act 39, an advertisement, to be transmitted by mail during 1976. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

145. **Racketeering Act No. 40:** On or about January 13, 1977, defendant PHILIP MORRIS did knowingly cause to be sent and delivered by the United States Mails a letter from Alexander Holtzman, Esq., counsel to Philip Morris addressed to Donald K. Hoel, Esq., Shook, Hardy & Bacon, Mercantile Bank Tower, 1101 Walnut, Kansas City, Missouri, approving Philip Morris' participation in a grant to fund Dr. Richard J. Hickey's CTR Special Project during 1977.

146. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 1005118751-8751 (US 21923) (O).

147. Defendant Philip Morris caused Racketeering Act 40, a letter, to be transmitted by mail on or about January 13, 1977.

148. **Racketeering Act No. 41:** On or about March 31, 1977, defendant PHILIP MORRIS did knowingly cause to be sent and delivered by the United States Mails a letter addressed to: Dr. Max Hausermann, Philip Morris Europe S.A., P.O. Box 11, 2003 Neuchatel, Switzerland, from Robert B. Seligman, Vice President for Research and Development, suggesting that the recipient comply with company policy of avoiding direct mail contact with Philip Morris' Cologne, Germany research facility by sending materials to a "dummy" mail address.

149. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question; Defendants' fraudulent promise to conduct independent, disinterested research; Defendants' fraudulent efforts to suppress development and marketing of a less hazardous cigarette; and Defendants' fraudulent efforts to conceal and suppress material information relating to smoking and health. 2000512794-2795 (US 20295) (A).

150. Defendant Philip Morris caused Racketeering Act 41, a letter, to be transmitted by air mail to Switzerland on or about March 31, 1977. 2000512794-2795 (US 20295) (A).

151. **Racketeering Act No. 42:** On or about December 29, 1977, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained statements suggesting that the contribution of smoking to disease was still an "open question" and that tobacco smoke does not harm nonsmokers.

152. This communication misrepresented and concealed the link between smoking and

disease; concealed that Defendants were funding, controlling, and managing research that Defendants maintained was disinterested and independent; furthered Defendants' fraudulent position that the link between smoking and disease was an open question; and falsely stated that tobacco smoke does not harm nonsmokers. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIFL0522279-2280 (US 21424) (O).

153. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 42, a press release, to be transmitted by mail on or about December 29, 1977. USX6390001-0400 at 0395-0396 (US 89555) (O) (Amended Supplemental Response Number 316 of Tobacco Institute to United States' First Set of Requests for Admission); Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

154. **Racketeering Act No. 43:** On or about January 17, 1979, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained statements that defendants had spent 75 million dollars on research over 20 years to learn whether smoking is harmful but that "the case against cigarettes is not satisfactorily demonstrated."

155. This communication misrepresented and concealed the link between smoking and disease; misrepresented and concealed that the tobacco industry was funding, controlling, and managing research that Defendants maintained was independent and disinterested; and furthered Defendants' fraudulent position that the link between smoking and disease was an open question. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0074006-4006 (US 21303) (O).

156. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 43, a press release, to be transmitted by mail on or about January 17, 1979. Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

157. **Racketeering Act No. 44:** On or about November 20, 1979, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN did knowingly cause to be sent and delivered by the United States Mails letters separately addressed to Thomas F. Ahrensfeld, Esq., Philip Morris; Max Crohn, Esq., Reynolds; Joseph Greer, Esq., Liggett; Arnold Henson, Esq., American; Ernest Pepples, Esq., Brown & Williamson; Arthur J. Stevens, Esq., Lorillard; and William Shinn, Esq., Shook, Hardy & Bacon, Kansas City, Missouri, from CTR counsel Edwin J. Jacob, Jacob & Medinger, New York, New York. The memorandum described a proposal to research the relationship between stress and cardiac disorder, and stated, "I have discussed this with Bill Shinn, who agrees with me that this study is well worth doing and that we should recommend it to you for approval, financing to be handled through Special Account #4."

158. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 517004087-4090 (US 20874) (A).

159. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American caused Racketeering Act 44, letters, to be transmitted by mail on or about November 20, 1979. USX6390001-0400 at 0085 (US 89555) (O) (B&W Response to Request No. 318); see also ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

160. **Racketeering Act No. 45:** On or about November 27, 1979, defendant BROWN & WILLIAMSON did knowingly cause to be sent and delivered by the United States Mails a letter from Ernest

Pepples, Esq., Brown & Williamson Vice President and General Counsel, addressed to CTR counsel Edwin J. Jacob, Esq., Jacob & Medinger, 1270 Avenue of the Americas, New York, New York 10020, regarding a proposal to fund a study on the relationship between stress and cardiac disorder, and agreeing that the study should be financed through Special Account #4.

161. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research.

162. Defendant B&W caused Racketeering Act 45, a letter, to be transmitted by mail on or about November 27, 1979. USX6390001-0400 at 0086 (US 89555) (O) (B&W Response to Request No. 319); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

163. **Racketeering Act No. 46:** In or about 1979, the exact date being unknown, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly publish a document entitled "Fact or Fancy?" and caused copies of said document to be sent and delivered by the United States Mails to newspapers and news outlets. This publication contained statements asserting that smoking does not contribute to low birth weight in babies and suggesting that cigarette smoking is not harmful to women.

164. This communication misrepresented and concealed link between smoking and disease; misrepresented and concealed that smoking did not contribute to low birth weight in babies; and misrepresented and concealed that cigarette smoking is not harmful to women. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud.

TIMN0133740-3798 (US 21280) (A).

165. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 46, a publication, to be transmitted by mail in or about 1979. USX6390001-0400 at 0344 (US 89555) (O) (Response of Tobacco Institute to Request No. 179); Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

166. **Racketeering Act No. 47:** During 1979, the exact dates being unknown, defendant PHILIP MORRIS caused to be placed in various national magazines an advertisement for Merit cigarettes entitled "Best Move Yet," which magazines were then sent and delivered by the United States Mails to subscribers and others. The advertisement stated that Merit's "ability to satisfy over long periods of time could be the most important evidence to date that MERIT science has produced what it claims: The first real alternative for high tar smokers."

167. This communication concealed knowledge that smokers compensate by changing how they smoke to obtain sufficient delivery of nicotine and that "low tar/low nicotine" cigarettes like MERIT were designed so that smokers could obtain variable levels of tar and nicotine, and falsely implied that "low tar/low nicotine" cigarettes like MERIT are less hazardous. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud.

168. Defendant Philip Morris caused Racketeering Act 47, an advertisement, to be transmitted by mail during 1979. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616; ADV0180463-0465 (US 5951) (O).

169. **Racketeering Act No. 48:** During 1979, the exact dates being unknown, defendant PHILIP MORRIS caused to be placed in various national magazines an advertisement for Merit cigarettes entitled "Merit Taste Eases Low Tar Decision," which magazines were then sent and delivered by the United States Mails to subscribers and others. The advertisement stated that Merit's "ability to satisfy over long periods of time could be the most important evidence to date that MERIT is what it claims to be:

The first real alternative for high tar smokers."

170. This communication concealed the Defendants' knowledge that smokers compensate by changing how they smoke to obtain sufficient delivery of nicotine and that "low tar/low nicotine" cigarettes like MERIT were designed so that smokers could obtain variable levels of tar and nicotine; and falsely implied that "low tar/low nicotine" cigarettes like MERIT are less hazardous. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 1002325022-5022 (US 21510) (A).

171. Defendant Philip Morris caused Racketeering Act 48, an advertisement, to be transmitted by mail during 1979. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

172. **Racketeering Act No. 49:** On or about May 13, 1981, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained statements that members of the Tobacco Institute had a "long-standing policy" of discouraging smoking by children and suggested that smoking is a free choice when done by adults.

173. This communication misrepresented that members of the Tobacco Institute discouraged smoking by children; misrepresented and concealed that members of the Tobacco Institute marketed to youth; and misrepresented that smoking is a free choice when done by adults. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0102493-2494 (US 21271) (O).

174. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through

defendant Tobacco Institute, caused Racketeering Act 49, a press release, to be transmitted by mail on or about May 13, 1981. Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

175. **Racketeering Act No. 50:** On or about November 9, 1981, defendant BRITISH-AMERICAN TOBACCO COMPANY (predecessor to BAT INVESTMENTS) did knowingly cause a letter to be delivered by the United States Mails, and defendant BROWN & WILLIAMSON did thereafter receive, a letter addressed to Mr. J. Kendrick Wells III, Esq., Brown & Williamson, 1600 West Hill Street, P.O. Box 35090, Louisville, Kentucky 40232, and signed by Sarah Mash, Secretary to M.J. Leach, BAT Co. The letter referenced an enclosed "copy of the Parliamentary Brief in order that you can see how the B & W amendments have been incorporated into the text," and sought Wells ' approval of the revised document. Brown & Williamson's amendments intended to ensure that the Brief did not contain anything that could be construed as an admission regarding the health effects of smoking.

176. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question. 680585135-5135 (US 22976) (A).

177. Defendant British-American Tobacco Company (predecessor to BAT Investments) caused Racketeering Act 50, a letter, to be transmitted by mail on or about November 9, 1981. USX6390001-0400 at 0086 (US 89555) (O) (B&W Response to Request No. 324); USX6390001-0400 0054-0055 (US 89555) (O) (BATCo Response to Request No. 324); ARU1290012-0022 (US 86700) (O) (BATCo Stipulation at ¶ 1, citing Exhibit A); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

178. **Racketeering Act No. 51:** On or about December 17, 1981, defendant BRITISH-AMERICAN TOBACCO COMPANY (predecessor to BAT INVESTMENTS) did knowingly cause to be delivered by the United States Mails, and defendant BROWN & WILLIAMSON did thereafter receive, a letter addressed to J. Kendrick Wells III, Esq., Brown & Williamson, 1600 West Hill Street, P.O. Box 35090, Louisville, Kentucky 40232, and copied to

Don Hoel, Esq., Shook, Hardy & Bacon, Kansas City, Missouri, from M.J. Leach, BAT Co. The letter enclosed, for review by Wells and Ernest Pepples, another Brown & Williamson attorney, a draft "UK Parliamentary Brief" in which BAT Co.'s position on smoking and health incorporates "open controversy" language urged by Brown & Williamson.

179. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question. 680584974-4985 (US 21382) (A).

180. Defendant British-American Tobacco Company caused Racketeering Act 51, a letter, to be transmitted by mail on or about December 17, 1981. USX6390001-0400 at 0086-0087 (US 89555) (O) (B&W Response to Request No. 325); USX6390001-0400 at 0055 (US 89555) (O) (BATCo Response to Request No. 325); ARU1290012-0022 (US 86700) (O) (BATCo Stipulation at ¶ 1, citing Exhibit A); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

181. **Racketeering Act No. 52:** On or about February 12, 1982, defendant BROWN & WILLIAMSON did knowingly cause to be sent and delivered by the United States Mails a letter from Ernest Pepples, Esq., Brown & Williamson General Counsel, addressed to Patrick M. Sirridge, Esq., Shook, Hardy & Bacon, 20th Floor, Mercantile Tower, 1101 Walnut, Kansas City, Missouri. The letter concurs in the recommendation to renew an annual grant to Dr. Arthur Furst to be paid from Special Fund 4.

182. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 521029995-0008 (US 20887) (A).

183. Defendant B&W caused Racketeering Act 52, a letter, to be transmitted by mail on or about February 12, 1982. USX6390001-0400 at 0087 (US 89555) (O) (B&W Response to Request No. 326); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

184. **Racketeering Act No. 53:** On or about April 7, 1982, defendant BRITISH-AMERICAN TOBACCO COMPANY (predecessor to BAT INVESTMENTS) did knowingly cause to be delivered by the United States Mails, and defendant BROWN & WILLIAMSON did thereafter receive, a letter addressed to W.L. Telling, Esq., Brown & Williamson International Tobacco, 1600 West Hill Street, Louisville, Kentucky 40232, from G.O. Brooks, BAT Co. The letter replied to a request from Telling for a report on a Smoker Compensation Study that examined how a cigarette smoker's method of smoking alters tar and nicotine delivery, and enclosed "a paper from one of our recent Product Knowledge Seminars [entitled "Human Smoking Behaviour"] which contains a summary of the work and a number of the tables from the report."

185. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' false and misleading statements regarding nicotine addiction, manipulation, and delivery. 660913609-3633 (US 22763) (O).

186. Defendant British-American Tobacco Company caused Racketeering Act 53, a letter, to be transmitted by mail on or about April 7, 1982. USX6390001-0400 at 0087 (US 89555) (O) (B&W Response to Request No. 327); USX6390001-0400 at 0055-0056 (US 89555) (O) (BATCo Response to Request No. 327); ARU1290012-0022 (US 86700) (O) (BATCo Stipulation at ¶ 1, citing Exhibit A); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

187. **Racketeering Act No. 54:** On or about April 8, 1982, defendant BRITISH-AMERICAN TOBACCO COMPANY (predecessor to BAT INVESTMENTS) did knowingly cause to be delivered by the United States Mails, and defendant BROWN & WILLIAMSON did thereafter receive, a letter addressed to J. Kendrick Wells III, Esq., Corporate Counsel, Brown & Williamson, 1600 West Hill Street, Louisville, Kentucky 40232, from L.C.F. Blackman, BAT Co., in which Blackman informed Wells that "[w]e have acted on the various points you have made" regarding a BAT Co. position paper relating to smoking and health.

188. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question. 680585743-5743 (US 21723) (A).

189. Defendant British-American Tobacco Company caused Racketeering Act 54, a letter, to be transmitted by mail on or about April 8, 1982. USX6390001-0400 at 0088 (US 89555) (O) (B&W Response to Request No. 328); USX6390001-0400 at 0056 (US 89555) (O) (BATCo Response to Request No. 328); ARU1290012-0022 (US 86700) (O) (BATCo Stipulation at ¶ 1, citing Exhibit A); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

190. **Racketeering Act No. 55:** On or about April 14, 1982, defendant BAT INDUSTRIES (predecessor to BAT P.L.C.) did knowingly cause to be delivered by the United States Mails, and defendant BROWN & WILLIAMSON did thereafter receive, a letter addressed to Dr. I.W. Hughes, Brown & Williamson, 1600 West Hill Street, P.O. Box 35090, Louisville, Kentucky 40232, from T.J. Walker, BAT Industries, Windsor House, 50 Victoria Street, London SW1H ONL, England. The letter referenced materials regarding the "BAT Board Guidelines" on public affairs matters, and referred to enclosed "secret" papers entitled "Assumptions and Strategies of the Smoking Issues."

[Stricken]

191. **Racketeering Act No. 56:** On or about March 17, 1983,

defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained statements disputing the addictiveness of cigarette smoking.

192. This communication misrepresented and concealed link between smoking and disease; misrepresented and concealed evidence of the addictiveness of cigarettes; and falsely promised and misrepresented that Defendants wanted to and would conduct independent and disinterested research regarding smoking and disease and make the results of such research public. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TNWL0019638-9640 (US 21703) (O).

193. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 56, a press release, to be transmitted by mail on or about March 17, 1983. Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

194. **Racketeering Act No. 57:** On or about July 20, 1983, defendant BRITISH-AMERICAN TOBACCO COMPANY (predecessor to BAT INVESTMENTS) did knowingly cause to be delivered by the United States Mails, and defendant BROWN & WILLIAMSON did thereafter receive, a letter addressed to K. Wells, Esq., Brown & Williamson, 1600 West Hill Street, P.O. Box 35090, Louisville, Kentucky 40202, from Miss A. Johnson, BAT Co. The mailing included "the T.I.' s Australian booklet on the Waxman Hearings" and a note that Johnson had written "to Public Affairs Department about the way in which they can use Dr. Colby's article and the Waxman Hearings' summary in relation to the overseas companies." Johnson also informed Wells that BAT Co. intended to make the smoking and health "controversy" a "central issue" in future presentations to members of the British Parliament.

195. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts

to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question. 680583674-3674 (US 21383) (A).

196. Defendant British-American Tobacco Company caused Racketeering Act 57, a letter marked "air express," to be transmitted by mail on or about July 20, 1983. 680583674-3674 (US 21383) (A); see also ARU1290012-0022 (US 86700) (O) (BATCo Stipulation at ¶ 1, citing Exhibit A); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

197. **Racketeering Act No. 58:** On or about July 27, 1983, defendant PHILIP MORRIS, did receive from the United States Mails a letter addressed to Frederic S. Newman, Esq., Philip Morris International, 120 Park Avenue, New York, New York 10017, from Patrick M. Sirridge, Esq., Shook, Hardy & Bacon, Kansas City, Missouri, enclosing a memorandum summarizing research on the addictive features of nicotine conducted by Philip Morris and recommending suppression of such research.

198. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny the addictiveness of nicotine; Defendants' fraudulent efforts to suppress and conceal material information regarding the link between smoking and health; and Defendants' fraudulent efforts to misrepresent and conceal evidence of the addictiveness of cigarettes. 2046754720-4731 (US 20476) (A).

199. Defendant Philip Morris caused Racketeering Act 58, a letter, to be transmitted by mail from Kansas City, Missouri, to New York, New York, on or about July 27, 1983. 2046754720-4731 (US 20476) (A).

200. **Racketeering Act No. 59:** On or about September 9, 1983, defendant BAT INDUSTRIES (predecessor to BAT P.L.C.) did knowingly cause to be delivered by the United States Mails, and defendant PHILIP MORRIS did thereafter receive, a letter from P. Sheehy, Chairman of BAT Industries, addressed to George

Weissman, Philip Morris, Inc., 120 Park Avenue, New York, New York, 10017. The letter discussed an advertisement of Philip Morris' Holland affiliate, and stated: "I find it incomprehensible that Philip Morris would weigh so heavily the short-term commercial advantage from deprecating a competitor's brand while weighing so lightly the long-term adverse impact from an on-going anti-smoking programme. . . . In doing so, Philip Morris . . . makes a mockery of Industry co-operation on smoking and health issues. . . ."

[Stricken]

201. **Racketeering Act No. 60:** On or about January 23, 1984, defendant BRITISH-AMERICAN TOBACCO COMPANY (predecessor to BAT INVESTMENTS) did knowingly cause to be delivered by the United States Mails, and defendant BROWN & WILLIAMSON did thereafter receive, a letter addressed to Mr. E.E. Kohnhorst, Brown & Williamson, P.O. Box 35090, Louisville, Kentucky 40232, from C.I. Ayres, Group Research & Development Centre, BAT Co., Southampton, England, in which Ayres discussed and sought Kohnhorst's comments concerning an upcoming conference on nicotine to be held in Southampton on June 6-8, 1984. Ayres acknowledged the existence of articles in the scientific literature linking nicotine with various diseases and predicted that the Cigarette Companies would be "under pressure to reduce the delivery of nicotine. My translation is that, in the future, we have to evolve ways and means of ensuring that smaller amounts of nicotine continue to give a satisfactory 'reward' to the smoker."

202. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts relating to nicotine manipulation and delivery, and Defendants' fraudulent denials that nicotine is not addictive. 103498901-8902 (US 21384) (O).

203. Defendant British-American Tobacco Company caused Racketeering Act 60, a letter, to be transmitted by mail on or about January 23, 1984. USX6390001-0400 at 0088-0089 (US 89555) (O) (B&W Response to Request No. 334); USX6390001-0400 at 0058 (US 89555) (O) (BATCo Response to Request No. 334); ARU1290012-0022 (US 86700) (O) (BATCo Stipulation at ¶ 1, citing Exhibit A); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

204. **Racketeering Act No. 61:** In or about April 1984, the exact date being unknown, defendant REYNOLDS did knowingly cause to be placed in numerous publications nationwide, including *U.S. News and World Report*, a weekly magazine, an advertisement entitled "We don't advertise to children," which magazine was then sent and delivered by the United States Mails to subscribers and others. This advertisement contained the statement "we don't want young people to smoke," and further stated, "Kids don't pay attention to cigarette ads, and that's exactly as it should be."

205. This communication misrepresented that Reynolds did not target the youth market; concealed that Reynolds did target the youth market; and falsely stated that young people do not pay attention to cigarette advertising. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 505302573-2573 (US 21627) (O).

206. Defendant RJR caused Racketeering Act 61, an advertisement, to be transmitted by mail in or about April 1984. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

207. **Racketeering Act No. 62:** In or about July 1984, the exact dates being unknown, defendant REYNOLDS did knowingly cause to be sent and delivered by the United States Mails letters from Reynolds' employee Ann Griffin, addressed to various children who wrote to Reynolds. In the letter, Reynolds claimed to be engaged in an effort to determine the harmful effects of smoking for the benefit of smokers, promised to support disinterested research into smoking and health, and claimed that research had not revealed any "conclusive" evidence linking smoking to disease.

208. This communication contained false statements and misrepresentations that RJR was engaged in an effort to determine the harmful effects of smoking for the benefit of smokers; Reynolds's false promise to support independent, disinterested research into smoking and health; and false claim that research had not revealed any "conclusive" evidence linking smoking to disease; fraudulently concealed that the tobacco industry was funding, controlling, and managing

research that Defendants maintained was independent and disinterested; and furthered Defendants' fraudulent position that the link between smoking and disease was an open question. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 505465919-5919 (US 20741) (A).

209. Defendant RJR caused Racketeering Act 62, letters, to be transmitted by mail in or about July 1984.

210. **Racketeering Act No. 63:** On or about August 28, 1984, defendant BROWN & WILLIAMSON did knowingly cause to be sent and delivered by the United States Mails, and defendant BRITISH-AMERICAN TOBACCO CO., LTD. (predecessor to BAT INVESTMENTS) did thereafter receive, a letter addressed to Mr. Ray Pritchard, Deputy Chairman, BAT Co., P.O. Box 482, Westminster House, 7 Millbank, London, England, from Ernest Pepples, Esq., Senior Vice President and General Counsel of Brown & Williamson, enlisting the recipient's help in suppressing a BAT employee's conclusions regarding the addictiveness of nicotine because the conclusion contradicted the position taken by Brown & Williamson in ongoing litigation.

211. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' false and misleading statements regarding nicotine addiction, manipulation, and delivery. 521016787-6788 (US 22129) (A).

212. Defendant B&W caused Racketeering Act 63, a letter, to be transmitted by mail on or about August 28, 1984. USX6390001-0400 at 0089 (US 89555) (O) (B&W Response to Request No. 337); USX6390001-0400 at 0058-0059 (US 89555) (O) (BATCo Response to Request No. 337); ARU1290012-0022 (US 86700) (O) (BATCo Stipulation at ¶ 1, citing Exhibit

A); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

213. **Racketeering Act No. 64:** In or about 1984, the exact date being unknown, defendant REYNOLDS did knowingly cause to be placed in daily newspapers an advertisement entitled "Can we have an open debate about smoking?" which newspapers were then sent and delivered by the United States Mails to subscribers and others. In this advertisement Reynolds claimed that "studies which conclude that smoking causes disease have regularly ignored significant evidence to the contrary," that this "significant evidence" comes from research "completely independent of the tobacco industry," and that "reasonable people" would consider the link between smoking and disease to be an "open controversy."

214. This communication misrepresented and concealed the link between smoking and health; concealed that many of the doctors and scientists who believed that the question of smoking and health was still an open question were conducting research that was funded, controlled, and managed by Defendants, while Defendants maintained that such research was disinterested and independent; falsely claimed that reasonable people would consider the link between smoking and disease to be an "open controversy"; and furthered Defendants' fraudulent position that the link between smoking and disease was an open question. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 513943434-3434 (US 50268) (A).

215. Defendant RJR caused Racketeering Act 64, an advertisement, to be transmitted by mail in or about 1984. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

216. **Racketeering Act No. 65:** In or about 1984, the exact date being unknown, defendant REYNOLDS did knowingly cause to be placed in numerous newspapers and magazines nationwide, including *The New York Times*, a daily newspaper, an advertisement entitled "Smoking and health: Some facts you've never heard about," which newspapers and magazines were then

sent and delivered by the United States Mails to subscribers and others. This advertisement contained the statement, "You hear a lot these days about reports that link smoking to certain diseases. This evidence has led many scientists and other people to conclude that smoking causes these diseases. But there is significant evidence on the other side of this issue. It is regularly ignored by the critics of smoking. And you rarely hear about it in the public media. But, it has helped persuade many scientists that the case against smoking is far from closed." Further, the advertisement contained the statement, "No one wants to know the real answers more than R.J. Reynolds. That is why we are providing major funding for scientific research. The funds are given at arms length to independent scientists who are free to publish whatever they find. We don't know where such research may lead. But this much we can promise: when we find the answers, you'll hear about it."

217. This communication misrepresented and concealed the link between smoking and disease; concealed that many of the scientists who believed that the case against smoking was far from closed were conducting research that was funded, controlled, and managed by the Defendants; falsely claimed that no one wanted to know the real answers more than RJR; misrepresented that Defendants were funding independent, disinterested research; falsely claimed that funding for scientific research was given at arms length to independent scientists who were free to publish whatever they found; falsely claimed that the public would be told about the answers to the smoking and health questions; and furthered Defendants' fraudulent position that the link between smoking and disease was an open question. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud.

218. Defendant RJR caused Racketeering Act 65, an advertisement, to be transmitted by mail from in or about 1984.

219. **Racketeering Act No. 66:** On or about February 18, 1986, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN, through defendant COUNCIL FOR TOBACCO RESEARCH, did

knowingly cause to be sent and delivered by the United States Mails letters addressed separately to Alexander Holtzman, Esq., Philip Morris; Wayne W. Juchatz, Esq., Reynolds; Josiah Murray III, Esq., Liggett; Ernest Pepples, Esq., Brown & Williamson; Paul Randour, Esq., American; and Arthur J. Stevens, Esq., Lorillard, from Donald K. Hoel, Esq., Shook, Hardy & Bacon, Mercantile Bank Tower, 1101 Walnut, Kansas City, Missouri. The letter recommends funding the work of Dr. Theodor Sterling for the years 1986-1988 as a CTR Special Project.

220. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 2015047161-7163 (US 21809) (A).

221. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American, through Defendant CTR, caused Racketeering Act 66, letters, to be transmitted by mail on or about February 18, 1986. USX6390001-0400 at 0089 (US 89555) (O) (B&W Response to Request No. 340); USX6390215-0329 at 0314 (US 77413) (A) (RJR Response to Request No. 340); ARU1290012-0022 (US 86700) (O) (BATCo Stipulation at ¶ 1, citing Exhibit A); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

222. **Racketeering Act No. 67:** On or about February 25, 1986, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN, through defendant COUNCIL FOR TOBACCO RESEARCH, did knowingly cause to be sent and delivered by the United States Mails letters addressed separately to Alexander Holtzman, Esq., Philip Morris; Wayne W. Juchatz, Esq., Reynolds; Josiah S. Murray III, Esq., Liggett; Ernest Pepples, Esq., Brown & Williamson; Paul A. Randour, Esq., American; and Arthur J. Stevens, Esq., Lorillard, from Patrick M. Sirridge, Esq., Shook, Hardy & Bacon, 1101 Walnut, Kansas City, Missouri, counsel to CTR. The letter advised the Cigarette Companies to continue funding through CTR research by a "Special Fund" scientist.

223. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 507876416-6417 (US 21810) (A).

224. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American, through Defendant CTR, caused Racketeering Act 67, letters, to be transmitted by mail on or about February 25, 1986. USX6390001-0400 at 0089-0090 (US 89555) (O) (B&W Response to Request No. 341); USX6390215-0329 at 0314 (US 77413) (A) (RJR Response to Request No. 341); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

225. **Racketeering Act No. 68:** On or about March 11, 1986, defendant REYNOLDS did knowingly cause to be sent and delivered by the United States Mails a letter from Reynolds counsel Wayne W. Juchatz, Esq., and addressed to Patrick M. Sirridge, Esq., Shook, Hardy & Bacon, 1101 Walnut, Kansas City, Missouri, counsel to CTR, in which Reynolds approved payment through CTR to a scientist conducting "Special Fund" research.

226. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 507876414-6414 (US 22765) (A).

227. Defendant RJR caused Racketeering Act 68, a letter, to be transmitted by mail on or about March 11, 1986. WAX0022020-2135 at 2120 (US 77413) (A) (RJR Response to Request No. 342).

228. **Racketeering Act No. 69:** On or about March 13, 1986, defendant PHILIP MORRIS COMPANIES did knowingly cause to

be sent and delivered by the United States Mails a letter from Philip Morris Companies employee Helen Frustace addressed to Donald K. Hoel, Esq., Shook, Hardy & Bacon, Mercantile Bank Tower, 1101 Walnut, Kansas City, Missouri, indicating approval of request to support Dr. Theodore Sterling's research project "provided it is also approved by four other companies."

229. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 2025819186-9186 (US 37284) (O).

230. Defendant Altria Group caused Racketeering Act 69, a letter, to be transmitted by mail from New York, New York, to Kansas City, Missouri, on or about March 13, 1986.

231. **Racketeering Act No. 70:** On or about April 1, 1986, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN, through defendant COUNCIL FOR TOBACCO RESEARCH, did knowingly cause to be sent and delivered by the United States Mails letters addressed separately to Alexander Holtzman, Esq., Philip Morris; Wayne W. Juchatz, Esq., Reynolds; Josiah S. Murray III, Liggett; Ernest Pepples, Esq., Brown & Williamson; Paul A. Randour, Esq., American; and Arthur J. Stevens, Esq., Lorillard, from Donald K. Hoel, Esq., Shook, Hardy & Bacon, 1101 Walnut, Kansas City, Missouri, counsel to CTR. The letter advised the Cigarette Companies to continue funding through CTR research by a "Special Project" scientist.

232. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 507731656-1656 (US 21709) (O).

233. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American, through

Defendant CTR, caused Racketeering Act 70, a letter, to be transmitted by mail on or about April 1, 1986. USX6390001-0400 at 0090 (US 89555) (O) (B&W Response to Request No. 344).

234. **Racketeering Act No. 71:** On or about April 23, 1986, defendant PHILIP MORRIS COMPANIES did knowingly cause to be sent and delivered by the United States Mails a letter from Eric A. Taussig, Esq., Assistant General Counsel, Philip Morris Companies, addressed to Dr. Paul C. Mele, 3205 Whispering Pines Drive, Silver Spring, Maryland. The letter alleged that Dr. Mele had violated a confidentiality agreement with Philip Morris and warned that "[i]n the future, you are expected to comply" with the agreement.

235. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question; Defendants' false and misleading statements regarding nicotine addiction, manipulation, and delivery; Defendants' fraudulent promise to conduct independent, disinterested research; and their efforts to suppress and conceal material information regarding the link between smoking and adverse health effects. 2047340350-0350 (US 22772) (A).

236. Defendant Altria Group caused Racketeering Act 71, a letter, to be transmitted by mail from New York, New York, to Silver Spring, Maryland, on or about April 23, 1986. 2047340350-0350 (US 22772) (A).

237. **Racketeering Act No. 72:** On or about April 23, 1986, defendant PHILIP MORRIS COMPANIES did knowingly cause to be sent and delivered by the United States Mails a letter from Eric A. Taussig, Esq., Assistant General Counsel, Philip Morris Companies, addressed to Dr. Victor J. DeNoble, 5603 Fox Run Drive, Plainsboro, New Jersey. The letter alleged that Dr. DeNoble had violated a confidentiality agreement with Philip Morris and warned that "[i]n the future, you are expected to comply" with the agreement.

238. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question; Defendants' false and misleading statements regarding nicotine addiction, manipulation, and delivery; Defendants' fraudulent promise to conduct independent, disinterested research; and their efforts to suppress and conceal material information regarding the link between smoking and adverse health effects. 2077541354-1354 (US 44603) (A).

239. Defendant Altria caused Racketeering Act 72, a letter, to be transmitted by mail from New York, New York to Plainsboro, New Jersey, on or about April 23, 1986. 2077541354 (US 44603) (A).

240. **Racketeering Act No. 73:** On or about September 4, 1986, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN did knowingly cause to be sent and delivered by the United States Mails letters addressed separately to Alexander Holtzman, Esq., Philip Morris; Wayne W. Juchatz, Esq., Reynolds; Josiah S. Murray III, Liggett; Ernest Pepples, Esq., Brown & Williamson; Paul A. Randour, Esq., American; and Arthur J. Stevens, Esq., Lorillard, from Patrick M. Sirridge, Esq., Shook, Hardy & Bacon, 1101 Walnut, Kansas City, Missouri, advising the companies to continue funding research by a former "Special Project" scientist through the "Shook, Hardy & Bacon Special Account."

241. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question; Defendants' fraudulent promise to conduct independent, disinterested research; and their efforts to suppress and conceal material information regarding the link between smoking and adverse health effects. 507875961-5962

(US 20796) (A).

242. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American caused Racketeering Act 73, letters, to be transmitted by mail, on or about September 4, 1986. WAX0022020-2135 at 2121 (US 77413) (A) (RJR Response to Request No. 347); USX6390001-0400 at 0090 (US 89555) (O) (B&W Response to Request No. 347).

243. **Racketeering Act No. 74:** On or about September 10, 1986, defendant PHILIP MORRIS COMPANIES did knowingly cause to be sent and delivered by the United States Mails a letter from Eric A. Taussig, Esq., Assistant General Counsel, Philip Morris Companies, addressed to Dr. Paul C. Mele, 3205 Whispering Pines Drive, Silver Spring, Maryland. The letter alleged that Dr. Mele and Dr. DeNoble had violated their respective confidentiality agreements with Philip Morris and stated that "The Company cannot tolerate this kind of conduct. . . . Any further breach of your agreement will result in action being taken."

244. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question; Defendants' false and misleading statements regarding nicotine addiction, manipulation, and delivery; Defendants' fraudulent promise to conduct independent, disinterested research; and their efforts to suppress and conceal material information regarding the link between smoking and adverse health effects. 2043724074-4075 (US 21916) (A).

245. Defendant Altria Group caused Racketeering Act 74, a letter, to be transmitted by mail from New York, New York to Plainsboro, New Jersey and Silver Spring, Maryland, on or about September 10, 1986. 2043724074-4075 (US 21916) (A).

246. **Racketeering Act No. 75:** On or about September 10, 1986, defendant PHILIP MORRIS COMPANIES did knowingly cause to be sent and delivered by the United States Mails a letter from Eric

A. Taussig, Esq., Assistant General Counsel, Philip Morris Companies, addressed to Dr. Victor J. DeNoble, 5603 Fox Run Drive, Plainsboro, New Jersey. The letter alleged that Dr. DeNoble and Dr. Mele had violated their respective confidentiality agreements with Philip Morris and stated that "The Company cannot tolerate this kind of conduct. . . . Any further breach of your agreement will result in action being taken."

247. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question; Defendants' false and misleading statements regarding nicotine addiction, manipulation, and delivery; Defendants' fraudulent promise to conduct independent, disinterested research; and their efforts to suppress and conceal material information regarding the link between smoking and adverse health effects. 2043724074-4075 (US 21916) (A).

248. Defendant Altria Group caused Racketeering Act 75, a letter, to be transmitted by mail from New York, New York to Plainsboro, New Jersey and Silver Spring, Maryland, on or about September 10, 1986. 2043724074-4075 (US 21916) (A).

249. **Racketeering Act No. 76:** From about April 1, 1988, through about June 30, 1988, defendant REYNOLDS caused an advertisement for Camel cigarettes to be placed in various print media, including the "Sporting News and other Jumbo Jr. Size Magazines," which magazines were then sent and delivered by the United States Mails to subscribers and others. This advertisement was captioned "Get On Track With Camel's 75th Birthday!" and depicted the Joe Camel character in a Formula One-type automobile racing suit, opening a bottle of champagne, with racing cars whizzing by in the background.

250. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 509131846-1847 (US 20823) (O).

251. Defendant RJR caused Racketeering Act 76, an advertisement, to be transmitted by mail, from about April 1, 1988, through about June 30, 1988. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo); Order #616; TLT0430001-0002 (US 76783) (A) (*Car Craft,* 1988).

252. **Racketeering Act No. 77:** On or about April 19, 1988, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN, through defendant COUNCIL FOR TOBACCO RESEARCH, did knowingly cause to be sent and delivered by the United States Mails letters separately addressed to Alexander Holtzman, Esq., Philip Morris; Wayne W. Juchatz, Esq., Reynolds; Josiah Murray III, Esq., Liggett; Ernest Pepples, Esq., Brown & Williamson; Paul Randour, Esq., American; and Arthur J. Stevens, Esq., Lorillard, from Bernard V. O'Neill, Jr., Esq., Shook, Hardy & Bacon, One Kansas City Place, 1200 Main Street, Kansas City, Missouri. The letter recommended funding Dr. Alvan Feinstein's work in clinical epidemiology as a CTR Special Project for two years.

253. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 2015006928-6929 (US 21811) (A).

254. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American, through Defendant CTR, caused Racketeering Act 77, letters, to be transmitted by mail on or about April 19, 1988. USX6390001-0400 at 0091 (US 89555) (O) (B&W Response to Request No. 351); USX6390001-0400 at 0316 (US 89555) (O) (RJR Response to Request No. 351); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

255. **Racketeering Act No. 78:** On or about May 9, 1988, defendant PHILIP MORRIS COMPANIES did knowingly cause to be sent and delivered by the United States Mails a letter from Philip Morris Companies employee Helen Frustace addressed to Bernard

V. O'Neill, Jr., Esq., Shook, Hardy & Bacon, One Kansas City Place, 1200 Main Street, Kansas City, Missouri, indicating approval Dr. Rodger L. Bick's request for a one-year extension of the funding for his CTR Special Project.

256. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 2015006925-6925 (US 20310) (O).

257. Defendant Altria caused Racketeering Act 78, a letter, to be transmitted by mail from New York, New York to Kansas City, Missouri, on or about May 9, 1988. 2015006925-6925 (US 20310) (O).

258. **Racketeering Act No. 79:** On or about May 16, 1988, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained statements disputing the addictiveness of cigarette smoking.

259. This communication contained false and misleading statements disputing the addictiveness of cigarette smoking. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN371572-1573 (US 87438) (A) (*The New York Times*, May 17, 1988).

260. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 79, a press release, to be transmitted by mail on or about May 16, 1988. Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

261. **Racketeering Act No. 80:** On or about May 16, 1988, defendant

PHILIP MORRIS COMPANIES did knowingly cause to be sent and delivered by the United States Mails a letter from Philip Morris Companies employee Helen Frustace addressed to Donald K. Hoel, Esq., Shook, Hardy & Bacon, One Kansas City Place, 1200 Main Street, Kansas City, Missouri 64105. The letter indicated the approval of Alexander Holtzman, Esq., Philip Morris Companies, to renew Dr. Carl Seltzer's CTR Special Project funding.

262. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 2015006923-6923 (US 23047) (O).

263. Defendant Altria caused Racketeering Act 80, a letter, to be transmitted by mail, on or about May 16, 1988. 2015006923-6923 (US 23047) (O).

264. **Racketeering Act No. 81:** On or about July 1, 1988, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained statements disputing the addictiveness of cigarette smoking.

265. This communication contained false and misleading statements disputing the addictiveness of cigarette smoking. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0125189-5189 (US 77065) (A).

266. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 81, a press release, to be transmitted by mail on or about July 1, 1988. Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

267. **Racketeering Act No. 82:** On or about August 18, 1988,

defendant REYNOLDS did knowingly cause to be sent and delivered by the United States Mails a letter from Reynolds employee Jo F. Spach addressed to Mr. Anthony A. Christina, 815 188th Street, Court E, Spanaway, WA 98387. The letter denied any causal link between smoking and disease.

268. This communication misrepresented and concealed the link between smoking and disease. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 515792869-2869 (US 20869) (A).

269. Defendant RJR caused Racketeering Act 82, a letter, to be transmitted by mail on or about August 18, 1988. WAX0022020-2135 at 2123 (US 77413) (A) (RJR Response to Request No. 356).

270. **Racketeering Act No. 83:** During 1988, the exact dates being unknown, defendant REYNOLDS caused a multi-page advertisement for Camel cigarettes to be placed in various print media, including Sports Illustrated, which magazines were then sent and delivered by the United States Mails to subscribers and others. The second page of the advertisement, which was captioned, "Some have it. Most don't," stated, "You can have it free!" and contained a coupon for a free pack of Camels. The advertisement depicted Joe Camel in the foreground, with a beautiful woman sitting on the hood of a convertible automobile in the background.

271. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 509131376-1378 (US 20822) (O).

272. Defendant Reynolds caused Racketeering Act 83, an advertisement, to be transmitted by mail during 1988. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo); TLT0430003-0007 (US 76784) (A) (*Sports Illustrated,* 1988).

273. **Racketeering Act No. 84:** During 1989, the exact dates being unknown, defendant REYNOLDS caused advertisements for

Camel cigarettes, to be placed in various print media, including magazines, which magazines were then sent and delivered by the United States Mails to subscribers and others. The advertisements were part of Program No. 900162, which involved "buy one, get one free coupons" and included the following advertisements:

a. An advertisement with the words "Bored? Lonely? Restless? What you need is . . . ." This advertisement featured the face of a beautiful woman gazing at the reader.

b. An advertisement captioned "Camel Smooth Moves." One such advertisement offered "Smooth Move #325 - Foolproof Dating Advice," and "Smooth Move #334 - How to impress someone at the beach." The "Foolproof dating advice" concluded with "[a]lways break the ice by offering her a Camel." The "advice" concerning the beach facetiously suggested that the reader "[r]un into the water, grab someone and drag her back to the shore, as if you 've saved her from drowning. The more she screams, the better" and "[a]lways have plenty of Camels ready when the beach party begins."

c. An advertisement captioned "Smooth Move #437 - How to get a FREE pack even if you don't like to redeem coupons."

274. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 506876715-6718 (US 21712) (O).

275. Defendant RJR caused Racketeering Act 84, an advertisement, to be transmitted by mail during 1989. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo); TLT0430008-0014 (US 76785) (A) (*Car Craft,* May 1989).

276. **Racketeering Act No. 85:** On or about January 11, 1990, defendant REYNOLDS did knowingly cause to be sent and delivered by the United States Mails a letter addressed to Principal, Willow Ridge School, Amherst, New York, from Jo F. Sprach, Manager, Public Relations Department, Reynolds, claiming that defendants, in a sincere attempt to determine what harmful effects, if any, smoking might have on human health, established CTR, claiming that scientists do not know the causes of the chronic diseases reported to be associated with smoking, and stating that Reynolds intends to continue to support scientific research in a

continuing search for answers. The letter asked the recipient to pass this information along to her students.

277. This communication misrepresented and concealed link between smoking and disease; concealed that through CTR, RJR and the other Defendants were conducting research that was funded, controlled, and managed by Defendants while Defendants maintained that such research was independent and disinterested; and furthered Defendants' fraudulent position that the link between smoking and disease was an open question. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 508466199-6200 (US 20813) (A).

278. Defendant RJR caused Racketeering Act 85, a letter, to be transmitted by mail, interstate, on or about January 11, 1990.

279. **Racketeering Act No. 86:** On or about March 5, 1990, defendant REYNOLDS did knowingly cause to be sent and delivered by the United States Mails a letter addressed to Mark Green, New York City Commissioner of Consumer Affairs, from James W. Johnston, Chairman and CEO of Reynolds. In response to a letter sent by Green to Louis V. Gerstner, Jr., Chairman and CEO of RJR Nabisco (predecessor to RJR Tobacco Holdings), in which Green had complained about the design of the "Joe Camel" advertising campaign in such a manner as to appeal to youths, Johnston stated that it "has long been an R.J. Reynolds policy not to induce youths to smoke," further stating that, as CEO of Reynolds, "I have reinforced this policy," and "I see no basis to conclude that R.J. Reynolds has conducted itself in an unethical, illegal or misleading manner."

280. This communication falsely stated and misrepresented that Reynolds did not market to youths, and concealed Reynolds's fraudulent efforts to target the youth market. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 515796367-6367 (US 22718) (O).

281. Defendant RJR caused Racketeering Act 86, a letter, to be transmitted by mail on or about March 5, 2000. WAX0022020-2135 at 2125 (US 77413) (A) (RJR Response to Request No. 360).

282. **Racketeering Act No. 87:** On or about May 24, 1990, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained statements suggesting that Cigarette Companies actively discourage smoking by young people.

283. This communication falsely stated and misrepresented that cigarette companies actively discouraged smoking by young people, and concealed Defendants' fraudulent efforts to target the youth market. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute principal gravamen of the scheme to defraud. TIMN0020530-0531 (US 62795) (O).

284. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 87, a press release, to be transmitted by mail on or about May 24, 1990. USX6390001-0400 at 0396-0397 (US 89555) (O) (Tobacco Institute Response to Request No. 361); Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

285. **Racketeering Act No. 88:** On or about August 31, 1990, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN, through defendant COUNCIL FOR TOBACCO RESEARCH, did knowingly cause to be sent and delivered by the United States Mails letters addressed separately to Wayne W. Juchatz, Esq., Reynolds; Josiah S. Murray III, Esq., Liggett; Ernest Pepples, Esq., Brown & Williamson; Paul A. Randour, Esq., American; Arthur J. Stevens, Esq., Lorillard; Charles R. Wall, Esq., Philip Morris Companies, from Patrick M. Sirridge, Esq., Shook, Hardy & Bacon, 1200 Main Street, Kansas City, Missouri 64105, advising

that the Companies fund research to be conducted by a scientist who generated favorable results for defendants.

286. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 521100179-0180 (US 21812) (A).

287. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American, through Defendant CTR, caused Racketeering Act 88, letters, to be transmitted by mail on or about August 31, 1990. WAX0022020-2135 at 2125 (US 77413) (A) (RJR Response to Request No. 362); USX6390001-0400 at 0091(US 89555) (O) (B&W Response to Request No. 362); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

288. **Racketeering Act No. 89:** On or about September 18, 1990, defendant REYNOLDS did knowingly cause to be sent and delivered by the United States Mails a letter addressed to Joanna Brown, from Joan F. Cockerham of the Reynolds Public Relations Department. Responding to concerns expressed by Ms. Brown about the "Joe Camel" ad campaign appealing to youth, the letter stated, "Our intention with this campaign, as with all of our advertising, is to appeal only to adult smokers. We would not have launched the current Camel campaign if we thought its appeal was to anyone other than this group."

289. This communication falsely claimed that Reynolds's intention in designing the "Joe Camel" ad campaign, and other campaigns, was to appeal only to adult smokers; falsely claimed that Reynolds would not have launched the campaign if it thought it appealed to anyone other than adult smokers; and concealed Reynolds's fraudulent efforts to market to youth. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud.

507706384-6384 (US 20782) (O).

290. Defendant RJR caused Racketeering Act 89, a letter, to be transmitted by mail on or about September 18, 1990. WAX0022020-2135 at 2126 (US 77413) (A) (RJR Response to Request No. 363).

291. **Racketeering Act No. 90:** On or about October 2, 1990, defendant AMERICAN did knowingly cause to be sent and delivered by the United States Mails a letter addressed to Patrick M. Sirridge, Esq., Shook, Hardy & Bacon, 1200 Main Street, Kansas City, Missouri 64105, from Paul A. Randour, Esq., American Vice President and General Counsel, approving payment to a "Special Project" researcher.

292. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. ATX300004098-4098 (US 58613) (O).

293. Defendant American caused Racketeering Act 90, a letter, to be transmitted by mail on or about October 2, 1990. USX6390001-0400 at 0091-0092 (US 89555) (O) (B&W Response to Request No. 364).

294. **Racketeering Act No. 91:** On or about October 11, 1990, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release entitled "Major New Initiatives to Discourage Youth Smoking Announced" to be sent and delivered by the United States Mails to newspapers and news outlets. This press release contained statements suggesting that defendants had a "longstanding policy" of discouraging and preventing smoking by youth.

295. This communication falsely stated and misrepresented that Defendants discouraged youth smoking; and concealed Defendants' fraudulent efforts to target the youth

market. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0015615-5617 (US 21265) (A).

296. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 91, a press release, to be transmitted by mail on or about October 11, 1990. Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

297. **Racketeering Act No. 92:** On or about June 4, 1991, defendant PHILIP MORRIS COMPANIES did knowingly cause to be sent and delivered by the United States Mails a letter from Philip Morris Companies' Charles R. Wall, Esq., Vice President and Associate General Counsel, in New York, to: Philippa J. Casingena, Esq., British American Tobacco Company Ltd., England; John Evans, Esq., Ashurst Morris Crisp, England; Marion Funck, Esq., Reemtsma Cigaretten Fabriken GmbH, Germany; Alan D. Porter, Esq., Imperial Tobacco Limited, England; and James W. Seddon, Esq., Rothmans International Limited, in which Mr. Wall enclosed "a brief statement and a somewhat longer statement discussing the 'risk factor' language" relating defendants' position on the health effects of smoking.

298. This communication misrepresented and concealed the link between smoking and disease. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute principal gravamen of the scheme to defraud. 2023235511-5512 (US 22725) (A).

299. Defendant Altria Group caused Racketeering Act 92, a letter, to be transmitted by mail to England and Germany on or about June 4, 1991. 2023235511-5512 (US 22725) (A).

300. **Racketeering Act No. 93:** On or about December 11, 1991, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails addressed to newspapers and news outlets. This press release

contained statements suggesting that the majority of smokers in the United States are of legal age when they begin smoking and that defendants have discouraged youth smoking.

301. This communication falsely claimed and misrepresented that the majority of smokers in the United States are of legal age when they begin smoking; falsely claimed that Defendants have discouraged youth smoking; and concealed Defendants' fraudulent efforts to target the youth market. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. TIMN0019059-9060 (US 21266) (A); TIMN0019059-9060 (US 62790) (O).

302. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 93, a press release, to be transmitted by mail on or about December 11, 1991. Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

303. **Racketeering Act No. 94:** On or about January 28, 1992, defendant REYNOLDS did knowingly cause to be sent and delivered by the United States Mails a letter addressed to James Harrison, President of the Vermont Retail Grocers Association, from Yancey W. Ford, Jr., Executive Vice President for Sales of Reynolds, stating "R.J. Reynolds Tobacco Co. does not want youth to smoke" and denying in substance that the "Joe Camel" advertising campaign was directed at youth.

304. This communication misrepresented and concealed link between cigarette advertising and youth smoking; falsely claimed that Reynolds discouraged youth smoking; and misrepresented that Reynolds did not target youths. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 515011420-1422 (US 51932) (O).

305. Defendant RJR caused Racketeering Act 94, a letter, to be transmitted by mail on

or about January 28, 1992. WAX0022020-2135 at 2126 (US 77413) (A) (RJR Response to Request No. 368).

306. **Racketeering Act No. 95:** On or about May 18, 1992, defendant PHILIP MORRIS COMPANIES did knowingly cause to be sent and delivered by the United States Mails a letter from Charles R. Wall, Esq., Vice President and Associate General Counsel, Philip Morris Companies, addressed to Bernard O'Neill, Esq., Shook, Hardy & Bacon, 1200 Main Street, Kansas City, Missouri. The letter accompanied a check representing Philip Morris' contribution to the research efforts of Theodor D. Sterling.

307. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 2023230770-0770 (US 20384) (A).

308. New Defendant Altria caused Racketeering Act 95, a letter, to be transmitted by mail from New York, New York, to Kansas City, Missouri, on or about May 18, 1992. 2023230770-0770 (US 20384) (A).

309. **Racketeering Act No. 96:** On or about August 28, 1992, defendant REYNOLDS did knowingly cause to be sent and delivered by the United States Mails a letter addressed to Dr. Francis A. Neelon, Editor of the North Carolina Medical Journal, purporting to be from Dr. Robert G. Fletcher, Medical Director of Reynolds, but bearing a handwritten notation on the copy retained by Reynolds stating that it was "written by SWM for Dr. Fletcher," complaining about an article in the North Carolina Medical Journal, and stating about the author of the article, "He claims the tobacco industry spends huge amounts of money promoting its products to youth. This is blatantly false. None of Reynolds Tobacco's product advertising or promotions are directed toward anyone under the legal age to smoke."

310. This communication misrepresented and concealed the link between cigarette advertising and youth smoking; falsely claimed that Reynolds discouraged youth smoking and

did not target the youth market. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 512024008-4011 (US 22994) (O); 512024008-4011 (US 76095) (O).

311. Defendant RJR caused Racketeering Act 96, a letter, to be transmitted by mail on or about August 28, 1992. WAX0022020-2135 at 2127 (US 77413) (A) (RJR Response to Request No. 370).

312. **Racketeering Act No. 97:** During 1992, the exact dates being unknown, defendant REYNOLDS caused an advertisement captioned "Camel Lights" to be placed in various print media, including Sports Illustrated, a magazine, which magazines were then sent and delivered by the United States Mails to subscribers and others. The advertisement depicted Joe Camel wearing sunglasses, a tee shirt, and blue jeans, with a pack of cigarettes rolled up in his sleeve and a lit cigarette hanging from his mouth, and casually leaning against a convertible automobile.

313. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 509131534-1534 (US 21717) (O).

314. Defendant RJR caused Racketeering Act 97, an advertisement, to be transmitted by mail during 1992. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo); TLT 0430015-0016 (US 76786) (A) (*Sports Illustrated,* 1993).

315. **Racketeering Act No. 98:** On or about March 11, 1993, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN did knowingly cause to be sent and delivered by the United States Mails letters addressed separately to Wayne W. Juchatz, Esq., Reynolds; Ernest Pepples, Esq., Brown & Williamson; Gilbert L. Klemann, II, Esq., American; Arthur J. Stevens, Esq., Lorillard; and Charles R. Wall, Esq., Philip Morris Companies, from Bernard V. O'Neill, Jr., Esq., Shook, Hardy & Bacon, 1200 Main Street, Kansas City, Missouri 64105, advising that the Cigarette Companies continue to fund research to be conducted by a scientist who generated favorable results for defendants and seeking financial contributions in proportion to each

Cigarette Company's "market share" to support such research.

316. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question, and Defendants' fraudulent promise to conduct independent, disinterested research. 512678470-8473 (US 22979) (A).

317. Defendants Philip Morris, RJR, B&W, Lorillard, and American caused Racketeering Act 98, letters, to be transmitted by mail on or about March 11, 1993. USX6390001-0400 at 0092 (US 89555) (O) (B&W Response to Request No. 372); USX6390215-0329 at 0322 (US 89555) (O) (RJR Response to Request No. 372); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

318. **Racketeering Act No. 99:** On or about November 12, 1993, defendant REYNOLDS did knowingly cause to be sent and delivered by the United States Mails a letter addressed to Mr. Mark E. Smith, 26582 Mocine Avenue, Hayward, California 94544, from Reynolds employee Catherine Clinton. The letter denied the existence of any proof that smoking causes lung cancer, heart disease, or emphysema, and asserted that "a cause and effect relationship between smoking and disease has not been established."

319. This communication misrepresented and concealed the link between smoking and disease. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 513601091-1091 (US 21815) (O).

320. Defendant RJR caused Racketeering Act 99, a letter, to be transmitted by mail on or about November 12, 1993. USX6390215-0329 at 0322 (US 77413) (A) (Reynolds Response to Request No. 373).

321. **Racketeering Act No. 100:** In or about December 1994, the exact date being unknown, defendant PHILIP MORRIS did knowingly cause a draft press release to be prepared, which was released in a final version in June 1995 and disseminated to the public through United States Mails. This press release stated that "Philip Morris is taking aggressive steps to keep cigarettes out of the hands of young people" and that the company sought to eliminate access to cigarettes by minors.

322. This communication misrepresented that the Defendants discouraged youth smoking; misrepresented that the Defendants did not target the youth market; and concealed that Defendants market to youth. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 2500050140-0141 (US 21804) (A).

323. Defendant Philip Morris caused Racketeering Act 100, a press release, to be transmitted by mail in or about June 1995. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

324. **Racketeering Act No. 101:** On or about October 31, 1996, defendant BAT INDUSTRIES (predecessor to BAT P.L.C.) did knowingly cause to be transmitted in interstate commerce by means of the mails comments for publication in the Wall Street Journal, which newspaper was then sent and delivered by the United States Mails to subscribers and others. The Chief Executive of BAT Industries, Martin Broughton, denied charges that BAT Industries, including its Brown & Williamson subsidiary, concealed research linking smoking and disease. He stated: "We haven't concealed, we do not conceal and we will never conceal. We have no internal research which proves that smoking causes lung cancer or other diseases or, indeed, that smoking is addictive."

[Stricken]

325. **Racketeering Act No. 102:** During 1996, the exact dates being unknown, defendant REYNOLDS caused multi-page advertisements captioned "Take a Rockin' Road Trip" and "Go ahead, it's on me," to be placed in various print media, including magazines which were then sent and delivered by the United States Mails to subscribers and others. The advertisements depicted Joe Camel and offered gift certificates in the amount of $25 to purchase tickets "to just about any Ticketmaster event," in

exchange for 100 Camel Cash C-Notes.

326. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. IRA0011362-1362 (US 33060) (O).

327. Defendant RJR caused Racketeering Act 102, advertisements, to be transmitted by mail during 1996. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo); 509136305-6306 (US 76788) (A) (*Glamour*, April 1996).

328. **Racketeering Act No. 103:** On or about July 3, 1963, defendant BROWN & WILLIAMSON did knowingly cause to be sent by cable, and BRITISH-AMERICAN TOBACCO COMPANY (predecessor to BAT INVESTMENTS) received, a message from Addison Yeaman, Esq., Brown & Williamson General Counsel, to A.D. McCormick, Esq., BAT Co., in London, England, with copies to Messrs. Finch, Wade, and Griffith, reporting that W.T. Hoyt, Executive Director of the TIRC had agreed to withhold a Battelle report from TIRC members or the Scientific Advisory Board, and further agreed that submitting certain information to the Surgeon General would be "undesirable."

329. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question; Defendants' false and misleading statements regarding nicotine addiction, manipulation, and delivery; and Defendants' fraudulent promise to conduct independent, disinterested research. 689033421-3421 (US 31045) (O).

330. Defendant B&W caused Racketeering Act 103, a letter, to be transmitted by cable, on or about July 3, 1963. USX6390001-0400 at 0059-0060 (US 89555) (O) (BATCo Response to Request No. 377); USX6390001-0400 at 0092 (US 89555) (O) (B&W Response to Request No. 377); ARU1290012-0022 (US 86700) (O) (BATCo Stipulation at ¶ 2, citing Exhibit B);

ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 2, citing Exhibit B).

331. **Racketeering Act No. 104:** On or about July 22, 1970, defendant LORILLARD did knowingly cause to be sent by telegram, and defendant REYNOLDS did receive, a message from Arthur J. Stevens, Esq., Lorillard General Counsel, to Henry Ramm, Esq., Reynolds Vice President and General Counsel, transmitting Lorillard's agreement to participate in a CTR Special Project that involved sponsoring a conference on the benefits of smoking.

332. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question; Defendants' false and misleading statements regarding nicotine addiction, manipulation, and delivery; and Defendants' fraudulent promise to conduct independent, disinterested research. 508293416-3416 (US 21514) (O).

333. Defendant Lorillard caused Racketeering Act 104, correspondence, to be transmitted by telegram on or about July 22, 1970. USX6390215-0329 at 0323 (US 77413) (A) (RJR Response to Request No. 378).

334. **Racketeering Act No. 105:** On or about January 3, 1971, defendant PHILIP MORRIS did knowingly cause to be transmitted on the nationally televised CBS program *Face the Nation*, air date January 3, 1971, statements before a live television and radio audience by Joseph Cullman III, President and CEO of Philip Morris, that misrepresented Philip Morris' funding of independent research and denied that cigarettes are hazardous or pose a hazard to pregnant women or their infants.

335. This communication misrepresented and concealed the link between smoking and disease; falsely promised and misrepresented that Defendants wanted to and would conduct independent, disinterested research regarding smoking and disease; concealed that Philip Morris and the other Defendants were funding, controlling, and managing research that Defendants maintained was independent and disinterested; falsely denied that cigarettes are hazardous or

pose a hazard to pregnant women or their infants; and furthered Defendants' fraudulent position that the link between smoking and disease was an open question. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 1002605545-5564 (US 35622) (A).

336. Defendant Philip Morris caused Racketeering Act 105, statements, to be transmitted live on national television and radio, on or about January 3, 1971. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

337. **Racketeering Act No. 106:** On or about September 16, 1976, defendants BROWN & WILLIAMSON did knowingly cause to be transmitted, and BRITISH-AMERICAN TOBACCO COMPANY (predecessor to BAT INVESTMENTS) did receive, a letter cable addressed to G.C. Hargrove, BAT Co., London, England, from Ernest Pepples, Esq., Brown & Williamson, counseling BAT to maintain the same position in England as Brown & Williamson maintained in America that the use of tobacco is not unduly dangerous.

338. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question. 680273641-3643 (US 20998) (A).

339. Defendant B&W caused Racketeering Act 106, a letter, to be transmitted by cable, on or about September 16, 1976. USX6390001-0400 at 0093 (US 89555) (O) (B&W Response to Request No. 380); ARU1290012-0022 (US 86700) (O) (BATCo Stipulation at ¶ 3, citing Exhibit C); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 2, citing Exhibit B).

340. **Racketeering Act No. 107:** On or about February 25, 1981, defendant REYNOLDS did knowingly cause to be sent by telex a message from Reynolds's employee Frank Colby addressed to Wilfried Dembach, Cologne, Germany, discussing the disciplining

of a company employee who admitted publicly that smoking plays a significant role in causing cancer.

341. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question. 504331775-1776 (US 22738) (O).

342. Defendant RJR caused Racketeering Act 107, a message, to be transmitted by telex, on or about February 25, 1981. 504331775-1776 (US 22738) (O).

343. **Racketeering Act No. 108:** On or about October 26, 1983, defendants BAT INDUSTRIES (predecessor to BAT P.L.C.) and PHILIP MORRIS did knowingly cause to be transmitted a telephone conversation between BAT Industries employee Eric Alfred Albert Bruell, Esq., and Philip Morris Vice President Hugh Cullman, in which the participants agreed to continue the Cigarette Companies' internal agreement not to compete with one another on issues relating to smoking and health.

344. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question; Defendants' fraudulent promise to conduct independent, disinterested research; Defendants' fraudulent efforts to suppress development and marketing of a less hazardous cigarette; and Defendants' fraudulent efforts to conceal and suppress material information relating to the link between smoking and adverse health effects. 301030943-0944 (US 46577) (A).

345. Defendant Philip Morris caused Racketeering Act 108, a conversation, to be transmitted by telephone, on or about October 26, 1983. 301030943-0944 (US 46577) (A).

346. **Racketeering Act No. 109**: On or about April 14, 1994, defendant PHILIP MORRIS did knowingly cause to be transmitted the

testimony of the President and Chief Executive Officer of Philip Morris, William I. Campbell, which was presented at a nationally televised hearing of the House Subcommittee on Health and the Environment. During this hearing, Mr. Campbell denied that nicotine is addictive, denied that Philip Morris research establishes that smoking is addictive, and denied that Philip Morris manipulates the amount of nicotine contained in cigarettes.

347. This communication falsely denied that nicotine was addictive; falsely denied that Philip Morris research established that smoking was addictive; and falsely denied that Philip Morris manipulated the amount of nicotine delivered to smokers. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 2023195738-5892 (US 21990) (A).

348. Defendant Philip Morris caused Racketeering Act 109, statements, to be transmitted by television, on or about April 14, 1994. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616; 2023195738-5892 (US 21990) (A).

349. **Racketeering Act No. 110:** On or about April 14, 1994, defendant REYNOLDS did knowingly cause to be transmitted the testimony of the Chairman and Chief Executive Officer of Reynolds, James Johnston, which was presented at a nationally televised hearing of the House Subcommittee on Health and the Environment. During this hearing, Mr. Johnston denied that nicotine is addictive and denied that Reynolds manipulates the amount of nicotine contained in cigarettes.

350. This communication falsely denied that nicotine is addictive; misrepresented that RJR did not manipulate the amount of nicotine delivered to smokers; and concealed that Reynolds manipulated the amount of nicotine delivered to smokers. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 2023195738-5892 (US 21990) (A).

351. Defendant RJR caused Racketeering Act 110, statements, to be transmitted by television, on or about April 14, 1994. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616; 2023195738-5892 (US 21990) (A).

352. **Racketeering Act No. 111:** On or about April 14, 1994, defendant LORILLARD did knowingly cause to be transmitted the testimony of the Chief Executive Officer of Lorillard, Andrew H. Tisch, which was presented at a nationally televised hearing of the House Subcommittee on Health and the Environment. During this hearing, Mr. Tisch denied that Lorillard manipulates the amount of nicotine contained in cigarettes.

353. This communication misrepresented that Lorillard did not manipulate the amount of nicotine delivered to smokers. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 2023195738-5892 (US 21990) (A).

354. Defendant Lorillard caused Racketeering Act 111, statements, to be transmitted by television, on or about April 14, 1994. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616; 2023195738-5892 (US 21990) (A).

355. **Racketeering Act No. 112:** On or about April 14, 1994, defendant LIGGETT did knowingly cause to be transmitted the testimony of the Chairman and Chief Executive Officer of Liggett, Edward A. Horrigan, Jr., which was presented at a nationally televised hearing of the House Subcommittee on Health and the Environment. During this hearing, Mr. Horrigan denied that Liggett manipulates the amount of nicotine contained in cigarettes.

356. This communication misrepresented that Liggett did not manipulate the amount of nicotine delivered to smokers. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 2023195738-5892 (US 21990) (A).

357. Defendant Liggett caused Racketeering Act 112, statements, to be transmitted by

television, on or about April 14, 1994. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616; 2023195738-5892 (US 21990) (A).

358. **Racketeering Act No. 113:** On or about April 14, 1994, defendant AMERICAN did knowingly cause to be transmitted the testimony of the Chief Executive Officer of American, Donald S. Johnston, which was presented at a nationally televised hearing of the House Subcommittee on Health and the Environment. During this hearing, Mr. Johnston denied that American manipulates the amount of nicotine contained in cigarettes.

359. This communication misrepresented that American did not manipulate the amount of nicotine delivered to smokers. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 2023195738-5892 (US 21990) (A).

360. Defendant American caused Racketeering Act 113, statements, to be transmitted by television, on or about April 14, 1994. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616; 2023195738-5892 (US 21990) (A).

361. **Racketeering Act No. 114:** On or about May 9, 1994, defendant PHILIP MORRIS did knowingly cause to be transmitted a telefax letter addressed to The Honorable Henry Waxman, Chairman, Subcommittee on Health and the Environment, Committee on Energy and Commerce, 2415 Rayburn House Office Building, Washington, D.C. 20515-6118, from Dr. Cathy Ellis, Director of Research, Philip Morris. The letter denied that nicotine causes addiction, based on a definition of addiction overwhelmingly rejected by public and mental health professionals: "intoxication, pharmacological tolerance, and physical dependence in a manner that would impair the smokers' ability to exercise a free choice to continue or to quit smoking."

362. This communication falsely denied that nicotine causes addiction. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 2029200293-0294 (US 21537) (O).

363. Defendant Philip Morris caused Racketeering Act 114, a letter, to be transmitted by telefax on or about May 9, 1994. ARU0892192-2230 at 2226 (US 86709) (A) (Philip Morris Responses to Request No. 388).

364. **Racketeering Act No. 115:** On or about April 27, 1995, defendant BROWN & WILLIAMSON did transmit and cause to be transmitted a telephone call placed by Brown & Williamson employee Melanie Gnadinger to Brown & Williamson Japan employee Hiromi Mikami in furtherance of defendants' public assertions that smoking does not cause disease.

365. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the link between smoking and disease was an open question. 450010016-0019 (US 21539) (O).

366. Defendant B&W caused Racketeering Act 115, a conversation, to be transmitted by telephone, on or about April 27, 1995. 450010016-0019 (US 21539) (O); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 2).

367. **Racketeering Act No. 116:** During 1999, the exact dates being unknown, defendant BROWN & WILLIAMSON did knowingly cause to be posted on the Brown & Williamson Internet web site a document entitled "Hot Topics: Smoking and Health Issues. The company stated:

> Brown & Williamson believes that the relevant issue should not be how or whether one chooses to define cigarette smoking as addictive based on an analysis of all definitions available. Rather, the issue should be whether consumers are aware that smoking may be difficult to quit (which they are) and whether there is anything in cigarette smoke that impairs smokers from reaching and implementing a decision to quit (which we believe there is not).

368. This communication falsely denied that smoking is addictive. This

communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 280400081-0082 (US 76600) (A).

369. Defendant B&W caused Racketeering Act 116, a statement, to be transmitted by its web site during 1999. USX6390001-0400 at 0094 (US 89555) (O) (B&W Response to Request No. 390); ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 2).

370. **Racketeering Act No. 117:** On or about November 20, 1962, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails addressed to newspapers and news outlets. This press release was entitled "TOBACCO INSTITUTE HEAD CALLS N.A.B. PRESIDENT'S CHARGES INCORRECT" and was issued in response to a comment by LeRoy Collins, President of the National Association of Broadcasters, that cigarette advertising is designed primarily to influence high school children.

371. This communication falsely denied that Defendants targeted their products to the youth market. This communication was for the purpose of executing the scheme to defraud because it constitutes the principal gravamen of the scheme to defraud. MNAT00280070-0070 (US 21724) (O).

372. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 117, a press release, to be transmitted by mail on or about November 20, 1962. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

373. **Racketeering Act No. 118:** On or about April 27, 1964, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, LIGGETT, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails addressed to newspapers and news outlets. This press release was

entitled "CIGARETTE MANUFACTURERS ANNOUNCE ADVERTISING CODE" and was issued to announce a so-called Cigarette Advertising Code establishing "uniform standards for cigarette advertising" to include standards relating to youth advertising, and other marketing activities, and the provision that "cigarette advertising shall not represent that cigarette smoking is essential to social prominence, distinction, success, or sexual attraction."

374. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied, and to deceive the public by fraudulently representing that they did not and would not market to youths. 2025345360-5362 (US 20414) (A); (*The New York Times*, April 28, 1964 (US 21608) (O)); HT0033177-3177 (US 21620) (O) (*The Wall Street Journal*, April 28, 1964); HT0033181-3182 (US 21621) (O) (AP article published on April 28, 1964 in *Chicago Tribune* and *Chicago Daily News*).

375. Defendants Philip Morris, RJR, B&W, Lorillard, Liggett, and American, through defendant Tobacco Institute, caused Racketeering Act 118, a press release, to be transmitted by mail on or about April 27, 1964. See ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1).

376. **Racketeering Act No. 119:** On or about November 15, 1967, defendant AMERICAN, did knowingly cause an advertisement to be sent and delivered by the United States Mails as an attachment to a letter of Nov 15, 1967 of that same date. The advertisement states that Carlton filter cigarettes delivers "70% less 'tar' than the average filter king."

377. This communication is relevant to and was in furtherance of Defendants' fraudulent efforts to exploit smokers' desire for less hazardous cigarettes, and Defendants' fraudulent and misleading representations regarding low tar and "light" cigarettes. This communication was for the purpose of executing the scheme to defraud because it constitutes the

principal gravamen of the scheme to defraud.

378. Defendant American caused Racketeering Act 119, an advertisement, to be transmitted by mail on or about November 15, 1967. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

379. **Racketeering Act No. 120:** On or about April 22, 1970, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant COUNCIL FOR TOBACCO RESEARCH, did knowingly cause a press release to be sent and delivered by the United States Mails addressed to newspapers and news outlets. This press release was entitled "STUDIES RAISE QUESTIONS ABOUT SMOKING AS HEALTH HAZARD," and was issued to identify studies supported by the Council for Tobacco Research that call into question whether "smoking has actually been shown to be a health hazard," or that there is a link between smoking and diseases such as lung cancer and emphysema.

380. This communication misrepresented and concealed the link between smoking and disease, and contained false promises and misrepresentations that the Defendants supported independent, disinterested research into the link between smoking and disease. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute the principal gravamen of the scheme to defraud. 500015901-5905 (US 47778) (A).

381. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through Defendant CTR, caused Racketeering Act 120, a press release, to be transmitted by mail on or about April 22, 1970. McAllister PD, Philip Morris, 5/24/02, 57:10-22.

382. **Racketeering Act No. 121:** On or about March 15, 1974 defendant REYNOLDS, did knowingly cause to be sent and delivered by the United States Mails a letter to National Family Opinion, 711 S. St. Clair Street, Toledo, Ohio 43691. The purpose of the letter is a request by Reynolds that, when National Family Opinion conducts its consumer surveys, it continue to question 14 through 17 year olds as well as 18 year olds.

383. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 500487414-7416 (US 21865) (A).

384. Defendant RJR caused Racketeering Act 121, a letter, to be transmitted by mail from Winston-Salem, North Carolina, to Toledo, Ohio, on or about March 15, 1974.

385. **Racketeering Act No. 122:** On or about September 24, 1974, defendant REYNOLDS did knowingly cause to be sent and delivered by the United States Mails, a letter and attachments regarding "Salem Back-Up Advertising and Creative Development Statement" to Mr. A. M. Allen, William Esty Company, Inc., 100 East 42nd Street, New York, New York. The purpose of the letter and attachments is to review Salem's advertising strategy and the effect it has on "young adults." The attachment statement refers to reviewing the Brand's image in the following manner: "This Brand 'personality' positioning will also provide, as a secondary benefit, an image which will improve Salem's attractiveness to . . . current Kool smokers . . . as well as to the majority of young adult smokers entering the cigarette market for the first time."

386. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 501721136-1140 (US 21868) (O).

387. Defendant RJR caused Racketeering Act 122, a letter and attachments, to be transmitted by mail on or about September 24, 1974.

388. **Racketeering Act No. 123:** On or about March 1, 1976, defendant COUNCIL FOR TOBACCO RESEARCH did knowingly cause to be sent and delivered by the United States Mails a letter and manuscript from Theodor D. Sterling, Director, Simon Fraser University, to Dr. William U. Gardner, Scientific Director, Council for Tobacco Research, that attributed the health effects of smoking to occupation. The letter, referring to the manuscript, states that "Smokers turn out to come from mostly blue collar occupations

where they are exposed with high probability to toxic dust, fumes, and chemicals."

389. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to Defendants' fraudulent efforts to misrepresent and conceal information relating to the link between smoking and disease. 11011805-1805 (US 34576) (O).

390. Defendant CTR caused Racketeering Act 123, a letter and manuscript, to be transmitted by mail on or about March 1, 1976. McAllister PD, Philip Morris, 5/24/02, 106:13-23.

391. **Racketeering Act No. 124:** On or about June 21, 1977, defendant BROWN & WILLIAMSON did knowingly cause to be sent and delivered by the United States Mails, a letter addressed to Mr. Andy Miller, McCann-Erickson, 485 Lexington Avenue, New York, New York, from D.A. Litwin, a letter discussing a project on marketing opportunities, and segmenting the cigarette market into the following flavor categories: "Taste," "Taste with implicit health benefit," "Taste with contemporaneous health benefit," and "Explicit health benefit."

392. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease and Defendants' fraudulent efforts to exploit smokers' desires for less hazardous cigarettes. 660041050-1051 (US 20952) (O).

393. Defendant B&W caused Racketeering Act 124, a letter, to be transmitted by mail from Louisville, Kentucky, to New York, New York on or about June 21, 1977. 660041050-1051 (US 20952) (O). See ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

394. **Racketeering Act No. 125:** On or about May 4, 1979, defendant BROWN & WILLIAMSON did knowingly cause to be sent and delivered by the United States Mails, a letter addressed to Mr. Joseph A. Califano, Jr., Secretary of Health, Education, and Welfare, Washington, DC 20201, from C.I. McCarty, Chairman, responding to letter of April 26, 1979 from Mr. Califano that urged Brown & Williamson to dedicate a percentage of its advertising budget to youth smoking prevention efforts. McCarty stated B&W's "policy against advertising or promoting the sale of cigarettes to persons under 21," and stated that it "does not have at hand the research data and other information necessary to a responsible analysis of the suggestion made in [the April 26 letter]."

395. This communication falsely denied that Defendants targeted their products to the youth market, and concealed material information relating to Defendants' fraudulent efforts to target the youth market. This communication was for the purpose of executing the scheme to defraud because it constitutes the principal gravamen of the scheme to defraud. 521038912-8912 (US 20890) (A).

396. Defendant B&W caused Racketeering Act 125, a letter, to be transmitted by mail from Louisville, Kentucky, to Washington, D.C., on or about May 4, 1979. 521038912-8912 (US 20890) (A). See ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

397. **Racketeering Act No. 126:** On or about May 18, 1979, defendant LIGGETT did knowingly cause to be sent and delivered by the United States Mails, a letter addressed to Mr. Joseph A. Califano, Jr., Secretary of Health, Education, and Welfare, Washington, DC 20201, from Raymond J. Mulligan, President, responding to a letter of April 26, 1979 from Mr. Califano, identifying that millions of children are regular cigarette smokers, and urging Liggett to dedicate a percentage of its advertising budget to youth smoking prevention efforts. Mulligan stated that "this Company does not promote or advertise its cigarette products to children or young people under twenty-one years of age, nor are our promotional

activities and advertising aimed at encouraging such children and young people to begin smoking or even continue smoking." The letter further stated that "Cigarette smoking is an adult pleasure and custom" and referred to industry policies aimed at "limiting the pleasure of smoking to adults."

398. This communication falsely denied that Defendants targeted their products to the youth market, and concealed material information relating to Defendants' fraudulent efforts to target the youth market. This communication was for the purpose of executing the scheme to defraud because it constitutes the principal gravamen of the scheme to defraud. 1003058023-8024 (US 20149) (A).

399. Defendant Liggett caused Racketeering Act 126, a letter, to be transmitted by mail from Durham, North Carolina, to Washington, D.C., on or about May 18, 1979. 1003058023-8024 (US 20149) (A).

400. **Racketeering Act No. 127:** On or about June 1, 1979, defendant BROWN & WILLIAMSON did knowingly cause to be sent and delivered by the United States Mails, a letter addressed to Mr. Joseph A. Califano, Jr., Secretary of Health, Education, and Welfare, Washington, DC 20201, from C.I. McCarty, Chairman, responding to a letter of April 26, 1979 from Mr. Califano, identifying that millions of children are regular cigarette smokers, and urging Liggett to dedicate a percentage of its advertising budget to youth smoking prevention efforts. McCarty stated: "We do not want children to smoke not because we agree with your oft-repeated slogan that smoking is 'slow-motion suicide' but because the decision whether to smoke, we think, is a decision which should be made by adults, not children. . . . I have serious doubts about the effectiveness of any campaign directed toward children advising them to postpone making the decision to smoke until they are adults. Such a campaign could backfire. Children might elect to smoke as a rebellion against authority or in an attempt to show adult behavior."

401. This communication falsely denied that Defendants targeted their products to the

youth market; concealed material information relating to Defendants' fraudulent efforts to target the youth market; and fraudulently denied the link between smoking and adverse health effects. This communication was for the purpose of executing the scheme to defraud because it constitutes the principal gravamen of the scheme to defraud. 660008960-8961 (US 21524) (A).

402. Defendant B&W caused Racketeering Act 127, a letter, to be transmitted by mail from Louisville, Kentucky, to Washington, D.C., on or about June 1, 1979. 660008960-8961 (US 21524) (A). See ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

403. **Racketeering Act No. 128:** On or about May 4, 1981, defendant REYNOLDS did knowingly cause to be sent and delivered by the United States mail, a letter from Warren Cowan, President, Rogers & Cowan, Inc., to Mr. Gerald Long, Executive Vice President, Reynolds, discussing Rogers & Cowan's past and continuing efforts on behalf of Reynolds to have smoking featured favorably "in a prominent way" in movies, with celebrities, on television, and in other arenas.

404. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 503579240-9244 (US 20718) (O).

405. Defendant RJR caused Racketeering Act 128, a letter, to be transmitted by mail from Beverly Hills, California, to Winston-Salem, North Carolina or about May 4, 1981.

406. **Racketeering Act No. 129:** On or about April 13, 1983, defendant BROWN & WILLIAMSON did knowingly cause a contract to be placed in the United States mail from Artistry Limited, Pinewood Studios, Iver Health, Bucks, England, to Brown & Williamson, through N.V. Domantay, Vice President, Brand Management, memorializing the agreement to place Barclay outdoor advertising displays in the film "Supergirl."

407. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 675048039-8042 (US 20976) (O).

408. Defendant B&W caused Racketeering Act 129, a contract, to be transmitted by mail from Bucks, England, to Louisville, Kentucky, on or about April 13, 1983. 675048039-8042 (US 20976) (O). See ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 1, citing Exhibit A).

409. **Racketeering Act No. 130:** On or about October 20, 1983, defendants PHILIP MORRIS INC., REYNOLDS, BROWN & WILLIAMSON, AND LORILLARD, through defendant TOBACCO INSTITUTE, did knowingly cause to be transmitted on the nationally televised ABC program *20/20*, air date October 20, 1983, before a live television audience, statements by Anne Browder of the Tobacco Institute that include "We feel very strongly that cigarette smoking is an adult custom that one should not even consider until they've reached the age of maturity," "We do everything possible to discourage teenage smoking," and "age of maturity is 21."

410. This communication contained false and misleading statements regarding Defendants' fraudulent efforts to target the youth market. This communication was for the purpose of executing the scheme to defraud because it constitutes the principal gravamen of the scheme to defraud. 690149518-9531 at 9520 (US 21046) (A); 690149518-9531 (US 78732) (A).

411. Defendants Philip Morris Inc., RJR, B&W, and Lorillard, through defendant Tobacco Institute, caused Racketeering Act 130, statements, to be transmitted by television, on or about October 20 1983. 690149518-9531 (US 21046) (A); 690149518-9531 (US 78732) (A).

412. **Racketeering Act No. 131:** On or about January 14, 1986, defendant PHILIP MORRIS did knowingly cause to be sent and delivered by the United States Mails, an advertising contract

addressed to the Los Angeles Dodgers, Inc., Advertising and Novelty Department, 1000 Elysian Park Ave., Los Angeles, California, for the purpose of placing Marlboro advertising in the 1986 Dodger scorecard and magazine available at Dodger major league baseball games.

413. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 2041595387-5387 (US 38212) (O).

414. Defendant Philip Morris caused Racketeering Act 131, an advertising contract, to be transmitted by mail from Los Angeles, California to New York, New York, on or about January 14, 1986. 2041595387-5387 (US 38212) (O).

415. **Racketeering Act No. 132:** On or about May 16, 1988, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails addressed to newspapers and news outlets. This press release was entitled "CLAIMS THAT CIGARETTES ARE ADDICTIVE CONTRADICT COMMON SENSE" and was issued in response to the Surgeon General's Report on nicotine addiction.

416. This communication contained false and misleading statements that nicotine was not addictive and that discredited the evidence that nicotine is addictive. This communication was for the purpose of executing the scheme to defraud because it constitutes the principal gravamen of the scheme to defraud. TIMN0019963-9963 (US 21239) (A).

417. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 132, a press release, to be transmitted by mail on or about May 16, 1988. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

418. **Racketeering Act No. 133:** On or about July 29, 1988, defendants PHILIP MORRIS, REYNOLDS, BROWN & WILLIAMSON, LORILLARD, and AMERICAN, through defendant TOBACCO INSTITUTE, did knowingly cause a press release to be sent and delivered by the United States Mails addressed to newspapers and news outlets. This press release quoted Mr. Charles O. Whitley of the Institute as stating "that the Surgeon General's Report 'undermines efforts to combat drug abuse,' " and that the Report calling cigarette smoking an addiction was "without medical or scientific foundation."

419. This communication contained false and misleading statements that nicotine was not addictive and that discredited the evidence that nicotine is addictive. This communication was for the purpose of executing the scheme to defraud because it constitutes the principal gravamen of the scheme to defraud. TIMN0125189-5189 (US 77065) (A).

420. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Racketeering Act 133, a press release, to be transmitted by mail on or about July 29, 1988. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

421. **Racketeering Act No. 134:** On or about April 5, 1990, defendant REYNOLDS did knowingly cause to be sent by wire and mail a memorandum from R.G. Warlick, Division Manager, to all area sales representatives instructions to list in their "Y.A.S. accounts" "[a]ll package action calls located across from, adjacent to [or] in the General vicinity of High Schools or College Campus. (under 30 years of age)."

422. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 507834615-4616 (US Ex. 21540*) (O).

423. Defendant RJR caused Racketeering Act 134, a memorandum, to be transmitted

by wire and mail on or about April 5, 1990. 507834615-4616 at 4615 (US Ex. 21540*) (O).

424. **Racketeering Act No. 135:** In or about 1999, the exact dates being unknown, defendant BROWN & WILLIAMSON did knowingly cause to be placed in newspapers and magazines nationwide an advertising campaign for KOOL cigarettes captioned "B Kool," which newspapers and magazines were then sent and delivered by the United States Mails to subscribers and others. Among several treatments, "B Kool" advertising depicted attractive young women gazing longingly back at a man in the foreground holding a lighted cigarette and a pack of Kools. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. (US 14557) (O).

425. Defendant B&W caused Racketeering Act 135, an advertisement, to be transmitted by mail in or about 1999. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo).

426. **Racketeering Act No. 136:** In or about 1999, the exact dates being unknown, defendant REYNOLDS did knowingly cause to be placed in newspapers and magazines a nationwide advertising campaign for Camel cigarettes captioned "Viewer Discretion Advised," which newspapers and magazines were then sent and delivered by the United States Mails to subscribers and others. Among several treatments, advertisements depicted a "farmer's daughter" scene that included a young man being run off by the irate father of an attractive blonde female. The caption reads, "VIEWER DISCRETION ADVISED. This ad contains: SS... Satisfied Smoking FV... Farm Violence AN ... Animal Nudity. *Mighty Tasty!*"

427. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 98402886-2888 (US 57307) (O).

428. Defendant RJR caused Racketeering Act 136, an advertisement, to be transmitted

by mail in or about 1999. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo); TLT0430033-0035 (US 76795) (A).

429. **Racketeering Act No. 137:** In or about 2000, the exact dates being unknown, defendant PHILIP MORRIS did knowingly cause a nationwide advertising campaign for Marlboro cigarettes captioned "Marlboro Country," to be placed in radio and television broadcasts, newspapers, which broadcasts and newspapers and magazines were then sent and delivered by the United States Mails or by wire transfer to subscribers and others. Among several treatments, advertisements often depicted a cowboy smoking or handling cigarettes in a western setting.

430. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. ADV0810166-0168 (US 14325) (A) .

431. Defendant Philip Morris caused Racketeering Act 137, an advertisement, to be transmitted by mail in or about 2000. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo); Order #616.

432. **Racketeering Act No. 138:** In or about 2000, the exact dates being unknown, defendant PHILIP MORRIS did knowingly cause a nationwide advertising campaign for Virginia Slims cigarettes, to be placed in newspapers and magazines, which newspapers and magazines were then sent and delivered by the United States Mails to subscribers and others. Among several treatments, advertisements often depicted slim, independent, well-dressed attractive women smoking cigarettes.

433. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. ADV0810242-0244 (US 14345) (A).

434. Defendant Philip Morris caused Racketeering Act 138, an advertisement, to be

transmitted by mail in or about 2000. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo); Order #616.

435. **Racketeering Act No. 139:** In or about 2001, the exact dates being unknown, defendant REYNOLDS did knowingly cause to be placed in newspapers and magazines a nationwide advertising campaign for Camel cigarettes captioned "Pleasure to Burn," which newspapers and magazines were then sent and delivered by the United States Mails to subscribers and others. Among several treatments, "Pleasure to Burn" advertising depicted attractive young men and young women smoking cigarettes or offering cigarettes, including series that are entitled, "7 Pleasures of the Casbah," "Turkish Gold," "Flavors of the Exotic," and "Turkish Jade."

436. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 524649701-9712 (US 21750) (O).

437. Defendant RJR caused Racketeering Act 139, an advertisement, to be transmitted by mail in or about 2001. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo).

438. **Racketeering Act No. 140:** In or about 2001, the exact dates being unknown, defendant REYNOLDS did knowingly cause to be placed in newspapers and magazines nationwide an advertising campaign for Winston cigarettes captioned "No Bull," which newspapers and magazines were then sent and delivered by the United States Mails to subscribers and others. Among several treatments, "No Bull" advertising depicted attractive young men and young women smoking cigarettes or offering cigarettes often in circumstances involving irreverent humor or sporting events, and touted that the Winston brand cigarettes had "100% Tobacco" and "No Additives".

439. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease, including the issue of whether the

link between smoking and disease was an open question. Moreover, this communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. 517509202-9211 (US 21752) (O).

440. Defendant RJR caused Racketeering Act 140, an advertisement, to be transmitted by mail in or about 2001. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo).

441. **Racketeering Act No. 141:** In or about 2001, the exact dates being unknown, defendant BROWN & WILLIAMSON did knowingly cause to be placed in newspapers and magazines a nationwide advertising campaign for KOOL cigarettes captioned "House of Menthol," which newspapers and magazines were then sent and delivered by the United States Mails to subscribers and others.

442. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. ADV0830349-0351 (US 14472) (A).

443. Defendants B&W caused Racketeering Act 141, an advertisement, to be transmitted by mail in or about 2001. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo); Order #616.

444. **Racketeering Act No. 142:** In or about 2001, the exact dates being unknown, defendant LORILLARD did knowingly cause to be placed in newspapers and magazines a nationwide advertising campaign for Newport cigarettes captioned "Pleasure! Fire It Up!," which newspapers and magazines were then sent and delivered by the United States Mails to subscribers and others. Among several treatments, "Pleasure! Fire It Up!" advertising depicted attractive young men and young women smoking cigarettes or offering cigarettes often in circumstances involving sports and other physical activities.

445. This communication was for the purpose of executing the scheme to defraud

because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease. Moreover, this communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. ADV0100745-0747 (US 2702) (A); ADV0100475-0477 (US 2616) (A).

446. Defendant Lorillard caused Racketeering Act 142, an advertisement, to be transmitted by mail in or about 2001. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo).

447. **Racketeering Act No. 143:** During June 2001, the exact dates being unknown, defendant LORILLARD did knowingly cause to be posted on the Lorillard Internet web site a document entitled "Marketing and Promotion." The section of the website entitled "Marketing and Promotion" represents that "Lorillard does not and will not design or implement any marketing or promotional program intended to encourage youth to smoke cigarettes, and will continue to utilize only those advertising, promotional and marketing materials that do not, directly or indirectly, target youth."

448. This communication contained false and misleading statements denying Defendants' fraudulent efforts to target the youth market. This communication was for the purpose of executing the scheme to defraud because it constitutes the principal gravamen of the scheme to defraud. VXA0104165-4166 (US 72746) (O) (Lorillard.website).

449. Defendant Lorillard caused Racketeering Act 143, a statement, to be transmitted over its Internet web site during June 2001. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 11).

450. **Racketeering Act No. 144:** During 1999 and through June 2001, the exact dates being unknown, defendant BROWN &

> WILLIAMSON did knowingly cause to be posted on the Brown & Williamson Internet web site a document entitled "Hot Topics: Corporate Responsibility." The section of the document entitled "Marketing Principles and Practices: Advertising," represents that "the intended audience for all B&W marketing programs is adults 21 and over."

451. This communication contained false and misleading statements denying Defendants' fraudulent efforts to target the youth market. This communication was for the purpose of executing the scheme to defraud because it constitutes the principal gravamen of the scheme to defraud. TLT0770044-0049 (US 86656) (A) (B&W website).

452. Defendant B&W caused Racketeering Act 144, a statement, to be transmitted over its Internet web site during 1999 and through June 2001. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 11); see ARU6460266-0288 (US 86699) (O) (B&W Stipulation at ¶ 2, citing Exhibit B).

> 453. **Racketeering Act No. 145:** During June 2001, the exact dates being unknown, defendant PHILIP MORRIS did knowingly cause to be posted on the Philip Morris Internet web site a document entitled "Philip Morris U.S.A. Marketing Policies." The section of the website entitled "Philip Morris U.S.A. Marketing Policies" represents that "All of our brand advertising and promotions are intended for adults who choose to smoke. They serve to enhance brand awareness, recognition and loyalty among adult smokers."

454. This communication contained false and misleading statements denying Defendants' fraudulent efforts to target the youth market. This communication was for the purpose of executing the scheme to defraud because it constitutes the principal gravamen of the scheme to defraud. Defendant Philip Morris caused Racketeering Act 145, a statement, to be transmitted over its Internet web site during June 2001. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 11); 2085287818-7820 (US 87440) (A) (Philip Morris

U.S.A. Web Site page dated February 2, 2001).

455. **Racketeering Act No. 146:** During June 2001, the exact dates being unknown, defendant R.J. REYNOLDS did knowingly cause to be posted on the R.J. Reynolds Internet web site a document entitled "Marketing Philosophy." The section of the website entitled "Marketing Philosophy" represents that "Reynolds Tobacco is not interested in, and does nothing aimed at, trying to persuade any nonsmokers to begin smoking."

456. This communication contained false and misleading statements regarding Defendants' fraudulent efforts to market to youth. This communication was for the purpose of executing the scheme to defraud because it constitutes the principal gravamen of the scheme to defraud. TLT0770095-0128 (US 72410) (A) (RJR website).

457. Defendant RJR caused Racketeering Act 146, a statement, to be transmitted over the Internet web site during June 2001. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 11); TLT0370600-0603 (US 76633) (A).

458. **Racketeering Act No. 147:** In or about 2001, the exact dates being unknown, defendant PHILIP MORRIS did knowingly cause a nationwide advertising campaign for Marlboro cigarettes captioned "Marlboro Country," to be placed in radio and television broadcasts, newspapers, which broadcasts and newspapers and magazines, were then sent and delivered by the United States Mails or by wire transfer to subscribers and others. Among several treatments, advertisements often depicted a cowboy smoking or handling cigarettes in a western setting.

459. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. ADV0900513-0515 (US 15245) (A).

460. Defendant Philip Morris caused Racketeering Act 147, an advertisement, to be transmitted over the radio and by mail, in or about 2001. ARU6450762-0791 (US 75941) (O)

(Declaration of Carlotta Figliulo at 2, ¶ 4); Order #616.

461. **Racketeering Act No. 148:** In or about 2001, the exact dates being unknown, defendant PHILIP MORRIS INC. did knowingly cause a nationwide advertising campaign for Virginia Slims cigarettes, to be placed in newspapers and magazines, which newspapers and magazines were then sent and delivered by the United States Mails to subscribers and others. Among several treatments, advertisements often depicted slim, independent, well-dressed attractive women smoking cigarettes.

462. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied. ADV0440004-0006 (US 11200) (A).

463. Defendant Philip Morris caused Racketeering Act 148, an advertisement, to be transmitted over the radio and by mail, in or about 2001. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo at 2, ¶ 4).

E. <u>Additional Instances of Mail and Wire Fraud Violations</u>

464. Defendants Philip Morris, RJR, B&W, and Lorillard caused their respective advertisements listed within Instances #149 - #577 to be transmitted by mail from 1998 to 2003. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo and Ex. B attached thereto).

465. These communications were for the purpose of executing the scheme to defraud because they transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied.

466. Defendants Philip Morris, RJR, B&W, and Lorillard caused their respective advertisements listed within Instances #578 - #734 to be transmitted by mail during 2000.

ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo).

467. These communications were for the purpose of executing the scheme to defraud because they transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied.

468. Defendants Philip Morris, RJR, B&W, and Lorillard caused their respective light/low tar advertisements listed within Instances #750 - #788 to be transmitted by mail from 1998 to 2003. ARU6450762-0791 (US 75941) (O) (Declaration of Carlotta Figliulo).

469. These communications are relevant to and were in furtherance of Defendants' fraudulent efforts to exploit smokers' desires for less hazardous cigarettes, and Defendants' fraudulent and misleading representations regarding low tar and "light" cigarettes. These communications were for the purpose of executing the scheme to defraud, as they constitute the principal gravamen of the scheme to defraud.

470. Defendant Philip Morris mailed sixteen issues of its Marlboro Unlimited magazine, from the spring 1997 premier issue to the winter 2000 issue. 3000100738-0871 (US 47298) (A); Dudreck PD, United States v. Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

471. Defendant Philip Morris caused Instance 735, a magazine, to be transmitted by mail during spring 1997. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

472. Defendant Philip Morris caused Instance 736, a magazine, to be transmitted by mail during summer 1997. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

473. Defendant Philip Morris caused Instance 737, a magazine, to be transmitted by mail during winter 1997. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

474. Defendant Philip Morris caused Instance 738, a magazine, to be transmitted by mail during spring 1998. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

475. Defendant Philip Morris caused Instance 739, a magazine, to be transmitted by mail during summer 1998. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

476. Defendant Philip Morris caused Instance 740, a magazine, to be transmitted by mail during fall 1998. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

477. Defendant Philip Morris caused Instance 741, a magazine, to be transmitted by mail during winter 1998. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

478. Defendant Philip Morris caused Instance 742, a magazine, to be transmitted by mail during spring 1999. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

479. Defendant Philip Morris caused Instance 743, a magazine, to be transmitted by mail during summer 1999. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

480. Defendant Philip Morris caused Instance 744, a magazine, to be transmitted by

mail during fall 1999. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

481. Defendant Philip Morris caused Instance 745, a magazine, to be transmitted by mail during winter 1999. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

482. Defendant Philip Morris caused Instance 746, a magazine, to be transmitted by mail during spring 2000. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

483. Defendant Philip Morris caused Instance 747, a magazine, to be transmitted by mail during summer 2000. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

484. Defendant Philip Morris caused Instance 748, a magazine, to be transmitted by mail during fall 2000. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

485. Defendant Philip Morris caused Instance 749, a magazine, to be transmitted by mail during winter 2000. 3000100738-0871 (US 47298) (A); Dudreck PD, Philip Morris, 8/26/03, 454:5-13, 455:16-456:25, 457:9-458:20, 458:21-460:2.

486. Defendant Philip Morris's Marlboro Unlimited communications were for the purpose of executing the scheme to defraud because they transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to target the youth market, which they publicly denied.

487. Defendant RJR caused Instance 789, a statement, to be transmitted over the

Internet web site during August 2003. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 12)

488. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking, i.e., second-hand smoke, and disease.

489. Defendant B&W caused Instance 790, a statement, to be transmitted over the Internet web site during August 2003. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 12).

490. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny there was a link between smoking, i.e. second-hand smoke, and disease.

491. Defendant Liggett caused Instance 791, an advertisement, to be transmitted by mail in November 2001. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 12); Order #616.

492. This communication is relevant to and was in furtherance of Defendants' fraudulent efforts to exploit smokers' desires for "safer" cigarettes.

493. Defendant Liggett caused Instance 792, a press release, to be transmitted by mail on or about February 2001. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 12; Order #616.

494. This communication is relevant to and was in furtherance of Defendants' fraudulent efforts to exploit smokers' desires for "safer" cigarettes.

495. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through

defendant Tobacco Institute, caused Instance 793, a press release, to be transmitted by mail in January 1993. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 3, ¶ 10); Order #616.

496. This communication was for the purpose of executing the scheme to defraud because it transmitted information relevant to and in furtherance of Defendants' fraudulent efforts to deny there was a link between smoking, i.e. second-hand smoke, and disease.

497. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Instance 794, an advertisement, to be transmitted by mail in May 1970. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 12); Order #616; Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4. .

498. This communication contained the false statement that Defendant Tobacco Institute "believes the American public is entitled to complete, authenticated information about cigarette smoking and health." This communication was for the purpose of executing the scheme to defraud as it is a misrepresentation, constituting the principal gravamen of the scheme to defraud.

499. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Instance 795, an advertisement, to be transmitted by mail in November 1969. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 12); Order #616; Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

500. This communication, attacking American Cancer Society and American Heart Association commercials which informed the public that cigarette smoking reduces a smoker's life by 8.3 years, furthered Defendants' fraudulent position that the link between smoking and

disease was an open question.

501. Defendants Philip Morris, RJR, B&W, Lorillard, and American, through defendant Tobacco Institute, caused Instance 796, a press release, to be transmitted by mail in October 1966. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 12); Order #616; Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4.

502. This communication that Defendants know of "no valid scientific evidence demonstrating that either 'tar' or nicotine is responsible for any human illness" is relevant and to and was in furtherance of Defendants' fraudulent efforts to deny that there was a link between smoking and disease.

503. Defendants Philip Morris, RJR, B&W, Liggett, Lorillard, and American, through defendant Tobacco Institute, caused Instance 797, a press release, to be transmitted by mail in July 1963. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 12); Order #616; Dawson TT, 1/12/05, 9928:19-9929:10; Dawson WD, 36:1-4. .

504. This communication falsely stated and misrepresented that Defendants did not promote or encourage smoking among youth when, in fact, they did. This communication was for the purpose of executing the scheme to defraud because its false statements and misrepresentations constitute principal gravamen of the scheme to defraud.

505. Defendant Philip Morris caused Instance 798, a public statement, to be transmitted by mail in March 1954. ARU6450056-0079 (US 75940) (O) (Declaration of Patricia A. Tobin, at 4, ¶ 12); Order #616.

506. This communication from Defendant Philip Morris that it would cease from selling cigarettes if it had any knowledge of the product's harmfulness, was made falsely and for

the purpose of executing the scheme to defraud because its falsity constitutes a principal gravamen of the scheme to defraud.

V

REMEDIES

A. Overview

1. Defendants' fraudulent conduct and RICO violations are reasonably likely to continue unless this Court imposes comprehensive equitable remedies to prevent and restrain such conduct.

2. On June 27, 2005, the United States submitted a detailed proposed order setting out a package of comprehensive equitable relief. Defendants have not submitted an alternative remedial scheme, nor did they put on any evidence that would support alternative remedies short of those the United States has requested.

(1) Defendants' Fraudulent Conduct Has a Very Real Human Toll

3. Dr. Timothy Wyant analyzed the smoking attributable adverse health effects among smokers who became addicted as youth (the "Youth Addicted Population," as calculated by Dr. Jonathan Gruber). The staggering magnitude of smoking attributable adverse health effects for the Youth Addicted Population demonstrates some of the immense suffering and human toll that Defendants' fraudulent conduct inflicts upon the American people. (But only some; the Youth Addicted Population does not include all smokers within the time period encompassed by this case.)

4. The Youth Addicted Population is defined as all people who smoked more than five cigarettes a day by the time they were twenty-one years old (regardless of whether or how long they continued smoking beyond age 21). Wyant WD, 10:3-9. From 1954 to 2000, 57 million adult smokers became addicted as youths. Id., 11:7-10.

5. By 2050, 13.4 million of the 57 million adults who became addicted as youth

between 1954 and 2000 will die of smoking. In addition, these 13.4 million smokers who die of smoking will collectively lose 173.5 million years of life due to their premature deaths, thus losing on average 12.9 years of life per smoker. By 2050, the 57 million adults in the Youth Addicted Population will suffer an additional 107.6 million disease treatment years for major smoking caused diseases beyond the number of such years that never-smokers will experience. Wyant WD, 13:1-23; TW001-W001 (US 17406) (A). None of these figures include deaths or treatment years attributable to secondhand smoke or conditions related to pregnancy or pregnancy outcomes. Wyant WD, 14:1-16.

6. The financial toll is also enormous. Recent studies demonstrate the enormous annual economic impact of smoking on the national economy; the financial cost of lost productivity due to death and disease is even higher than the cost of medical care. In 2004, the Surgeon General reported that smoking is responsible for $81 billion per year in lost productivity, on top of $75 billion per year for medical care expenses, for a total smoking-related cost of approximately $157 billion per year. TLT0930001-0949, ch. 7 at 869 (US 88621) (A).

7. Within the 57 million current adult smokers in the Youth Addicted Population alone, the elevated annual health care costs associated with these additional disease treatment years by 2050 will accumulate to $839.8 billion (in 2001 dollars). Wyant WD, 14:1-16; US 17406 (A). When the cost of treating smoking-attributable diminished health in this population is included, the total health care costs by 2050 due to smoking in this population is over one trillion dollars. Wyant WD, 133:3-7; TW019C-019C (US 17740) (A).

8. As Dr. Richard Carmona, the U.S. Surgeon General, testified, "approximately 440,000 people a year in the United States die prematurely from smoking, and smoking remains the largest preventable cause of death in the United States." The Surgeon General further

testified, referring to the 2004 Surgeon General's Report, that "every day nearly 5,000 people under 18 years of age try their first cigarette, and in 2001, an estimated 46.2 million American adults smoked." As the Surgeon General stated, "these numbers represent an enormous emotional and financial burden for their families and for our health care system." Carmona WD, 1:19-1:21, 11:24-11:26; TLT0930001-0949 at 0006 (US 88621) (A). The Surgeon General also concluded, in the 2004 Surgeon General's Report, that "[t]here have been more than 12 million premature deaths attributable to smoking since the first published Surgeon General's report on smoking and health in 1964." TLT0930001-0949 at 0861 (US 88621) (A).

9. As the 2000 Surgeon General's report states, "what may be the foremost obstacle to changing the social norm of smoking [is] the multifaceted actions of the industry in preventing prevention. . . . . Taken together, and backed by the enormous resources of the industry, these efforts have considerable impact in promoting tobacco use and retarding efforts to reduce or prevent it." VXA1240104-0567 at 0156 (US 64316) (A).

10. Defendants' consistent denigration over the past half-century of the toll its product has on human health amply demonstrates its status as a deviant and rogue industry. Brandt TT, 9/28/04, 973:22-974:12.

(2) Basic Injunctive Relief Will Not Be Sufficient on Its Own

11. An order comprised solely of basic injunctive relief directed at Defendants, i.e., commanding or preventing an action, would be insufficient to prevent and restrain Defendants from future RICO violations. It is reasonably likely that Defendants would find ways to evade, undermine, or circumvent any Court order that solely imposed basic injunctive relief. Therefore, additional forms of injunctive relief are required to prevent and restrain Defendants from future RICO violations. These additional forms include the smoking cessation program proposed by

the United States (discussed in § V.B., infra), the youth smoking reduction remedy proposed by the United States' expert Jonathan Gruber (discussed in § V.D., infra), the requirement of corrective statements (discussed in § V.E, infra), the disclosure of documents, disaggregated marketing data, and health and safety risks (discussed in § V.F., infra), comprehensive review of defendants' business practices (discussed in § V.G., infra), and separate Court-appointed officials to investigate and adjudicate compliance with this Court's Orders.

12. For decades, Defendants have evaded, undermined, circumvented, and violated past prohibitions and commands. Their responses to past commands and prohibitions concerning youth marketing illustrate why several portions of this Court's Order are necessarily broad (such as the portion of the Court's order that prohibits Defendants from engaging in any marketing activities which a Court-appointed officer finds have the effect of marketing cigarettes in a manner appealing to youth). Such broad wording is necessary to prevent and restrain future unlawful conduct that these Defendants have demonstrated a propensity to engage in by evading, sidestepping, undermining and circumventing past specifically-worded prohibitions and past generally-worded prohibitions that lack adequate enforcement mechanisms.

13. As summarized below, Defendants claimed that their 1964 Advertising Code prohibited youth marketing, but they swiftly evaded its force by eliminating its Code Administrator enforcement mechanism. When the Broadcast Ban prohibited television and radio advertisements, they circumvented it by turning to event sponsorships and billboard advertising. When the MSA prohibited billboard advertising and limited event sponsorships, they circumvented it by turning to price promotions and evading its event sponsorship limits. Although this Court is obliged to impose appropriate basic injunctions – for example, by restricting price promotions on the top youth brands and by prohibiting motor sport sponsorships

– Defendants' past conduct demonstrates why the Court must also impose a broadly-worded prohibition on all youth-appealing marketing and go beyond basic injunctions to institute a reliable Court-appointed enforcement mechanism.

(a) Advertising Code of 1964

14. Through Defendants' voluntary Advertising Code of 1964, Defendants subjected themselves to self-imposed prohibitions on youth-oriented advertisements (as well as advertisements that made health claims). The Advertising Code was thus of the same form as a basic injunction, commanding or preventing particular actions. Specifically, key aspects of the Code prohibited: (1) advertising in television or radio programs or in publications primarily directed to persons under twenty-one years of age; (2) advertising that represents cigarette smoking as essential to social prominence, distinction, success, or sexual attraction; (3) advertising using models or other characterizations who appear under twenty-five years of age; (4) advertising suggesting that healthy-looking models derive their attractiveness from smoking or that good health is due to smoking; (5) using sports celebrities that have special appeal to persons under twenty-one years of age; (6) sampling to persons under twenty-one; (7) advertising depicting a smoker as participating in, or obviously having just participated in, a physical activity requiring stamina or athletic conditioning beyond normal recreation; and (8) advertising making health claims. MNAT00608606-8614 (US 21228) (A).

15. Defendants publicly highlighted that their 1964 Advertising Code created a Code Administrator to enforce its provisions. Indeed, the second sentence of their April 27, 1964 press release announcing the Code trumpeted, "An independent Administrator will enforce the Code." 2025345360-5362 at 5360 (US 20414) (A).

16. The Advertising Code commanded Defendants to submit all cigarette

advertisements to the Code Administrator for pre-publication review and clearance to ensure that they complied with the Code's prohibitions on youth marketing. MNAT00608606-8614 at 8608 (US 21228) (A); 1964 Advertising Code at 3 (JD 011171) (A). However, by 1967, several tobacco companies had already backed out of the Code Administrator enforcement provision. For example, Lorillard's CEO, Manuel Yellen, withdrew Lorillard's participation in the Code Administrator provision in a March 25, 1966 letter, stating:

> The Code was essentially the cigarette industry's response to a recognized need for industry self-regulation during a time of uncertainty over the course of future legislative and regulatory action.
>
> It is our belief that the circumstances which led to the establishment of the Code administration have now significantly changed. . . .
>
> Accordingly, we now wish to advise you of our resignation

03595414-5415 (US 21385) (O).

17. By 1970, there was no Code Administrator at all, because Defendants had decided to abandon the office of the Code Administrator. Defendants' own expert, Dr. Langenfeld, acknowledged on cross-examination that the Advertising Code provisions that commanded Defendants to submit all cigarette advertisements for the Code Administrator's pre-publication review and approval lost all force, and the Advertising Code's youth marketing restrictions have had no enforcement mechanism since 1970. Langenfeld TT, 3/10/05, 15191:3-15193:13; see also US FF § III.E(3)(a), supra. Within half a decade, in other words, Defendants removed themselves from the Advertising Code's command to submit all advertisements to the Code Administrator for pre-publication review by the simple expedient of removing the Code Administrator.

18. Even though Defendants eliminated the Advertising Code's enforcement mechanism, they repeatedly referred to the Advertising Code over the following decades as

preventing them from marketing to young people. ATX040294056-4056 (US 58599) (A); 2021183859-3862 at 3859 (US 36717) (A). Specifically, Defendants have repeatedly publicly stated that the Advertising Code prohibits them from marketing to persons under twenty-one. Krugman WD, 166:3-167:12.

19. Nonetheless, Defendants have not adhered to these promises. Although the Advertising Code has numerous generally-worded prohibitions concerning various kinds of youth marketing, it has not stopped Defendants from marketing and advertising to individuals under twenty-one, and their marketing practices have been contrary to the letter and spirit of the Code. Id. at 179:5-9; see generally US FF § III.E(3)(a), supra.

20. Defendants' internal documents are quite candid that they do not comply with the Advertising Code and that, in fact, they believe that re-instituting a Code Administrator would be an "extreme and radical form[] of self-regulation," to be resumed only if absolutely necessary to avoid **legally binding** prohibitions or commands. An April 1991 R.J. Reynolds's executive summary stated that R.J. Reynolds was not following the Advertising Code, but that "RJR and the industry" might consider "re-institution of the Code with a Code Administrator" as "the most extreme instance" of several possible "extreme and radical forms of self-regulation [which might be] deemed necessary and effective to avoid extraordinary restrictions or an outright advertising ban." 507755082-5094 at 5093 (US 20787) (O); see also US FF § III.E(3)(b), supra.

21. Defendants' adoption of the Code and subsequent public statements regarding the Code were in fact a public relations gambit designed to assuage the public's concerns about Defendants' cigarette marketing to youth. Although Defendants made numerous public statements that the Code prevented them from marketing to youth, these statements were in fact false and misleading. Defendants wrote the Code with loopholes that would permit them to

continue to market to youth. 1967 FTC Report at 24-27 (US 22148) (A); see generally US FF §§ III.E(3)(a) & (b), supra.

(b) Broadcast Ban of 1971

22. The Broadcast Ban of 1971 prohibited Defendants from broadcasting cigarette advertisements by radio or television. It was thus of the same form as a basic injunction, commanding or preventing particular action.

23. Joseph F. Cullman III, Chairman both of Philip Morris and of TI's Executive Committee, testified in 1969 that the tobacco industry would comply with a federal broadcast ban under certain conditions. He justified this with the curious phrase that **"it takes an affirmative act** on the part of the viewer or listener to avoid broadcast advertising. By contrast . . . an affirmative act **is** required by the reader to see and comprehend such advertising" in newspapers and magazines. 680263421-3422 at 3421 (US 22345) (A) (emphases added).

24. Nonetheless, Defendants have undermined the Broadcast Ban for decades by sponsoring sporting and music events that result in widespread television coverage of cigarette brand names and imagery, such as the Virginia Slims professional women's tennis tournament, Virginia Slims "Fashion Spree," Benson & Hedges Blues Festival, Marlboro Music Tour, Marlboro "Mini Grand Prix," NASCAR Winston Cup auto races, and Marlboro professional racing events. Krugman WD, 103:9-19, 107:21-112:23. Defendants thus responded to and sidestepped the Broadcast Ban's command by shifting resources from the now-prohibited television and radio broadcasts of cigarette **advertisements,** to sponsoring sporting and music events so that cigarette **marketing** would be broadcast by television and radio – broadcasts which Cullman of Philip Morris and TI's Executive Committee acknowledged "it takes an affirmative act . . . to avoid." 680263421-3422 at 3421 (US 22345) (A)

25. In addition, Defendants further intentionally circumvented the purpose of the 1971 Broadcast Ban – to reduce youth exposure to cigarette marketing – by immediately and massively increasing their expenditures on billboard advertisements visible to youth and adults alike, as well as by immediately increasing their spending on newspaper and magazine advertising two-and-a-half-fold, from $64 million in 1970 to $158 million in 1971. FTCDOCS-0049-1753 to 1821 at 1780 (JD 003567) (O).

26. Defendants increased their spending on outdoor advertising – mostly billboards – even more stupendously immediately after the 1971 Broadcast Ban, increasing their outdoor marketing **five-fold** from under $12 million in 1970 to over $60 million in 1971. Defendants deliberately did this even though – just like the television advertisements that Cullman spoke about in his curious phrase in 1969 – **"it takes an affirmative act** on the part of the viewer . . . to avoid [outdoor] advertising." FTCDOCS-00491753-1821 at 1781 (JD 003567) (O); 680263421-3422 at 3421 (US 22345) (A) (emphasis added).

27. Defendants continued to increase their expenditures on billboard advertising over the next several decades. By 1979, as a May 1981 FTC Staff Report found, "The top five outdoor advertisers in 1979 were the five largest cigarette companies. Almost half of all billboards in the United States advertise cigarettes." Defendants' use of outdoor cigarette advertisements was "large and still increasing." FTC, *Staff Report on the Cigarette Investigation* (1981), ch. 2 at 2-5 (JD 004744) (A). And in 1990, the Centers for Disease Control ("CDC") reported that, in 1988, cigarettes remained "the most heavily advertised product in outdoor media." VXA1243241-3243 at 3242 (US 64306) (A).

28. It was no accident that Defendants immediately quintupled their spending on billboard and other outdoor advertising immediately after the 1971 Broadcast Ban, and no

accident that by 1979, the five largest cigarette companies (all current Defendants or predecessors to current Defendants) were the nation's top five outdoor advertisers, and no accident that in 1988, cigarettes were the most heavily advertised product in outdoor media. Defendants specifically intended their outdoor and billboard marketing to **"replace television as a reach medium,"** that is, as a medium reaching a large percentage of the population. James J. Morgan, a Marlboro brand manager in the 1960s and 1970s and later the President of Philip Morris, testified that "the whole story of the broadcast ban is not the story of the broadcast ban, it is the story of the creation of the Marlboro outdoor effort." After "losing television . . . I and then a couple of my associates came up with the idea that **outdoor could replace television as a reach medium.**" Morgan PT, Minnesota v. Philip Morris Inc., 4/22/98, 13454:10-13456:11 (emphasis added).

29. The experience of the Broadcast Ban amply demonstrates that even when Defendants are subjected to a specific command or prohibition to stop their marketing to youth – here by prohibiting television and radio advertisements – Defendants immediately invest considerable resources and skill to circumvent the restriction – here, through sponsorships that secure widespread television visibility for cigarette brand names and imagery, as well as by massively shifting (and increasing) their huge marketing budgets from one medium to another. Referring to Morgan's Minnesota testimony that "the whole story of the broadcast ban . . . is the story of the creation of the Marlboro outdoor effort," id., Dr. Robert Dolan testified, "If an agreed-to restriction on marketing practices makes marketing less efficient, Defendants could simply substitute additional dollars or effort to compensate for this, as they have in the past." Dolan WD, 146:17-20. The same will likely be just as true for the particular prohibitions on marketing practices that this Court is imposing through basic injunctions. Accordingly, any

remedies ordered by the Court must also include flexible mechanisms to respond to Defendants' likely efforts to compensate for the specific prohibitions that the Court will impose as basic injunctions.

(c) Defendants Have Circumvented and Undermined the MSA's Basic Injunctions

30. The Master Settlement Agreement ("MSA") is a negotiated agreement, signed in November 1998, that ended the states attorneys general lawsuits against the tobacco industry in exchange for certain commands and prohibitions. (As discussed below, not all Defendants are subject to the MSA, and the MSA is inadequate to prevent and restrain future misconduct. See US FF § V.A(3), infra.

31. The MSA's commands and prohibitions include (among other provisions) specific prohibitions and restrictions on forms of marketing that are known to appeal to youth, including prohibitions on outdoor and billboard advertisements, and restricting each signatory to only one tobacco brand-name sponsorship. The MSA also includes a very generally-worded prohibition on youth targeting. MSA §§ III(a), (c), (d) at 19-24 (JD-045158) (A). Notwithstanding the MSA's obvious intent to reduce youth marketing, Defendants have substantially increased their marketing expenditures since agreeing to the MSA's advertising and other marketing restrictions, with 30% more marketing expenditures in 2002 than just two years earlier in 2000. FTC, *Cigarette Report for 2002* (2004) at 1 (JD-013056) (A).

(i) Defendants Have Circumvented and Undermined the MSA's Billboard Ban by Switching to Price Promotions

32. Defendants have not only increased their marketing expenditures since the MSA, but have focused their increased expenditures in areas especially appealing to youth. Decades of Defendants' internal marketing documents demonstrate that they have long known that youth are

highly price sensitive, and thus especially susceptible to changes in cigarette prices. Because youth are more price sensitive than adults, price promotions are calculated to market more effectively to youth than to adults. See US FF § III.E(6), supra, and § V.K(2), infra.

33. Defendants have not lowered their total marketing and promotion expenditures in response to the MSA's prohibition on billboard advertising and its restrictions on print advertising, but rather have both increased their marketing expenditures, and have shifted those increased expenditures towards price-based promotions. Dolan WD, 145:10-146:22; Krugman WD, 101:16-102:9.

34. As Dr. Dolan testified:

> The MSA's restrictions on inputs, i.e. the way companies can engage in marketing, does present challenges to the companies. Because of the MSA, the companies did modify their marketing practices. **As they had in the past, however, they were able to draw on their marketing expertise to come up with a revised marketing approach to achieve their objectives or outputs.**

Dolan WD, 146:13-16 (emphasis added).

(ii) Marlboro Formula 1 Sponsorship (in addition to Marlboro Indy Racing League Sponsorship) Evades and Undermines the MSA's Sponsorship Restrictions

35. As discussed above, one of Defendants' responses to the 1971 Broadcast Ban on television advertisements was to begin spending hundreds of millions of dollars in underwriting entertainment events with cigarette-brand sponsorships which attract large audiences in person and receive substantial television exposure, including highly desired youth viewers. To limit this avenue of youth marketing, the MSA restricted each Participating Manufacturer to one brand name sponsorship. MSA § III(c) at 19-22 (JD-045158) (A).

36. Philip Morris CEO and chairman Michael Szymanczyk agreed at trial that the rationale for the MSA's restriction on brand name sponsorships was "to reduce the exposure of

youth to the cigarette brand names and reduce the association of cigarettes with athletic events." Szymanczyk TT, 4/11/05, 18375:18-18376:9.

37. Nonetheless, Philip Morris has circumvented and undermined the MSA's restriction on brand name sponsorships so that American youth are exposed to Marlboro imagery through multiple auto racing sponsorships. There are several auto racing leagues, such as the Indy Racing League (IRL), the Formula 1 racing league, and NASCAR. Philip Morris sponsors a Marlboro Indy Racing League team, Marlboro Team Penske, which races at multiple venues around the United States each year; its best-known race each year is the annual Indianapolis 500. Szymanczyk agreed that the MSA prohibits all other Philip Morris sponsorships. Szymanczyk WD, 115:5-22.

38. But American youth are also subjected to additional Marlboro imagery and marketing due to the Formula 1 racing team Scuderia Ferrari Marlboro. (US 93343) (A). This Marlboro racing team races two vehicles and has two drivers. The Marlboro brand name and logo are prominently displayed on both race cars and the driver uniforms. 235241790-235241790 (US 93263) (A). The Philip Morris Formula 1 sponsorship impacts audiences and viewers in the United States, particularly when the races are broadcast in the United States and when photographs of the Marlboro vehicles are printed in American magazines and newspapers. Numerous media in the United States cover the Formula 1 Marlboro racing team and thus increase U.S. exposure of the Marlboro brand:

(a) Network and cable television, (US 92110) (A); (JD-055390) (A); Myers TT, 5/19/05, 21681:17-21682:3, 21685:20-21686:13, 21707:6-19;

(b) Magazines such as *Sports Illustrated* and *AutoWeek*, TLT0530001-TLT0530010 (US 93250) (A); (US 93338) (A); (US 93339) (A); (US 93340) (A); (US 93341)

(A); (US 93342) (A); TLT110 0006-0026 (US 89461) (A); TLT110 0027-0035 (US 89462) (A); (US 92137) (A);

(c) Newspapers such as *USA Today* and the *Washington Post*, (US 92110) (A); Myers TT, 5/19/05, 21707:14-19; and

(d) The Internet, (US 93256) (O); (US 93274) (A); (US 93276) (A); (US 93290) (A); (US 93331) (A); (US 93332) (A).

The Formula 1 Marlboro brand sponsorship expands the viewership and exposure of the Marlboro brand name and brand imagery in the United States. Myers WD, 36:6-7; Myers TT, 5/19/05, 21689:6-9; see generally US FF § III.E(7)(c)(iii), supra.

39. Philip Morris defends the Formula 1 Marlboro brand sponsorship on the ground that the official sponsor is its affiliate Philip Morris International, a wholly owned subsidiary of its ultimate parent, Defendant Altria, and that neither PMI nor Altria is subject to the MSA. But American youth are wholly unaware of which corporate entity sponsors the Formula 1 Marlboro marketing and imagery that they see. As Matthew Myers, president of the Campaign for Tobacco Free Kids, testified:

> The Philip Morris Formula One sponsorship enables the companies to get the Marlboro brand in front of a worldwide audience, including an audience here in the United States. Viewers see only the Marlboro logos all over the race cars and uniforms. The fact is that the source of the Marlboro Formula One racing team sponsorship is indistinguishable to the American viewer from the source of Philip Morris's other brand name racing sponsorship, the Marlboro Indy Car racing sponsorship.

Myers WD, 36:7-12.

40. When asked specifically how he would characterize Philip Morris's compliance with the MSA's brand name sponsorship provisions, Szymanczyk asserted, "We have gone well beyond the text of the MSA, as well as respecting the spirit of the MSA and the concerns raised by the Attorneys General." Szymanczyk WD, 136:3-6. In light of the overwhelming evidence to the contrary, these representations are not credible.

41. Szymanczyk also sits on the Corporate Management Committee of Defendant Altria. Altria Group, Inc. 2004 Annual Report at 5 (US 92109) (A). It is undisputed that Defendant Altria, the parent of both Defendant Philip Morris USA and non-Defendant Philip Morris International, "can control how the Marlboro logo is used by either company." Myers WD, 36:12-14; see also Myers TT, 4/15/05, 21720:1-13 (testifying to Altria's ability to control the Marlboro trademark worldwide). Even though Altria Corporate Management Committee member Szymanczyk acknowledges that the rationale for the MSA's restricting brand name sponsorships is "to reduce the exposure of youth to the cigarette brand names and reduce the association of cigarettes with athletic events," Szymanczyk TT, 4/11/05, 18375:18-18376:9, there is no evidence that he or anyone else in the Altria group of companies has done anything to protect American youth from being exposed to Marlboro cigarette imagery and marketing through the Marlboro Formula 1 sponsorship as well as through the Marlboro Indy Racing League team. Szymanczyk and Philip Morris are not "respecting the spirit of the MSA [sponsorship restrictions]," Szymanczyk WD, 136:3-6; they are undermining and circumventing those restrictions.

(iii) The MSA's Generally-Worded Prohibition on Youth Targeting Has Not Changed How Defendants Market Their Cigarettes

42. Section III(a) of the MSA, entitled "Prohibition on Youth Targeting," provides a generally-worded prohibition: "No Participating Manufacturer may take any action, directly or indirectly, to target Youth within any Settling State in the advertising, promotion or marketing of Tobacco Products...." MSA § III(a) at 19 (JD-045158) (A). This general prohibition has done little to change the way that Defendants market their cigarettes. Indeed, the wording of this general prohibition is similar to the general wording of the 1964 Advertising Code. See US FF § V.A(2)(a), supra.

43. When RJR first entered the MSA in 1998, it continued placing cigarette ads in magazines with high youth readership at the same rate it had before. In a court case that took over three years to litigate, the California courts eventually affirmed findings that from 1999 through 2001, RJR did not make any "changes to its media advertising schedules, did not include in its media plans the goal of reducing exposure of its advertising to youth and did not determine the extent its advertising was exposed to youth." People ex rel. Lockyer v. R.J. Reynolds Tobacco Co., 11 Cal.Rptr.3d 317, 322-23 (Ca. Ct. App. 2004). RJR did announce changes to its advertising placement policies the same day that suit was filed in March 2001, but "those changes had minimal impact in reducing exposure of its advertising to youth." Id. at 323 & n.3. Moreover, RJR was well aware – or should have been – that its advertising was reaching youth as much as young adults. To be sure, RJR "'studiously avoided' measuring its advertising exposure to youth, probably because [it] 'knew the likely result of such analysis.'" Id. at 327 (quoting trial court decision). Nonetheless, the appellate court upheld the trial court's determination that RJR "knew to a substantial certainty that its advertising was exposed to youth to the same extent it

was exposed to young adults." Id. at 328.

44. Likewise, Lorillard did not change its principal "Pleasure" advertising campaign for Newport, the second-leading brand smoked among youth ages 12 to 17, after entering the MSA. Milstein TT, 1/10/05, 9312:1-9314:9; 9417:18-9421:25.

45. The tobacco industry experience summarized above – from the 1964 Advertising Code to the 1971 Broadcast Ban to the 1998 MSA – makes clear that this Court cannot rely upon basic injunctions alone; additional forms of injunctive relief are also required to prevent and restrain Defendants from future RICO violations.

(3) The MSA Is Inadequate to Prevent and Restrain Future Misconduct

46. Defendants have repeatedly claimed that even if they are liable under RICO, the MSA is all the relief that is needed to prevent and restrain future violations, and this Court therefore has no need to impose any remedial orders for that purpose; during closing arguments, counsel stated that the MSA "is a watershed event . . . I don't think the effectiveness of the MSA can be questioned." Defs.' closing arg., TT, 6/8/05, 236261:1-6.

47. The evidence before the Court resoundingly disproves this claim. Defendants are not complying with the letter and spirit of the MSA; enforcement is cumbersome and exceptionally time-consuming; and even if Defendants were in full compliance with the letter and spirit of the MSA, it would be insufficient to prevent future frauds.

(a) Defendants Are Not Complying with the Spirit, and Frequently Violate the Letter, of the MSA

48. Defendants assert that the MSA "works," apparently because they have repeatedly been caught violating it.

49. The MSA has numerous restrictions which Defendants are violating and evading. In other instances, Defendants have intentionally undermined the purpose of various MSA

restrictions. Some examples are discussed in this part of US FF § V to demonstrate why the MSA is not adequate to prevent and restrain future violations. Other examples are discussed elsewhere in US FF § V. See, e.g., US FF § V.A(2)(c), supra (Defendants' response to the MSA demonstrates that basic injunctions alone are insufficient); US FF § V.H, infra (Philip Morris created the Philip Morris External Research Program despite the MSA's command to dissolve CIAR).

50. The MSA prohibits Defendants and their lobbyists from opposing new state or local tobacco-control legislation, and specifically prohibits them from lobbying against measures to enhance the enforcement of laws that prohibit the sale of tobacco products to youth. MSA § III(m) at 29-32 (JD-045158) (A). Despite this provision, a registered lobbyist for Philip Morris named Scott Stenger registered in opposition to a Wisconsin State bill to authorize local governments to conduct compliance checks on youth tobacco sales a certain number of times a year. As Wisconsin State Senator Judith B. Robson wrote Wisconsin Attorney General James Doyle in a March 23, 2000 letter, "This is a clear violation of the Master Settlement Agreement." (US 92114) (A).

51. Philip Morris's only response is that even though the MSA prohibits its lobbyists from opposing tobacco-control legislation, Philip Morris has no problem with its lobbyists doing so, so long as they say that their opposition is on behalf of another client – the Tavern League, in Stenger's case – rather than on Philip Morris's behalf. Szymanczyk TT, 4/11/05, 18366:13-21. However, as Wisconsin Senator Robson wrote:

> This is smoke and mirrors. If the tobacco companies can have their lobbyists appear under the guise of [representing] other entities, the entire prohibition against lobbying will be gutted. It will become common practice for tobacco lobbyists to appear on behalf of entities that just happen to share the same perspective as the tobacco companies. The tobacco companies are smart enough

not to have their lobbyists work directly on forbidden topics, but **they are achieving their goals with end-runs like this.**

(US 92114) (A) (emphasis added).

52. Three states – Illinois, New York, and Maryland – filed actions against Brown & Williamson alleging that its "Kool Mixx" marketing campaign violated the MSA's prohibition against youth targeting. B&W settled the actions on October 5, 2004, two weeks after trial began in this action, and agreed to restrictions on their future Kool Mixx promotions and monetary payments to support youth smoking prevention. (US 92037) (A).

53. Sharon Smith, current Vice President of Marketing Services for RJR and former Director of Marketing Services and Operations at B&W, acknowledged that B&W received complaints from NAAG about its "B Kool" advertising campaign, but that "Brown & Williamson did not change the content of the B Kool campaign as a result of the concerns expressed by NAAG." Smith WD, 32:20-33:8. Susan Ivey, current President and CEO of Reynolds American and Chairman and CEO of RJR, and former CEO of B&W, acknowledged receiving complaints about the "B Kool" ad campaign from Governor Chiles of Florida, but that B&W did not change its ads to address his complaint that the campaigns wrongly targeted youth. Ivey WD, 11:4-12:1.

54. Philip Morris's chairman and CEO Michael Szymanczyk testified that the state attorneys general have never taken an enforcement action against Philip Morris. Szymanczyk TT, 4/11/05, 18357:21-18358:2, 18359:1-3. To the contrary, though, Philip Morris's counsel asserted while cross-examining a United States expert witness at trial in this action that "there have been more than 40 practices raised by the State's Attorneys General [against] Philip Morris USA" under the MSA. Dolan TT, 12/8/04, 8010:5-10. Counsel's representation is supported by letters from states attorneys general, as well as summaries of the many states attorneys general notifications/complaints, in Philip Morris's annual "MSA Compliance Reports," which are

prepared internally by Philip Morris to document issues related to the MSA. JD-041836 (A) (1999); JD-050566 (A) (2000); JD-053079 (A) (2001); JD-046586 (A) (2002); JD-055037 (A) (2003).

55. One notable dispute occurred in 2001. The MSA limited Philip Morris to just one brand name sponsorship, which it then used to sponsor a Marlboro brand race team in the CART racing league. In 2001, Philip Morris attempted to enter its CART Marlboro brand race cars in the Memorial Day Indianapolis 500 – the namesake race of the Indy Racing League. Philip Morris's chairman and CEO, Michael Szymanczyk, admitted that CART and the Indy Racing League are two distinct racing leagues, with two distinct approval organizations. Szymanczyk TT, 4/11/05, 18377:15-19.

56. It was only after Washington State Attorney General Christine Gregoire notified Philip Morris that sponsoring Marlboro vehicles in races in two different leagues would violate the MSA that Philip Morris removed the Marlboro brand names from its race cars and uniforms for the 2001 Indianapolis 500. Szymanczyk WD, 131:1-132:10. (After the warning from Attorney General Gregoire, Philip Morris has not attempted to enter its Marlboro vehicles in the races of both leagues, and following the 2001 season, Philip Morris switched from its CART Marlboro brand sponsorship to its current Indy Racing League Marlboro sponsorship. Szymanczyk TT, 4/11/05, 18380:22-18381:1.) Philip Morris's immediately removing the Marlboro brand names when confronted before the 2001 Indianapolis 500 race indicates that it was well aware that entering Marlboro brand race cars in two different leagues in a single season violated the MSA.

57. The MSA does include one very short sub-section entitled, "Corporate Culture Commitments Related to Youth Access and Consumption." It has not been a success. This sub-

section requires each company to designate an "Executive Level Manager" who would be responsible "to identify methods to reduce Youth access to, and the incidence of Youth consumption of, Tobacco Products." MSA § III(*l*) at 29 (JD-045158) (A); see also id., § I at 2 (reciting that "the Participating Manufacturers are committed to reducing underage tobacco use by discouraging such use and by preventing Youth access to Tobacco Products").

58. Two executives at Lorillard have been designated as Lorillard's "Executive Level Manager" under the MSA's "corporate culture commitment" provision: Ronald Milstein, Lorillard's Vice President and General Counsel, from April 15, 1999 to September 2000; and Steven Watson, Lorillard's Vice President of External Affairs, from September 2000 to the present. Milstein TT, 1/7/05, 9312:4-9314:14. Despite Watson's obligation to identify methods to reduce Youth access to tobacco products under this "corporate culture commitment" provision (and despite Milstein's previous obligation to do so under this provision), Watson and Milstein exchanged e-mails on November 2, 2001, in which Watson stated that he did not want to identify to the states attorneys general one obvious method to prevent Youth access to tobacco products. Lorillard had received information identifying more than 1,100 retail stores in just four states that had been cited, fined or convicted for selling cigarettes to minors. Milstein asked Watson, "Do you intend to give this info to NAAG or the AGs?" Watson's answer, in its entirety, was: "Unless you think there is legal reasons [sic] to do so, I would be inclined not to share this info." At trial, Milstein asserted that Corporate Culture Commitment Executive Level Manager Watson was "inclined not to share" Lorillard's information about retail stores that sold cigarettes to minors with NAAG because NAAG had been discussing creating a central website with similar information. However, as Milstein acknowledged, over three years later, as of January 2005, there was still no such central website. Milstein TT, 1/7/05, 9356:24-9359:16; 99409377-9377

(US 89183) (A).

59. The courts have found that RJR is a serial violator of the MSA. See, e.g., People ex. rel. Lockyer v. R.J. Reynolds Tobacco Co., 11 Cal.Rptr.3d 317, 323, 327-28 (Cal. Ct. App. 2004) (discussed supra; finding that RJR did not change its youth magazine placement policies from the 1998 signing of the MSA until the day that it was sued in March 2001; and even then RJR's 2001 changes had insignificant effects on youth exposure to its advertising campaigns); State ex. rel Goddard v. R.J. Reynolds Tobacco Co., 75 P.3d 1075 (Ariz. Ct. App. 2003) (holding that RJR violated MSA by placing cigarette advertisements at auto racetrack year-round); People ex. rel. Lockyer v. R.J. Reynolds Tobacco Co., 132 Cal.Rptr.2d 151 (Cal. Ct. App. 2003) (same; discussed infra); State ex rel. Petro v. R.J. Reynolds Tobacco Co., 820 N.E.2d 910 (Ohio 2004) (discussed infra; finding RJR violated MSA with promotional tobacco brand name matchbooks).

60. Most recently, on July 26, 2005, the state of Vermont has filed a complaint and petition for contempt, alleging that RJR has violated MSA § III(r) which prohibits any participating manufacturer from making "any material misrepresentation of fact regarding the health consequences of using any tobacco product." Complaint, Vermont v. R.J. Reynolds Tobacco Co., No. 744-97 CNC & S-0816-98 (Superior Ct. filed July 26, 2005).

(b) The Court Is Unable to Rely upon the Hope of Full Enforcement of the MSA

61. The MSA imposes monitoring and enforcement duties upon hard-pressed states attorney general offices and diverts them from their numerous other obligations (and also requires taxpayers, rather than Defendants, to pay to enforce Defendants' compliance). In addition, the MSA is exceptionally time-consuming to enforce and is subject to inconsistent interpretations.

(i) MSA Enforcement Is Extraordinarily Time-Consuming

62. Michael Szymanczyk, Philip Morris's chairman and CEO, asserted that if the states attorneys general believed that Philip Morris was violating one of the MSA's requirements, the MSA "would allow the Attorneys General to issue a court order." Enforcing the MSA is far from so easy. Indeed, the Court challenged Szymanczyk's assertion, prompting him to acknowledge that the MSA obliges the states attorneys general to "go to court and conceivably obtain a court order." Szymanczyk TT, 4/7/05, 18122:1-11.

63. The MSA requires that before any enforcement action may begin, a state must "[w]henever possible" first discuss the dispute to determine if it can be resolved informally. MSA § VII(c)(6) at 50-51, § XVIII(m) at 134 (JD 045158) (A). If these virtually mandatory informal discussions are unsuccessful, the state must then provide thirty days' written notice of its intent to initiate a proceeding. Id. § VII(c)(2) at 50.

64. MSA enforcement proceedings take nearly as long to be litigated as tobacco liability lawsuits. It took over five years for Ohio to reach the end of RJR's appeals in a case involving RJR's advertising its tobacco brands on free promotional matchbooks. Ohio ex rel. Petro v. R.J. Reynolds Tobacco Co., 820 N.E.2d 910 (Oh. 2004). RJR was the only signatory to the MSA which continued to distribute branded matchbooks with cigarette advertisements. Id. at 914. In 1999, several states attorneys general alerted RJR that its branded matchbooks violated the MSA's prohibition on tobacco brand merchandise, for informal discussions – required "[w]henever possible" under MSA § VII(c)(6) at 50-51 (JD 045158) (A). When the informal discussions failed, Ohio moved for a show-cause order in March 2001. After proceedings in the trial court and intermediate appellate court, the Ohio Supreme Court affirmed on December 30, 2004, holding that RJR had violated the MSA's prohibition on distributing tobacco branded

merchandise, and that the MSA intended to prohibit the "subtle yet ubiquitous marketing of tobacco products." Id. at 917. It thus took over five years to receive a final decision resolving this issue.

65. Similarly, the California attorney general lawsuit against RJR for failing to change its magazine advertising placement policies following the MSA took well over four and a half years to resolve. People, ex rel. Lockyer v. R.J. Reynolds Tobacco Co., 116 Cal.App.4th 1253, 11 Cal.Rptr.3d 317 (Ca. Ct. App. 2004). State attorneys general met with RJR and voiced concern about its targeting youth in magazine advertising placement on November 4, 1999, People ex. rel Lockyer v. R.J. Reynolds Tobacco Co., No. GIC 764118, 2002 WL 1292994, at *4 (Cal. Superior Ct. June 6, 2002); after informal discussions failed to resolve the issue, the complaint was filed in March 2001, and the California Court of Appeals affirmed the trial court's decision on March 19, 2004, and denied rehearing on June 9, 2004. Even that did not resolve the matter, because the appellate court remanded to the trial court for further proceedings to determine the size of RJR's monetary sanction.

66. Liggett did not sign the MSA because it had previously broken ranks with the other Defendants and reached an earlier settlement with the state attorneys general in March 1997. Liggett's conduct in this litigation reveals that it has violated its own agreement with the states attorneys general. As part of its March 1997 settlement, "Liggett agreed to waive attorney-client privilege and work product protection with respect to internal Liggett-only privileged documents relevant to smoking and health cases." LeBow 4/4/05 WD, 5:5-10; see also LGX002002-2064 at 2020-2021 (LI 338) (A). LeBow characterized the scope of the waiver as being "all-encompassing for everything up to that point in time; to release any and all documents that we had and to waive any and all privilege." LeBow TT, 4/4/05, 17563:14-17564:7.

67. In violation of its March 1997 agreement with the state attorneys general to make an "all-encompassing" waiver of internal Liggett-only smoking and health documents "for everything up to that point in time," Liggett withheld thousands of documents from production in this lawsuit on grounds of privilege and work-product protection. Liggett Privilege Logs in United States v. Philip Morris, vols. 1-4, UCX020 1355-1528 (US 93271) (A). Many of the withheld documents were internal Liggett-only smoking and health documents written before Liggett's March 1977 settlement with the state attorneys general. Id. at 1355, 1360, 1361; LeBow TT, 4/4/05, 17568:4-17569:8.

(ii) The MSA Is Subject to Inconsistent Interpretations and Enforcement

68. Even when a state does issue a written notice of intent to initiate a proceeding, it may initiate an enforcement action only in its own jurisdiction; the MSA specifically prohibits any state from "seek[ing] to enforce the terms of the Consent Decree of another Settling State." MSA § VII(b), (c)(1) at 49 (JD 045158) (A). In addition, many provisions of the MSA contain very general terms, subject to multiple interpretations which often force the individual states to periodically bring enforcement actions to obtain a judicial ruling on the meaning of certain terms under the MSA. Myers TT, 5/18/05, 21630:4-12.

69. Enforcement actions concerning the meanings of terms in the MSA are subject to disparate and inconsistent rulings, because each jurisdiction applies its own law of contracts to interpret the MSA's terms. In 2003, appellate courts in New York and California issued contrary decisions – each drawing on its own state's contract law – in response to parallel enforcement actions against RJR's placing cigarette billboard advertisements at Winston Cup NASCAR auto racetracks. Contrast People ex rel. Lockyer v. R.J. Reynolds Tobacco Co., 107 Cal.App.4th 516, 132 Cal.Rptr.2d 151 (Ca. Ct. App. 2003) (racetrack ads prohibited), with New York v. R.J.

Reynolds Tobacco Co., 304 A.D.2d 379, 761 N.Y.S.2d 596 (N.Y. App. Div. 2003) (racetrack ads allowed).

(c) The MSA Is Inadequate to Prevent Defendants from Engaging in Future Misconduct

70. Defendants have asserted that even if this Court finds them liable for violating the RICO statute, the Court should not issue any remedies Order on the ground that the MSA fully prevents them from engaging in any future misconduct.

71. As an initial matter, three Defendants are not subject to all the provisions of the MSA. As this Court previously recognized, **"the MSA cannot preclude relief in this RICO action** because two of the Defendants, BATCo and Altria, are not even signatories to that Agreement." Order #537, published as United States v. Philip Morris USA Inc., 316 F. Supp. 2d 6, 12 (D.D.C. 2004) (emphasis added). Indeed, Philip Morris's rationalization for multiple auto racing Marlboro brand sponsorships in the face of the MSA's restriction on such sponsorships is that the Marlboro Formula 1 sponsorship is controlled by Altria, and that Altria is not subject to the MSA. Ending just this one aspect of Defendants' youth marketing – Defendants' ability to market to American youth via motor sports sponsorship – will alone require this Court to enter an order that goes beyond the MSA.

72. In addition, a third Defendant, Liggett, is exempt from important provisions of the MSA. LeBow TT, 4/4/05, 17570:14-17572:4 (when asked whether Liggett complies with the document disclosure obligations required by MSA § IV, responding, "This [provision of the MSA] does not apply to us, as Mr. Marks [Liggett counsel] pointed out.").

73. Moreover, the MSA does not compel the full package of relief that is necessary to prevent and restrain future RICO violations. As the Court has previously recognized, the MSA

does not (1) require Defendants to make corrective statements regarding health risks and nicotine addiction; (2) require Defendants to fund effective cessation programs; (3) appoint Court-appointed officials to implement the relief granted; (4) enjoin Defendants from future RICO violations; or (5) enjoin Defendants' alleged youth-marketing practices. Order #537, published as United States v. Philip Morris USA Inc., 316 F. Supp. 2d 6, 11 (D.D.C. 2004) (internal quotation marks and citations omitted; items in list renumbered).

(d) The Scope of the 1997 Proposed Resolution Reveals the Need for More Comprehensive Relief than the MSA Commands

74. The inadequacies of the MSA in preventing and restraining Defendants' future misconduct may be seen by comparing its terms to those in the Proposed Resolution of June 20, 1997. This was a signed memorandum of understanding between the states attorneys general and the tobacco companies they were suing, which would have resolved the states attorneys general lawsuits and provided the companies with protection against federal lawsuits. It would thus have required federal legislation, known as the McCain legislation, to take effect. 2073325723-5793 at 5791 (US 42978) (A).

75. The Proposed Resolution and the MSA differed in important respects. The agreements reached in the MSA were weaker and narrower than the Proposed Resolution. Matthew Myers, president of the Campaign for Tobacco-Free Kids, participated in the Proposed Resolution negotiations over several months in 1997. As he testified, "The differences are not because any of the problems had been solved in the interim, nor are they because the evidence about what remedies would be most effective or what needed to be done had changed." Myers WD, 13:9-13, 22:13-22.

76. The 1997 Proposed Resolution provided for specific earmarked funds for tobacco use cessation: $1 billion per year for the first four years, and thereafter $1.5 billion per year to be

paid by the Cigarette Company Defendants. 2073325723-5793 at 5760 (US 42978) (A); Myers WD, 23:14-17. The MSA did not earmark any funds for smoking cessation programs, nor did any of its provisions require the settling States to spend any funds for this purpose. Myers WD, at 54:16-20. The United States seeks funding for smoking cessation programs.

77. The Proposed Resolution provided for specific earmarked funds to be spent on public education. 2073325723-5793 at 5759-5760 (US 42978) (A). The MSA provided for $300 million per year that was guaranteed for only five years, and contained limitations on how those funds could be spent. MSA at 41-48 (JD-045158) (A); Myers WD, 23:1-13. The United States seeks funding for public and counter-marketing.

78. The Proposed Resolution sought to reduce underage tobacco use by giving the Cigarette Company Defendants economic incentives "to take every step possible to ensure that the advertising, marketing and distribution requirements of this Act are met, and imposing substantial surcharges on the manufacturers in the event the underage tobacco-use reduction targets are not achieved. 2073325723-5793 at 5746-5747 and 5773-5779 (US 42978) (A). The MSA contains no such provision imposing a mandatory surcharge upon Cigarette Company Defendants in the event underage tobacco use is not reduced. Myers WD, 25:4-7. The United States seeks to have youth smoking targets imposed with financial incentives.

79. The Proposed Resolution required Defendants to establish a national tobacco document depository that would contain previously non-public or confidential tobacco industry documents in Washington, D.C., open to the public, to serve as a resource to litigants, public health groups, and anyone else with an interest in Defendants' corporate records on the subjects of smoking and health, addiction or nicotine dependency, less hazardous cigarettes and underage use of tobacco and marketing. 2073325723-5793 at 5786 (US 42978) (A). The MSA's

requirement to provide public access to certain tobacco industry documents through tobacco document websites applies only to the original participating manufacturers. Moreover, the MSA's requirement to maintain tobacco document websites expires in less than five years, on June 30, 2010. MSA § IV at 36-41 (JD-045158) (A). The United States seeks disclosure of documents, disaggregated marketing data, and information concerning health and safety risks.

80. The Proposed Resolution sought to regulate the use of product descriptors such as "light" and "low tar" and require a mandatory disclaimer stating that such "light" and "low tar" products are not shown to be less hazardous than other cigarettes. 2073325723-5793 at 5731, 5736 (US 42978) (A). The MSA contains no provision regulating the use of the descriptors "light" and "low tar." Myers WD, 24:16-18. The United States seeks a prohibition on such descriptors.

81. The Proposed Resolution banned all brand name sponsorships, including concerts and sporting events. 2073325723-5793 at 5731 (US 42978) (A). The MSA permitted certain brand name sponsorships. MSA § III(c) at 19-20 (JD-045158) (A). Moreover, the MSA contained a serious loophole that allowed Defendant Philip Morris to use its international Marlboro brand sponsorship of Formula I racing to impact the United States. Myers WD, 5/09/05, 35:20-36:14; see generally US FF §§ III.G(7)(c)(iii) and V.A(2)(c)(ii), supra. The United States seeks a ban on all motor sports sponsorships. This and the other specific Proposed Resolution remedies absent from the MSA but which the United States seeks here – all of which Defendants agreed to accept in the context of the Proposed Resolution – will prevent and restrain Defendants from engaging in future RICO violations.

(4) The Companies Have Not Made Meaningful Changes

82. Defendants assert that they are now new companies headed by changed

management. During opening statements, for example, counsel for Defendants asserted that there has been "profound change" at Defendants' companies because "you had a new generation of management. You had new people coming through all of these companies who were brought up under a different period, had a different vision, had a different ethic." Wells opening, TT 9/22/04, 213:24, 220:17-21. Similarly, Michael Szymanczyk, Chairman and CEO of Philip Morris, acknowledged that this lawsuit alleges "significant wrongful conduct, including making misrepresentations, concealing material information and marketing to youth." What would prevent Philip Morris from such "wrongful conduct" in the future, he claimed, is that its senior leadership has seen "significant change" since 1997. "That significant change . . . has had a profound impact on the culture of the company. It is no exaggeration to say that the culture of this company has been completely transformed over the past eight years." Szymanczyk WD, 41:16-42:6.

83. Szymanczyk testified that he prepared a demonstrative, showing that 12 of the 13 other members of Philip Morris's "Senior Leadership Team" members had been appointed to their current positions since 1999. He emphasized that he himself had appointed all but one of those executives to their current positions since he was promoted to Chairman and CEO in 1997. JDEM 040284 (O); Szymanczyk WD, 42:9-44:20. Szymanczyk testified at trial that these "changes" in senior management showed "that the people have changed significantly in terms of who they are and who is in what leadership positions, and that . . . in many ways the company has moved to a different place." Szymanczyk TT, 4/7/05, 18110:7-10.

84. Szymanczyk's demonstrative, as revealed on cross-examination, was misleading. Szymanczyk conceded that the Philip Morris executives whom he promoted to his Senior Leadership Team, and whom he showed on his demonstrative as appointed to their current

positions since 1999, were in fact veterans who average some 15-20 years' tenure at Philip Morris or one of its sister companies. For example, Szymanczyk listed himself as appointed to his current position in 1997, but he has actually has been with Philip Morris for fifteen years. As Szymanczyk's cross-examination revealed, the correct full chart is as follows:

Michael Szymanczyk,	listed as appointed to current position	1997; actual tenure: 15 years
John Nelson,	"	2002; actual tenure: over 15 years;
David Beran,	"	2002; actual tenure: 15-30 years;
Craig Johnson,	"	2002; actual tenure: about 15 years;
Denise Keane,	"	2001; actual tenure: almost 30 years;
Howard Willard,	"	2002; actual tenure: about 15 years;
Nancy Lund,	"	1999; actual tenure: 20 years;
Gregory Cummings,	"	2002; actual tenure: 25 years;
Kevin Benner,	"	2003; actual tenure: 8 years;
Tina Walls,	"	2003; actual tenure: about 19-20 years;
Michael Farris,	"	2004; actual tenure: about 20 years;
Virginia Murphy,	"	2005; actual tenure: about 12 years;
Richard Solana,	"	2005; actual tenure: 11-12 years; and
Harry Steele,	"	1990; actual tenure: about 20 years.

JDEM 040284 (O); Szymanczyk TT, 4/7/05, 18111:24-18117:9. Indeed, Szymanczyk acknowledged that when appointing his Senior Leadership Team, he merely shifted Philip Morris and Altria executives from one leadership position to another, and did not "go outside of Philip Morris to fill **any** of those positions as depicted on the exhibit JDEM 040284." Szymanczyk TT, 4/7/05, 18118:18-18119:3 (emphasis added).

85. Further demonstrating that Philip Morris has not changed its corporate culture, Szymanczyk testified, in response to a question from the Court, that Philip Morris deliberately chose to hire Youth Smoking Prevention leaders from within the company, rather than experienced professionals from outside the company. Szymanczyk TT, 4/7/05, 18273:7-18274:13.

86. The tenures of the other Defendants' senior management likewise belies any claim of "a new generation of management . . . brought up under a different period." Lorillard's senior

management reflect an average of 22 years tenure with the company:

Martin L. Orlowsky, Chairman, President and CEO	25 years
Ronald Milstein, Vice President and General Counsel	9 years
George Telford, Vice President, Brand Marketing	29 years
Kathy Sparrow, Vice President, Sales	25 years
Victor D. Lindsley III, Senior Group Brand Director	24 years

Orlowsky WD, 1:2-14; Milstein TT 1/7/05, 9257:11-12; Telford PD United States v. Philip Morris, 6/26/02, 15:3-16:6; Sparrow PD, United States v. Philip Morris, 2/25/02, 9:19-22; Lindsley PD, United States v. Philip Morris, 5/16/02, 13:17-14:12.

87. BATCo's senior management reflect an average of 23 years' tenure with BATCo and Brown & Williamson:

Nicholas Brookes, former Chairman and CEO of B&W; now Regional Director, America-Pacific Region of BATCo	27 years
Paul Adams, Chairman of BATCo; also Managing Director and CEO of BAT plc	14 years
Graham Read, BATCo Head of Global Strategic Research	29 years

Brookes PD, United States v. Philip Morris, 5/2/02, 19:21-20:1; P. Adams PD, United States v. Philip Morris, 8/22/02, 14:1-10; Read TT, 3/21/05, 16281:19-16282:1.

88. R.J. Reynolds's senior management (which includes many senior managers from B&W following their merger) reflects an average of 24 years' tenure with the industry:

Andrew Schindler, Non-Executive Chairman, RAI	31 years
Susan M. Ivey, President and CEO, RAI; Chairman and CEO, RJR; former CEO of B&W	24 years
Lynn J. Beasley, President and Chief Operating Officer, RJR	23 years
Charles A. Blixt, Executive Vice President and General Counsel, RAI and RJRT	20 years
Frances Creighton, Executive Vice President, Marketing, RJRT	24 years
Brennan M. Dawson, Senior Vice President, Government Relations, RJRT; former Vice President for External Affairs at B&W and former TI spokesperson:	19 years

Schindler WD, 1:6-2:11; Ivey WD, 1:3-2:11; Beasley WD, 1:6-13; Blixt PD, United States v. Philip Morris Inc., 10/31/02, 20:4-6; Creighton PD, United States v. Philip Morris Inc., 6/20/02,

13:22-24; Dawson WD, 1:19-20, 2:6-9, 3:1-2, 3:21-4:1.

89. BATCo, Liggett, Philip Morris, and Altria have all violated this Court's Orders. Their misconduct in this very litigation thus further establishes that the Court cannot simply trust Defendants to abide by a basic injunction; rather, it will be necessary to appoint Court-appointed officials to police Defendants' compliance with this Court's remedies order.

90. BATCo launched an especially aggressive effort to thwart the United States' ability to discover documents that came to light as a result of the McCabe litigation in Australia. BATCo eventually forced the Court to find it in conditional contempt of Court; and, when BATCo still did not come into compliance with the Court's Orders, to find BATCo in civil contempt of Court and to impose daily monetary sanctions until it purged itself of contempt.

91. In Order #343, issued on April 14, 2003, the Court adopted the Special Master's detailed Report & Recommendation #102, and required BATCo to produce or assert privilege within thirty days over documents in the possession of BATCo's 32%-owned Australian subsidiary, British American Tobacco Australia Services (BATAS). BATCo did not comply. On October 3, 2003, this Court found BATCo "conditionally" in contempt of Order #343, but postponed imposing monetary sanctions to give BATCo one last opportunity to come into compliance with Order #343 by October 17, 2003. Order #411, published as United States v. Philip Morris, 287 F. Supp. 2d 5 (D.D.C. 2003). Even then, BATCo still did not come into compliance, and so, on October 20, 2003, this Court found BATCo in contempt of Court and ordered it to pay $25,000 per day until it came into compliance. Order #419 at 2, available at United States v. Philip Morris Inc., No. 99-CV-2496 (GK), 2003 WL 22462167, at *1 (D.D.C. Oct. 20, 2003), monetary sanctions stayed, 219 F.R.D. 9 (D.D.C. 2003), contempt vacated as of January 15, 2004, 220 F.R.D. 109 (D.D.C. 2004). BATCo ultimately paid $1.4 million in

sanctions for this contempt of Court. Order #904, Mem.-Op. at 4.

92. In another episode of BATCo's egregious violation of this Court's Orders, BATCo first produced an unprepared witness as its corporate designee under Fed. R. Civ. P. 30(b)(6) to discuss the public portions of the Foyle Memorandum and BATCo's document management and document destruction policies. In Order #341, the Court therefore ordered BATCo to produce a knowledgeable witness for a renewed deposition on these topics. BATCo's witness for the re-deposition was once again unprepared. In sanctioning BATCo for its "egregious lack of candor regarding compliance with Order #341," the Court held that "BATCo not only violated a Court Order, but also misled the Court in its submissions about whether it was going to comply with the Order, and then misrepresented the facts about what it had previously told the Court on that subject during oral argument." Order #904, Mem.-Op. at 4. As a result of BATCo's willful defiance of this Court's Order #341, the Court sanctioned BATCo $250,000 and held that BATCo would not be allowed to proffer evidence or make arguments concerning these topics. Order #904.

93. Nor was BATCo's litigation misconduct in this lawsuit limited to avoiding discovery concerning document suppression and destruction. Its misconduct also sought to avoid discovery of "Guildford Reports" that BATCo had its lawyers prepare to report on the documents selected by members of the public for copying from the Guildford Depository. In the face of this Court's Orders (as well as this District's local rules), the Court found that the Special Master's "finding that BATCo did not act in good faith is fully justified by the record. . . . The Court cannot agree . . . that the Government is to be faulted for not having ‘pursued the matter further' in the face of BATCo's repeated and obdurate refusal to meet and confer in good faith." Order #332, Mem.-Op. at 6 (internal citation omitted).

94. During this litigation, this Court ordered a waiver of privilege asserted by Liggett for well over 500 documents as a sanction for Liggett's "egregious" conduct in withholding responsive documents from discovery – either with no notice to the United States at all (due to hiding numerous documents in a single privilege log entry), or due to privilege log entries with grossly deficient descriptions. As the Special Master stated, in findings this Court adopted:

> [T]he Special Master finds the inaccuracies Plaintiff pointed out in Liggett's logs to be quite disturbing. Such erroneous entries seriously undermine the entire system for privilege challenges and threaten the integrity of the process, the Court's orders, and the schedule set in this matter.

R&R #111 at 11, adopted by Order #360. See also R&R #127 at 11 (on subsequent in camera review of 557 more documents from Liggett's privilege logs, finding the "misleading descriptions egregious, as the challenging party must rely on the descriptions in deciding whether to challenge withheld documents," and recommending waiver of hundreds of documents, adopted in relevant part by Order #410).

95. The largest contempt sanction in this case has been rendered against the largest Defendants, Philip Morris and Altria, for violating Order #1, which ordered all parties to preserve "all documents and other records containing information which could be potentially relevant to the subject matter of this litigation." As the Court previously ruled: "Despite this Order, Defendants Philip Morris and Altria Group deleted electronic mail (‘email') which was over sixty days old, on a monthly systemwide basis for a period of at least two years after October 19, 1999." Order #600, published as United States v. Philip Morris USA, Inc., 327 F. Supp. 2d 21, 23 (D.D.C. 2004), reconsideration denied by Order #903.

96. As the Court previously found:

> **In short, it is astounding that employees at the highest corporate level in Philip Morris, with significant**

> **responsibilities pertaining to issues in this lawsuit, failed to follow Order # 1,** the document retention policies of their own employer, and, in particular, the "print and retain" policy which, if followed, would have ensured the preservation of those emails which have been irretrievably lost. **Moreover, it must be noted that Philip Morris is a particularly sophisticated corporate litigant** which has been involved in hundreds, and more likely thousands, of smoking-related lawsuits.

Id., 327 F. Supp. 2d at 25 (emphases added).

97. The Court found that "the reckless disregard and gross indifference displayed by Philip Morris and Altria Group toward their discovery and document preservation obligations" required a substantial penalty for their spoliation of evidence. Id., 327 F. Supp. 2d at 26. The Court set the amount of the sanction at $2,750,000 – a quarter million dollars for each of the eleven high-ranking Philip Morris and Altria corporate officials who violated this Court's document preservation Order #1. Id. at 24, 26.

98. It was necessary to craft remedies that took into account that, "As a practical matter, as this Court noted at the January, 2003 status hearing, 'you cannot recreate what has been destroyed.' **Because we do not know what has been destroyed, it is impossible to accurately assess what harm has been done to the Government and what prejudice it has suffered."** Order #600, published as United States v. Philip Morris USA, Inc., 327 F. Supp. 2d at 25 (emphasis added; internal citation omitted). The Court therefore barred Philip Morris and Altria from calling the employees at the highest corporate level who destroyed evidence and violated this Court's Order #1. Id.

99. If any more evidence were needed that these Defendants are not profoundly changed companies, during live testimony in open court in 2005, over forty years after the 1964 Surgeon General's Report, the executive chairman of Reynolds American Inc, R.J. Reynolds' ultimate parent, refused to admit that smoking does cause disease:

Q. I'm not talking about significant health risks, I'm talking about causation. . . . **You will not admit, will you, on the stand here today on behalf of R.J. Reynolds, that cigarette smoking causes disease, will you?**

A. I believe it significantly increases the risk and very well may, in some people. I mean, that's the testimony.

* * *

Q. So you say it's possible, it's likely, but you don't say it does, do I have that right?

A. Yes.

Schindler TT, 1/24/05, 10812:3-22 (emphases added).

100. R.J. Reynolds also refuses to admit that smoking causes disease:

Q. Let's look at your testimony, Mr. Schindler, on page 18 of your written direct. I want you to go to line 19.

Now, the question that was posed there is similar to what we've been discussing. **"Reynolds has never admitted that smoking causes lung cancer?" The answer that's proposed is: "We have not." Isn't that an accurate response as well, that Reynolds has not admitted that smoking causes lung cancer?**

A. Yes.

Id. at 10812:23-10813:5 (emphasis added).

(5) Defendants Do Respond to Economic Incentives, and Money Is What Drives Their Conduct; Accordingly, the Court's Remedies Order Must Include Economic Incentives

101. The driving force behind Defendants' decades of fraudulent conduct is money. Through such misconduct, Defendants seek to generate as much money as possible from the sale of their product. In addition, Defendants believe that the very survival of the tobacco industry depends upon their successfully executing their schemes to defraud. The record is replete with examples of this mindset, involving, *inter alia*, low-tar cigarettes, addiction, youth marketing, ETS, and targeting smokers who want to quit. A small sample of the evidence is provided below.

102. Defendants took advantage of those smokers who wanted to quit or who were

feeling pressure to quit by marketing "light" or "low tar" cigarettes. The evidence adduced at trial demonstrated that Defendants developed and marketed low-tar cigarettes as a "health reassurance" to make those smokers who wanted to quit or who were feeling pressure to quit instead smoke a "low-tar" brand instead of quitting. Defendants never disclosed that such cigarettes do not have a health benefit, as they were only concerned about padding their bottom line.

(a) A 1992 BATCo marketing document described cigarettes as "a ‘drug' administration system for public use," and acknowledged that smokers buy low-tar cigarettes because they are worried about their health but cannot stop smoking: "True, there is now a group of ‘health concerned smokers' who buy low or ultra-low delivery products and puff away valiantly . . . they must really need the relief of those internal pressures very badly indeed!" Because cigarettes leave smokers always craving more, **"Let us hope . . . that they, our consumers, continue to remain unsatisfied. All we would want then is a larger bag to carry the money to the bank."** 400993160-3331 at 3320, 3322, 3329 (US 75975*) (A) (emphasis added).

(b) A 1980 "RJR Secret" project memo discussed marketing approaches to take with those smokers feeling pressure to quit, including "to convince the [health reassurance] target that the new brand is a reflection of his rational, sensible decision to switch to a low ‘tar.' The idea here is to appeal to his intellect, i.e. the intelligent choice. Again an attempt is made to make him feel better about smoking this particular brand." 500251567-1570 at 1568 (US 21563) (A).

103. Defendants understand the role addiction plays in sustaining the tobacco industry.

While Defendants kept evidence of addiction hidden from the public, Defendants and their executives relied on addicting the public to keep profits, and salaries, high.

(a) A 1977 Philip Morris memorandum entitled "Smoker Psychology Program Review" stated that this program's mission was to "[s]tudy the psychology of the smoker in search of information that can increase corporate profits." The memo went on to discuss nicotine's role: **"Without this chemical compound, the cigarette market would collapse, P.M. would collapse, and we'd all lose our jobs and our consulting fees."** 1000046538-6546 at 6538, 6542 (US 26074) (A) (emphasis added).

(b) A 1979 BATCo document considered alternative products **"to satisfy the 'individual' who is about to give up or has just done so, i.e., in other words, customers in danger of extinction."** The document postulated that:

> **[T]he high profits additionally associated with the tobacco industry are directly related to the fact that the customer is dependent upon the product.** Looked at another way, it does not follow that future alternative "Product X" would sustain a profit level above most other product/business activities unless, like tobacco, it was associated with dependence.

109872505-2508 at 2507, 2508 (US 21530) (A) (emphases added).

104. Defendants were not concerned about the harmful effects of ETS on the public, but instead were only concerned about how ETS would affect company profits:

(a) At the 1987 "Down Under" internal conference to discuss ETS, Philip Morris was very concerned that the tobacco industry was "just at beginning of impact of [the] ETS issue" and that **"in U.S., [the] ETS issue will have [a] devastating effect on sales."** 2021502102-2134 at 2109-2110 (US 20346) (A) (underline emphasis in original; boldface emphasis added).

(b) At that same conference, the Philip Morris Vice Chairman was told that the ETS situation "can't get any worse. Sales are down, can't be attributed to taxes or price increases. ETS is the link between smokers and non-smokers and is, thus, the anti's silver bullet." 2021502671-2678 at 2678 (US 22950) (A).

105. Defendants callously market to youth in order to maintain a healthy market share.

(a) A 1989 R.J. Reynolds memorandum entitled, "Dollar Value of YAS [Young Adult Smokers] Over Time," calculated the company's profits "[i]f an 18 year old adopts an RJR full price brand." The document noted that if the company gained "5.5 share points of smokers 18-20 per year, 1990-93 (about 120,000 smokers per year)," and "if we hold these YAS for the market average of 7 years, they would be worth <u>over $2.1 billion in aggregate incremental profit</u>. . . . [T]his payout should be worth a decent sized investment." 507181261-1261 at 1261 (US 20007) (O) (emphasis in original). R.J. Reynolds has determined that to succeed, it must market to youth under the age of twenty-one. In discussing "Younger Adult Smokers" or "YAS," a marketing document prepared for RJR in the late 1980s states, "YAS are the only source of replacement smokers. Less than one-third of smokers start after age 18. Only 5% of smokers start after age 24. . . . RJR is substantially underdeveloped and declining in share of 18-20 year old smokers." MBDOJ06953-7030 at 6969 (US 59747) (O).

(b) Defendants falsely state that the industry-wide Advertising Code prevents them from marketing to youth. A Philip Morris memorandum dated July 9, 1994 reveals that Philip Morris's motive for falsely stating that it adheres to an industry-wide Advertising Code is to avoid external, legally binding marketing restrictions

which would decrease smoking incidence and decrease profits. The memorandum stated: "The immediate implication [of advertising restrictions] for our business is clear: If our customers have fewer opportunities to enjoy our products, they will use them less frequently and the result will be an adverse impact on our bottom line." 2504024765-4767 (US 21992) (O).

106. As Dr. Jeffrey Harris testified, Defendants act collusively to further their shared economic interests. Harris WD, 22:19-23:14 ("Defendants have engaged during the past five decades in a sustained cooperative arrangement in which they have jointly denied that smoking caused disease, jointly refrained from making comparative health claims about each others' products, and jointly withheld potential risk-reducing alternatives from the marketplace."). This means "sustaining the demand for cigarettes on the one hand, and staving off adverse legal judgments which indirectly, but nonetheless could significantly impinge on profits." Harris TT, 10/14/04, 2519:20-2520:6. This collusive conduct includes denying that smoking causes disease until Defendants, incentivized by threat of a large judgment, admitted that smoking causes disease. Harris TT, 10/14/04, 2508:5-11; 2510:1-10.

107. Defendants have thus persistently focused on the **billions** of dollars they can add to their bottom line through fraudulent conduct, despite the human suffering their misconduct inflicts upon the health and well-being of the American public. Defendants' persistent focus on maximizing the bottom line through misconduct mandates that any effective remedies order must impose economic incentives to prevent and restrain Defendants from future misconduct.

108. In testimony not challenged on cross-examination, Dr. Max Bazerman observed:

> Evidence demonstrates that these frauds have been highly profitable. For instance, evidence shows that most adults who smoke start smoking as young people, which leads to the conclusion that defendants have a significant incentive to market

> their products to young people. Evidence also shows that most adults who smoke would like to quit, which leads to the conclusion that defendants have substantial incentives to market light/low tar cigarettes as an alternative to quitting. . . . **Therefore, absent Court intervention, there is no reason to assume that these fraudulent behaviors will cease to be profitable for defendants in the future and as a result, defendants will experience incentives to engage in them.**

Bazerman WD, 20:7-15 (emphasis added).

109. Economic incentives are needed to prevent and restrain defendants from marketing to youth. "As long as expected profit from cigarette sales to young people exists, the misconduct of marketing cigarettes to young people will continue." Bazerman WD, 46:15-16. As Dr. Bazerman testified, Defendants' "incentives to maximize profit are outweighing the incentives to avoid the misconduct of targeting underage individuals in the defendant companies' marketing efforts." Bazerman TT, 05/04/05, 203226:2-10.

110. The remedies sought by the United States remove Defendants' economic incentive to continue to engage in fraudulent conduct. The forward-looking remedy proposed by Dr. Jonathan Gruber, discussed in detail in § V.D, infra, imposes an assessment on Defendants that exceeds their gain from appealing to youth if youth use of a Defendant's product exceeds a target level. This remedy creates incentives for Defendants to avoid any RICO-violating activities that make their products appealing to youth by removing their ability to profit from youth smoking – profits that RJR estimated in 1989 would earn it alone an additional $2.1 billion per year just for smokers from ages 18-20. Gruber TT, 05/10/05, 20610:22-20611:1; Gruber WD, 14:10-18; 507181261-1261 at 1261 (US 20007) (O). As Dr. Gruber testified, such a remedy provides an economic incentive for Defendants to cease RICO violating activities. Gruber TT, 05/10/05, 20611:2-5; see also Bazerman WD, 46:23-47:2 ("Dr. Gruber's expert report proposes a mechanism aimed at eliminating the economic incentives that defendants experience to market

cigarettes to young people.").

111. Dr. Bazerman testified at trial that Defendants have an incentive to market light and low-tar cigarettes to those individuals who want to quit and smokers who have quit that want to abstain from smoking. Dr. Bazerman also testified that a smoking cessation remedy will "eliminate the incentives that encourage defendants to design and market cigarettes in ways intended to appeal to this population." Bazerman WD, 65:5-14. This testimony was unchallenged by Defendants on cross examination of Dr. Bazerman, and Defendants offered no expert witness to combat that testimony.

112. Dr. Bazerman further testified that implementing a counter-marketing campaign, if effective, "will remove from the marketplace a population of consumers and potential consumers of defendants' products." As a result, Defendants' "incentive to market to this population will be eliminated and their behavior will change accordingly." Bazerman WD, 65:15-20. This testimony was unchallenged by Defendants on cross-examination of Dr. Bazerman, and Defendants offered no expert witness to combat that testimony.

113. To rebut the testimony of several of the United States' experts, Defendants called Daniel Fischel, Dennis Carlton, and James Heckman as expert witnesses. All three are associated with the litigation consulting firm Lexecon, and among them, they have provided paid expert testimony on hundreds of occasions. Fischel TT, 5/27/05, 22134:22-23; Carlton TT, 6/2/05, 22734:7-16; Heckman TT, 4/13/05, 18766:7-8. Each of these experts also has a history with these Defendants, and Fischel acknowledged at trial that the tobacco industry, and many of the law firms representing Defendants, have been sources of income for him personally and for Lexecon. Fischel TT, 5/27/05, 22138:5-7; Heckman TT, 4/13/05, 18816:18-24; Carlton TT, 6/2/05, 22752:3-10. The record demonstrates that the Lexecon witnesses are paid inordinate

sums of money; yet their work in this case lacked diligent preparation. Dr. Heckman, who received $1,000 per hour for his work, brought with him to the stand notes that he used to refresh his own recollection to answer a question posed by Defendants' counsel. Heckman TT, 4/14/05, 19006:6-7. Dr. Carlton, who has earned over $21 million in the last two years for his work with Lexecon, did not read all of the documents on his reliance list, failed to cite peer-reviewed literature or any other data to support several of his conclusions, and admitted that he was unaware of "the growing body of literature" analyzing the economic effects of the MSA on the tobacco industry – an issue upon which he opined. Carlton TT, 6/2/05, 22752:16-22753:3, 22778:6-20, 22810:14-18. Finally, despite earning over $30 million in the last four years through his work for Lexecon and billing Defendants $1,000 per hour for his time, Fischel violated the Rule on Witnesses by calling his assistant during the lunch break to discuss cross-examination questions regarding data that appeared in his own written direct, the first draft of which was written by Defendants' counsel. Fischel TT, 5/27/05, 22137:10-18, 22128:14-22129:24, 22216:21-22219:1. Accordingly, the testimony of the three Lexecon witnesses is accorded little weight in light of the diligent work accomplished by the United States' expert witnesses.

114. Of course there is nothing wrong with Defendants' (or any other corporation's) seeking to maximize profits while fully obeying the law. As the record amply demonstrates, however, that is not what Defendants do. Instead, Defendants seek to maximize profits through misconduct. Bazerman TT, 05/04/05, 20348:4-17. This is unacceptable. The Court's comprehensive package of equitable remedies must therefore impose economic incentives to prevent and restrain future misconduct.

115. Based upon the above findings and the trial record, the Court finds that a comprehensive program of equitable relief is necessary to prevent and restrain Defendants from

continuing to engage in fraud and violate the RICO statute.

B. Defendants Should Be Required to Fund a Smoking Cessation Program[1]

116. Of the nearly 47 million smokers in the United States, approximately 32 million want to quit smoking but have thus far been unable to do so. Of those smokers who want to quit, 18.8 million try to quit each year, but most of them fail, as only 1.2 million American smokers make a successful quit attempt each year. Fiore TT, 5/17/05, 21280:4-21281:7; (US 18267) (A).

117. Defendants have utilized misleading brand descriptors and engaged in marketing campaigns specifically designed to mislead consumers into believing that low tar cigarettes are less hazardous than higher tar cigarettes or constitute a step toward quitting, and continue to do so. See US FF § III.D, supra. Defendants have designed products and created marketing campaigns with the specific intent to keep smokers who want to quit from doing so. See id.. At the same time, Defendants have designed cigarettes to insure that they would deliver higher nicotine yields (and with more nicotine, greater amounts of tar) than the machine-measured yields achieved through the FTC testing method. See id.. These and other aspects of Defendants' wrongful conduct have been pervasive and have affected, and will continue to affect, every smoker in the United States. Burns TT, 2/16/05, 13620:3-10.

118. Many current smokers switch from high to lower tar cigarettes each year: 4-9% of smokers switch brands every year, and 75% of switchers switch down in tar. See US FF § III.D(1), supra. This represents between 1.4 million to 3.2 million smokers every year. In total,

[1] The remedies that the Court may order based on these findings obviously depend on the legal standards that will apply. As the Court is aware, the United States has filed a petition for certiorari, seeking review of the D.C. Circuit's decision on the availability of disgorgement and the meaning of the statutory phrase "prevent and restrain." The relevance of particular factual findings contained in this section to the remedies that the Court might order may depend on the Supreme Court's disposition of the certiorari petition

low tar brands are smoked by 81.9% of all smokers, or a total of approximately 38.5 million smokers. See US FF § III.D(2), supra.

119. Evidence establishes that approximately half of the smokers who smoke low tar cigarettes hold the mistaken belief that low tar cigarettes are less hazardous than higher tar cigarettes or constitute a step toward quitting. See US FF § III.D, supra.

120. Accordingly, between 700,000 and 1.6 million of the smokers who switch down in tar every year (i.e., 50% of 1.4 to 3.2 million annual switchers to "low tar") and a total of 19.25 million smokers of low tar cigarettes (i.e., 50% of 38.5 million "low tar" smokers) hold the mistaken belief that they are taking a step for their health or toward quitting.

121. Based on the statistical data showing that 30% of smokers want to quit but do not make a quit attempt, it is reasonable for the Court to conclude that there are at least 5.75 million persons who want to quit smoking but smoke low tar cigarettes with the mistaken belief that they provide a health benefit compared to higher tar cigarettes and fail to make a quit attempt in a given year.

122. In addition, every year approximately 730,000 youth under the age of eighteen begin daily smoking, and Defendants' marketing is a substantial contributing factor to youth smoking initiation. See US FF § III.E, supra. Research demonstrates that youth, like all smokers, do not appreciate the health risks of smoking and that youth disproportionately fail to appreciate the addictiveness of cigarettes. A majority of those youths who begin daily smoking become addicted and eventually join the group of American smokers who want to quit. See US FF § III.A(4), supra.

123. The defendants are highly likely to continue engaging in fraudulent conduct for at least the first year following judgment, before the comprehensive set of remedies imposed by the

Court has full effect on Defendants' conduct and its impact on the American public.

124. A comprehensive national smoking cessation program has the potential to reach the more than 30 million smokers in the United States who want to quit but are unable to do so in any given year and who have been and continue to be victims of Defendants' fraudulent conduct. A comprehensive program has the potential to reach smokers of diverse populations, to normalize quitting, and to make sure that every smoker who wishes to quit has the opportunity to do so successfully using science-based treatments. Fiore WD, 17:1-3.

125. Between 77% and 92% of smokers are addicted. See US FF § III.C(1), supra. Their continued smoking substantially increases their risk of serious disease and premature death. See US FF § III.A(1), supra. As David Burns, M.D., one of the world's most accomplished researchers in smoking and health, persuasively explained during cross-examination by Defendants, a comprehensive smoking cessation program has the potential to reduce significantly the extraordinary death and disease burden caused by smoking. Burns TT, 2/16/05, 13629:8-17. See also US FF § V.A(1), supra (discussing enormous toll in human suffering caused by smoking). Defendants are well aware of these facts, but do not provide cessation programs. Indeed, while Philip Morris attempted to tout its "QuitAssist" website during cross-examination of Dr. Henningfield, the materials Defendants showed to Dr. Henningfield do not even mention the word "nicotine," let alone meaningfully inform smokers of nicotine's primary role in causing smoking addiction and thus its powerful role in impeding cessation. Henningfield TT, 11/30/04, 7483:14-7484:15.

126. The United States' expert witness, Michael C. Fiore, M.D., M.P.H., is eminently qualified to offer expert opinions on the components, structure, utilization and effectiveness of a comprehensive, population-based smoking cessation program, including the need for sustained

and well-funded promotion of the program. Dr. Fiore is a Professor of Medicine at the University of Wisconsin, and has provided clinical treatment for patients addicted to tobacco and performed research and intervention related to tobacco dependence for almost twenty years. Fiore WD, 4:13-6:6.

127. Dr. Fiore is also the founder and Director of the Center for Tobacco Research and Intervention in Madison, Wisconsin (UW-CTRI). Dr. Fiore and his colleagues have created a diverse portfolio of research, outreach and intervention programs, policy activities, and direct services to smokers in order to fulfill the mission of UW-CTRI: "To expand our understanding of tobacco dependence and its treatment and to use this knowledge to design and implement interventions that will significantly reduce tobacco use in Wisconsin, the nation, and beyond." Under Dr. Fiore's direction, UW-CTRI provides services to thousands of Wisconsin residents through its outreach program and its Wisconsin Tobacco Quit Line, which provides telephonic cessation counseling services to Wisconsin residents. The Center is currently involved in clinical trials of medications under development by the pharmaceutical industry, namely rimonabant, varenicline, and a nicotine vaccine. In the past, UW-CTRI also conducted clinical trials on the nicotine patch, bupropion and other medications for the treatment of tobacco dependence. Dr. Fiore continues to focus on tobacco treatment in both the research conducted by the Center and by its Wisconsin outreach program: new studies are designed to better match individuals and their treatments and to focus on long term outcomes of quitting. The Center's future goals include working to increase quit rates to 50% or greater and developing treatments that can be better matched to individual differences such as gender and racial and ethnic status. Id. at 5:1-6:6, 10:13-11:11.

128. Dr. Fiore's research has focused on understanding tobacco dependence and

developing effective strategies, both clinical and population-based, to facilitate treatment of tobacco dependence. Id. at 6:7-11, 7:9-9:13. Dr. Fiore chaired the panels that produced the Agency for Health Care Policy and Research (now called the Agency for Healthcare Research and Quality, or AHRQ) Clinical Practice Guideline (#18), *Smoking Cessation* (1996) and the United States Public Health Service Clinical Practice Guideline: *Treating Tobacco Use and Dependence* (2000).

129. Dr. Fiore also chaired the United States Department of Health and Human Services Subcommittee on Cessation of the Interagency Committee on Smoking and Health, which in 2003 produced a National Action Plan for promoting tobacco cessation in the United States, and chaired the United States Health Care Financing Administration (HCFA) Expert Panel on Interventions to Promote Smoking Cessation in the Medicare Population. Id. at 9:13-23.

130. Defendants did not call an expert witness in Dr. Fiore's field and did not call any witness with sufficient qualifications to challenge Dr. Fiore's opinions. Instead, Defendants called Donald Rubin, Ph.D., a statistician who has never designed a smoking cessation program, Rubin TT, 5/24/05, 21993:19-21, never conducted research on effective strategies for smoking cessation or nicotine replacement therapy, id. at 21993:22-25, 21994:21-23, never served as a government or state consultant for cessation programs, id. at 21994:1-3, 18-20, and conceded that he is not an expert in the treatment of tobacco dependence. Id. at 21994:4-6. Dr. Rubin further admitted that the Court should look to someone like Dr. Fiore to identify the components of a smoking cessation program. Id. at 22000:22-22001:4.

131. Dr. Rubin has testified as an expert witness for the Defendants in numerous lawsuits since 1997, and received between $1.5 million and $2 million providing testimony and

consulting for them between 1997 and 2002 alone. Id. at 21973:6-12, 21976:20-21978:2. Defendants paid Dr. Rubin between $200,000 and $250,000 in 2004, representing between 25% and 33% of his gross consulting income. Id. at 21978:3-10. He was compensated for his work in this case at $1250 per hour for consulting time and $1600 per hour for testimony, including time spent testifying at trial. Id. at 21976:6-11.

132. The Court observed the demeanor of these witnesses live at trial. Dr. Fiore's opinions are entitled to greater weight than those of Dr. Rubin, and Dr. Fiore was a more credible witness than Dr. Rubin.

133. The recommendations and analyses contained in the United States Public Health Service Clinical Practice Guideline: *Treating Tobacco Use and Dependence* (2000), developed by a panel that Dr. Fiore, provide the most comprehensive recommendations for treating tobacco use and dependence. Fiore WD, 31:19-21.

134. The Guideline recommendations were developed through a comprehensive and systematic review of every article in English language journals on the subject of the treatment of tobacco dependence, and a total of approximately 6,000 articles were reviewed by a staff of scientists and support individuals with the Guideline panel. The Guideline was reviewed by seventy outside peer reviewers, and so its peer-review process was far more extensive than that employed for a journal article (typically three reviewers). Fiore WD, 35:1-36:8, 37:21-38:4, 40:5-8.

135. The work of the Subcommittee on Cessation of the Interagency Committee on Smoking and Health, as reflected in *Preventing 3 Million Premature Deaths, Helping 5 Million Smokers Quit: A National Action Plan for Tobacco Cessation* (2003), represents the scientific judgment of some of the world's foremost experts on treating tobacco dependence, population-

based smoking cessation programs, implementing initiatives to improve the public health and, in particular, to lessen the disease burden associated with tobacco use, and the developing communications to promote behavioral change and utilization of public health initiatives. The panel also included health policy makers, federal officials, and representatives from the health insurance and business industry sectors. Fiore WD, 21:11-23:11, 24:5-25:4; *Preventing 3 Million Premature Deaths, Helping 5 Million Smokers Quit: A National Action Plan for Tobacco Cessation* (2003) (US 89464) (A).

136. The testimony of Dr. Fiore, the 2000 Clinical Practice Guideline, the work of the Subcommittee on Cessation of the Interagency Committee on Smoking and Health, and the weight of the scientific literature establish that a comprehensive, evidence-based smoking cessation program should include: (1) a national tobacco quitline network that will provide universal, barrier-free access to evidence-based counseling and medications for tobacco cessation; (2) an extensive paid media campaign to encourage all smokers in the United States to quit using tobacco; (3) a new, broad, and balanced research agenda to achieve future improvements in the reach, effectiveness and adoption of tobacco dependence interventions across both individuals and populations; and (4) training and education to ensure that all clinicians in the United States have the knowledge, skills and support systems necessary to help their patients quit tobacco use. Fiore WD, 17:22-18:20; U.S. Public Health Service Clinical Practice Guideline: *Treating Tobacco Use and Dependence* (2000) (JD-001210) (A); *Guide to Tobacco Use Prevention and Control* (Guide to Community Preventive Services) (2001) (US 64554) (A); *Draft National Blueprint for Disseminating and Implementing Evidence-Based Clinical and Community Strategies to Promote Tobacco Use Cessation* (2002) (US 89463) (A); *Preventing 3 Million Premature Deaths, Helping 5 Million Smokers Quit: A National Action*

Plan for Tobacco Cessation (2003) (US 89464) (A).

137. A quitline network delivers evidence-based counseling and medications to help smokers who want to quit do so successfully. A quitline allows tobacco users to access these treatments by calling a toll-free telephone number and speaking to a trained counselor, who provides information and assistance to the tobacco user in planning and then following through on a quit attempt. Fiore WD, 28:14-29:16.

138. To be most effective, quitline services (both counseling and medications) must be available to all smokers, without any cost or insurance barriers. Fiore WD, 28:14-29:16.

139. Counseling services should be of sufficient intensity to maximize chances of success. For this reason and based on research findings, counseling should include at least four person-to-person, proactive calls from trained quitline counselors. Fiore WD, 28:14-29:16.

140. Proactive quitlines are characterized by two key components. First, when the smoker makes the first call, an extensive intake is completed to collect all the critical information necessary to personalize an evidence-based quit plan. Second, this extensive intake call is followed by a series of subsequent outgoing counseling calls, initiated by the quitline, to assist the smoker every step of the way though the quit plan. The quitline can also receive additional incoming calls from smokers during a quit attempt - for example, if a smoker is having particularly difficult withdrawal symptoms, he or she can call the quitline for individualized evidence-based advice. In essence, a proactive quitline is a real-time partner in successful quitting. Fiore WD, 30:13-23.

141. Quitline counseling should be augmented with free FDA-approved pharmacotherapy (either over-the-counter medications or vouchers for prescription medications). The FDA has approved six medications for smoking cessation to date. Five of the medications

are nicotine replacement therapies – nicotine gum, nicotine patches, nicotine lozenges, nicotine inhalers and nicotine nasal spray. The sixth approved medication to date, bupropion SR, is an anti-depressant that has been shown to be effective in treating tobacco dependence. All six of these pharmacotherapies are effective. Fiore WD, 28:14-29:16, 43:10-22, 45:5-47:7; (JD-001210) (A); VXA4490327-0404 (US 89468) (A); VXA4490274-0326 (US 89469) (A).

142. Quitline counselors should be trained to work with smokers to establish a personalized and detailed quitting plan, including specific advice on the types of medication that are most appropriate for the smoker in making the quit attempt. The trained quitline counselors who staff the quitline should then be able to work with smokers both during the initial intake calls and every step of the way through the process of quitting. Fiore WD, 28:14-29:16, 44:1-4.

143. If an over-the-counter medication is most appropriate, the medication should be mailed directly to the smoker along with personalized quitting information. If it is determined that the most appropriate medicine for a smoker is a prescription agent such as bupropion, the quitline should include a voucher for the prescription medication when the personalized quitting information is sent to the smoker (with the smoker then visiting a physician or other provider for the prescription and allowing the smoker to get the voucher filled by a pharmacy). Fiore WD, 29:5-7, 44:4-10.

144. Quitline services should be available for the language, culture, and educational background of all users and should be available 24 hours per day, seven days a week, so that whenever a smoker wants to make an assisted quit attempt he or she is able to do so. Fiore WD, 29:7-8, 29:14-16.

145. A national telephone quitline should not replace existing state quitlines. Instead, states should have the capacity to maintain their own quitlines and personalize them to the states'

particular features. As recommended by Dr. Fiore, a national quitline network should be built on the network of state and regional services to ensure that local control can be maintained. The organization that administers a national quitline network as part of a remedial order entered in this case should therefore be permitted and encouraged to build on existing resources. Local control should be maintained but maintained in the context of a nationally funded system that delineates the core performance standards that will result in maximum reach and maximum effectiveness. Fiore WD, 42:21-43:8.

146. The clinical effectiveness of proactive quitlines in helping smokers quit is well-documented in scientific literature. In addition, the effectiveness is supported by two published meta-analyses. First, a meta-analysis published in the 2000 Clinical Practice Guideline demonstrated a 1.2 estimated odds ratio for proactive telephone counseling. A more recent meta-analysis published in 2002 by the Cochrane Collaborative involving twenty-seven studies demonstrated a 1.56 odds ratio for proactive telephone counseling compared to less intensive intervention (e.g., self-help quitting materials). Fiore WD, 31:3-13; JDX016 0624-0830 at 0655-0656 (JD-001210) (A); Stead LF, Lancaster T, Perera R. Telephone counselling for smoking cessation, Cochrane Database System Rev. 2003; (1):CD002850 (US 89465) (A).

147. To maximize its overall effectiveness, the different parts of a comprehensive program should be integrated and viewed as interdependent. Experience with smoking cessation programs and clinics demonstrates that the different parts of a comprehensive program are more effective when applied in tandem with the other components of the program. Fiore WD, 18:21-19:22.

148. Barriers to access prevent most smokers from successfully accessing treatment that has proven effective at helping people quit smoking. Such barriers include eligibility

requirements, screening processes, co-payment obligations, language and other cultural barriers, limited access to services, lack of awareness, limits to covered benefits, and fragmentation of care. One of the reasons that comprehensive smoking cessation treatment is so underutilized in this country is that there are often barriers to use even where services are offered. There are thirty-six state-managed quitlines and five states with formal agreements for coverage by the Cancer Information Service at the National Cancer Institute, but these 41 state quitlines are generally not available to all smokers, are only available for part of the day, are not promoted, do not offer medications to all callers, do not meet language and cultural needs of all smokers, and do not offer a complete menu of services to smokers. The existence of these barriers to treatment results in only 1-2% of smokers using state quitlines each year. Having barrier-free access to evidence-based smoking cessation therapy is essential for a smoking cessation program to reach the largest number of smokers and thereby help the maximum number of smokers quit. Fiore WD, 20:7-18, 41:14-21, 42:2-9; Fiore TT, 5/17/05, 21285:6-24,, 21286:25-21287:22.

149. Different barriers impact utilization in different ways:

(a) Eligibility requirements prevent utilization of services by many smokers who would otherwise call existing quitlines. Fiore TT, 5/17/05, 21286:7-21; (US 18265) (A).

(b) Screening processes lead to complicated and detailed assessments of the types of insurance quitline callers have, leading some callers to terminate calls during the intake process. Fiore TT, 5/17/05, 21286:25-21287; (US 18265) (A).

(c) Cost barriers, including co-payment obligations, are a significant barrier to utilization, particularly due to the high rate of smoking among persons of lower socioeconomic status and smokers without health insurance. In a 1998 article

published in the *New England Journal of Medicine* (Curry SJ, Grothaus LC, McAfee T, Pabiniak C. Use and Cost Effectiveness of Smoking-cessation Services Under Four Insurance Plans in a Health Maintenance Organization, N Engl J Med 1998; 339(10):673), Dr. Susan Curry and her colleagues reported that 3.5% of health plan participants utilized a smoking cessation benefit under standard coverage with a co-payment obligation, compared to a utilization rate of 11.6% with full coverage. In other words, the utilization rate triples if there is no co-payment requirement. Fiore TT, 5/17/05, 21287:11-21289:16; VXA100 0605-0611 at 0608 (US 64387) (A); (US 18265) (A).

(d) Due to budget constraints, many states limit counseling and other services to English or English and Spanish only. In addition, budget limitations on existing quitlines make it difficult for counselors to be adequately trained to address cultural issues that exist with different ethnic groups; for example, tobacco has a cultural significance to many Native American tribes. Fiore TT, 5/17/05, 21292:3-21293:4; (US 18265) (A).

(e) Most existing quitlines, including, as an example, the State of Wisconsin, are only available during limited hours of the day or limited days during the week. This is an additional barrier to utilization. Fiore TT, 5/17/05, 21293:5-21.

(f) Inadequate training of physicians and other health care professionals, as well as limited access to health care services, results in lower utilization of smoking cessation services. Fiore TT, 5/17/05, 21293:22-21294:15; (US 18265) (A).

(g) Fragmentation of care, or the disassociation of key components for the treatment of tobacco dependence, makes it more difficult for smokers to access

comprehensive care and is a barrier to access. Fiore TT, 5/17/05, 21294:17-21295:11; (US 18265) (A).

(h) In addition, experience with state-run quitlines demonstrates that providing cost-free medications increases both call rates and utilization rates:

1. In a Wisconsin program that targeted older smokers, the state dispensed nicotine patches through the mail when smokers called the quitline. Specifically, Wisconsin offered nicotine patches to smokers over 65 who called the state quitline for a six-month period. With a series of news conferences as the only promotion, 5.5% of the population of over-65 smokers in the state called the quitline during the six-months that nicotine replacement therapy was offered. Fiore WD, 44:21-45:4.

2. When New York City offered free nicotine patches to smokers of more than ten cigarettes per day, the city received more than 400,000 calls to its quitline in just three days. Fiore TT, 5/18/05, 21592:1-21594:6; North American Quitline Consortium, *Quitline Operations: A Practical Guide to Promising Approaches* (2005) at A10 (US 92128) (A). The city exhausted its supply of 34,090 nicotine patches within weeks, with the distribution reaching between 4.7% and 5.0 % of eligible smokers in that time period. Id. at A9.

150. Multifaceted communications campaign requires effectively promoting a national telephone quitline network and insuring maximum utilization. A media campaign should have four goals: First, to promote the use of the national tobacco quitline and other effective cessation interventions: second, to motivate tobacco users to make a quit attempt and increase demand for effective cessation services; third, to motivate parents to quit by informing them of the health

risks that secondhand smoke poses to their families and informing them that their smoking increases the likelihood that their children will smoke; and fourth, to reach all segments of the population, including the most underserved and hard-to-reach populations such as low socioeconomic status, certain racial and ethnic minorities, and those of limited English proficiency. Fiore WD, 53:16-54:9.

151. The promotional campaign should be developed by independent media and communications scientists seeking to implement the most effective messages and strategies: A standing group of communications experts will be best equipped to design the promotional campaign, evaluate it, and ensure that it is as effective as possible. A promotional campaign needs to be pervasive, that is, to be a consistent presence in the everyday lives of smokers in the same way that tobacco marketing is now. To do that, the media campaign must use the full range of media - radio, television, print media, signage, the Internet, etc. Fiore WD, 54:10-15.

152. Research on statewide tobacco control programs has shown that aggressive media campaigns are effective in targeted ways such as prompting individuals to use evidence-based treatments such as quitline services, and discouraging children and adolescents from starting to smoke. Some of the strongest evidence of the effectiveness of such media campaigns comes from settings where they were implemented as part of multi-component programs. Such programs increase cessation across a variety of populations, indicating their widespread impact. This research was summarized by the CDC in as part of its 1999 publication, *Best Practices for Comprehensive Tobacco Control Programs*, among other places. Fiore WD, 55:1-13; (JD-002727) (A).

153. The multifaceted communications campaign should be funded at a minimum level of $375 million per year, and at a maximum level of up to $1 billion per year:

(a) Cessation program funding of $1 billion per year for a promotional campaign to achieve the cessation program objectives identified above is well-supported as a recommendation of Dr. Fiore and the Subcommittee on Cessation of the Interagency Committee on Smoking and Health. It is also supported by the expert opinion of Dr. Michael Eriksen and the bases therefor. See US FF § V.C, infra.

(b) The Subcommittee on Cessation was comprised of numerous experts in the field of public health with substantial media experience. Dr. Robert Croyle has been involved with the cancer control and population science media activities as part of his portfolio of work at the National Cancer Institute. Dr. Susan Curry, both in her previous work at Group Health Cooperative of Puget Sound and the University of Washington as well as in her current role at the University of Illinois in Chicago, utilizes media and communications activities as a component of many programs. Dr. Ron Davis has served as a director of the Office on Smoking and Health at the Centers for Disease Control and Prevention and as the Chief Medical Officer for the State of Michigan, where he played an active role in communicating messages of importance for health promotion and disease prevention to the residents of Michigan. As director of the Center for Health Promotion and disease prevention at the Henry Ford Health Systems, Dr. Davis is currently promoting and developing programs that improve health among the enrollees of the Henry Ford Health System. Kathryn Gordon is the Director of the Center for Medicare and Medicaid Services, which has been involved actively in a program to test a new smoking cessation benefit among Medicare enrollees. Dr. Cheryl Healton is involved in extensive media activities, including the truth®

campaign directed by the American Legacy Foundation. Dr. Rosemarie Henson, who directs the United States Office on Smoking and Health, is involved in extensive activities aimed at helping keep children and adolescents from starting to smoke and helping adults to quit. Dr. Howard Koh directed the comprehensive tobacco control program in Massachusetts in his role as its Commissioner of Health. Dr. James Marks had extensive media experience that was essential in his role as Director of the CDC's National Center for Chronic Disease Prevention and Health Promotion. Dr. Tracy Orleans, a senior scientist at the Robert Wood Johnson Foundation, has directed a number of programs on tobacco and has promoted the programs in order to increase utilization. As United States Surgeon General, Dr. David Satcher directed communications activities at the United States Public Health Service, including a number of health promotion and disease prevention communications initiatives. And Dr. John Seffrin, Chief Executive Officer of the American Cancer Society, led the Cancer Society's communications efforts to prevent cancer in America, including its communications efforts to reduce tobacco use. Fiore WD, 24:5-20, 55:23-57:8.

(c) The Subcommittee's considerations support a $1 billion annual recommendation:

1. Decisions and judgments that scientists and experts make for public health today must be based on prior experience. Fiore TT, 5/18/05, 21520:16-18; Carmona TT, 5/3/05, 20134:3-20. From 1967 to 1970, when the Federal Communications Commission required licensees who broadcast cigarette commercials to provide free media time for anti-smoking public service announcements under the Fairness Doctrine, the time donated for the anti-

smoking messages amounted to approximately $375 million per year in 2005 dollars. Peer-reviewed literature supports the effectiveness of the Fairness Doctrine spending equivalent. Fiore WD, 57:9-58:15; Fiore TT, 5/18/05, 21520:11-21521:2.

2. Experience with other media campaigns at the state and national level supports the $1 billion funding level. For example, the American Legacy Foundation's truth® campaign, which has been much more limited than the promotional campaign proposed by the Subcommittee on Cessation and recommended to the Court by Dr. Fiore, supports expenditures of at least $100 million per year for television alone. And while some of those offering testimony to the Subcommittee on Cessation as it developed its recommendation suggested that a television-only campaign would cost only $100 million dollars per year, the Subcommittee on Cessation called for a comprehensive, multifaceted media campaign to achieve the multiple goals described above..

3. A comprehensive media force is needed to counter the more than $12 billion per year that the tobacco industry currently spends on advertising and promotion. TLT093 0001-0949 at 0909 (US 88261) (O); Fiore WD, 57:18-58:2.

(d) Consideration of the Fairness Doctrine supports a minimum promotional campaign funding level of $375 million. The goal of cessation funding is to help smokers to quit, particularly the 32 million smokers who want to, and communicating to them about cessation services is therefore an important component of any program. The impact of the Fairness Doctrine supports the

effectiveness of a $375 million annual promotional expenditure. Fiore WD, 57:9-58:20; Fiore TT, 5/18/05, 21520:11-21521:16; Carmona TT, 5/3/05, 20134:3-20.

(e) As Dr. Eriksen testified, the CDC's *Best Practices* (1999) recommended spending between one and three dollars per capita per year for counter-marketing efforts, although this does not include a coordinated nationwide component. At the time of the 1999 CDC *Best Practices* publication, this would have been between $300 and $900 million per year; due to inflation and population increases since 1999, these figures would now be 25% higher (i.e., $375 million to $1.125 billion per year). Eriksen WD, 10:15-19.

154. An effectively promoted, barrier-free smoking cessation quitline will yield an expected utilization rate of 10%, *i.e.*, 10% of American smokers each year can be expected to undergo counseling services and take medications for a quit attempt. Fiore WD, 52:7-53:14; Fiore TT, 5/17/05, 21284:3-17; VXA452 0053-0061 at 0058-0059 (US 89470) (A). This conclusion is supported by, *inter alia*, CDC's *Best Practices for Comprehensive Tobacco Control*, which determined that 10% of all smokers "18 years and older would be expected to use cessation services each year." GVT 0050344-0431 at 0370 (JD-002727) (A).

155. A 10% utilization rate can be achieved if the call rate to the quitline is 16%. Fiore WD, 52:7-53:14; VXA452 0053-0061 (US 89470) (A).

156. The preponderance of the evidence establishes that a 16% call rate and 10% utilization rate are achievable estimates. For example:

(a) Group Health Cooperative of Puget Sound, now known as Free and Clear, Inc., achieved a call rate of 8% for its comprehensive quitline for five consecutive

years without any promotional activity. Fiore WD, 52:15:22; VXA452 0053-0061 (US 89470) (A).

(b) Promotional activity greatly increases call rates. Peer-reviewed research findings from Deborah J. Ossip-Klein and Scott MacIntosh, published in the *American Journal of Medical Sciences*, reported: "Research has clearly demonstrated that broad community-based promotion increases quitline utilization. For example, Ossip-Klein et al. demonstrated that free television, radio, and newspaper promotions tripled call rates compared with promotion through smoking cessation settings alone." DBR-102546-2550 at 2547 (JD-068087) (A) (footnotes omitted); Fiore TT, 5/18/05, 21596:18-21597:25.

(c) Ossip-Klein and MacIntosh's overall conclusion that "advertising, paricularly when tagged to antismoking media campaigns, increases call rates and may stimulate calls from those who do not otherwise seek help" is consistent with the evidence considered by the Subcommittee on Cessation of the Interagency Committee on Smoking and Health in reaching its determination that a 16% call rate and a 10% utilization rate is achievable. DBR-102546-2550 at 2547 (JD-068087) (A); Fiore TT, 5/18/05, 21603:14-21604:8.

(d) The 16% call rate is further supported by testimony provided to the Subcommittee on Cessation by Dr. Shu-Hong Zhu, the Director of the tobacco quitline for the State of California and a noted and published scientist in the treatment of tobacco dependence. Fiore TT, 5/18/05, 21595:7-20. In both written and oral testimony before the Subcommittee, Dr. Zhu indicated: "The potential of quitlines has not been fully exploited, largely for lack of sufficient state funding. It is estimated

that it is possible for 15% of the smoking population in any given state to call a quitline and request services if there is proper promotion. This means that the existing quitline operation capacity can increase tenfold." VXA452 0429-0432 at 0431 (JD-068082) (A); Fiore TT, 5/18/05, 21595:21-21596:17. Based on his extensive experience in the field, Dr. Zhu stated the view that providing medications as part of quitline services and utilizing media campaigns to "help change the societal norm about smoking and increase the motivation to quit" will contribute to the achievable tenfold increase in quitline utilization. VXA452 0429-0432 at 0431-0432 (JD-068082) (A).

(e) As noted previously, when New York City offered free nicotine patches in 2003 to smokers of more than ten cigarettes per day, the city received more than 400,000 calls to its quitline in just three days and exhausted its supply of 34,090 nicotine patches within weeks, with the distribution reaching between 4.7% and 5.0 % of eligible smokers in that short period. Fiore TT, 5/18/05, 21592:1-21594:6; North American Quitline Consortium, *Quitline Operations: A Practical Guide to Promising Approaches* (2005) at A9-A11 (US 92128) (A).

157. The cost of providing quitline services is $419 per caller to a telephone quitline, as calculated by Group Health Cooperative for the Subcommittee on Cessation of the Interagency Committee on Smoking and Health. VXA452 0053-0061 at 0057 (US 89470) (A). The Group Health Cooperative was specifically selected to provide cost estimates to the Subcommittee on Cessation of the Interagency Committee on Smoking and Health because: (1) its program includes both counseling and medicine; and (2) it offers services without eligibility requirements for participation, so it removes some, but not all, of the barriers to access. Fiore TT, 5/18/05,

21598:1-21599:6. The experience of the Group Health Cooperative, unrebutted by any evidence in the record, demonstrates that there must be an average of 1.6 callers for every person who will participate in a smoking cessation program that is run through a telephone quitline. Fiore WD, 52:7-12; VXA452 0053-0061 (US 89470) (A). At $419 per caller, multiplied by 1.6, the cost of providing services is $670.40 for each smoker who utilizes counseling and medications in a smoking cessation program, and the $670.40 cost per smoker can be used to calculate the total cost of designing a comprehensive program.

158. It is reasonable to expect that 20% of those smokers who utilize counseling and medications as part of a comprehensive program will quit successfully, with a successful quit defined as 6 months without smoking. Fiore WD, 70:3-11; Fiore TT, 5/17/05, 21281:9-15, 21301:20-21302:20.

159. If an effectively promoted, barrier-free smoking cessation quitline is utilized by 10% of smokers each year (based on a 16% call rate) and the quit rate among participants is 20%, there will be almost 1 million successful quits per year. Fiore WD, 70:3-11; VXA449 00494-0534 at 0508 (US 89464) (A).

160. Based on a 20% expected quit rate, if a smoking cessation program is utilized by 10% of smokers, it will take twenty-five years to help every American smoker who wants to quit to do so successfully. This will eliminate entirely the population of addicted smokers who want to quit and who have been and continue to be targets of Defendants' fraudulent marketing and cigarette design. Fiore TT, 5/17/05, 21299:24-21301:10; (US 18266) (A).

161. The twenty-five year time period reflects consideration of epidemiological data concerning: (1) the number of smokers who will quit whether a smoking cessation program is funded or not, (2) the current smokers who will die each year, and (3) new smokers who are

expected to begin smoking and become addicted to cigarettes every year. Fiore TT, 5/17/05, 21299:24-21301:10; (US 18266) (A).

162. The expected quit rate of 20% is supported by both randomized clinical trials and population-based smoking cessation programs:

(a) The 2000 Clinical Practice Guidelines provide reliable and valid estimates of the efficacies of the components of a national smoking cessation program. Rubin TT, 5/24/05, 22020:19-23. The 2000 Clinical Practice Guidelines also provide estimates of effectiveness obtained through meta-analyses undertaken following review of all or almost all published research findings on the treatment of tobacco dependence. Rubin TT, 5/24/05, 22020:1-18. The 2000 Clinical Practice Guidelines reported an odds ratio of 1.2 for proactive telephone counseling. Fiore WD, 31:3-13. The results of the meta-analyses show the following efficacy (expressed as an odds ratio of successfully quitting with medication compared to a placebo) and effectiveness (expressed as percent abstinence, *i.e.*, quit rate) of the following medications:

1. bupropion – 2.1 and 30.5%;
2. nicotine gum – 1.5 and 23.7%;
3. nicotine inhaler – 2.5 and 22.8%;
4. nicotine nasal spray – 2.7 and 30.5%;
5. nicotine patch – 1.9 and 17.7%.

JDX016 0624-0830 (JD-001210) (A); Rubin TT, 5/24/05, 22020:24-22030:12.

(b) Population-based smoking cessation programs also support the 20% expected quit rate:

1. Dr. Shu-Hong Zhu reported in the *New England Journal of Medicine* that 12-month abstinence rates for callers to the California Smokers Helpline were 23.3%. Rubin TT, 5/24/05, 22051:11-22052:7 (discussing Zhu, Anderson et al. Evidence of Real-World Effectiveness of a Telephone Quitline for Smokers. N Engl J Med 2002; 347(14):1087).

2. Smokers of ten or more cigarettes per day who participated in the New York City Department of Health and Mental Hygeine nicotine patch program achieved a quit rate of 33%. Rubin TT, 5/24/05, 22052:8-22053:20 (discussing Cummings KM and Hyland A. Impact of Nicotine Replacement Therapy on Smoking Behavior. Ann. Rev. of Publ. Health 2005, 26:583-599 at 590).

3. Callers to the Wisonsin state quitline who receive telephone counseling have achieved a 22% quit rate. Fiore TT, 5/17/05, 21302:3-10.

4. The quit rate for participants in the Group Health Cooperative full coverage program was 28%, as reported by Dr. Susan Curry in the *New England Journal of Medicine*. VXA100 0605-0611 at 0609 (US 64387) (A); Fiore TT, 5/17/05, 21302:11-14.

Thus, an expected quit rate of 20% is amply supported by the evidence.

163. Based on this expectation that 20% of smokers who utilize counseling and medications will quit successfully, it is necessary to provide treatment for five smokers per successful quit attempt.

164. Accordingly, if a smoking cessation program is to help a number of smokers quit that equals those who can reasonably be expected to be affected by Defendants' fraudulent conduct in the next year, it must provide treatment for five times that number. More specifically:

(a) As set out above, Defendants' marketing activities can reasonably be expected to be a substantial contributing factor to 730,000 new youth daily smokers in the next year, and their fraudulent marketing and design of low tar cigarettes can reasonably be expected to cause up to 1.6 million smokers next year to switch down in tar based on the mistaken belief that they are taking a step for their health or toward quitting, making a total of 2,330,000 smokers. If a smoking cessation smoking program is to assist 2,330,000 persons to quit smoking, the expected 20% successful quit rate requires it to be utilized by a minimum of 11,650,000 persons.

(b) If a program is funded so as to treat 2,330,000 smokers per year, which would reflect an achievable annual utilization rate of under 5% of smokers, it must be funded for five years to achieve 2,330,000 quits.

(c) With a cost of $670.40 per smoker who utilizes counseling and medications, it will cost $1.56 billion per year to provide tobacco dependence treatment to 2,330,000 smokers. The addition of between $375 million and $1 billion in annual promotional expenditures brings the total annual cost to between $1.93 billion and $2.56 billion per year for quitline components and promotion.

165. Any organization that administers a smoking cessation program as part of the equitable remedies imposed in this action should be permitted to make grants for research and for training of health professionals, so long as the program serves a minimum number of persons per

year with quitline counseling and medications. In order to pursue these objectives, any organization that administers a smoking cessation program as part of the equitable remedies imposed in this action should be allowed to obtain funding for the smoking cessation program from other sources and/or to utilize public-private partnerships to maximize the program's reach and effectiveness.

166. A broad and balanced set of research initiatives is important to improve treatments for tobacco dependence and train the next generation of tobacco scientists. Substantial declines in national smoking rates are difficult to achieve at present because certain populations either are not aided by current treatments, or are not adequately exposed to them. Populations that currently are less likely to benefit from available treatments include those with psychiatric co-morbidities such as depression; pregnant women; certain racial and ethnic minorities; adolescent smokers; and individuals with very high levels of nicotine dependence. Fiore WD, 60:9-61:5.

167. The Subcommittee on Cessation considered the need for research funding and recommended $500 million annually for smoking cessation research as part of the National Action Plan. The genesis for the recommendation, and Dr. Fiore's corresponding recommendation to the Court, is the recognition that two key factors are critically important to helping more Americans quit successfully: first, success rates are still far less than 50%; second, as the population of smokers has evolved over the last fifty years, there are pockets of high prevalence and low cessation success that require new research and thus new research funds. Id. at 61:19-62:10.

168. The National Institutes of Health has provided a model that has been used on a pilot basis to establishment Transdisciplinary Tobacco Use Research Centers (TTURC). This model that can comprehensively target specific critical tobacco cessation research questions.

These questions include identifying treatments that are effective in youth smokers, developing specific medications that might be helpful for specific populations, and identifying more effective treatment for low socioeconomic status, less educated, and racial and ethnic minority smokers. The NIH TTURC model had been used in existence at a limited number of Centers. In 1999, NIH initially funded seven very successful centers at a rate of $15 million per year for five years, but that funding has been cut substantially. Because it was designed to pull together researchers built around a specific cessation target and to include components to translate the research findings into practice, the TTURC model represents a means to move tobacco dependence research if appropriately funded. The Subcommittee concluded that effective research results would be achieved by establishing thirty of these centers nationally at a cost of $450 million per year ($15 million per year per center), and administering them through a national coordinating center charged with bringing the findings together and disseminating them at a cost of another $50 million per year. The full TTURC research program recommended by the Subcommittee would thus cost $500 million per year. Id. at 62:11-63:3.

169. Funding for physician and healthcare professionals' training should help healthcare professionals make screening for tobacco use a routine part of their practice, and give physicians the knowledge and tools to support their interventions with patients to encourage quitting. Id. at 64:1-15.

170. Funds dedicated to training and education should be distributed as grants to medical and other healthcare profession schools to develop, implement, and evaluate curricula for evidence-based treatment of tobacco dependence for healthcare profession students and graduates receiving training, such as interns and residents. The goals of such training should be broad and establish a standard of care for treating and referring patients who use tobacco.

Curricular components should include how to intervene and follow up effectively with tobacco-using patients, how to implement systems changes to facilitate intervention, and how to access more intensive services for patients. Id. at 64:16-23.

171. A smoking cessation program consisting of the components set out the preceding paragraphs, to be funded by Defendants, is an important part of a comprehensive remedial order to prevent and restrain future racketeering activity on the part of the Defendants. Moreover, as Dr. Fiore explained:

> From my own experience treating more than 10,000 smokers in Wisconsin over the past 17 years, I know that every day people who are motivated to quit are making the tragic decision to switch to low tar cigarettes in the mistaken belief that they are taking a step for health. They are trying to quit "cold turkey" and failing. They are finding reasons to postpone quitting. All of these are decisions that should and can be prevented with a comprehensive program.

Fiore WD, 70:16-21.

C. Defendants Should Be Required to Fund a Counter-Marketing Campaign

(1) Counter-Marketing is Crucial to a Comprehensive Package

172. Defendants' marketing is a substantial contributing factor to youth smoking initiation and continuation. See US FF § III.E(4), supra.

173. Defendants spend billions of dollars on marketing its products. Today's eighteen year olds have grown up during a period in which the tobacco companies have spent approximately $100 billion on marketing cigarettes. Youth overwhelmingly smoke the three most heavily advertised brands, Marlboro, Camel, and Newport. Eriksen 5/9/05 WD, 6:1-6:13; Healton WD, 17: 6-18:8.

174. Defendants fraudulently state that they do not market to youth. As the evidence adduced at trial has proven, Defendants continue to intentionally direct their marketing efforts at

adolescents. See US FF § III.E(7), supra. A counter-marketing campaign will prevent and restrain Defendants from fraudulently marketing to youth in the future by informing youth that they are being manipulated and lied to by the tobacco industry, thereby making Defendants' marketing efforts targeted at youth less effective. See, e.g., Healton WD, 18:14-19:8. As Dr. Bazerman testified, an effective counter-marketing campaign "will remove from the marketplace a population of consumers and potential consumers of defendants' products." As a result, Defendants' "incentive to market to this population will be eliminated and their behavior will change accordingly." Bazerman WD, 65:15-20.

175. Dr. Eriksen, the only expert witness in the field of public health to testify about the effectiveness of counter-marketing campaigns, recommended a counter-marketing campaign directed at the American public. Eriksen 5/9/05 WD, 3:1-9.

176. As set forth below, counter-marketing is a critical element of an effective remedy designed to prevent and restrain violations of RICO. Any remedy that excludes a counter-marketing component would be incomplete. The evidence introduced in this case establishes that counter-marketing public education campaigns are proven effective in preventing and reducing youth smoking. The efficacy of counter-marketing campaigns has been demonstrated through peer reviewed studies published in the scientific literature and recognized by the Surgeon General of the United States.

177. In its 1999 publication, *Best Practices for Comprehensive Tobacco Control Programs*, the Centers for Disease Control recommended that counter-marketing programs be one of nine core components of a comprehensive state based tobacco control program. Eriksen 5/9/05 WD, 9:16-10:2; JD-002727 (A).

178. The 2000 Surgeon General's Report, *Reducing Tobacco Use*, identified counter-marketing as critical to reducing tobacco use:

> Countermarketing: Changing a social environment that fosters of norm of tobacco use is an essential element of national, state, and local programs. This change requires strategies to counter the billions spent in advertising and promotion that reach young people and adults with misleading images about tobacco

VXA1240104-0567 at 0483 (US 64316) (A).

179. The 2000 Surgeon General's Report, *Reducing Tobacco Use*, concluded:

> Countermarketing activities can promote smoking cessation and decrease the likelihood of initiation. Countermarketing campaigns also can have a powerful influence on public support for tobacco control activities and provide an educational climate that can enhance the efficacy of school- and community-based efforts.

VXA1240104-0567 at 0135 (US 64316) (A).

180. There is a direct correlation between counter-marketing efforts and youth smoking reduction. Historical evidence demonstrates the efficacy of counter-marketing public education campaigns. From 1967 through 1970, the Fairness Doctrine required television and radio stations to broadcast one anti-smoking message for every three tobacco advertisements. As a result, approximately $200 million (in 1970 dollars) was spent during this time period on anti-smoking advertising on television and radio. During this time period, teenage smoking prevalence was 3% less than during the 16 months prior to the Fairness Doctrine. Adult smoking prevalence for the first time in the 20th Century fell for more than three consecutive years in a row during this time period. Evidence suggests that the anti-smoking messages had a greater effect than cigarette advertising. Eriksen 5/9/05 WD, 7:22-8:8; VXA1240104-0567 at 0518 (US 64316) (A).

181. Current evidence also demonstrates the efficacy of counter-marketing campaigns. In recent years a number of states, including California, Florida, and Massachusetts, have funded comprehensive counter-marketing campaigns as part of larger tobacco control efforts. The rates of reduction in cigarette smoking among youth in these states exceeded the rates observed in other states. Eriksen 5/9/05 WD, 8:9-9:15.

182. In 1998, Florida's statewide tobacco control program included anti-smoking advertisements (the Florida Truth Campaign) that sought to deglamorize smoking and to provide youth with information about the tobacco industry. After one year of the program there was nearly a 20% reduction in smoking among middle school students and an 8% reduction in smoking among high school students. After two years of the program, there was a 40% reduction in smoking among middle school students and an 18% reduction among high school students. The results of the Florida campaign were documented in a 2000 article in the *Journal of the American Medical Association*. Eriksen TT, 5/16/05, 21056:3-24; Healton WD, 19:9-20:1.

183. In 1990, California launched a statewide media campaign as part of its Tobacco Control Program. The media campaign sought to denormalize tobacco use and to raise public awareness regarding the industry's marketing practices. A 1994 study by Pierce and colleagues cited in the 2000 Surgeon General Report found that California's media campaign was effective in stemming the rise in teen smoking rates that had been observed in California prior to the campaign's launch. VXA1240104-0567 at 0496-97 (US 64316) (A).

184. A longitudinal study of Massachusetts youth cited in the 2000 Surgeon General Report demonstrated the efficacy of the state's anti-smoking media campaign. The study found that among youth ages 12-13, those who had been exposed to the television campaign were

significantly less likely to progress to established smoking. VXA1240104-0567 at 0499 (US 64316) (A).

185. The Task Force on Community Preventive Services, a national effort led by the CDC to systematically review the scientific evidence to determine the effectiveness of a variety of community interventions, evaluated community interventions to reduce tobacco use. In its 2001 report, the Task Force concluded that there was "strong evidence" on the effectiveness of media campaigns with other interventions to reduce the initiation of smoking among young people. The Task Force's finding of "strong evidence" is the highest criteria of effectiveness provided by the Task Force. Eriksen 5/9/05 WD, 10:3-14.

186. Dr. Eriksen testified at trial about the methodology utilized by the Task Force to reach its finding regarding counter-marketing:

> [E]xperts from around the country reviewed all of the peer-reviewed published literature on the effectiveness of a variety of tobacco control interventions . . . they went through a very rigorous analytic effort with explicit rules of evidence to make a determination as to whether the evidence was sufficient or not to conclude that counter-marketing made a difference with young people, and they gave it its highest level of conclusion that it does.

Eriksen TT, 5/16/05, 21176:24-21177:25

187. The Centers for Disease Control and Prevention Media Campaign Resource Center guidelines issued in 2003 and the testimony of Dr. Eriksen established that an effective counter-marketing campaign: (1) must be long term; (2) should consist of integrated, not isolated, components; (3) must be integrated into the larger tobacco control program; (4) must be culturally competent; (5) should be strategic; (6) should be evaluated; and (7) should be adequately funded. Eriksen 5/9/05 WD, 3:17-4:2.

188. Scientific evidence demonstrates that to be effective, counter-marketing campaigns must be sustained over time, and are most effective when conducted as campaigns and coordinated with and integrated into other elements of a comprehensive tobacco control program. Eriksen 5/9/05 WD, 4:3-5:17.

189. The 2000 Surgeon General's Report called for sustained counter-marketing campaigns: "In light of the ubiquitous and sustained pro-tobacco messages, countermarketing efforts of comparable intensity and duration are needed to alter the social environmental context of tobacco use." VXA1240104-0567 at 0518 (US 64316) (A).

190. Four years later, the 2004 Surgeon General's Report again stressed that tobacco control efforts, such as counter-marketing, need to be sustained over time:

> There is a need for a continuing and sustained national tobacco use prevention and control effort. Many factors encourage tobacco use in this country: the positive imagery of smoking in movies and in the popular culture, the billions of dollars spent by the tobacco industry to advertise and promote cigarettes (e.g., $11.2 billion in 2001 [Federal Trade Commission]) . . . Additionally, funding levels for many effective state and national counter-advertising campaigns were recently reduced.

TLT0930001-0949 at 0909 (US 88621) (A).

191. Adequate funding is essential to ensure that counter-marketing programs are effective. The 2000 Surgeon General's Report states, "[a] factor that has limited the success of traditional media campaigns [intended to reduce tobacco use] is the small size of the campaign budgets compared with the advertising and marketing budgets of the tobacco industry." Eriksen 5/9/05 WD, 4:3-5:17; VXA1240104-0567 at 0517 (US 64316) (A).

192. A counter-marketing campaign should be funded at a minimum level of $400 million annually for at least ten years. The MSA funded the American Legacy Foundation at $300 million per year, but guaranteed that funding level for only five years. MSA at 41-48 (JD-

045158) (A). As Dr. Healton testified, this funding has now ceased. Healton WD, 34:13-35:10. In addition, a further $100 million per year is needed for an effective and comprehensive national public education campaign on secondhand smoke. Id., 10:2-16. The 1999 CDC's *Best Practices for Comprehensive Tobacco Control Programs* and Dr. Eriksen's testimony establish that between $300 and $900 million per year, in 1999 dollars and based upon the 1999 population, were required for a comprehensive counter-marketing campaign. Due to inflation and population increases since 1999, these figures are now 25% higher (i.e., $375 million to $1.125 billion per year). Eriksen 5/9/05 WD, 10:15-23.

(2) The American Legacy Foundation is the Appropriate Recipient of the Court-Ordered Funding for Public Education

193. An independent public health organization already exists with the proven capacity to develop and implement a comprehensive, effective, public education campaign on a national scale. The American Legacy Foundation is a national, independent, public health foundation established in March 1999 as a result of the Master Settlement Agreement. Its Board of Directors includes two governors, appointed by the National Governors Association, two state attorneys general, appointed by the National Association of Attorneys General and two state legislators, appointed by the National Council of State Legislators. These six Directors appoint the additional five Directors. The Foundation's mission is to build a world where young people reject tobacco and anyone can quit. The Foundation develops both national and local programs to educate the public about the addictiveness, social costs and health effects of tobacco through, in part, counter-marketing and grass roots marketing campaigns. The Foundation's efforts also include educating the public about the dangers of second-hand smoke. Healton WD, 3:1-14, 6:1-18, 8:11-10:19.

194. The truth® campaign, launched in February 2000, is the Foundation's counter-marketing campaign designed to prevent youth from smoking. Structured as a brand – truth® – it includes print, radio, and television advertisements as well as internet and grassroots components. The campaign is primarily directed towards open-to-smoking, sensation-seeking 12 to 17 year olds. The campaign consists of hard-hitting, edgy advertisements that educate youth on tobacco-related issues, such as the addictiveness of cigarettes, the social costs of smoking and tobacco-related disease, and how the tobacco industry has marketed its products over the years. The American Legacy Foundation's truth® campaign is the only non-industry-sponsored, nationwide anti-tobacco campaign directed at youth. Healton WD, 11:3-12:11,15:5-16:9; Healton TT, 5/12/05, 20831:6-17.

195. Truth® ads are not designed for adults and in fact many truth® ads rely on approaches that adults find unappealing. Adults must keep the intended audience in mind when they view the ads. Healton WD, 16:1-9.

196. Providing information about the marketing practices of the tobacco industry as part of counter-marketing is critical in order to educate youth that their desire to smoke is, in part, a result of the $12.3 billion spent annually on advertising and promotion by the tobacco industry. Healton TT, 21840:23-21842:12; TLT093 0001-0949 at 0909 (US 88261) (A); Fiore WD, 57:18-58:2.

197. Truth® advertisements expose how Defendants market their products. For example, one truth® advertisement featured an internal R.J. Reynolds's marketing document titled "Project SCUM" in order to inform young people about how the industry targeted certain groups with its marketing. "Project SCUM" stands for "Project Sub Culture Urban Marketing." The document detailed a plan by Reynolds to increase sales of its Camel cigarettes in San Francisco

among "consumer subcultures" such as gays, "street people," and those with alternative life styles. R.J. Reynolds issued a public apology after details of the program were publicly disclosed. Healton TT, 21868:3-21871:22; 519849940-9948 at 9941 (US 90127) (A).

198. In developing the truth® campaign, the American Legacy Foundation relied in part on the recommendations of a panel of youth marketing experts convened by the Columbia University School of Public Health and funded by the Office on Smoking and Health of the Centers on Disease Control and Prevention to create the framework for an effective tobacco counter-marketing campaign. One of the key recommendations of the Expert Panel was to use a "brand" to market an anti-tobacco message that could compete with tobacco brands such as Marlboro. Legacy also relied on the Panel's insight that the "brand" should communicate that teens are being manipulated and lied to by adult institutions such as the tobacco industry. Healton WD, 17:6-19:8; Healton TT, 5/19/05, 21840:32-21842:12.

199. The development of the truth® campaign was also informed by the documented success of Florida's Truth Campaign. The Florida Truth campaign was the first youth tobacco counter-marketing campaign developed that relied on the recommendations of the Columbia Expert Panel. Healton WD, 19:9-15.

200. Truth® advertisements are directed at 12 to 17 year olds because the vast majority of smoking initiation takes place within this age group. Truth® advertisements run on youth-oriented television networks such as MTV (Music Television), the WB (Warner Brothers), and UPN (United Paramount Network) during programs with high youth viewership. Healton WD, 15:5-10, 21:18-23:4.

201. Truth® has developed into the largest youth smoking prevention campaign ever executed in the United States. The New York chapter of the American Marketing Association

awarded the truth® campaign its Gold and Grand EFFIE awards in 2003 for its success in reducing youth smoking prevalence. Legacy was only the second non-profit organization to be awarded the Grand EFFIE in its thirty-five year history. Healton WD, 12:1-11, 16:14-17:5.

202. The American Legacy Foundation conducts extensive scientific evaluations of the truth® campaign. Ongoing evaluation of counter-marketing campaigns such as truth® is critical to ensure the continued success of such programs. Eriksen 5/9/05WD, 4:3-5:17; Biglan WD 400:17-401:11; Healton WD, 24:2-25:14.

203. On an on-going basis, the Foundation conducts Legacy Media Tracking Surveys (LMTS). These telephone surveys measure exposure to tobacco marketing and counter-marketing, attitudes and beliefs toward tobacco, and tobacco use behaviors among youth. The Foundation is currently conducting the tenth wave of the LMTS. The surveys are designed to include nationally representative samples of youth ages 12 to 17 and young adults ages 18 to 24. Questions included in the LMTS are designed particularly to measure youth attitudes and beliefs towards tobacco, as well as their tobacco use behaviors. Healton WD, 40:13-42:6.

204. The truth® campaign is proven effective. Exposure to truth® has been associated with changes in youth beliefs and attitudes toward tobacco, as well as reductions in youth smoking prevalence. Healton WD 25:8-12, 33:20-34:5.

205. Beginning in late 2000, the Foundation first looked at whether there were demonstrated changes in tobacco-related beliefs and attitudes among teens. Changing youth attitudes toward the tobacco industry is significant because the scientific literature demonstrates that attitudes predict behavior. Shifting youths' key attitudes toward tobacco significantly increases the likelihood of changing their smoking behavior. Approximately two years later, the

Foundation examined whether truth® was associated with a reduction in youth smoking prevalence. Healton WD, 24:4-25:4, 46:20-47:11.

206. The Foundation's LMTS survey research has demonstrated that exposure to the truth® campaign is associated with changes in youth beliefs and attitudes toward tobacco. The analysis, which was based on the first two LMTS surveys (LMTS I & LMTS II), was set out in a 2002 peer-reviewed article published in the *American Journal of Public Health* (Farrelly MJ, Healton CG, Davis KC, Messeri P, Hersey JC, Haviland ML. "Getting to the Truth: Evaluating National Tobacco Countermarketing Campaigns," AJPH 2002; 92(6):901) ("2002 article"). LMTS I, which provided a baseline for comparison, was conducted before the December 2000 launch of the truth® campaign. LMTS II was conducted ten months after the launch. The 2002 article examined the relationship between exposure, as measured in the LMTS surveys, to truth® and Philip Morris's "Think. Don't smoke" campaigns and changes in attitudes and beliefs towards tobacco and intention to smoke during the next year. The 2002 article concluded that exposure to truth® was associated with an increase in anti-tobacco attitudes and a decrease in intention to smoke, while exposure to "Think. Don't Smoke" was associated with an increase in intention to smoke. Exposure to "Think. Don't Smoke" was associated with a 23% increase in the odds of reporting an intent to smoke in the next year. Wittes TT, 6/1/05, 22481:4-22484:8; Healton WD, 39:14-21, 45:9-14; 47:2-4; (JD-065578) (A).

207. The results from LMTS I and LMTS II also demonstrated that awareness of the truth® campaign was significantly greater than awareness of Philip Morris's "Think. Don't Smoke" campaign. Unaided awareness of truth® was 21.9% as opposed to 3.2% for "Think. Don't Smoke." Thus, a survey respondent was nearly seven times more likely to have unaided

recall of a truth® advertisement than a "Think Don't Smoke" advertisement. Healton WD, 42:20-44:11.

208. Philip Morris engaged in extensive correspondence with Legacy about the conclusions drawn from LMTS I and LMTS II which were summarized in the 2002 article. The record of this correspondence before the Court demonstrates that Philip Morris's focus was to challenge the article's findings that exposure to "Think. Don't Smoke" was associated with an increased intention to smoke, and not to dispute the efficacy of the truth® campaign. In fact, Philip Morris did not challenge the conclusion that exposure to the truth® campaign was associated with attitude change. One of Philip Morris's main criticisms was that the survey did not account for all of Philip Morris's "Think. Don't Smoke" advertisements that were running during the relevant time period. However, the LMTS surveys were designed to capture awareness of advertisements airing nationally. When directly asked by Dr. Healton, Philip Morris's Senior Vice President Youth Smoking Prevention and Corporate Responsibility, Howard Willard, would not answer whether the "Think. Don't Smoke" advertisements which Philip Morris claimed were omitted had in fact aired nationally. Nor, despite Legacy's requests, would Philip Morris provide any other information to Legacy to support its contention that more of its ads were running during the relevant time period. Healton TT, 5/12/05; 20872:20-20873:11, 20886:1-20; Healton TT, 5/19/05, 21817:1-21818:17; Healton WD, 47:12-57:6.

209. Philip Morris also claimed that the 2002 study did not measure the effect of "Think. Don't Smoke" on its target audience of 10 to 14 year-olds, but concentrated instead on 12 to 17 year-olds. However, the article was clear that it was examining the impact of the two campaigns on 12 to 17 year-olds, the age group most likely to begin smoking. Defendants' expert

was unfamiliar with the literature regarding how many 10 to 11 year-olds begin to smoke. Wittes TT, 22446:23-22447:3, 22573:24-22574:1.

210. Although the 2002 article did not expressly disclose the relationship between the American Legacy Foundation and the Research Triangle Institute which collected and analyzed the data, the article clearly describes the affiliations of the authors, including the authors employed by Research Triangle Institute, as well as their roles in the preparation of the article. (JD-065578) (A).

211. Philip Morris never engaged in a public dialogue with the scientific community about the findings of the 2002 article. Defendants did not introduce into evidence or refer in any fashion to any peer-reviewed articles criticizing the findings of the 2002 article. Healton WD, 54:12-18.

212. In addition to being associated with changes in the attitudes of teens about smoking, truth® has also been associated with dramatic reductions in youth smoking prevalence in the United States. Two years after the truth® campaign was launched, Legacy evaluated whether the changes in beliefs and attitudes related to exposure to truth® translated into actual changes in youth smoking behavior.

213. Between 2000 and 2002, youth smoking prevalence declined from 25.8% to 18.0% according to the Monitoring the Future survey conducted by the University of Michigan. The Monitoring the Future Study consists of annual surveys administered in schools to monitor youth alcohol, tobacco and illicit drug use in the United States. It is primarily funded by the National Institutes of Health – National Institute on Drug Abuse. It has been conducted since 1975 and is considered the most reliable source for this type of information. Healton WD 24:18-20, 26:5-13.

214. Based on this information, Legacy's evaluation focused on three questions: Did truth® play a role in the decline? If yes, how much of the decline could be attributed to truth®? Was there a dose response relationship between the amount of exposure to truth®? **The truth® campaign contributed to approximately 22% of the overall decline in youth smoking rates between 2000 and 2002. There were approximately 300,000 fewer youth smokers as a result of the campaign.** The results of this evaluation were summarized in a 2005 peer-reviewed article published in the *American Journal of Public Health* (Farrelly MJ, Davis KC, Haviland ML. Messeri P, Healton CG. "Evidence of a Dose-Response Relationship Between "truth" Antismoking Ads and Youth Smoking Prevalence," AJPH 2005; 95(3): 425) ("2005 article"). Healton WD, 24:4-25:16; (US 89452) (A).

215. The 2005 article compared the trends in youth smoking behavior documented in the Monitoring the Future Survey with exposure to the truth® campaign. Exposure to the truth® campaign was measured in each of the 210 media markets in the United States using gross rating points (GRPs), which represent the percentage of the target audience that saw an advertisement multiplied by the average number of times they saw the advertisement. The authors took into account confounding variables that could have influenced youth smoking prevalence, such as grade, race, ethnicity, the different youth smoking rates in each of the media markets, and potential state-level influences such as state investment in tobacco control efforts. The article concluded that there was a statistically significant dose-response relationship between exposure to truth® and youth smoking behavior. Healton WD, 25:17-25:16-32:17; (US 89452) (A).

216. Defendants' expert criticized the 2005 article's conclusion based on her contention that at higher levels of GRP exposure, truth® was associated with an increase in the prevalence of youth smoking. She presented graphs that she had developed which purported to extrapolate the

effect of high GRP levels of truth® exposure on youth smoking rates. Wittes WD 67:6 - 69:9, Wittes TT, 6/1/05, 22466:22-22468:9.

217. On cross-examination, however, Defendants' expert conceded that the charts in the 2005 article showed that at the higher GRP levels, there was less of a decrease in youth smoking but there still was a decrease. Wittes TT, 6/1/05, 22479:3-20. She conceded that she had no idea how many schools were included in the upper level GRP doses and she had made no effort to find out this information. During cross-examination it was brought out that she had never worked with data from the Monitoring the Future Survey and had never spoken with anyone at the University of Michigan involved with the survey. In addition, she conceded that she only first learned about GRPs when she read the two papers in preparation for testifying in this case, and that she does not know the exact definition of GRP and cannot even say whether GRPs are a measurement or a proxy. Wittes TT, 6/1/05, 22480:11-22481:3, 22484:9:-22485:5, 22519:8-22520:14.

218. Defendants have acknowledged the efficacy of the American Legacy Foundation's efforts to reduce youth smoking. An April 2, 2004 letter, Michael Szymanczyk, the Chairman and CEO of Philip Morris, wrote to Dr. Healton, president and CEO of Legacy, that "[w]e continue to believe that much of Legacy's work has been significant in contributing to reductions in underage smoking." Szymanczyk in all his conversations with Dr. Healton never questioned the efficacy of Legacy's work in reducing underage smoking. PM3000185320-5322 at 5322 (JD 052837) (A); Healton TT, 5/16/05, 21865:22-21866:6.

219. The general counsel of Lorillard, Ronald Milstein, testified at trial that research had shown that the truth® campaign was effective in reducing youth smoking rates. Steven Watson, Lorillard Vice President for External affairs, acknowledged that youth smoking rates

have declined since 1996, and that Lorillard supports the mission of the American Legacy Foundation. Watson also testified that the Monitoring the Future Study recognized the truth® campaign as contributing to this overall decline in youth smoking rates. Milstein TT, 1/7/05, 9366:6-9368:15; Watson PD, United States v. Philip Morris, 4/2/02, 62:25-63:6, 100:7-16; Watson PD, American Legacy Foundation v. Lorillard Tobacco Co., 12/8/04, 60:10-61:9.

220. Former President George G.W. Bush has gone on record in a videotaped statement praising the efficacy of the truth® campaign: "The American Legacy Foundation's truth® campaign is saving young lives and I applaud them for it. These ads are smart, they're humorous, they're tough, and they're edgy-not for you and me, but for our kids and grand kids, **and most of all, they work**." Healton TT, 5/19/05, 21872:14-21874:5; (US 93771) (A) (emphasis added).

221. Defendants called no witness with sufficient qualifications to challenge the efficacy of counter-marketing campaigns generally, or the efficacy of the truth® campaign specifically. In response to the overwhelming public health and other evidence offered by the United States on the efficacy of counter-marketing and the truth® campaign, Defendants offered the testimony of a bio-statistician with no expertise in developing or evaluating counter-marketing public education campaigns to opine about the methodologies utilized in two studies evaluating the truth® campaign. Wittes TT, 6/1/05, 22487:17-19.

222. Dr. Wittes testified in her written direct that she looked at the two published papers evaluating the truth® campaign as a "peer reviewer." However, during cross-examination it was revealed that she has never even served as a peer reviewer for a journal article or other research evaluating the effectiveness of a media campaign, let alone for a public education campaign. Wittes TT, 6/1/05, 22486:2-22.

223. Dr. Wittes offered no opinions about the efficacy of counter-marketing campaigns in general, or the truth® campaign specifically. Indeed, she conceded on cross-examination that she had never even seen a truth® advertisement and was not offering the opinion that the truth® campaign had been ineffective at reducing youth smoking. Wittes TT, 6/1/05, 22485:21-23, 22487:2-23.

224. The root of Dr. Wittes' criticism was exposed during cross-examination as an unfounded bias manifesting itself in her belief that no observational study, no matter how well designed or extensively peer-reviewed, can ever provide conclusions about whether public health communications effect population-wide behavior. She explicitly testified that in her view, the only way to determine whether the truth® campaign is efficacious in reducing youth smoking is through a randomized controlled trial. Wittes TT, 6/1/05, 22489:5-22491:24.

225. Dr. Wittes offered no support for her opinion that observational studies cannot provide conclusions about the efficacy of public health communication campaigns such as truth®, and her opinion is contrary to the published literature. On cross-examination, Dr. Wittes was confronted with *Public Health Communication: Evidence for Behavioral Change* by Dr. Robert C. Hornik. Dr. Hornik is Professor of Communications, holds the Wilbur Schramm Chair in Communications and Health Policy at the Annenberg School for Communications at the University of Pennsylvania, and serves as the Director of the Center for International Health and Development Communications. Dr. Hornik, in contrast to Dr. Wittes, has led efforts to design and evaluate large-scale public health communication and education programs. In his book, Dr. Hornik concludes that non-experimental and quasi-experimental approaches to the evaluation of public health communication, such as observational studies, are necessary in order to achieve

valid results. Randomized, controlled trials, on the other hand, are rarely a feasible method of evaluation:

> Finally, accept that evaluations of public health communication programs will rarely produce the unequivocal evidence promised in randomized controlled trials of pills. Sometimes this is feasible for smaller scale trials where enough resources can be mustered to produce a substantial additional dose of exposure, but most often this is not the case. If evaluations are to respect the way that public health communication programs work, then they will likely depend on alternative approaches: Natural experiments, correlated time series and other such non-experimental and quasi-experimental approaches. They are less definitive methodologically than controlled trials, but they respond to the nature of the intervention at issue. A moderately good answer to the right question is better than a very good answer to the wrong question. The effects of communication interventions must be evaluated with a methodology that respects their character and the way they work, but is still credible enough to influence policy discussion.

Defendants have conceded that Dr. Hornik's conclusions are entitled to deference as a reliable authority and learned treatise pursuant to Federal Rule of Evidence 803(18). Wittes TT, 6/1/05, 22491:25-22494:11; Defs. Mot. Entry of Exhibit Order Related to Janet Wittes, filed 7/8/05 (R. 5542).

226. When pressed about her specific criticisms of the methodological flaws in the 2002 and 2005 articles, Dr. Wittes could not explain whether – or if so, how – these flaws would affect the results. Dr. Wittes criticized the 2005 paper for relying on the Monitoring the Future data because of the survey's 10% non-response rate. However, she could not explain how the non-response rate had any effects on the findings reported in the 2005 paper. Dr. Wittes criticized the 2002 and 2005 articles for not controlling for peer smoking, but could not explain how failing to control for peer smoking would confound the relationship between exposure to truth® and youth smoking. Moreover, she conceded that she is not familiar with the literature on whether youth choose their friends in part based on their friends' smoking behavior; agreed that if

truth® does reduce youth smoking it will impact not just individual youth but their friends as well; and acknowledged the well-known adage that one must not adjust for variables affected by treatment. Wittes TT, 1/6/05, 22501:8-22508:16, 22578:11-22579:18, 22579: 20-23, 22582:16-20, 22583:19-21.

227. Dr. Wittes relied on four letters – chosen for her by Defendants' attorneys – between Philip Morris and Legacy as support for her conclusion that not all the Philip Morris "Think Don't Smoke" advertisements were included in the 2002 article. During cross-examination, Dr. Wittes acknowledged that she did not know how many letters were exchanged between Philip Morris and Legacy on this issue, and that she never asked Defendants' attorneys whether there was additional correspondence. Wittes TT, 1/6/05, 22551:1-22552:15.

228. Dr. Wittes's total lack of experience in evaluating media campaigns and national public health communication led her to reject the evaluation method that best fits the context and character of a media campaign. Her bias against any research design other than randomized trials is contrary to the weight of scientific experience in the field and eliminates any credibility to her criticism of the 2002 and 2005 studies.

229. Defendants have not evaluated the efficacy of their youth smoking prevention programs. In addition, no peer reviewed articles have been published demonstrating the efficacy of any of Defendants' youth smoking prevention programs. Healton TT, 5/19/05, 21866:19-21867:1.

230. The American Legacy Foundation is an independent third-party organization with a proven ability to implement effective public education campaigns and should be funded by Defendants in the amount of $400 million annually for the next ten years to prevent and restrain

Defendants from engaging in future RICO violations. Legacy is authorized to receive these funds pursuant to § VI(f)(10) of the Master Settlement Agreement.

D. Strict Targets for Reductions in Youth Smoking Are Required to Prevent and Restrain Defendants from Fraudulently Marketing to Youth in the Future

231. The remedy proposed by the United States to reduce youth smoking (the "Youth Smoking Reduction Remedy") will act to reduce the economic incentive for defendants to engage in future RICO violations that make their brands appealing to young people. Gruber WD, 7:22-8:2; 28:1-5; Gruber TT, 05/10/05, 20610:20-20611:5. In short, under the Youth Smoking Reduction Remedy, Defendants will not use promotions that make their products appealing to youth because they won't financially benefit from appealing to those youths. Gruber WD, 14:10-18.

232. Roman Weil, a defense expert, agreed that the "proposed remedy does give Defendants economic incentives to achieve the targeted reductions in youth smoking." Weil WD, 6:3-4. Indeed, in an exhibit prepared and highlighted at trial by Weil, it is clear that "where a Defendant cigarette manufacturer is above its youth smoker target and committing [a] future RICO violation would likely increase the number of youth smokers of its brands, [the Youth Smoking Reduction Remedy] increases that Defendant's economic incentives to avoid future RICO violations." (JDEM-060674) (A); Weil WD, 17:9-18:2; Weil TT, 05/31/05, 22319:17-22320:6. Based upon the totality of the evidence presented in this case, it is clear that Defendants' RICO violations have made their products more appealing to youth. See US FF § III.E, supra. Weil did no analysis and did not seek out any advice or expert assistance that would contradict the evidence, which confirms that Defendants RICO violations make tobacco products appealing to youth. Weil TT, 05/31/05, 22314:8-22316:5, 22319:8-10, 22320:2-12.

Thus, as Weil admits, the Youth Smoking Reduction Remedy will, in fact, create an economic incentive for Defendants "to avoid future RICO violations." Weil WD, 18:2.

233. The Youth Smoking Reduction Remedy was proposed by Jonathan Gruber, a noted Ph.d. economist from the Massachusetts Institute of Technology, who the Court recognized as an expert in the field of economics. Gruber TT, 05/10/05, 20589:1-6. In his former capacity as a Deputy Assistant Secretary for Economic Policy at the United States Treasury Department, he acted as point person on issues related to tobacco regulation, he served on an interagency task force charged with evaluating the April 1997 Proposed Resolution between tobacco manufacturers and the states attorneys general, and he served on an interagency task force charged with evaluating legislation to comprehensively regulate youth smoking in the United States known as the McCain bill. He is currently the director of the Program on Children at the National Bureau of Economic Research, the leading academic economic research institution in the country not affiliated with a particular university. He is widely published and is currently or has previously served as an editor for several leading journals in the field of economics. Gruber has received several national awards recognizing his scholarship and in 2004 was selected as a member of the National Institute of Medicine (IOM). Gruber WD, 2:4-6:16; (US 89458) (A).

234. As part of Gruber's participation on the United States' interagency task force on the 1997 Proposed Resolution, Gruber focused on the evaluation of the proposed "youth lookback" provision included in the Proposed Resolution, which imposed a financial assessment on the tobacco industry if youth smoking rates exceeded certain target levels. Id., 5:3-11. The experts presented by Defendants to attack the Youth Smoking Reduction Remedy, Drs. Roman Weil and Dennis Carlton, have no such prior experience. Weil TT, 05/31/05, 22402:25-22403:5.

Weil, for example, could not even say whether he had ever read the 1997 Proposed Resolution. Id., 22404:23-25.

235. Tobacco-related research has been and continues to be a major focus of Gruber's research. He has published numerous articles on the economics of smoking and health, particularly focused on youth smoking, including *Is Addiction "Rational'? Theory and Evidence* published in the *Quarterly Journal of Economics*; *Youth Smoking in the 1990s: Why Did it Rise and What are the Long Term Implications*, which was published in the *American Economic Review*; and he edited a book entitled *Risky Behavior Among Youth: An Economic Analysis*. Gruber WD, 6:12-7:17. The experts presented by Defendants to attack the Youth Smoking Reduction Remedy, Drs. Roman Weil and Dennis Carlton, have never published on the subject of smoking, let alone on the topic of youth smoking. JDM2710011-0023 (US 93831) (A); Weil TT, 5/31/05, 22361:16-24. Moreover, Weil admitted that he had not reviewed testimony from the United States' marketing and youth smoking witnesses in this case (Weil TT, 5/31/05, 22324:17-23, 22324:24-22325:3, 22328:16-22329:2) and instead was relying upon "thought experiments" and "back-of-the-envelope calculations" to support his conclusions, for which he charged Defendants $1,500 per hour. Id., 22327:10-11, 22354:25-22355:1, 22372:10, 22398:21-22, 22407:7-8.

236. The Youth Smoking Reduction Remedy imposes no financial assessment on Defendants unless they fail to meet certain targeted reductions in youth smoking. Gruber WD, 8:4-5. The target reductions in youth smoking are 6% per year between 2007 and 2013, for a total reduction of 42% among those 12-20 years old. Id., 8:1-8.

237. The youth smoking reduction targets are reasonable and attainable for three reasons. First, these targets are the same that these Defendants agreed to as part of the 1997

Proposed Resolution, albeit on a slower timetable. Id., 15:15-16:16; (US 18255) (A); (US 18263) (A); Gruber TT, 5/10/05, 20592:10-15. Under the Youth Smoking Reduction Remedy, Defendants effectively receive credit for the 30% reduction in youth smoking that has already occurred from 1997 to 2003. Gruber WD, 16:17-17:3; Gruber TT, 5/10/05, 20590:19-20591:15. Indeed, if the targets in the 1997 Proposed Resolution had been put in place in 1998, as of 2004, Defendants would have met their targets and would not have been subject to an assessment. Gruber TT, 5/10/05, 20592:16-21.

238. Second, the testimony by marketing and youth smoking experts in this case overwhelmingly established that Defendants' market to youth. US FF § III.E, supra. Thus, curtailing these actions will result in a reduction in youth smoking and allow Defendants to meet the targets contained in the Youth Smoking Reduction Remedy.

239. Third, prior price increase experience in the tobacco market demonstrates that Defendants can meet the youth smoking reduction targets solely by instituting price increases that are equivalent to increases that have been instituted in the past. Because the price elasticity of youth smoking initiation is -1 (i.e., each 10% increase in cigarette prices leads to a 10% reduction in youth initiation), meeting the 42% smoking reduction among youth required under this remedy, solely by raising prices, would require Defendants to raise their prices by 42% over the seven-year period from 2006 to 2013. Gruber WD, 19:15-20:21. Such a reduction is feasible given that Defendants have instituted similar price increases over similar seven-year time periods in the past. For example, from 1993-2000, real net cigarette prices rose by 46%, slightly in excess of the price increase that would be required for Defendants to meet the targets contained in the Youth Smoking Reduction Remedy, if they chose to meet those targets solely by raising prices. Id., 20:21-21:4.

240. Moreover, it is unlikely that Defendants would choose to meet those targes solely by raising prices. As Gruber testified, "the idea of this remedy is to let them choose the most efficacious way to meet the targets. I doubt purely raising price would be that method." Gruber TT, 5/10/05, 20597:25-20598:6. Defendants have a variety of mechanisms through which they can reduce youth use of their products. Raising prices is only one of those mechanisms. Gruber WD, 21:5-14.

241. Defendants nonetheless contend that a 42% price increase would devastate them, because they would suffer insurmountable losses of market share. This is not borne out by the evidence. Weil asserts that Defendants' loss of market share as the result of the proposed remedies in this case would exceed the loss of market share experienced by Defendants following the MSA. Weil WD, 25:1-14. First, Weil confirmed that the cost of the remedies sought by the United States is only half of the cost of Defendants' payments under the MSA. Weil TT, 05/31/05, 22335:4-22336:8. Despite this fact, Weil fails to explain why Defendants' loss of market share would be greater than the loss of market share following the MSA. Second, Weil admitted on cross-examination that he had not reviewed peer-reviewed literature that found that the MSA had little or no impact on the viability of Defendants' businesses, even though he was opining on the impact of even lower payments resulting from potential remedies in this case. Id., 22336:16-25, 22361:16-24. Third, Weil was unable to state whether the change in market share following the MSA was the result of cost differentials between Defendants and Subsequent Participating Manufacturers. Id., 22357:15-22358:23. In fact, Weil admitted that during the period since the MSA, American consumers have, in general, been more attracted to generic products while the overwhelming majority of Defendants' sales are in premium brands. Id., 22358:24-22360:4. Fourth, Weil presented no computations of the impact on price created by

the remedies proposed by the United States. In comparison, Gruber provided historical data demonstrating that a price increase substantially in excess of 42% (the amount required to meet the youth smoking targets if only price is used as a means to achieve the target) did no discernable damage to Defendants' profitability. As Gruber testified, from 1997 to 2002 these Defendants raised prices by 60% and, even though the increased revenue from those price increases went to states in the form of MSA payments rather than into company coffers, Defendants remain profitable. Gruber TT, 05/10/05, 20596:18-20597:4. Fifth, even if Defendants' experts could and had estimated impact on sales, they have done no analysis to determine whether other players in the market (namely the SPMs and the Non-Participating Manufacturers) would meet the price increases. Sixth, Weil was confused whether the cost differential numbers he was citing from Gruber were average or marginal. They were actually marginal. But, Weil concluded that it would not make a difference to his opinion even though the marginal difference was only 5% of the average difference ($.20 marginal cost difference / $4.00 average cost difference). Id., 22363:25-22365:8; 22370:24-22372:15. In short, Defendants' experts have failed to review the relevant literature, failed to understand the numbers they relied upon, and failed to do the analysis necessary to support the broad assertions that they have made.

242. The youth smoking figures used in the Youth Smoking Reduction Remedy will be based upon the National Survey on Drug Use and Health (NSDUH). The NSDUH is a nationally representative survey that provides the large sample sizes and brand-specific smoking information necessary to measure youth smoking in applying the Youth Smoking Reduction Remedy. Gruber WD, 18:5-15. The number of youth by which a Defendant misses its target is calculated in two steps. First, using data from the NSDUH, the excess of each Defendants' youth

smoking percentage over the target youth smoking percentage is computed. Second, the excess percentage is then multiplied by the number of youth ages 12 to 20 from the U.S. Census to determine the number of youth misses. Id., 26:9-15. Finally, for years after the first year, Defendants are only assessed for new misses, not those who were already counted in previous years. As Gruber explains:

> [I]f 2007 is the first year in which assessments are levied, then from 2008 onwards, the assessments are only on the net increase in the number of misses over the previous year, accounting for natural attrition.
>
> The following example illustrates how this adjustment works. Suppose that in 2008 a defendant missed the target by 1 million youth smokers. Suppose that in 2009 they also missed by 1 million youth smokers. Finally, suppose that 20% of that defendant's youth smokers in 2008 were 20 year olds. This implies that the 1 million by which the target is missed in 2009 includes 800,000 of those by which the target was previously missed, plus 200,000 new misses (to replace the 200,000 who became 21 years old). So the assessment would only be applied on the 200,000 new misses in the year 2009.

Id., 26:16-27:10.

243. Defendants' experts have criticized the Youth Smoking Reduction Remedy, arguing that it fails to account tor the fact that smokers switch brands over their lifetime or the fact that smokers who most frequently use one brand may still smoke other brands occasionally. Carlton WD, 14:3-10. First, because joint and several liability applies, this argument is moot. Second, even assuming no joint and several liability, the approach in the Youth Smoking Reduction Remedy is appropriate because its intent it to fully ensure that a Defendant is not encouraged to attract individuals to its product as youth. Youths' later actions as adults are of no moment. Gruber WD, 19:5-14.

244. Under the Youth Smoking Reduction Remedy, if Defendants fail to meet the targeted reductions, they will be assessed $3,000 per youth by which they exceed the target level.

$3,000 is the upper limit on the lifetime proceeds a Defendant could expect to earn from making its brands appealing to youth. Id., 8:5-11, 22:2-7. Gruber employed a thorough and exacting five-step process to compute this upper limit on lifetime proceeds. Id., 22:8-26:4.

245. There is no dispute that the Youth Smoking Reduction Remedy is forward-looking. Id., 14:21-15:6. Moreover, as an "outcome-based" remedy, it avoids many of the pitfalls inherent in an "input-based" remedy, such as basic injunctive relief. Id., 13:16-18.

246. An "outcome-based" remedy ties the financial assessments to an output measure, which in this case is the level of youth smoking, rather than to "input" measures, such as the number and type of youth advertisements, cigarette sampling techniques employed by Defendants, or Defendants' direct mail marketing practices. Id., 8:18-9:4. The Youth Smoking Reduction Remedy's outcome-based approach will create an incentive for Defendants to avoid future RICO violations. Moreover, because Defendants are most knowledgeable about how they act to make their products appealing to youth, the Youth Smoking Reduction Remedy's outcome-based approach will allow Defendants to choose the avenue to meet the targets rather than having the Court attempt to define the path with inherently less complete knowledge. In short, the outcome-based approach is the most efficient and effective means of removing the economic incentive for Defendants to engage in future RICO violations that make their brands appealing to young people. Id., 9:5-16.

247. To be effective, the Court's remedies Order must include outcome-based components, because relying upon an input-based approach alone will not be sufficient to prevent and restrain Defendants from engaging in future RICO violations. An input-based approach alone suffers from several deficiencies. Gruber WD, 9:5-13:8. However, input-based measures have value despite their limitations, and are a useful complement to the outcome-based approach

proposed by Dr. Gruber. Including an outcome-based approach in this Court's remedies Order will address the deficiencies which would arise with a solely input-based approach to relief. Id., 13:9-14:9.

248. Weil suggests that injunctive relief is preferable because it is "more targeted." Weil WD, 7:22-25. His assertion lacks support in the record. First, Weil admitted that he has "no expertise with which to evaluate whether ascertaining the truth or falsity of Defendants' future public statements would be easy or hard...." Second, Weil admits that he "didn't systematically look at the potential side effects of the injunctive relief that [he] proposed to the court" Id., 8:16-18; Weil TT, 05/31/05, 22302:12-15. Third, when asked whether he had done an analysis to support the costs he asserted that the Court would incur to enforce injunctive relief, Weil admitted that he "did not." Id., 22311:7-15.

249. Also, the outcome-based approach prevents Defendants from simply retooling their marketing efforts to avoid a Court injunction but still reach youth through some new and novel approach; something they have been successful at doing in the past, as discussed in Section V.A(2), supra (discussing how Defendants have undermined the Advertising Code, Broadcast Ban, and MSA). Indeed, the limited efficacy of the MSA demonstrates that an input-based remedy is decidedly less effective. As Robert Dolan testified:

> The MSA's restrictions on inputs, i.e. the way companies can engage in marketing, does present challenges to the companies. Because of the MSA, the companies did modify their marketing practices. As they had in the past, however, they were able to draw on their marketing expertise to come up with a revised marketing approach to achieve their objectives or outputs.

Dolan WD, 146:13-16 (emphasis added).

E. Corrective Communications Are Required to Prevent and Restrain Defendants from Making Fraudulent Public Statements on Smoking and Health Issues

250. Substantial evidence supports the United States' request that Defendants issue corrective communications on the smoking and health issues that have been the subject of Defendants' pervasive campaign of fraud for a half-century. Further, the specifics of this remedy are tailored to reflect the nature and scope of Defendants' own public relations and marketing efforts, as evidenced in the record.

251. The trial record amply proves that Defendants have made false, deceptive, misleading, and otherwise fraudulent public statements from the Frank Statement in January 1954 through to the present. See US FF §§ III.A(1) & (2), supra (public statements on adverse health effects, including exposure to secondhand smoke); § III.C(1), supra (public statements on addictiveness of smoking and nicotine); § III.C(2), supra (public statements on nicotine manipulation); § III.E, supra (public statements on youth marketing); § III.D, supra (statements on "light" and "low tar" cigarettes).

252. Evidence in the record shows that certain of Defendants' public statements communicating their positions on smoking and health issues continue to omit material information or present information in a misleading and incomplete fashion. For example, Reynolds's current website statement on the health effects of smoking continues to insist that smoking "causes disease in some individuals" only "in combination with other factors." (JD-068012) (A); see also Schindler TT, 1/24/05, 10810:9-10813:5 (Reynolds' recent Chairman and CEO refusing to admit that cigarette smoking causes disease).

253. Philip Morris's current website claims that Philip Morris's position on addiction is the same as the public health community, but Philip Morris's statement on addiction omits the material information that nicotine delivered by cigarettes is a drug and that it is addictive.

3000172188-2188 (JD-053199) (A); Henningfield WD, 105:15-106:12 (explaining why Defendants' failure to communicate that cigarette smoking is addictive **because it involves the addictive drug nicotine** omits "vital information").

254. Similarly, the corporate website for BATCo's parent company – a website to which BATCo contributes and which reflects its views, see Defs.' Motion for Summary Judgment on the Grounds That There Is No Reasonable Likelihood of Future RICO Violations, Rule 7.1/56.1 Statement of Material Facts Not in Dispute (R. 2394, filed 8/1/03), at 43 – currently has a "Frequently Asked Questions" section that asks "Is Nicotine Addictive?" (US 89563) (O). The answer fails even to use the word nicotine. Dr. Henningfield explained why the statement misstates the scientific evidence and is contrary to numerous internal BATCo documents acknowledging the role of nicotine in maintaining addictive smoking behavior. Henningfield WD, 106:13-108:1.

255. And Philip Morris's package onsert, as shown through the cross-examination of Denise Keane, Philip Morris's general counsel, included for short periods on certain brands of its "light" cigarettes, mentioned that tar and nicotine doses can be affected if a smoker blocks the ventilation holes, but omitted material information about the invisible ventilation holes – what they are, where they are placed on a cigarette, what they do, and how not to block them. Keane TT, 1/18/05, 10422:3-10423:3. See also id., 10461:6-11 (stating that package onserts allow the most direct communication of material information to smokers).

256. As United States' witnesses have attested, certain language in some of Defendants' more recent positions on smoking and health issues, following their decades of outright fraudulent statements, do represent a step forward. See, e.g., Henningfield TT, 11/29/04, 7185:2-8. However, evidence in the record supports a finding that notwithstanding Defendants' self-

serving claims that they have "come clean" on smoking and health issues, and notwithstanding a general prohibition in the Master Settlement Agreement that preclude the Defendants who are party to the MSA from making any "material misrepresentation of fact regarding the health consequences of using any Tobacco Product," MSA § III(r) at 36 (JD-045158) (A), Defendants continue to make affirmative statements on smoking and health issues that omit material truthful information. See Complaint, Vermont v. R.J. Reynolds Tobacco Co., No. 744-97 CNC & S-0816-98 (Superior Ct. filed July 26, 2005).

257. As became evident during the trial, particularly during the testimony of the most senior Reynolds executive, Andrew Schindler, Defendants' statements are intended to communicate some information about smoking and health and to give the appearance of frank openness, while in fact in many cases they are little more than mild semantic variations on their prior fraudulent positions and are designed to protect their defense in ongoing litigation by not contradicting their past fraudulent statements. It is therefore apparent that general proscriptions have failed to curtail Defendants' making statements that fit well within the broad category of representations that implicate the federal mail and wire fraud statutes. Accordingly, the Court finds a limited campaign of prescripted affirmative communications is warranted to prevent Defendants from continuing to make statements on smoking and health issues that are false, misleading, and/or contain material omissions, and from publicly portraying and promoting such statements as proof of "openness" and "disclosure" when they are not.

258. Defendants have used numerous public fora to disseminate their statements on smoking and health issues and to execute their fraudulent scheme, including newspapers, television, magazines, pamphlets, package onserts, and Internet websites.

259. More recently, Defendants – particularly Altria and Philip Morris – have used many of these same fora to promote their allegedly responsible corporate behavior, including statements on smoking and health positions and alleged youth smoking prevention efforts. Philip Morris presented the components and scope of this campaign during its live examination of Denise Keane. See generally Keane TT, 1/19/05, 10566:4-10578:17.

260. Newspapers. From the inception of the fraudulent scheme, newspapers have been a leading way for Defendants to disseminate public statements on smoking and health issues. See, e.g., 86017454-7454 (US 21418) (A) (1954 Frank Statement printed in 448 newspapers nationwide); 2023011263-1263 (US 20371) (A) (1994 Philip Morris "Facts You Should Know" advertisement in the *New York Times*); 500810940-0941 (US 23036) (A) (BATCo's Blackie Letter to Editor in 1994); TI00581619-1629 (US 62969) (A); Dawson WD, 114:18-115:21; Dawson TT, 1/12/05, 9907:21- 9918:8 (ghostwritten letter to the editor challenging evidence of health effects of secondhand smoke, prepared for outside scientist to send to editors at AP, UPI, and 22 newspapers across the country, without disclosing TI's role or that scientist was a paid Tobacco Institute consultant); 513943434- 3434 (US 50268) (A) (1984 RJR newspaper statement that whether smoking causes disease is an "open controversy").

261. In November 2002, Philip Morris placed about 15.8 million glossy inserts (JD-041513) (A), in editions of thirty general circulation newspapers. Keane WD, 43:13-17; see also (JD-052908) (A) (listing the 30 newspapers in which the insert was included).

262. Television. Defendants have actively prepared media spokespersons to communicate their joint fraudulent statements on smoking and health issues, and have pursued and used opportunities on television shows to disseminate those messages. See US FF § I.C(5), supra (describing Tobacco Institute's College of Tobacco Knowledge); see also, e.g., Dawson

WD, 45:10-46:4 (discussing US 21286 (A), transcript of *Good Morning America* on January 11, 1989, reflecting statements on addiction), 46:5-48:2 (other television appearances during which Dawson made statements on smoking and health issues).

263. Philip Morris and Altria have run a range of television (and radio) advertisements to improve their public image and to promote Philip Morris's website. See, e.g., Keane TT, 10/19/05, 10577:1-25, 10620:9-18 (testimony about Philip Morris's national television and radio advertising campaign).

264. Package Onserts. Both Philip Morris and B&W have made use of onserts to convey certain information to consumers in recent years. See, e.g., (JD-041096) (A) (Philip Morris onsert discussing "low tar" and "light" cigarettes that omits role of nicotine addiction in causing the smoker compensation that eliminates any meaningful health benefit from "low tar" cigarettes compared to their full-tar counterparts); TLT0960001-0002 (US 87216) (A) (B&W onsert for Advance cigarette that omitted information about nicotine, addiction, compensation, ventilation holes and other material matters from the onsert first used with the Advance product by Star Scientific); see also Blackie WD, 181:12-182:20; Blackie TT, 10/26/04, 3897:11-3900:15 (discussing B&W's advance onsert compared to the Star Scientific onsert).

265. During the pendency of this case, in November 2002 Philip Morris for a limited period of time placed an onsert on 135 million packs of certain of its "light" and "low tar" cigarette brands. Keane TT, 1/19/05, 10576:8-25; see also id., 10578: 4-17 (testimony about February 2004 "omnibus" onsert promoting website, JD-054553 (A)). Philip Morris claims to have reached 90% of smokers of its "low tar" brands through its onsert program. Id., 10615:23-10616:2, 10616:11-10617:20.

266. Pamphlets. During the course of the fraudulent scheme, Defendants – particularly the Tobacco Institute – have prepared numerous pamphlets and brochures that summarize Defendants' public positions on a range of smoking and health issues, including the health effects of smoking and exposure to secondhand smoke, addiction, youth smoking, marketing practices, and others. See, e.g., 1005152849-2896 (US 20226) (O) (1969 publication issued by the Tobacco Institute); TIMN0055129-5135 at 5130 (US 21298) (O) (1977 pamphlet from the Tobacco Institute stating, "Has the Surgeon General's report established that smoking causes cancer or other diseases? No."); 2023916742-6776 at 6745 (US 20396) (A) (1992 Philip Morris pamphlet "Tobacco Issues and Answers").

267. In July 2000 and September 2001, Philip Morris claims to have distributed a brochure placed on the countertop at retail outlets that promoted the Philip Morris website to 200,000 retailers nationwide. The September 2001 brochure also communicated Philip Morris's position on the health effects of smoking. Keane TT, 1/19/05, 10571:4-10572:15; see also (JD-053192) (A) (Philip Morris's 2001 retail countertop brochure).

268. Internet. Each Defendant that existed independently at the close of trial maintains or supports a corporate website. There were frequent references to these websites during trial. Many witnesses testified about them and their contents, and many exhibits were introduced into the record that consisted of excerpted portions (and, in some instances, entire printouts) of these websites. (These corporate websites are distinct from the document websites that some but not all Defendants were ordered to create pursuant to the MSA. Document websites are discussed separately in Section V.F(1), infra.) The Defendants' corporate websites are:

- Philip Morris: www.pmusa.com. See, e.g., JD-053199 (A) (printout of entire Philip Morris website).

- Altria: www.altria.com. See, e.g., Parrish TT, 1/27/05, 11359:14-11360:9; Parrish TT, 1/25/05, 11024:11-15; JD-046719 (A) (website of Altria launched October 13, 1999).
- R.J. Reynolds: www.rjrt.com. See, e.g., JD-068012 (A).
- Lorillard: www.lorillard.com. See, e.g., Milstein TT, 1/7/05, 9269:18-9270:4; US 86693 (A) (copy of press release printed from Lorillard website)
- Liggett: www.liggettgroup.com. See also LeBow WD 4/4/05, 11:9-14, 12:12 (discussing website of Liggett affiliate Vector Tobacco).
- BATCo: www.bat.com. See, e.g., US 86692 (O); US 89563 (O)

269. Defendants have used their corporate websites as a primary way to communicate their views on smoking and health issues to the public. See, e.g., (JD-068012) (A) (current Reynolds statement on causation); US 89563 (O) (BAT website Q&A on "Is nicotine addictive" that does not mention nicotine in the answer).

270. Martin Orlowsky, President, Chairman, and CEO of Lorillard, testified that Lorillard posted corporate policies on its website. Lorillard's Vice President and General Counsel Ronald Milstein testified that "the website's statement is the public statement of Lorillard regarding these issues," and stated in response to a question from the Court, "If we want to talk to the public we use our website." Orlowsky TT, 10/13/04, 2337:22-24; Milstein TT, 1/10/05, 9417:2-3, 9452:25:9453:1.

271. Philip Morris's website "is the central point of communication" for Philip Morris "to provide information to smokers about our products." Szymanczyk TT, 4/11/05, 18497:11-17. Denise Keane, Senior Vice President and General Counsel for Philip Morris, confirmed this point, testifying that Philip Morris's website is "the core" of Philip Morris's efforts "to create the

broadest platform possible" to communicate with the public. Keane TT, 1/19/05, 10550:4-6; see also id., 10549:20-23.

272. Susan Ivey, President and CEO of Reynolds American Inc. and former CEO of Brown & Williamson, testified that B&W put its positions on its website, and that when it did so, it intended consumers to act in reliance upon its statements. Ivey TT, 11/16/04, 6068:23-24, 6098:16-19. See also US 76600 (A) (1999 B&W website stating that a "relevant issue" about smoking is "whether there is anything in cigarette smoke that impairs smokers from reaching and implementing a decision to quit (which we believe there is not)").

273. Magazines. Magazines have historically, and until very recently, been a primary vehicle for Defendants' advertising, including advertising intended to appeal to adolescents and teenagers, and fraudulent advertising for "light" cigarettes. See, e.g., (US 9846) (A) (1999 B&W advertisement for ultra light cigarettes with implied health reassurance message, "Isn't it time you started thinking about Number One?").

274. Press Releases. The evidence in the record shows that during the course of Defendants' unlawful scheme, press releases – statements prepared by Defendants and then usually sent to news media outlets for dissemination to the public – have likely been the most oft-utilized means for communicating and publicizing Defendants' fraudulent statements on smoking and health matters.

275. Altria used press releases to publicize the launch of the Altria corporate website (JD-046719) (A), in October 1999. Keane TT, 1/19/05, 10566:19-21 (confirming issuance of press release, JD-054558 (A)).

276. Direct Mail Databases. Another means for disseminating information to the public, and to smokers in particular, has been Defendants' increasing use of mailing databases

that enable Defendants to mail marketing material and other information directly to the tens of millions of people in the database. Philip Morris, Lorillard, Reynolds, and B&W (prior to its acquisition by Reynolds) all have maintained direct mail marketing databases. See US FF § III.E(7)(d), supra.

277. In November 1999, after it had publicly launched its corporate website, Philip Morris sent a mailing promoting the website (JD-042707) (A) directly to 29 million people on its marketing database. Keane TT, 1/19/05, 10569:17-10570:8.

278. Philip Morris has also promoted its website address by printing it on all packs of Philip Morris cigarettes. Keane TT, 1/19/05, 10567:10-10568:10.

279. The United States' proposed corrective communications campaign utilizes a subset of the same communication vehicles Defendants have used, both historically and recently, to disseminate their fraudulent positions on smoking and health issues and to promote themselves as responsible corporate citizens. Specifically, the remedy requires Defendants to utilize newspapers, Internet websites, point-of-sale displays, and onserts to communicate specific statements, as approved by the Court, on smoking and health issues.

F. Disclosure of Documents, Disaggregated Marketing Data, and Health and Safety Risks Is Required to Prevent and Restrain Future Unlawful Conduct

280. As set out in detail above, Defendants' suppression of information has been part and parcel of their fraudulent activity and their overarching scheme to defraud, and such suppression continues to this day. See US FF § III.F, supra. Ordering the creation and maintenance of document depositories and document websites (i.e., websites which provide the public with free Internet access to tobacco industry documents) is a disincentive for future misconduct because Defendants know that their business practices will be subjected to public display. Such disclosure will thus prevent and restrain future misconduct. As Defendants'

counsel said during opening statements, document websites achieve transparency, "so that people can monitor what the tobacco companies are doing." Webb opening statement, 9/22/04, 370:19-25.

281. Document websites and depositories ensure public access to internal company documents. Szymanczyk WD, 200:3-6.

282. Adding documents that are produced in litigation to the Minnesota Depository and to the Defendants' document websites "ensure[s] that the information known by the tobacco companies is available and readily accessible to the public." Szymanczyk WD, 202:15-19.

283. As Dr. Allen M. Brandt, Professor of the History of Science at Harvard University and of the History of Medicine at Harvard Medical School testified, document depository and website archives of industry documents are of "great importance" to research because they provide "a remarkable archive of industry materials on questions of great significance in the history of cigarette smoking." Brandt WD, 19:9-11.

284. The existing document websites and depositories created and maintained as a result of litigation during the 1990s, when joined with the discovery materials produced in this case, provide "a remarkable volume of internal industry material that sheds important light on the history of research into the health risks associated with tobacco; the strategies of the industry for marketing cigarettes; as well as the industry's internal and sponsored research programs." Brandt WD, 27:1-5.

285. Such document collections allow researchers to "gain insights into the internal behind-the-scenes processes, planning, and activities of individuals and institutions[;] deepen and enhance our understanding of the logic of decision-making, planning and the deeper contexts of

issues than might be available in the public record[; and] provide access to motivations, strategies, and actions not always available in printed sources." Brandt WD, 28:18-29:1.

286. Defendant BATCo uses its existing document depositories to collect information about the topics and specific documents that members of the public, as well as its litigation opponents, review and select for copying. As this Court stated in Order #332, BATCo maintains daily records on all BAT Group documents which are selected for review, and all documents which are selected for copying, by visitors to the Guildford Depository. BATCo then provides this information to its lawyers at the Lovells law firm, and requests and receives legal advice – provided in daily reports known as "Guildford Reports" – based upon BATCo's knowledge of every single document that visitors to the Guildford Depository review or select for copying. The Health Committee of the U.K. House of Commons stated in its Second Report, entitled, *The Tobacco Industry and the Health Risks of Smoking* (2000), "We find it a matter of concern that BAT takes such an interest in those organizations using the Depository. We do not think it is appropriate for them to sift through the individuals wishing to examine public access materials, working out who is a scientist, who is an academic, who is British or who is a potential litigant." 322241213-1295 at 1282 (US 93249) (O).

287. Unless expressly prohibited by Court order, Defendants will be able to use their document websites to gather, store, and make use of information about visitors to those websites, such as information about their computer "domains" and other data identifying their research institution, government agency, company, or law firm, as well as the searches that they conduct and the documents they view and print or download. The BAT plc website, to which BATCo contributes and with which it agrees (see Defs.' Motion for Summary Judgment on the Grounds That There Is No Reasonable Likelihood of Future RICO Violations, Rule 7.1/56.1 Statement of

Material Facts Not in Dispute (R. 2394, filed 8/1/03) at 43), specifically states that it collects website visitors' Internet Protocol addresses. BAT website "Conditions of Use" § 4 (JD-013221) (O).

(1) Document Websites

288. Section IV of the MSA obliges certain Defendants to create and maintain document websites. MSA § IV(c) & (e) at 36, 39 (JD-045158) (A). See, e.g., Keane TT, 1/18/05, 10376:22-10377:7 (discussing Philip Morris's document website, www.pmdocs.com); McAllister WD, 8:25-9:4, 15:4-5 (discussing CTR document website, http://www.ctr-usa.org/ctr).

289. Neither Altria nor BATCo was a signatory to the MSA, and so neither is obliged to have any document website. Bennett LeBow acknowledged on behalf of Liggett that Liggett is not subject to the MSA's document website provisions. He also acknowledged that "Liggett has not agreed to create and maintain a website on an ongoing basis, like the original participating manufacturers, that contains documents that Liggett produces in smoking and health litigation." LeBow TT, 4/4/05, 17570:14-17572:4.

290. The MSA's document website obligations end on June 30, 2010, and it applies only to documents produced by these Defendants in litigation. As David Beran testified, the requirement applies to "many documents we produce in litigation," but it does not apply to all. Beran WD 82:17-20; Beran TT, 4/18/05, 19342:4-14.

291. Document websites have several significant features that document depositories do not. Collections of tobacco documents placed on the web following the litigation of the 1990s, unlike the majority of non-digitized archival materials, are generally searchable through the web. In addition, not all members of the public are able to travel to Minnesota to access the

Minnesota Depository, so a document website "increases the availability of the documents to the general public," as well, of course, as to Court-appointed monitors. Brandt WD, 28:1-8; Szymanczyk WD, 202:4-6.

292. Defendants' own expert witnesses used Defendants' document websites to do research for background information and to find internal company documents concerning nicotine pharmacology. Gentry TT, 10/14/04, 2360:15-2361:3; Rowell WD, 8:17-22.

293. Bibliographic data provided by Defendants' existing document websites are essential to ascertain such information as the authors of documents who are not identified within the document. Harris WD, 135:12-16. Such bibliographic data reveals who received a given document, and whether it comes from a Defendant's legal or marketing department. Redgrave arguments, TT, 10119:9-23, 10121:8-10122:22.

(2) Document Depositories

294. Separately from the documents available on document websites, hard copies of many documents are maintained in document depositories. The May 1998 Minnesota settlement obliged the Minnesota Settling Defendants to pay to maintain and operate the Minnesota Depository, for 10 years, and those Defendants and BATCo to send additional documents produced in smoking and health litigation there for the same period. Those obligations will thus cease in May 2008. Minnesota consent judgment § VII(C), (E) (JD-093326) (A).

295. The Minnesota settlement did not oblige Liggett to send documents to the Minnesota Depository or to create any other document depository. Nor has Liggett voluntarily created a document depository on its own. Bennett LeBow, Chairman and CEO of Vector Group and VGR Holding, testified that he is unaware of Liggett's having a document depository that is publicly available anywhere in the United States. LeBow TT, 4/4/05, 17622:16-22.

296. During the Minnesota litigation, BATCo created the Guildford Depository in Guildford, England, to provide the Minnesota litigants with access to documents created before that litigation's document cutoff date, August 18, 1994. See Order #38 (protocols for United States trip to Guildford Depository for access to pre-August 18, 1994 documents available to the public); Order #75 ¶ 2 at 2 (same, for access to non-public "files created between August 18, 1994 and December 31, 1999"). BATCo is obliged to maintain and operate the Guildford Depository collection of documents from 1994 and earlier for another 10 years. Minnesota consent judgment § VII(D) (JD-093326) (A). That obligation thus ceases in May 2008. As discussed by Health Committee of the U.K. House of Commons in its Second Report, entitled, *The Tobacco Industry and the Health Risks of Smoking* (2000), the Guildford Depository falls short of the standards for a usable archive in many ways. 322241213-1295 at 1282-1283 (US 93249) (O) (reporting that there are no document-level indices at the Guildford Depository, and the file-level indices "gave no useful indication of the material contained in the eight million pages stored at Guildford. . . . [O]nly the title of the file was indexed and, as we discovered, this often gave absolutely no indication of the contents.").

(3) Assertions of Privilege and Confidentiality

297. The purposes of document disclosure will be substantially frustrated unless Defendants are ordered to provide complete and accurate information about any documents they withhold on grounds of privilege or other protection, as well as confidentiality. This must include complete and accurate information about any courts or other authorities which have previously overruled Defendants' assertions of privilege or other protection, as well as confidentiality. In Order #51, § III.G.9, this Court ordered Defendants to identify all privilege

assertions which were previously overruled, including court action, and to provide copies of all orders overruling such privilege assertions.

298. Defendants have been recalcitrant about providing the public with access to documents over which they have lost privilege. For example, many of the most significant documents detailing Defendants' past history came to light only as a result of past orders overruling Defendants' assertions of privilege, especially including the Minnesota crime-fraud rulings that led to over 32,000 documents being produced. Defendants agreed to allow the Minnesota plaintiffs to seek authority to place those documents in the Minnesota Depository. Minnesota consent judgment § VII(C) (JD-093326) (A). This Court and many other courts have found that Defendants thus waived privilege over these documents, as well as through the non-British Defendants' producing their documents (which became known as "Bliley documents") to a congressional subcommittee. Order #149, published as United States v. Philip Morris, Inc., 212 F.R.D. 421 (D.D.C. 2002), and cases cited therein.

299. Defendants have been abusive in designating and withholding documents on both privilege grounds and confidentiality grounds. Charles Wall, now Altria's General Counsel and Senior Vice President, and previously an attorney at Shook Hardy & Bacon for twenty years, wrote a March 20, 1985 memorandum, produced by BATCo after its privilege assertions were overruled in Order #397. Wall wrote that in Cipollone, Shook Hardy & Bacon designated **all** tobacco industry documents that were not already in the public domain as "confidential," **without any attempt "to determine whether in fact the documents were treated as confidential or could be defined as confidential by the federal rules and case law."** 503140888-0907, 0899 (US 29670) (O) (emphasis added).

300. As discussed above, Liggett committed egregious abuses in its privilege logs in this action, as well as asserted privilege over documents for which it had waived all privilege in its 1997 settlement with the states' attorneys general. See US FF §§ V.A(3)(b)(i), V.A(4), supra. Moreover, when scientist Dr. Dennis Dietz first joined Liggett in 1990, Liggett attorneys instructed him to write **"Privileged and Confidential"** on any document he thought was "going to be sensitive"; he conceded that "sensitive" issues included "any issue that . . . could crop up in a product liability case." Dietz TT, 3/29/05, 17158:19-17163:22, 17172:9-24. As Dietz wrote in a contemporaneous December 5, 1990 memorandum, Liggett's attorneys emphasized the importance of marking scientific documents as "Privileged and Confidential" in the context of protecting such documents from disclosure in product liability litigation. LWDOJ00002067-2070 at 2067 (US 93217) (A); LWDOJ00002066-2066 (US 93218) (A).

301. Although the value of most confidential information declines with time, Defendants do not routinely "dedesignate" documents that they withhold from the public on confidentiality grounds. See, e.g., Read TT, 3/22/05, 16460:9-16466:20; 322275335-5372 (US 93197) (A) (discussing 38-page fax dated September 14, 2000, titled "Documents Not in the Public Domain" and listing over a thousand BATCo research and development reports not in the public domain).

(4) Disaggregated Marketing and Sales Data

302. Compelling disclosure of disaggregated marketing and sales data are required "to provide greater transparency to the public as to what is being spent and what effect it's having." Eriksen TT, 5/16/05, 20135:18-23. Compelling Defendants to make publicly available the disaggregated marketing and sales data that their own expert witness recommends be released to

the public domain is needed to ensure transparency and to prevent Defendants from continuing to make false denials of the effects of their conduct upon youth smoking.

303. The Defendants do not make publicly available brand-specific, promotion-specific, or other disaggregated data on their marketing expenditures or sales, such as the disaggregated marketing data that the FTC adds up in its reports of aggregated total figures. Beran TT, 4/18/05, 19324:22-19325:16; Eriksen WD, 87:22-88:2.

304. Philip Morris's Retail Leaders price discount program vividly illustrates Defendants' selective release of such information. Through this program Philip Morris discounts cigarettes or gives other incentives to 200,000 retail outlets in the United States, which account for 85% of the cigarettes sold at retail in the United States. Willard TT, 4/14/05, 19083:1-19084:20. Mark Beran, Philip Morris's Executive Vice President of Strategy, Communications and Consumer Contact, acknowledged that Philip Morris does not make public how much Philip Morris pays retail stores and outlets through its Retail Leaders Program for product placement and promotion. Beran TT, 4/18/05, 19343:4-19344:2. Nonetheless, Philip Morris does selectively release other disaggregated promotion information about the Retail Leaders program when it believes it helpful. Specifically, Philip Morris highlighted that from 2001 to 2004 it spent about $125 million per year (totaling $500 million over the four years) on one component of the Retail Leaders program – the "Progressive Merchandising Option" – to publicize its expenditures on what it considers to be a youth smoking prevention program. Szymanczyk WD, 153:1-154:7; Szymanczyk TT, 4/7/05, 18217:1-18218:3.

305. Nor do Defendants make detailed data on brand-specific, promotion-specific, and other disaggregated marketing expenditures or sales available to the public or public health researchers for research purposes. Both the United States' and Defendants' experts agree that

detailed calculations of the precise impact of Defendants' various kinds of marketing expenditures upon youth smoking requires such disaggregated data. Eriksen WD, 87:22-88:5; Heckman TT, 4/13/05, 18875:7-10. The United States' and Defendants' expert witnesses further agreed that such disaggregated data must be broken down to show spending expenditures by geographic region and type of market. Eriksen WD, 88:2-5; Eriksen TT, 5/16/05, 21054:25-21055:12.

306. Defendants' expert witness James Heckman testified that in preparing to testify in this case, he requested data from his litigation contract firm, Lexecon, and/or Defendants' attorneys, to show Defendants' advertising budgets broken down by geographical regions, but did not receive the data he requested. Heckman TT, 4/13/05, 18944:15-18949:12. He asked Lexecon or Defendants' attorneys for data disaggregated not only by region, but broken down all the way to "neighborhood blocks, the kind of data that marketing people can sometimes get access to." Id. at 18954:22-18955:2. He testified that such disaggregated data, broken down by geographic markets and regions, is of central importance: "I would repeat the statement that it would help understand the factual – approve [sic] **the factual base on all sides of this case to have that information in the public domain."** Heckman TT, 4/14/05, 18960:2-15 (emphasis added); see also id. at 18996:3-4 ("Well, I agree that more disaggregated data would be productive as I testified yesterday and would testify any day.").

(5) Disclosure of Health and Safety Risks

307. Defendants have gone to great lengths to suppress information about the health effects of their products. See generally US FF § III.F, supra (suppression and concealment). As Dr. Max Bazerman testified, "Evidence exists that defendants have not been forthcoming with

accurate and complete information concerning the health and safety risks associated with cigarette smoking." Bazerman WD, 62:37-63:1.

308. Mandatory disclosure is the only mechanism for the public or others to learn about Defendants' research. Bonhomme WD, 66:18-22 ("With the exception of the document website, documents or research that we do is held confidential within the organization."). To prevent and restrain Defendants from continuing to suppress such material information from the public and from their consumers, Defendants must be ordered to provide "accurate and complete information concerning the health and safety risks associated with cigarette smoking." Id., 63:1-4. Ensuring that this happens will require appointing Court-appointed officials who have access to Defendants' papers and personnel.

G. Comprehensive Review of Defendants' Business Practices Is Required to Prevent and Restrain Future Frauds

(1) Fraud Pervades Defendants' Business Practices

309. For over five decades, Defendants have engaged in a massive scheme to defraud the public and this fraud continues to this day. See US FF § III., supra. Using their Research and Development, advertising, marketing, and public relations business functions, Defendants perpetrate this scheme to defraud through various means, including:

(a) causing public dissemination of numerous false, deceptive and misleading statements denying that cigarette smoking and Environmental Tobacco Smoke cause disease and other adverse health effects (See US FF § III.A-C, supra);

(b) failing to conduct or sponsor independent, disinterested research into the potential adverse health effects of smoking despite public dissemination of numerous false, deceptive and misleading statements that they would conduct or sponsor such research (See US FF § III.B, supra).

(c) causing public dissemination of numerous false, deceptive and misleading statements denying that cigarettes are addictive (See US FF § III.C(1), supra);

(d) designing cigarettes with the purpose of ensuring rapid delivery of a controlled level of nicotine sufficient to create and maintain addiction despite public dissemination of numerous false, deceptive and misleading statements denying that they manipulate nicotine levels (See US FF § III.C(2), supra);

(e) deceptively marketing "light" and "low tar" cigarettes as less hazardous despite their knowledge to the contrary (See US FF § III.D, supra);

(f) marketing to youth despite public dissemination of numerous false, deceptive and misleading statements denying that they marketed to youth (See US FF § III.E, supra); and

(g) suppressing the disclosure of information that could jeopardize their public relations positions and litigation defenses (See US FF § III.F, supra).

310. Defendants' fraudulent conduct has permeated all aspects of their operations – from how they design and market their products to how they communicate with the public about them. Bazerman WD, 43:10-13. It is clear that the current business practices of the still-operating Defendants encourage fraudulent behavior to occur. Bazerman WD, 45:4-6.

311. This fraudulent behavior is driven by profit, and there is no question that Defendants are profitable companies. See US FF § V.A(5), supra. Without changes to their business practices and policies, Defendants will continue to engage in RICO violations as long as this behavior reaps profits. Bazerman WD, 19:19-21; Harris TT, 10/14/04, 2519:24-2520:6. Removing the incentives, practices, and policies that lead to RICO violations will prevent and restrain future frauds. Bazerman WD, 1:14-2:10; Bazerman TT, 5/4/05, 20322:18-20324:12.

(2) Independent Investigation and Oversight of Defendants' Business Practices Is Reasonable and Necessary In Order to Address Defendants' Pervasive Fraud

312. Because a "culture" of fraud permeates Defendants' business practices, Defendants cannot be allowed the responsibility of identifying and implementing changes to their own businesses. Thus, it is necessary for an impartial agent of the Court to conduct an independent review of Defendants' business policies, practices, and operations in order to identify and

implement appropriate procedures and measures, which will remove the incentives, practices, and policies that have led Defendants to commit RICO violations. Bazerman WD, 2:20-3:3, 45:1-6.

313. Dr. Max Bazerman, an expert in behavioral decision research with a specific focus in managerial and organizational contexts, evaluated the incentives operating on Defendants' business practices. Bazerman WD, 1:16-19, 4:13-16. Since 1977, Dr. Bazerman has served on the faculties of distinguished business schools, such as Boston University, Massachusetts Institute of Technology, and the Kellogg Graduate School of Management at Northwestern University. For the past five years, Dr. Bazerman has been the Jesse Isidor Straus Professor of Business Administration at Harvard Business School. (no bates) (US 89457) (A) (Curriculum Vitae). In addition to his teaching and research, Dr. Bazerman has consulted to "corporations, international financial institutions, professional associations, not-for-profit organizations, and municipalities" for over twenty years. Id. at 11:13-16. Many of the corporations to which Bazerman consults are renowned multinational entities in various industries. Id. at 12:1-5; Bazerman TT, 5/4/05, 20489:24-20491:8. Specifically, Bazerman teaches corporate executives in the areas of decision making and negotiations, including "ethical aspects of decision making." Bazerman WD, 11:17-23.

314. One aspect of Dr. Bazerman's research is particularly relevant to this case. In 1997, Dr. Bazerman and his colleagues published a paper that examined alleged corruption in the auditing industry and recommended structural changes to auditing firms "so that incentives that create corruption and bias would not occur in the future." Id. at 38:17-23, 39:4-10. In 2000, the Securities and Exchange Commission ("SEC") invited Dr. Bazerman to testify at a hearing on

auditor independence and Dr. Bazerman presented recommendations to restructure auditing firms to eliminate incentives for misconduct. Id. at 39:11-41:6.

315. Defendants called Daniel Fischel, a part-time law professor and litigation consultant, to respond to Bazerman's testimony. Other than providing advice through counsel for litigation, Fischel has never advised corporate boards of directors, has never consulted directly to senior management of any corporation, nor has he consulted to companies on issues of corporate reorganization or restructuring. Fischel TT, 5/27/05, at 22144:25-2145:10. As a paid expert witness and litigation consultant, Fischel has earned approximately $3 million to $4 million in salary and bonuses each year from 2001 through 2004. Id. at 22136:13-18, 22137:10-18. Furthermore, through business dealings as President of the litigation consulting firm, Lexecon, Fischel received a total income of $20 million in 2003. Id. at 22135:16-22137:9; US 93792 (A). Fischel, however, first denied receiving that sum when directly asked by the United States on cross examination. Id. at 22135:13-15.

316. The Court observed the demeanor of these witnesses live at trial. Based on his expertise and experience with organizational behavior, Dr. Bazerman's opinions pertaining to the incentives that drive Defendants' unethical and fraudulent conduct are entitled to greater weight than those of Fischel.

317. Ensuring that Defendants fully comply with this Court's remedies Order will require that the Court-appointed officials have full access to Defendants' premises, papers, and personnel. Provisions of the MSA authorizing state attorneys generals to inspect documents and interview employees will largely expire by the end of 2006. This Court's remedies Order will require at least as much authority to monitor Defendants as they voluntarily agreed to in settling

the states' attorney general lawsuits. Szymanczyk WD, 118:2-4; MSA § VII(g) at 52 (JD-045158) (A); Szymanczyk TT, 4/11/05, 18344:13-18346:20.

318. Access to Defendants' facilities, operations, employees, meetings, and records is imperative in order for the independent investigation to be effective. Bazerman WD, 45:1-6. Remedial changes to Defendants' business practices will require the independent investigators to become familiar with the "organizational architecture" of Defendants' companies, which includes "the ways in which the people, tasks, competencies, structures, incentives, and culture of a firm interrelate." Bazerman WD, 45:12-23. An effective way to do this is through witnessing the corporate culture in person. The independent investigators will need to talk with employees, attend meetings, and review Defendants' operations firsthand, especially since the evidence demonstrates that Defendants' written policies are not necessarily what is done in practice. See discussion at end of US FF § V.G(3), infra. (discussing Mission Statements); see also Gulson WD, 8:16-10:16, 15:1-12; Gulson TT, 2/17/05, 13756:14-13757:21 (describing BATCo's written and "unwritten" document retention policies). The independent investigators also play an integral role in overseeing Defendants' compliance with remedies such as the cessation programs and targeted reductions in youth smoking discussed above. See US FF §§ V.B & V.D, supra.

(3) Independent Review and Oversight of Defendants' Business Practices Is Aimed at Addressing Specific Fraudulent Conduct

319. The goal of the independent review and oversight of Defendants' business practices is to identify and implement procedures and measures that will prevent and restrain Defendants from continuing to engage in fraud. This may be accomplished in numerous ways, including but not limited to: (a) eliminating economic incentives for Defendants to market and sell cigarettes to youth; (b) changing compensation and promotion policies for managers and executives to produce outcomes inconsistent with misconduct; (c) requiring subcontracting of

certain research to independent third parties monitored by the Court; (d) requiring Defendants to divest intact their research and development, current product development activities, and all other relevant material regarding less hazardous cigarettes so that less hazardous cigarettes can be brought to the marketplace; (e) requiring the institution of programs to educate managers in such a way to address bias in decision making; (f) creating internal mechanisms for employees, agents and contractors to report misconduct without fear of retribution; and (g) changing oversight and reporting arrangements to produce outcomes inconsistent with misconduct. Bazerman WD, 2:11-19, 3:4-15.

320. As set forth below, the United States has presented evidence that each of these potential changes to Defendants' business practices and policies is aimed at preventing and restraining specific future fraudulent conduct.

321. Defendants have substantial economic incentives to sell cigarettes to youth and they act to attract young people to smoking because they need new young smokers to stay in business and increase profits. "Market research showed all the tobacco companies that, unless an individual began smoking by age 18, it was very unlikely that he or she would ever start." Dolan WD, 62:11-14. Consequently, Defendants recognized that young smokers were the key to sustaining the industry. A 1984 RJR document states, "Younger adult smokers are the only source of replacement smokers . . . . If younger adults turn away from smoking, the industry must decline, just as a population which does not give birth will eventually dwindle." 501431517-1610 at 1526 (US 20680) (A).

322. Defendants' marketing to teenagers sustains their customer base and generates substantial profits over the long term. Dolan WD, 67:8-68:11; 507181261-1261 (US 20007) (O). Publicly, however, Defendants deny that they market to youth. See generally, US FF § III.E,

supra. Defendants' economic incentives to engage in this fraud continue to operate within their businesses and outweigh incentives that Defendants currently have to change their marketing practices. In fact, Defendants have refused to implement measures voluntarily that would make their marketing efforts less appealing to youth. For example, Altria has consistently opposed proposals from its shareholders that the company voluntarily submit all advertising and marketing to "independent and certifiable testing to ensure that it is not equally or more appealing to those [under eighteen]." GTS1491471-1501 at 1498-1499 (US 87738) (A); 2078016400-6453 at 6435-6435 (US 20531*) (A); GTS1482016-2055 at 2041-2042 (US 87740) (A).

323. As long as it is profitable for Defendants to market and sell cigarettes to young people, this behavior will continue. The United States has presented evidence of measures that would eliminate the economic incentives to market cigarettes to young people, such as targeted reductions in youth smoking, US FF § V.D, supra, and counter-marketing programs, US FF § V.C, supra.

324. Defendants' executives and officers also profit substantially from all of Defendants' business practices, including those that comprise the overarching scheme to defraud the public. Clearly, there are financial incentives for Defendants' executives to continue business practices that provide them with lucrative salaries, stock options and other perquisites. The record contains numerous examples of these substantial financial incentives:

(a) Andrew Schindler, Non-Executive Chairman of Reynolds American Inc. ("RAI"), earned total compensation of **$10,301,913** in 2003, Schindler WD, 7:13-7:15; and **$44 million to $45 million** in 2004. Schindler TT, 1/24/05, 10712:1-5.

(b) As incoming President and CEO of RAI, Susan Ivey earned **$1.1 million** in 2004, while Lynne Beasley, President of Reynolds, earned **$4.6 million** in total compensation in 2004, and Charles Blixt, Executive Vice President of Reynolds,

earned **$3.6 million** in total compensation in 2004. VXA4870234-0310 at 0267 (US 89456) (A).

(c) Michael Szymanczyk, Chairman of Philip Morris, earned **$2.9 million** in salary, incentive, and other compensation in 2004, plus another **$2.7 million** in restricted stock awards, dividends and defined contribution plans. Szymanczyk WD, 2:23-3:14.

(d) In 2004, Denise Keane, Senior Vice President and General Counsel of Philip Morris, received a salary of **$525,000**, a bonus of approximately **$350,000 or $400,000**, a stock option package dependent upon company performance, and other benefits. Keane TT, 1/19/05, 10523:15-10525:8.

(e) Bennett LeBow, of Liggett, earned total compensation of about **$3.8 million** in 2003. LeBow WD, 4:12-20.

325. The compensation of these executives is based almost exclusively on traditional financial measures, rather than on measures inconsistent with misconduct. For example, Andrew Schindler's bonus is based on "market share performance." Schindler WD, 7:22-8:2. Schindler admitted that the structure upon which his bonus was based provided no incentive for reducing youth smoking. Schindler TT, 1/24/05, 10712:20-23. Reynolds's current executive compensation polices are based on two principles: attracting and keeping "high caliber" executives, and "quantifiable measures of RAI's financial performance and/or stock price performance." VXA4870234-0310 at 0264-0265 (US 89456) (A). Other Defendants' executive compensation policies are similar. Keane TT, 1/19/05, 10523:20-25 (Philip Morris); AG8000100000-0073 at 0023 (JD-052854) (A) (Altria); TLT1022236-2258 at 2247 (US 87743) (A) (Lorillard).

326. Motivated by profits and maximizing shareholder return, Defendants will continue to act consistently with these incentives. Bazerman WD, 1:20-22; Bazerman TT, 5/4/05, 20324:8-13. Bennett LeBow summarized this sentiment by agreeing that he "wanted to make as much money as [he] possibly could selling cigarettes" because "[t]hat's what a business person

normally does." LeBow TT, 4/4/05, 17576:20-17577:7. Defendants continue to earn significant profits, due in part by committing fraud. Thus, it is important to change the focus of Defendants' compensation and promotion policies to produce outcomes that are inconsistent with fraud. Bazerman WD, 47:3-12, 48:10-16; Bazerman TT, 5/4/05, 20494:21-20495:3. Even Defendants' expert witness, Daniel Fischel, agreed that compensating managers using "nonfinancial measures [of] conduct inconsistent with fraud" is a way to discourage managers from engaging in fraud. Fischel TT, 5/27/05, 22157:20-22158:5.

327. When confronted with proposals to tie executive compensation to nonfinancial measures, such as reductions in youth smoking, Defendants have declined to implement such measures voluntarily. Overlooking the long-term profitability of addicting young smokers, Andrew Schindler rationalized, "the sale of Reynolds cigarettes to minors represents an extremely small amount of Reynolds' total sales and thus is insignificant to any bonus." Schindler WD, 7:22-8:2. Philip Morris claims that executive compensation is based on meeting the goals expressed in its Mission Statement. Szymanczyk asserts that he is "compensated based on the progress we make toward our Mission." Szymanczyk WD, 1:18-20. Philip Morris and Altria, however, have opposed shareholder proposals requesting that the company "voluntarily create a formula linking future executive compensation packages with achievement in specific decreases in teen consumption of our company's brands." GTS1491471-1501 at 1497 (US 87738) (A); 2078016400-6453 at 6432 (US 20531*) (A). Lorillard has also declined to implement such policies voluntarily. TLT1022236-2258 at 2251 (US 87743) (A). To prevent and restrain Defendants from engaging in fraud, such as marketing cigarettes to youth, there is a need for independent evaluation of Defendants' business practices to ascertain how to accomplish and implement changes to executive compensation and promotion polices that will produce

outcomes inconsistent with this fraud. Bazerman WD, 53:12-18; Bazerman TT, 5/4/05, 20454:7-20455:18.

328. Profits and the continuation of their businesses have also motivated Defendants to use their Research & Development functions to commit fraud. See US FF §§ III.A-F, supra. Defendants have collectively generated research that supports their public positions on smoking and health, addition, and nicotine. See id. At the same time, they suppress the results of studies that are unfavorable to the industry. See US FF § III.F, supra.

329. Examples of this continuing fraud include Defendants' concerted efforts to produce research that the industry could use in support of its public positions on ETS. In a 1988 BATCo document memorializing a "special meeting of the UK Industry on Environmental Tobacco Smoke," held on February 17, 1988 in London, Dr. Sharon Boyse, a B&W scientist, stated that:

> Philip Morris presented to the UK industry their global strategy on environmental tobacco smoke. In every major international area (USA, Europe, Australia, Far East, South America, Central America, & Spain), they are proposing, in key countries, to set up a team of scientists organised by one national coordinating scientist and American lawyers, to review scientific literature and **carry out work on ETS to keep the controversy alive.** They are spending vast sums of money to do so, and on the European front Covington & Burling, lawyers for the Tobacco Institute in the USA, are proposing to set up a London office from March 1988 to coordinate these activities.

321140944-0949 at 0944 (US 20586) (A) (emphasis added); Blackie TT, 10/25/04, 3703:1-3703:8.

330. Covington & Burling attorney John Rupp asserted that Boyse-Blackie's summary of the Philip Morris and Covington & Burling "global strategy" on ETS was "inaccurate in many respects." Rupp WD, 90:16-17. However, internal industry documents belie Rupp's assertion.

Indeed, Rupp's goal was to recruit "a core group of scientists who are fully trained on the issues" to write articles and participate on the industry's behalf at conferences. 2500048635-8640 at 8636-8637 (US 20550)(A); 2500048508-8515 at 8510 (US 20549) (A); 300543209-3215 at 3210 (US 28138) (A).

331. Defendants also attempted to conceal the funding source of the ETS studies that they supported, so that the studies would seem to come from "independent sources." See generally US FF § III.A(2), supra; 2500048976-8998 at 8989 (US 23007) (A) (1990 Asia ETS Consultant Project); 300541761 (US 23597) (O) (1991 Hong Kong monitoring study); see also US FF § III.A(2), supra (discussing Defendants' "ghostwriting" of scientific studies). Defendants have touted the Enstrom and Kabat article, "Environmental tobacco smoke and tobacco related mortality in a prospective study of Californians, 1960-1998," as support for their position that ETS does not cause disease. (JD-024496) (A). Researcher James Enstrom's affiliation with Defendants is not mentioned in this article. Yet, the record here shows that Enstrom received $525,000 from CIAR to conduct the study. Eisenberg WD, 49:21-50:3; 566943549-3579 (US 85813) (A); 2505442777-2960 at 2815 (US 25643*) (A). In addition, Enstrom had a previous decades-long working relationship with Defendants. 2063610840-0841 at 0840 (US 85796) (A). Defendants have failed to note these facts when publicly praising the results of the study. ARG0412302-2303 (US 86747) (O) (BATCo website); TLT1020487-0488 (US 88461) (O) (BATCo website); Defs.' Opening Stmt, TT, 9/22/04, 328:21-25.

332. To prevent and restrain Defendants from using their research activities to perpetrate fraud, an independent agent is needed to review and monitor Defendants' research activities to determine whether such activities need to be placed under the direction of an independent third party. Bazerman TT, 5/4/05, 20333:3-9. Defendants' own expert witness,

Daniel Fischel, agreed that, if research functions are being used to commit fraud, then one logical solution is to subcontract those functions to an independent third party. Fischel TT, 5/27/05, 22158:14-22159:1.

333. Another way in which Defendants have used their R&D functions and marketing practices to commit fraud is through their marketing and development of less hazardous cigarettes. Defendants agreed not to compete on smoking and health issues in the marketing of cigarettes. See US FF § III.A, supra. Despite knowing that the commercial success of less-hazardous products depends upon informing consumers about their potential for harm reduction, Defendants have consistently withheld this information from consumers, because it would contradict their public relations position denying that smoking causes disease. See id.; 2086120855-0890 at 0855, 0871 (US 45812) (A) (Philip Morris's Accord); 510959750-9752 at 9750 (US 51536) (A) (RJR's EW); TLT0960001-0002 (US 87216) (A) (B&W's Advance).

334. To prevent and restrain Defendants from continuing their refusal to develop and market less hazardous products in order to protect their false public relations campaign, an independent review of Defendants' current research in this area is imperative. Bazerman WD, 58:4-9. The experience with the development and marketing of Advance is instructive in this regard. See US FF § III.A(3)(g), supra Star Scientific, an independent tobacco company, test marketed Advance, which was developed under an agreement with B&W. Star provided consumers with onsert information about Advance's potential for harm reduction. See 524942388-2389 (US 52963) (A) and 524942390-2391 (US 88038*) (O); Blackie WD, 180:4-16. B&W, however, renegotiated the agreement and then repackaged Advance without the previous statements of smoking's harms to consumers. TLT0960001-0002 (US 87216) (A). Consequently, an independent investigation of Defendants' less hazardous research and

development activities is needed to determine measures to divest intact these activities from Defendants' operations, so that less hazardous cigarettes can be brought to the marketplace. Bazerman WD, 58:23-59:8.

335. Certainly, Defendants' overarching scheme to commit fraud continues to this day due to the decisions of Defendants' managers and executives that perpetuate this fraud. Indeed, numerous individuals at Defendants' companies have intentionally misrepresented the facts about smoking and deceived the public. For instance, Thomas Sandefur, former Chairman and CEO of Brown & Williamson, frequently told others within the company, "we need to hook ‘em young and hook ‘em for life." Wigand WD, 89:8-15. Yet, testifying under oath before Congress, Sandefur denied that nicotine is addictive. TLT0730001-0850 at 0594 (US 77011) (O). Wayne Juchatz, longtime counsel for RJR, along with other company attorneys, monitored and suppressed the work of scientist Robert DiMarco, who believed the company should develop "less mutagenic," or "safer" cigarettes. Juchatz told DiMarco that he could not conduct this type of research, as such products imply that RJR's existing products are not safe. Juchatz TT, 11/18/04, 6583:19-6587:5. Ultimately, DiMarco was forced to work with the company's Legal Department to ensure that he would conduct the work that he wanted, but in a way that did not jeopardize the company's legal defenses or public positions. Id. at 6590:19-6591:2.

336. Intertwined with this intentionality are individuals who have supported Defendants' public positions on smoking and health while remaining ignorant of Defendants' internal research and knowledge. Brennan Dawson, former spokesperson for TI, claims that Defendants did not provide her with any information that nicotine was addictive and that Defendants did not share with her that they accepted the view that smoking tobacco caused diseases, such as lung cancer. Dawson WD, 53:9-12; 54:8-11; 55:5-9, 80:11-16. The United

States called Dr. Bazerman to discuss social science research that shows how individuals identify with positions they have taken or roles that they have assumed to the point where "they see the world as they wanted to see it." Bazerman WD, 6:7-7:2. Bazerman also described how bias and unintentional conduct flow from the intentional frauds committed by those in Defendants' companies. Bazerman TT, 5/4/05, at 20333:3-9.

337. Defendants contend that their respective Mission Statements, Corporate Principles, and executive training programs evidence a commitment to ethical standards of behavior. "In order for a Mission Statement to have meaning and be effective, the company's actions must reflect the values expressed in the mission statement." Bazerman WD, 68:10-11. Unfortunately, Defendants' Mission Statements are words which have proven wholly inadequate to prevent fraud and misconduct. See id. at 68:17-72:7 (discussing policy statements of Philip Morris, Reynolds, and Lorillard).

338. Philip Morris is a prime example of the failure of a company's stated corporate principles. The Court previously determined that at least eleven employees of Philip Morris failed to comply with Order #1, ¶7 (requiring preservation of "all documents and other records containing information which could be potentially relevant to the subject matter of this litigation."). Order #600 Mem. Op. at 2. The Court was particularly troubled by the fact "that those eleven employees hold some of the highest, most responsible positions in [Philip Morris]." Order #600 Mem. Op. at 2. At the time this occurred, Philip Morris's "Core Values" claimed, "we conduct ourselves within both the spirit and the letter of the law, regulations, agreements and policies that govern us. . . ." Szymanczyk WD, 34:9-10. Despite this claim, Philip Morris did not report the lack of compliance to the Court until four months after learning about the situation. Order #600 Mem. Op. at 2. In addition, there is no evidence that any of the eleven employees

were disciplined or reprimanded for failing to follow the company's "print and retain" policy. Instead, Philip Morris chose to "improve the entire process, rather than take actions against the individuals," because Defendant decided that the loss of email was "inadvertent." Wallmeyer PD, United States v. Philip Morris, 12/20/02, 397:15-20. Philip Morris, however, ignores the fact that, these high level employees failed to follow an explicit company policy and disregarded the Court's Order.

339. Preventing and restraining Defendants from engaging in future fraud depends upon the ability of their executives and managers to make decisions that are in line with the law and ethical behavior. Implementing programs at Defendants' companies to educate managers about "ethical aspects of decision making" will address the intentional fraud. Bazerman WD, 20:1-6, 24:18-21. "The managers would be educated on the ethics of this new organization and on what is appropriate behavior." Id. at 60:9-13.

340. In contrast to the numerous instances where Defendants have failed to discipline misconduct, Defendants have also punished and suppressed individuals who have attempted to disseminate information that contradicts Defendants' public relations positions. See US FF § III.F, supra. In 1984, Philip Morris shut down the lab where Drs. Victor DeNoble and Paul Mele conducted nicotine research using rats, because "the work [they] were doing was inconsistent with the industry's position in litigation." DeNoble WD, 38:4-14. Philip Morris placed DeNoble and Mele in an office, separate from the lab facilities, where their only tasks were to find other positions outside of the company. Id. at 38:22-39:2; see also Mele WD, 26:17-21, 27:11-19. Dr. Jeffrey Wigand, former Vice President of R&D at B&W, had long-standing disagreements with then President and COO, Thomas Sandefur on various issues, such as "safer cigarettes, biotesting of additives . . . [and] lawyer involvement in the editing and revising of

scientific documents." Wigand TT, 1/31/05, 11691:22-11693:2. Soon after Wigand proposed removing the additive coumarin from B&W cigarettes, because it was found to be a carcinogenic substance by the National Toxicology Program, Sandefur became Chairman and CEO of B&W and Wigand was terminated. Id. at 11692:21-11693:8, 11699:24-11700:10. Defendants cursorily dismissed these employees, not for deficient job performances, but to protect Defendants' public policy positions and litigation defenses. See DeNoble TT, 1/6/05, 9067:4-9069:20; Mele WD, 26:22-27:4; Wigand WD, 16:1-18:15; Wigand TT, 1/31/05, 11598:3-7.

341. Based on these experiences, an independent investigation of Defendants' personnel policies and practices is necessary. Implementing internal mechanisms for employees, agents and contractors to report misconduct without fear of retribution will prevent and restrain Defendants from suppressing individuals who oppose Defendants' public relations positions. Bazerman WD, 60:14-61:2.

342. Finally, Defendants have also structured their companies to compartmentalize information such that some individuals presenting information to the public have remained intentionally and unintentionally uninformed of Defendants' internal knowledge-- often remaining willfully blind to Defendants' fraudulent conduct. As noted previously, Brennan Dawson claims that, despite being a spokesperson for the industry, she was not informed of Defendants' internal knowledge about addiction and the adverse health effects of smoking. Similarly, Denise Keane, General Counsel of Philip Morris, was responsible for responding to the FTC's request for information regarding research on consumer perception of tar and nicotine ratings and brand descriptors. Keane informed the FTC that Philip Morris did not have such internal research; however, this was not accurate. Compare Keane WD, 48:12-23, with 2049455309-5318 at 5315 (US 22218) (A) and 2045628312-8328 (US 22217) (A). Keane

claimed that no one at Philip Morris provided her with that information and her response to the FTC was based on "specific conversations [she] had with company people, as to the nature of research that [Philip Morris] conducted." Keane TT, 1/18/05, 10375:7-10; Keane WD, 48:22-49:13. Yet, at the same time she failed to request such information specifically from the Marketing Department. Keane TT, 1/18/05, 10373:19-10374:14.

343. Individuals working on behalf of Defendants who provide information to government agencies, law enforcement, or the public at large must have all relevant information available to them if these representatives are to provide accurate and candid information on behalf of Defendants. To prevent and restrain Defendants from shielding information from their public representatives, an independent review of, and changes to, Defendants' oversight and reporting arrangements are necessary so that information is communicated properly throughout each company. Bazerman WD, 61:11-62:32.

(4) Remedies to Business Practices Requires Comprehensive Change

344. Clearly, fraud permeates Defendants' business practices. To prevent and restrain future fraud requires **comprehensive** review and oversight of Defendants' business practices. As Dr. Bazerman noted, this is not the case where "a few top managers engaged in a relatively discrete episode of illegal behavior . . . [or] where the problem is limited to a CEO or top executive who embezzled money from a company and where the company itself, as an organization, is not involved in any wrongdoing." Bazerman WD, 43:3-9. Comprehensive change to Defendants' business practices must be implemented to change the culture of fraud that exists at these companies. Id. at 10-13.

345. Based on the management literature and his experience consulting to corporations, Dr. Bazerman explained two ways comprehensive change may be implemented: through

leadership succession and "discontinuous change." Id. at 43:18-44:1. First, leadership succession is not uncommon when businesses are moving from one business model to another. Id. at 56:13-17; Bazerman TT, 5/4/05, 20494:4-20. An independent investigation of Defendants' corporate structure may reveal that removal may be warranted if any officer, employee, or other member of senior management has been found, after due notice and an adjudicatory proceeding, to have committed a RICO violation. See Bazerman WD, 54:16-55:23. Second, Defendants need to create a new business model, which moves away from the fraudulent practices of the past and present. Implementing "discontinuous change" means that there will be simultaneous and fundamental changes to the ways in which the companies do business. Bazerman WD, 44:6-11. This also means that an independent investigation will take into account ways to implement a comprehensive package of structural changes to Defendants' business practices, as well as incorporate other remedial measures such as counter-marketing and cessation programs. Id. at 2:5-10.

(5) Response to Defendants' Claims that Comprehensive Changes Will Result in Adverse Effects on Stakeholders and Market Share

346. Defendants contend that imposing changes to their business practices and requiring them to fund certain programs will adversely affect the companies, as well as "innocent stakeholders," such as employees and shareholders. Carlton WD, 37:14-23; Weil WD, 21:20-22; Fischel WD, 14:4-13. Most of the adverse effects and harms asserted by Defendants' experts are economic, and none of their expert witnesses takes into account the magnitude of Defendants' fraud.

347. Defendants called Drs. Dennis Carlton and Roman Weil to examine how the United States' remedies would effect Defendants' businesses. Carlton concluded that, if the remedies explained by Drs. Gruber, Fiore, Healton and Eriksen were implemented as a

comprehensive structure of relief, Defendants' competitive position in the marketplace "vis-a-vis non-defendant cigarette companies" would be more adversely affected than if a single remedy alone was imposed. Carlton WD, 37:14-23. These adverse effects to Defendants' competitive position mean that there will be "significant decline in share of cigarette sales." Id. Similarly, Weil concluded that requiring Defendants to pay "unconditional" payments for smoking cessation and counter-marketing programs would "impair Defendants' ability to compete meaningfully in the U.S. cigarette market" and possibly bankrupt these companies. Weil WD, 21:18-20. These opinions, however, are specious. Carlton was unable to testify about the overall profitability of Defendants' companies if the United States' remedies were imposed; he simply had a "hunch" that they would decline. Carlton TT, 6/2/05, 22786:1-13, 22787:6-9. Moreover, Weil did not calculate or analyze particular amounts of assessments that would cause any particular Defendant to become bankrupt. Weil TT, 5/31/05, 22331:10-19.

348. Daniel Fischel focused his analysis almost exclusively on Dr. Bazerman's testimony regarding removal of senior management. Without providing evidence or explanation, Fischel cursorily opined that if senior management at Defendants' companies were removed and replaced with "inexperienced" people, then shareholders, employees and the public would be adversely affected. Fischel WD, 14:4-13. According to Weil, requiring "unconditional" payments for smoking cessation and counter-marketing programs would also adversely affect "innocent third parties," such as shareholders, employees, retirees, and the States. Weil WD, 21:20-22. In reaching his conclusions, Weil did not qualify or concretely identify the alleged harms to Defendants' shareholders or employees. Weil TT, 5/31/05, 22334:8-13, 22348:25-22350:21, 22351:23-22352:8. Weil admitted that Defendants' retirees are harmed only if the pension funds maintained by Defendants are underfunded. Id. at 22353:24-22354:6.

349. While Weil assumed that liability was found, Fischel did not. Weil WD, 19:23-20:2; Fischel TT, 5/27/05, 22260:5-11. In his analysis, however, Weil did not examine the benefits that Defendants have received as a result of engaging in RICO violations. Weil TT, 5/31/05, 22352:9-16. Also, Carlton's analysis did not take into account "externalities," such as medical costs borne by society for the treatment of smoking related illnesses (Carlton TT, 6/2/05, 22854:1-3), nor did he consider "the history of the defendants' conduct that's being brought into question in this case." Id. at 22666:25-22667:3. In analyzing the impact of the United States' remedies, Defendants' experts failed to weigh the economic harms, such as possible declines in market share, against the benefits of stopping a history of fraud that has a devastating toll on public health. See Carmona WD, 1:18-21.

H. Defendant Philip Morris has Continued the Functions of CTR and CIAR through its Philip Morris External Research Program

350. The MSA, signed by certain Defendants on November 23, 1998, required that Defendants shut down and disband CIAR within 45 days of "Final Approval." Although the MSA was signed by the parties in November 1998, "Final Approval" by the settling States did not take place until approximately one year later. CTR was disbanded in October 1998 in accordance with an agreement with the New York attorney general. (No Bates) JD-045158 at 32-33 (A); 70005153-5362 at 5153-5186 (JE-021048) (A).

351. The CIAR Board of Directors voted to dissolve CIAR on October 7, 1999, and Eisenberg formally dissolved the organization on December 6, 1999. 86205205-5206 (US 21091) (O). However, a number of documents suggest that Defendants have continued the mission of CIAR, and to a large extent CTR, through a new organization called the Philip Morris External Research Program, or PMERP.

352. Defendants were already forming a plan to reconstitute CIAR at the time the MSA was signed. On November 25, 1998, Lorillard general counsel Arthur Stevens wrote a letter to Philip Morris general counsel Denise Keane with copies to Charles Blixt at Reynolds and Ernie Pepples at B&W. Stevens wrote: "Please call me later in the morning on Monday, November 30, 1998, so that we can discuss the status of the plan to reinstate CIAR. The matter seems to be 'dragging' without direction toward a positive resolution." 86205404 (US 22164) (A). Eisenberg recalled at trial that the CIAR Board of Directors had voiced their intent in 1998 to reconstitute the CIAR as well, and that he expected to be the director of the reconstituted organization. Eisenberg TT, 11/15/04, 5881:6-17, 5883:2-6.

353. Defendants' plan to reform CIAR continued into 1999. On March 7, 1999, Philip Morris USA counsel Mark Berlind sent an e-mail to James McNasby, telling him, "I will call you tomorrow about selecting counsel for the organization that would replace CIAR." 2064207030B (US 25744) (A).

354. In a March 11, 1999 memorandum from CIAR Board member Helmut Reif to Peter Lipowicz and Cathy Ellis in Richmond, Reif reviewed a proposal to form a new indoor air research organization. Reif recognized and lamented the similarities to CIAR, from a company-chosen Board of Directors with full authority over research, to the possible interference by Philip Morris lawyers:

> According to this draft, the new Corporation will be founded and paid by one company only who has all theoretical rights of interference. Since the company consists of lawyers as well, we have to make sure that nobody from the outside could construct a view that lawyers are again dominating research.

2063871374-1380 at 1380 (US 92030) (A).

355. On October 11, 1999, Eisenberg faxed Philip Morris a proposal to form an "External Research Program" to administer research largely using the CIAR model of an SAB, a research agenda, and peer reviewers. 2073327299-7301 (US 90035) (A).

356. The PMERP was established in early 2000. The program is administered by an entity called Research Management Group (RMG). RMG is headed by Max Eisenberg, the former executive director of CIAR. PMERP/RMG, also founded in early 2000, is operated out of the same offices in Linthicum, Maryland, that formerly housed CIAR. PMERP/RMG employs many of the same persons who were employed by CIAR, and even uses the same phone numbers as the former CIAR. Eisenberg WD, 52:6-10, 53:10-16; Eisenberg TT, 11/15/04, 5852:10-5853:7.

357. Eisenberg testified that he and Philip Morris established a "Research Focus" and Request for Applications for PMERP in the same way that the Research Agenda and Request for Applications were established for CIAR. Eisenberg TT, 11/9/04, 5637:16-5638:14; 2085317779-7809 (US 22200) (A). Eisenberg located peer reviewers for the PMERP in the same way he had done for CIAR; in fact, the PMERP utilized a number of former CIAR peer reviewers and grantees, as well as TI-ETSAG project recipients, including James Enstrom, Alan Hedge, Samuel Lehnert, Roger Jenkins, and Antonio Miguel. Eisenberg TT, 11/9/04, 5638:15-5639:9; 2085317779-7809 at 7802 (US 22200) (A). All told, 44 out of the 105 peer-reviewers listed by PMERP in its 2000 Request for Applications were drawn from the peer reviewer list in the 1998 CIAR Request for Applications. 2085317779-7809 at 7802 (US 22200) (A); 86616778-6810 (JD-042662) (A); Eisenberg TT, 11/15/04, 5663:14-18.

358. Eisenberg also organized the formation of a Scientific Advisory Board (SAB), similar in structure to the CIAR SAB. The PMERP SAB was originally staffed with two former

members of the CIAR SAB. Eisenberg WD, 53:22-54:3; 2085317779-7809 at 7780 (US 22200) (A). Also, researchers funded through CIAR have continued to receive funding through the PMERP. Eisenberg WD, 54:14-17.

359. The approval authority for PMERP projects in 2000 was originally a group of Philip Morris executives called the Scientific Research Review Committee (SRRC). Eisenberg TT, 5639:16-5640:7. According to the 2000 Request for Applications, the SRRC not only had exclusive approval authority, but its approval was conditioned on the serving the "business needs" of the company. 2085317779-7809 at 7783 (US 22200) (A).

360. The approval authority was later changed to the Scientific Advisory Board prior to the 2001 Request for Applications. 2082735680-2082735706 at 5682 (JD-043675) (A). Eisenberg testified at trial that the SAB still has funding authority even today. Eisenberg TT, 11/15/04, 5831:9-13. However, he was forced to concede on further examination that the SAB has no authority to sign contracts with researchers or commit funds for any studies. This authority continues to reside with Philip Morris. Eisenberg TT, 11/15/04, 5861:6-5862:6

361. A Philip Morris document titled "Philip Morris External Research Program Management Report" reveals the stark similarities in the types of work funded by the former CIAR and the current PMERP. For example, a number of projects, by their title, relate directly to ETS and indoor air quality. 2085522647-2721at 2663, 2671, 2672, 2675, 2688, 2697, 2717, 2720 (US 25310) (A). The PMERP has in many respects also taken over the role of the now-defunct CTR. Eisenberg conceded at trial that the CTR and PMERP research are very similar; in fact, when comparing the PMERP topic areas to those in the 1997 CTR Report table of contents, he testified: "That table of contents list is about as broad an area in biomedical research as there is. In fact, there is – I can't think of any proposal that would come in that wouldn't fall within one

or more of those areas. And, therefore, any proposal that the Philip Morris' External Research Program were receiving would certainly fall within one of those areas some place." Eisenberg TT, 11/15/05, 5877:14-5878:5.

362. CIAR funded $4-5 million in research annually. Eisenberg TT, 11/15/04, 5834:23-5835:1. In 1997, Defendants' contributions to CTR reached their peak - approximately $45 million - to carry out CTR-funded research. DXA0630917-1033 at 1022-1023 (US 75927) (A). According to Eisenberg, the PMERP currently funds between $45 and $50 million in research annually. Eisenberg TT, 11/9/04, 5634:9-11. Thus, the PMERP is able to provide and replace the combined funding of both CIAR and CTR, in addition to funding the exact same types of research carried out by the former entities.

363. Thus, Philip Morris is single-handedly able to achieve and operate through the PMERP what Defendants were able to achieve and operate through CIAR.

I. Surgeon General Reports at the Time of Publication Provide a Statement of Scientific Consensus on Smoking and Health; Prohibiting Defendants from Distorting or Misrepresenting Surgeon General's Reports Is Necessary to Prevent and Restrain Future Fraud

364. Smoking and health is one of the most well-studied subjects in the field of public health. The Reports of the Surgeon General on Smoking and Health are comprehensive reviews of the medical and scientific literature on smoking, smokers, and the effects of smoking on disease and death rates. Burns WD 9:2-16, 10:13-11:16, 14:10-12. The Surgeon General's Reports are authoritative statements of existing scientific consensus, and the 1964 Report "became a model for nonpartisan, independent governmental assertions of scientific evidence of public moment." Brandt WD 99:9-100:1.

365. The Reports of the Surgeon General are considered to be authoritative statements of scientific consensus in the scientific and medical communities. Benowitz WD 11:4-8; Burns

WD 12:16-17. The peer review process for Surgeon General's Reports is more extensive and objective than the peer-review process for most scientific journals. Burns WD 18:2-7.

366. Beginning with the first Report in 1964, the United States Public Health Service has followed the scientific consensus formation approach when producing a Report of the Surgeon General on Smoking and Health. The scientific community forms a consensus on issues of causation by reviewing all of the scientific evidence available; examining that evidence for its strength, consistency, coherence, temporal association and biological plausibility; and then reaching a judgment as to whether the data support a causal relationship between smoking and a disease. Burns WD, 14:13-19.

367. The Reports go through a careful process to ensure that individual biases are not determining the conclusions or statements within the volume. That process occurs through a set of expert reviews of the Report at various stages in its preparation. Individual scientists are first selected and asked to author chapters on a given topic. Sometimes the entire Report will be devoted to a specific topic, like cancer, heart disease or lung disease, but individuals are asked to offer chapters or sections on specific questions that relate to the issue examined, so that chapters can be assembled to cover the entire topic. The individual authors selected have extensive knowledge in the specific area that they are asked to write about, with the constraints that all of the pertinent scientific literature is to be considered and that conclusions of the chapter are to be based on the data presented in that literature rather than on the individual perspective of the author. Initial drafts of chapters are prepared for each Report by the individual authors, and the initial drafts are received by the editors and edited into chapters. Once the chapters are submitted, the editors make all subsequent changes and the chapters are not resubmitted to the authors for approval of those changes. The chapters are next sent out to a group of expert

scientific reviewers for peer review of their scientific accuracy and completeness, as well as for balance, tone and appropriateness of the conclusions drawn from the scientific data. These comments are integrated into the volume, and the entire volume is sent out to a group of senior scientists in the academic community for review of the entire volume for its accuracy, balance and tone. The Report is also formally reviewed by each of the agencies of the Public Health Service. Once these reviews are completed, the editors again integrate the comments into the text to strengthen the text and the science. Each Report is then submitted for formal clearance by the Centers for Disease Control, by the Assistant Secretary for Health and the Surgeon General, and by the Secretary of Health and Human Services. Once it is cleared, it is transmitted as a formal requirement of the law to Congress as the official position of the HHS on the issue. It is also released to the public and the press. Burns WD, 15:3-16-7; accord Henningfield WD, 140:12-142:10; Benowitz WD, 11:11-14, 12:4-8.

368. The scientific conclusions presented in each of the Reports of the Surgeon General are based on the consensus of then-existing scientific understanding. Burns WD, 14:10-12; accord Benowitz WD, 12:4-8. Nevertheless, the tobacco industry responded to the 1964 Report by distorting and denying the scientific evidence set forth in it. Brandt WD, 112:5-113:15; 500052010-2018 at 2011 (US 63600) (A).

369. In fact, Defendants, most often collectively through the Tobacco Institute, have routinely attacked the conclusions of the Reports of the Surgeon General simultaneously with and immediately after the reports were issued, even when their own internal studies and knowledge supported the Surgeon General's conclusions. See, e.g., Brandt WD, 115:7-118:22; 1005152849-2896 (US 20226) (O) (1969 publication issued by the Tobacco Institute undermining the 1964 Surgeon General's Report and subsequent public health publications);

TIMN0055129-5135 at 5130 (US 21298) (O) (1977 pamphlet from the Tobacco Institute mischaracterizing the 1964 SGR); TIMN0127049-7072 (US Ex. 21532) (O) (describing Tobacco Institute preemptive attack on the 1979 Surgeon General's Report); Henningfield WD 151:9-154:19; TIMN0019963-9963 (US 64514)(A) (press release attacking the 1988 Report); TIMN0019963-9963 (US 21239) (A) (same); Dawson WD 38:6-40:10; Dawson TT, 1/12/05, 9873:23 -9878:12 (US 62252) (A) (describing coordinated attack on the 1989 Report); Dawson WD 65:19-71:11 (US 21286) (A) (describing coordinated attack on the 1989 Report).

J. Strict Limitations Upon Brand Descriptors Are Required to Prevent and Restrain Future Frauds, Since Express and Implied Health Claims Made by Brand Names, Descriptors, and Marketing Are Misleading

370. As described exhaustively in US FF § III.D, supra, cigarettes marketed with descriptors such as "low tar," "light,", "mild," "natural," and similar terms are no less likely to be harmful than other cigarettes. The terms themselves have no standardized meaning aside from a non-enforceable industry practice to apply the "light" descriptor to cigarettes with 7 to 14 milligrams of tar as reported by the FTC method, and "ultra light" to cigarettes with fewer than 7 milligrams of tar. Keane WD, 56:14-23; Mulholland WD, 26:4-27:9; accord Henningfield WD, 56:8-11. In addition, "light" cigarettes are designed to allow smokers to obtain much higher levels of nicotine than are measured by the FTC method, and consumers are therefore highly likely to receive much higher deliveries of tar and nicotine than the FTC yields. Burns WD, 29:6-13; Monograph 13, DXA0310399-0650 (US 58700) (A).

(1) Consumers Interpret Many Brand Names, Descriptors and Marketing to Imply That Certain Brands of Cigarettes Are Less Harmful than Others, and Defendants Know It

371. The overwhelming evidence introduced at trial establishes that in the aftermath of the 1964 Surgeon General's Report, Defendants developed and introduced low tar and nicotine

brands in order to dissuade smokers from quitting smoking. See US FF § III.D, supra (Low Tar/Low Nicotine). In particular, as Dr. Dolan testified, Defendants knew that the main reason people wanted to quit was due to health concerns, and many smokers felt guilty about continuing to smoke. Dr. Dolan further testified that "two very specific activities directed at deterring quitting were: (1) the fostering of a 'continuing controversy' denying that any negative health impacts had been proven and (2) the introduction of low tar and nicotine brands as 'health reassurance' brands." Defendants "introduced a number of brands and brand extensions lower in tar and nicotine and positioned them as 'health reassurance' brands to meet health concerns of smokers." Defendants' own internal research showed that "smoking low tar and nicotine helped a smoker to reduce guilt about smoking and thus made a smoker less likely to quit. Smoking a 'health reassurance' product with its low tar FTC rating was a 'compromise' to justify not quitting." Dolan WD, 106:14-107:2; 118:4-8; 118:23-119:21; 126:8-16; accord Burns WD, 69:3-14 (testifying that beginning in the 1950s, Defendants "introduced and marketed filtered cigarettes and 'low tar and nicotine' cigarettes as an effort to prevent smokers from quitting based on growing health concerns among smokers").

372. The 2004 Surgeon General's Report noted the apparent success of these attempts by Defendants to keep smokers from quitting by their widespread marketing of low tar cigarettes as less harmful. 2004 Surgeon General's Report at 901 (US 88621) (A); see also Monograph 13 at 5, TLT095001-001 (US 88847) (A); DXA0310399-0650 (US 58700) (A).

373. Nevertheless, although lower-yield cigarettes have dominated the U.S. market for many years, there has been no corresponding reduction in smoking-related disease among U.S. smokers; in fact, the disease risk has increased. Burns WD, 33:18-35:9; Monograph 13, DXA0310399-0650 (US 58700) (A).

374. In addition, the disclosure of internal industry documents, among other developments, has revealed that the amount of tar and nicotine present in lower-yield cigarettes is similar to that available in "full flavor" versions, and that Defendants have intentionally designed to allow smokers to obtain a different delivery from that obtained by the FTC method. "The internal tobacco industry documents demonstrate the design characteristics, the design intent for developing these products, the testing that was done, . . . and the results of that testing demonstrate that what was happening was that cigarettes were intentionally being designed to vary the yield when smoked differently, and that the reason for that design was to satisfy the nicotine ingestion required by individual smokers." Burns WD, 39:7-40:14.

375. As described in detail in US FF § III.D(1), supra, Defendants conducted extensive research on quitting to help them identify, understand, and deter potential quitters. Defendants' internal documents show that they were confident that if they could convince potential quitters that low tar cigarettes were a healthier choice and an acceptable alternative to quitting, they could keep their sales from declining. See also Burns WD, 41:12-18, 46:21-47:9, 49:11-20.

376. As the following examples illustrate (and as also discussed in US FF § III.D(3)(a) & (b), supra.), the evidence also clearly establishes both that Defendants knew smokers were switching to low tar cigarettes either as an alternative to quitting or in the belief they would help them quit, and that Defendants intentionally marketed their low tar brands to take advantage of consumers' mistaken belief that such brands were less harmful and better for their health.

377. Carolyn Levy, who was Philip Morris's Director of Consumer Research (among many other positions) testified that Philip Morris studied the reasons people quit smoking, as well as smokers' mistaken beliefs about low tar cigarettes. See, e.g., Levy WD, 26:1-5, 26:20-28:10, 28:20-30:8, 31:5-22, 32:2-33:8, 33:12-34:9, 34:23-35:2; 1000368057-8081 at 8060, 8066

(US 20098*) (A); 2080009523-9529 at 9524 (US 88156) (A); 2080009511-9515 at 9511 (US 20535) (A).

378. Advertisements and internal documents discussing RJR's low tar brands and brand extensions establish that RJR knew that low tar cigarettes appeal to "health conscious" smokers and would-be quitters, and that RJR exploited that appeal to reduce "quitting and switching losses." See, e.g., 650340129-0193 at 0180, 0183 (US 20948) (A); ADV0121663-1665 (US 3545) (A); ADV0141197-1199 (US 4403) (A); ADV0160142-0144 (US 4954) (A); ADV0160274-0277 (US 4998) (A); 502313230-3308 at 3235, 3240 (US 22151) (A); 502784092-4100 at 4097 (US 22153) (A); 500672011-2172 at 2069 (US 20645) (A); 500251567-1570 at 1567-1569 (US 21563) (A); 700173214-3217 at 3214, 3215, 3216-3217 (US 22121) (A).

379. B&W's internal documents similarly demonstrate its intent to "'intercept' people who are trying to give up smoking" by offering them products that they and their friends and family members would perceive as less harmful. See, e.g., 650510607-0607 (US 87138) (A); 660026713-6718 at 6714, 6717-6718 (US 85030) (A); 566628004-8083 at 8015 (US 20940) (O); 190200047-0116 at 0061, 0071, 0106 (US 22162) (A). The documents further illustrate that the advertising campaigns were successful, because consumers perceive low tar cigarettes as both "better for you" and an acceptable alternative to quitting. See, e.g., 250255336-5347 at 5339, 5343-5347 (US 22031) (A); 250255060-5075 (US 22170) (A).

380. Dr. Jeffrey Wigand testified that, given the understanding of smoker compensation at B&W and the other BAT companies and these companies' design of their cigarettes for elasticity of delivery, B&W and the other BAT companies did not believe that their "light" and "mild" brand descriptors were accurate. Dr. Wigand added:

> First, everyone at Brown & Williamson, indeed throughout all of BAT, understood that the machine method for measuring nicotine and tar yield grossly understated the tar and nicotine actually ingested by the smoker. Second, again throughout the BAT organization, we knew that smokers compensated to obtain more nicotine than was reported on the label and that compensation increased as a smoker moved from a full flavor to a light cigarette.

Wigand WD, 124:2-13.

381. BATCo researched and developed low tar products to "serve as an important mechanism for reassuring smokers" and to offset the fact that "most smokers wish to quit." 109883101-3103 at 3101, 3102 (US 21518) (A); 105562110-2189 at 2114 (US 21516) (A); see also Dolan WD, 103:6-10.

382. Lorillard expressly marketed its "True" cigarette as an acceptable alternative to quitting for smokers concerned about their health. ADV0151115-1117 (US 4853) (A); ADV0160097-0099 (US 4939) (A); ADV0160281-0283 (US 5000) (A); 325100040-0040 (US 87206) (A); 03496228-6630 at 6268, 6269 (US 20057) (O); ADV0281033-1035 (US 10447) (A); 03061394-1394 (US 21700) (A); ADV1030052-0054 (US 87462) (A); 01408237-8237 (US 21808) (A). Lorillard knew that consumers interpreted its ads to mean that True was less harmful to health than other cigarettes. 03496228-6630 at 6277, 6280 (US 20057) (O).

383. Liggett's Dr. Anthony Albino sent an e-mail dated September 5, 2001, to a number of recipients, including Bennett LeBow, Chairman of the Board and Chief Executive Officer of Vector Group, Ltd., and VGR Holding Inc., stating that "the adoption of 'light' cigarettes over the past 25 years was mainly due to the PERCEPTION of safety." VDOJ6743-6744 at 6743 (US 64727) (A) (emphasis in original); LeBow TT, 4/4/05, 17594:24-17596:17. Liggett continues to market light cigarettes under its brands Class A, Eve, Jade, Liggett Select,

Montego, Pyramid, and under a generic Private Label. (US 93254) (A); LeBow WD, 66:10-12; LeBow TT, 4/4/05, 17597:6-17598:16, 17600:4-17603:2.

(2) Defendants Intend Consumers to Be Deceived Since They Knowingly Continue to Use Misleading Descriptors

384. The evidence has established conclusively that beginning with the introduction of filters to cigarettes in the 1950s and continuing until today, Defendants have reacted to consumers' rising awareness of the health consequences of smoking by developing and marketing products that smokers wrongly perceive to be safe or at least safer than "regular" cigarettes.

385. The evidence set forth in full in US FF § III.D(3)(a), supra, demonstrates that over several decades, Defendants have used several techniques to persuade consumers that so-called "low tar" and "low nicotine" cigarettes are less harmful than "full flavor" or regular cigarettes and consequently present an acceptable alternative to quitting smoking. As a result, consumers labor under a longstanding and pervasive mistaken belief that "low tar/low nicotine" cigarettes are safer. See US FF § III.D, supra. Most recently, in the face of Monograph 13's demonstration that "light" and "mild" cigarettes are at least as harmful, and may be more harmful as, "full-flavor" cigarettes, Defendants have developed new descriptors such as "natural" to convey the same implied, but false, safety message.

386. All Cigarette Company Defendants presently market low tar cigarettes to smokers who are concerned about the health effects of smoking. See US FF § III.D, supra; Burns WD, 62:5-7.

387. Jeanne Bonhomme, Director of Consumer Insights for Philip Morris, testified at trial that Philip Morris currently "aims its low tar cigarette marketing at least in part at smokers of regular cigarettes who are concerned about the amount of tar they are inhaling and want to reduce it," and that she has been aware during her decades of conducting consumer research for

Philip Morris that some smokers switch to low tar cigarettes because they believe such cigarettes are less harmful. Bonhomme WD, 43:11-14; 65:15-22. Philip Morris's recent internal research continues to reinforce the company's knowledge that consumers perceive "light" cigarettes as "better for you." See, e.g., 2063687348-7527 at 7350, 7353-7356, 7357, 7359 (US 39820*) (A) (1998); 2080486996-7108 at 7010-12 (US 45330) (A) (1998); 2070657640-7650 at 7644, 7646 (US 22015) (A) (1998); 2048941177-1201 at 1180, 1183, 1187 (US 38731) (A) (1996). Nevertheless, Philip Morris continues to use these misleading descriptors and limits its communications to smokers which might counteract the smokers' mistaken belief that light cigarettes are less dangerous.

388. Philip Morris's website includes statements about low-delivery cigarettes and brand descriptors. Keane TT, 1/18/05, 10399:8-10400:2. The website falsely claims that descriptors are value-neutral terms designed to help consumers choose among cigarettes based on taste.

> Philip Morris USA frequently describes cigarette brands using terms such as "full flavor," "medium," "mild," "light" and "ultra light." These terms are commonly referred to as descriptors and facilitate smokers' ability to distinguish among different product offerings.
>
> Descriptors are generally used as a point of comparison (with respect to attributes such as strength of taste and flavor and tar and nicotine yield as measured by a machine method) for a cigarette brand in order to distinguish it from other brands on the market.

TLT0770066-0088 at 0077 (US 72408) (A); Szymanczyk WD 75:20-76:6.

389. As Dr. Farone testified, the terms "Light" and "Low Tar," as used by Defendants, are "meaningless" and "arbitrary," because "light" and regular cigarettes of the same brand can have the same FTC yields:

> [T]here are lights of certain brands with higher tar levels than regulars of other brands from the same company, and there are also lights and regulars of the same brand that have the same FTC tar rating. So therefore the term ‘light' is not related to tar or taste. For example, according to the most recent FTC report of tar and nicotine yields, Philip Morris sells versions of Virginia Slims and Virginia Slims Lights that both deliver 15 mg of tar by the FTC method.

Farone WD, 116:3-14; 525311179-1223 at 1185, 1207-1208, 1222 (US 52977) (A).

390. Similarly, RJR has been aware for decades that smokers of its "light" brands such as Vantage, Doral, Now, and Salem brand extensions perceive their cigarettes as less harmful than full-flavor cigarettes. See, e.g., 500210073-0075 (US 22108) (A); Orlowsky WD, 70:12-71:6; 511469097-9250 at 9105, 9116 (US 20842) (A); 514343517-3566 at 3522, 3524-26, 3530, 3540, 3556 (US 51848) (O). For example, a 1981 research report into the relative market placement of Vantage and Merit recommended that Vantage marketing be modified to better "target" smokers with health concerns: "Perhaps a more balanced approach is needed, both to tone down the perceptions of harshness and to renew the belief that VANTAGE does indeed address the target consumer's health/safety concerns." 523474848-4851 at 4848 (US 22156) (A); Orlowsky WD, 71:15-72:16. Martin Orlowsky, who was Senior/Executive Vice President of Marketing for RJR from 1984 to 1986, acknowledged that RJR targeted its marketing of these brands towards health-conscious smokers. Orlowsky TT, 10/13/04, 2288:24-2289:19.

391. Gary Burger, Senior President of Research & Development for RJR in a 1997 deposition, testified that RJR was aware that consumers smoke low tar cigarettes for the perceived health benefit. Burger testified that "[c]ertainly, smokers perceive lower tar cigarettes in some ways to be better for them and therefore they want them." He further testified that consumers "have that impression that there are higher levels of bad stuff in high tar cigarettes and

lower levels of bad stuff in low tar cigarettes." Burger PD, Arch v. American Tobacco Co., 8/21/97, 226:9-243:18.

392. Nevertheless, RJR's website falsely claims that it uses descriptors merely to convey differences in taste:

> Our company, like other cigarette manufacturers, uses brand descriptors such as 'full flavor,' 'lights' and 'ultra lights' to differentiate cigarette brand-styles in terms of such characteristics as strength of taste, and reported 'tar' and nicotine yield.

TLT0770095-0128 at 0111 (US 72410) (A) (emphasis added); Schindler WD, 64:19-65:3.

393. B&W has marketed its low tar brands, especially its Carlton brand, with full knowledge that low tar smokers are "health conscious" and believe that "switching down" to lower FTC yields will decrease the health risks of smoking. See, e.g., 176020783-0800 at 0785, 0792, 0798 (US 23351) (A); 250255336-5347 at 5340, 5343-5347 (US 22031) (A). Research conducted for B&W as recently as 2000 confirmed that consumers still misperceive "lights" as less harmful. 250255060-5075 at 5064, 5066-5068, 5071-5075 (US 22170) (A); Ivey WD, 59:20-60:12.

394. Nevertheless, in May 2004, Brown & Williamson's website falsely stated that the significance of brand descriptors was instead a taste message:

> Cigarette brands in the U.S. are usually identified on packs, cartons and advertising as belonging to the following categories: 'Ultra Lights' or 'Ultra Low Tar', 'Lights' or 'Low Tar', and 'Full Flavor" . . . . Recent published studies suggest that **the majority of smokers use descriptors to guide their product selection based on taste**. . . .

TLT1040056-0062 at 0061 (US 88628) (A) (emphasis added); Ivey WD, 70:5-14.

395. BATCo's files contain numerous recent research reports confirming that many smokers of light cigarettes believe they are reducing their risks from smoking, and Dr. Sharon

(Boyse) Blackie, former Head of the Smoking Issues Department at BATCo, testified at trial in this case that she has "been aware for some time that some smokers believe that low tar cigarettes are less hazardous to their health," and that "some smokers believe that by switching to low tar cigarettes, they will achieve a health benefit." Blackie WD, 184:14-21. See, e.g., 321541609-1679 at 1609, 1644, 1652 (US 22052) (A) (1998 research report indicating that 40.5% of light smokers believe lights are less harmful); 321989078-9276 at 9121-9122 (US 28819) (O) (1999 report indicating that nearly 40% of lights smokers had switched for "health reasons"); 760008596-8803 at 8770, 8800 (US 54588) (A) (2002 research report including smokers' perception that lights pose a lower health risk).

396. Lorillard had early success positioning Kent as a "health brand," and its appeal to health conscious smokers with advertisements for True continued into the 1980s and 1990s. See ADV0191018-1020 (US6538) (O); see also ADV0200073-00075 (US 6682) (O); ADV0200176-0180 (US 6711) (O); 970469347-9474 at 9433 (US 85104) (O). Martin Orlowsky, Chairman, President, and CEO of Lorillard, testified at trial in this case that Lorillard's True advertisements were targeted toward smokers who, due to their concerns about health risks, were seeking a low-tar cigarette. Orlowsky TT, 10/13/04, 2288:24-2289:19.

397. Similarly, Liggett not only has a history beginning in the 1950s of deliberately promoting its filtered and low tar cigarettes to health-conscious smokers, see 696000888-0916 at 0894, 0900 (US 21387) (A); ADV1100051-0053 (US 88718) (A); ADV1100068-0071 (US 88723) (A); ADV1100040-0043 (US 88715) (A), but (as mentioned above) it continues to market numerous brands of light cigarettes today. Bennett LeBow testified in this trial that Liggett continues to market light cigarettes because it could not remain in business if it stopped. LeBow further testified that every cigarette manufacturer in the industry must continue to sell

light cigarettes in order to stay in business. (US 93254) (A); LeBow WD, 66:10-12; LeBow TT, 4/4/05, 17597:6-17598:16, 17600:4-17603:2.

398. As data have emerged establishing that "light" and "mild" cigarettes are at least as harmful as "full-flavor" brands, Defendants have developed new descriptors to convey implied health reassurance messages. B&W developed and marketed the "Kool Natural Lights" brand extension beginning in 1998. Despite having marketing research showing that consumers incorrectly interpret the word "natural" to mean that the cigarettes are safer than conventional cigarettes, 210430297-0396 at 0322 (US 67711) (A), B&W advertised Kool Natural Lights without informing consumers that "natural" cigarettes are no safer than any others. Smith TT, 1/6/05, 9178:18-9182:9; ADV0100742-0744 (US 2701) (A) (advertisement in 2001 issue of *Rolling Stone*); (US 12651) (A) (advertisement in 2000 issue of *Maxim*).

399. Philip Morris has recently contemplated developing an additive-free brand extension of its low-tar Merit brand. Its 1998 internal research indicated that "[a]dditive-free is an excellent fit with ‘light'" because it "[r]einforces ‘better for you'." 2080486996-7108 at 7010-7012 (US 45330) (A); Bonhomme WD, 17:2-16.

400. As Dr. Burns testified, the Scientific Advisory Committee on Tobacco for the World Health Organization has concluded descriptors should be banned as inherently misleading consumers as to the relative health risks of different brands of cigarettes. It recommended that "misleading health and exposure claims should be banned. . . . Banned terms should include light, ultra-light, mild and low tar, and . . . . should include not only misleading terms and claims but also names, trademarks, imagery and other means to conveying the impression that the product provides a health benefit." Burns WD 59:14-61:7; TLT1010692-0699 at 0695 (US 86658) (A).

401. This evidence shows that it will not be sufficient for the Court simply to forbid Defendants from misrepresenting the health effects of "light" and "low tar" cigarettes, but rather, that Defendants must be prohibited from using any descriptor which conveys a health message. The design of "lower yield" cigarettes is intentionally deceptive. Burns WD, 45:3-48:5. By continuing to use descriptors such as "lights" and "low tar," Defendants knowingly convey the false impression that cigarettes with those labels are less harmful than other cigarettes. Consumers' false belief is so pervasive and longstanding, and has been exploited and promoted by Defendants for so long, that preventing and restraining future fraud requires this Court to ban any future use of descriptors which convey a health message.

K. Prohibiting Defendants from Marketing Cigarettes with Youth-Appealing Marketing and Imagery Is Required to Prevent and Restrain Future Frauds

(1) Defendants Continue to Market Cigarettes with Youth-appealing Marketing and Imagery, and Will Continue to Do So Unless the Court Intervenes

402. Defendants continue to fraudulently deny that they market to youth and that their advertising is a substantial contributing factor to youth smoking. A ban on any marketing activities which have the effect of marketing cigarettes in a manner appealing to youth in the United States is required to prevent and restrain Defendants from fraudulently marketing to youth in the future.

403. Dr. Eriksen, a public health expert who formerly headed the CDC's Office on Smoking and Health, recommended that youth-appealing or misleading imagery in cigarette advertising and promotion be removed and replaced with "factual, black and white communication." Eriksen 5/9/05 WD, 24:18-26:5.

404. The National Survey on Drug Use and Health estimates that in 2003, there were over three million 12 to 17 year olds who were current smokers. Eriksen 1/17/05 WD, 44:20-22; (JD-067884) (A).

405. The extensive literature on smoking initiation demonstrates that the vast majority of smokers begin smoking before the age of 18. The 1989 Surgeon General's Report concluded, "Smoking begins primarily during childhood and adolescence." The 1994 Surgeon General's Report found that 81.6% of persons who had ever tried a cigarette tried their first cigarette before the age of 18. A similar percentage (81.9%) of persons who had ever smoked daily tried their first cigarette before the age of 18, and 53% became daily smokers before the age of 18. According to the National Survey on Drug Use and Health, in 2001 the average age for starting to smoke was 16.1 years of age. Eriksen 1/17/05 WD, 1:11-19, 35:1-37:14.

406. Each of the Cigarette Company Defendants understands that to expand or maintain its share of the cigarette market it must influence young people to smoke its brands. Defendants are well aware that most people begin smoking as teenagers, and remain loyal to their initial brand choice of cigarettes, as their internal documents demonstrate. As Dr. Dolan testified, the Cigarette Company Defendants understand that "the time to get someone to enter the market was as a teenager. If the tobacco companies did not get a person to begin smoking and begin smoking their brand as a teenager, they likely never got that person as a customer." Biglan WD, 100:22-105:24; 209:5-210:34, 237:2-241:17, 285:1-295:4; Dolan WD, 62:7-63:15.

407. Dr. Dolan further explained the importance to tobacco companies of attracting teenagers to their brands:

> The route to long-term success for a brand and a company was well understood by the tobacco companies. If you got someone to start smoking your brand, they typically dedicated all their purchases to you from then on. First, on a given day they did not seek variety by

> jumping around from one brand to the next. You did not have to share them with anybody. Second, they picked a brand and stuck with it over time. Given the dynamics of the cigarette market, Defendants understood that these starters were likely to be teenagers. The tobacco companies know that, if you didn't attract a good share of these starters, whom you could count on to be loyal to you, you were in trouble long-term. This was the key dynamic of the business and a driver of companies' planning.

Dolan WD, 90:16-91:3.

408. Philip Morris is keenly aware that the success of its business depends on getting teenagers to smoke its Marlboro brand. Myron Johnston, Senior Economist for Research and Development at Philip Morris, authored a March 31, 1981 research report,"Young Smoker: Prevalence Trends, Implications, and Related Demographic Trends" in which he concluded: "the overwhelming majority of smokers first begin to smoke while still in their teens . . . [I]t is during the teenage years that the initial brand choice is made: At least part of the success of Marlboro Red during its most rapid growth period was because it became the brand of choice among teenagers who then stuck with it as they grew older." Biglan WD, 100:21-105:24; 1000390803-0855 at 0808 (US 22334) (A).

409. RJR recognizes that its market share depends upon getting adolescents to start smoking its brands. Up until the early 1980's the company collected data on the brand choice of teenagers. A February 2,1973 RJR "Research Planning Memorandum on Some Thoughts about New Brands of Cigarettes for the Youth Market," authored by Claude Teague, Assistant Director of Research, stated in no uncertain terms RJR's need to capture the youth market: "Realistically, if our Company is to survive and prosper, over the long term, we must get our share of the youth market." Biglan WD, 285:14-295:4; Schindler TT, 1/24/05,10862:5-11; 502987357-7368 at 7358 (US 21475) (A).

410. Lorillard's consumer research demonstrates that the company has analyzed the age at which most people begin smoking and the initial brand choice of smokers. An October 1981 report prepared for Lorillard, "An Exploratory Study for Newport - Smoking and Purchase Behavior of Young Adults," analyzed the results of focus group research. The report indicated that "[o]ne-half of these respondents started to smoke at ages 10 to 13 years, with the pattern being precisely equal between the male and female respondents . . . Among these participants it was rare to start smoking at an age older than 18 years . . . Both the male and female respondents . . . cited Newport as a brand used by those who are just starting to smoke." Biglan WD, 209:12-210:34; 83896981-7009 at 6995, 7000 (US 55927) (A).

411. B&W knows that it must attract new smokers in order to maintain and grow its business. A B&W 1985 Strategic Marketing Plan concludes that "[h]igh attraction of starters key to growth whether by company (PM) or brand (Newport, Virginia Slims, Marlboro or Generics)." Biglan WD, 237:16-241:17, 670146621-6701 at 6626 (US 30805) (A).

412. Armed with the knowledge that influencing young people to smoke their cigarette brands is vital to their business, the Cigarette Company Defendants have conducted extensive research on what motivates adolescents to take up smoking. Based on their research, the Cigarette Company Defendants understand that adolescents smoke in order to appear popular, masculine, independent, cool, rebellious, or to have excitement. Biglan WD, 36:15-37:6.

413. Dr. Biglan, the only psychologist who testified, addressed the complicated issue of youth smoking initiation. The changes that occur during adolescence result in the need for adolescents to: (1) develop a self-image that bolsters their confidence; (2) to be popular with their peers and the opposite sex; (3) to feel and be seen as independent; (4) to experience fun, excitement and adventure; (5) to succeed in school, sports and social activities; and (6) to rebel

against authority. In addition, adolescent boys desire to be seen as masculine, and adolescent girls desire to be and be seen as attractive. To the extent that the themes and images in the tobacco companies' marketing communicate to adolescents that they can satisfy these needs by smoking a particular cigarette brand, adolescents are vulnerable to that marketing. Empirical research demonstrates that exposure to cigarette advertising increases adolescents' perception that smoking will meet the needs described above. Biglan WD, 42:12-43:13; 53:2-10; 95:9-96:18.

414. Phillip Morris has researched why young people begin smoking and it understands the specific social and psychological needs that motivate adolescent smoking. A March 20, 1984 Philip Morris document entitled "The Cigarette Consumer" concluded that "[p]eople begin smoking 1) [because of] peer pressure, 2) to rebel/assert independence, 3) to appear grown up, [and] 4) to experiment," and that "products targeted to younger end of spectrum [are] most viable" because that "segment is more amendable to advertising." Biglan WD, 105:25-106:10; 2500002189-2207 at 2203, 2205 (US 21460) (A).

415. B&W has studied what motivates people to begin smoking in devising marketing strategies for its brands. A 1976 B&W document entitled "Viceroy Agency Orientation Outline" was created to "prepare agencies for the creative and positioning assignments on Viceroy." In a section titled "Why People Smoke," the document discussed the "real or perceived benefits of smoking," which include "symbol of maturity or independence," "social ice breaker," and "presentation of self in a favorable manner associated with the cigarette brand image." The document indicated that the "primary target" for Viceroy were "[m]ales ages 16-35." 680116947-6968 at 6947, 6952, 6959 (US 21877)(A).

416. The manager of consumer research for RJR, Donald Tredennick, specifically addressed "What causes smokers to select their first brand of cigarettes" in a July 3, 1974

memorandum to F. Hudnall Christopher, Director of Marketing Research at RJR. The memorandum discussed "Initial Reasons for Smoking" and indicated that "smoking is often a way to gain entree to a group by effecting an appearance of being mature, sophisticated, sexy or manly." Tredennick concluded that "If a person is going to smoke cigarettes, he generally starts during his teens, primarily to conform with a close friend or friends, to give himself greater confidence in stress situation . . . The main causes of initial brand selection; i.e., the influence of friends, the user image a brand projects and differentiated product characteristics, are logically related to the reasons a young person begins to smoke." 501899346-9355 at 9346-9347, 9351 (US 20688) (A).

417. Lorillard produced documents in this litigation revealing that it has extensive information about smoking initiation among young people. A 1969 Eastman Chemical Products report titled "1969 Survey of Cigarette Smoking Behavior and Attitudes" provided to Lorillard stated that "an attempt has been made to determine the reasons why people decide to smoke." Among survey respondents ages 16 to 24, the report concluded "[s]howing off, feeling of confidence, enjoyment, conformity to group, and because an unbreakable habit has been established were the dominant responses" to the question "[w]hy do members of your sex smoke?" Among survey respondents, nearly 20% of males and over 10% of females reported feeling "big," while nearly 20% of both sexes mentioned confidence and security as reasons why they started smoking. 81560431-0496 at 0431, 0460 (US 85200) (A).

418. Defendants use their knowledge about what motivates young people to start smoking and intentionally develop marketing campaigns that appeal to youth. Defendants in their marketing campaigns utilize images, themes, and attributes that make smoking their brands appealing to adolescents by effectively communicating to them that they can satisfy their

psychological needs by smoking their brands. The themes and images utilized by Defendants in their marketing include, but are not limited to, independence, confidence, masculinity, attractiveness, adventurousness, sophistication, glamour, athleticism, sexual attractiveness, thinness, popularity and peer approval, rebelliousness and being "cool." Biglan WD, 36:22-37:6; 53:20-54:3; Krugman WD 94:14-95:14.

419. Dr. Biglan testified that "[t]here's extensive literature on the influence of tobacco company marketing on adolescent smoking and all of the psychological variables that lead up to adolescent smoking." Biglan TT, 1/10/05, 9778:16-9779:3.

420. Defendants conduct extensive consumer research to determine the appeal of their marketing to18 to 24 year olds which also provides information on its appeal to smokers under the age of 18. As Dr. Biglan testified at trial: "I would also add that there's not a bright line between 17 and 18 . . . and the themes and images that are successful and can be developed through research with 18-to-24-year-olds, you can be confident will also be effective with those under 18." Susan Ivey, Chairman and CEO of RJR and former CEO of B&W, acknowledged that advertising targeting young adults could also appeal to youth. Biglan TT, 1/10/05, 9524:21-9525:24; Ivey WD, 16:4-6.

(a) Philip Morris Marketing Appeals to Youth

421. Based on its knowledge of what motivates adolescents to smoke, Philip Morris's marketing consistently and successfully associates Marlboro, Parliament and Virginia Slims brands with images, themes, and attributes that make smoking these brands appealing to adolescents. Biglan WD, 105:25-106:5.

422. Philip Morris through its marketing of Marlboro successfully associates the brand with themes and images of masculinity, independence, and popularity which appeal to youth.

Philip Morris at times has also associated the Marlboro brand with themes and images of excitement and adventure, as well as relaxation, all of which are appealing to youth. As Dr. Krugman testified, "[t]he Marlboro Man has become an icon in American life symbolizing and communicating freedom, independence, authenticity, ruggedness and adventure." The 1994 Surgeon General's Report, *Youth and Tobacco: Preventing Tobacco Use Among Young People,* stated that **"[t]he Marlboro cowboy (also know as the Marlboro man) epitomizes [t]he stereotype of American independence."** Biglan WD, 119:19-120:7; Krugman WD, 98:3-11; VXA0130158-VXA0130484 at 0351 (US64693) (A) (emphasis added).

423. The senior brand manager for Marlboro, Steve Sampson, has acknowledged that masculinity and adventure are some of the "core values" for Marlboro. Philip Morris's consistent use in its Marlboro advertising of images of handsome, rugged men has associated the brand with masculinity. The image of masculinity particularly appeals to adolescent boys who are seeking to establish a masculine self image, and Marlboro marketing communicates that they can achieve this goal by smoking Marlboro. Biglan WD, 120:10-16, 123:11-129:11.

424. Philip Morris's own research demonstrates that the company has been successful in associating Marlboro with masculinity. A December 21, 1995 report on sixteen focus groups conducted with male Marlboro smokers stated, "The most common associations with the brand [Marlboro Reds] were ‘rugged,' ‘tough,' ‘masculine,' ‘cowboy,' ‘outdoors,' and the ‘West.'" 2047134293- 4297 at 4293 (US 89187) (A).

425. As revealed by its internal marketing documents, Philip Morris recognizes the importance of associating Marlboro with the theme of independence, and Marlboro advertisements contain images that associate the brand with freedom and independence. The images in Marlboro advertisements associating the brand with freedom and independence are

appealing to adolescents because many adolescents feel constrained by parents and teachers. Marlboro cigarettes became a symbol of freedom, autonomy, and independence to these adolescents as a result of the imagery contained in Marlboro advertisements. In the 1994 Surgeon General's Report *Youth and Tobacco: Preventing Tobacco Use Among Young People*, the Surgeon General noted that "[t]he brands most successful with teenagers seem to be those that offer adult imagery rich connotations of independence, freedom from authority, and/or self-reliance." Biglan WD, 130:12-136:24; VXA0130158-VXA0130484 at 0350 (US64693) (A).

426. Philip Morris has sought to communicate that Marlboro is the most popular brand through its ubiquitous and high-quality advertisements placed in magazines featuring well-known celebrities and through its point of sale marketing. The company understood that associating the Marlboro brand with popularity would make the brand attractive to young smokers. A May 1999 Philip Morris National Market Structure Study concluded, "Both YAMS [Young Adult Male Smokers] and YAFS [Young Adult Female Smokers] value peer popularity of a brand very highly compared to older menthol smokers." Internal company research demonstrates the effectiveness of Philip Morris's efforts to associate the Marlboro brand with popularity. A January 1996 report entitled "Marlboro Marketing Mix Monitor" stated that among the top ten attributes of Marlboro identified by consumers were "Most popular . . . Popular with both men and women . . . Growing in popularity," and "Best known brand in the world." Philip Morris preys on adolescents' need for acceptance by convincing teenagers that smoking Marlboro is a means to popularity and peer acceptance. Biglan WD, 150:7-174:15; 2073578573-8650 at 8605 (US 43350*) (A); 2063515175-5197 at 5182 (US 39742) (A).

427. Philip Morris continues to utilize Marlboro brand imagery in its direct mail marketing, at point of sale, and on Marlboro cigarette packs. Suzanne LeVan, Vice President of

Marlboro and former Vice President of Philip Morris Premium Brands, testified that Marlboro's brand image has not changed since 1954. Marlboro's brand imagery is an "image that portrays quality, freedom, independence, adventure, and the gateway to the American frontier, the American West." LeVan PD, United States v. Philip Morris, 6/25/02, 124:14-17, 221:10-221:14; Biglan TT 1/10/05, 9530:6-9533:3. Philip Morris CEO Michael Szymanczyk acknowledged during cross-examination that Philip Morris was not doing all that it could to reduce the visibility of its brand name advertising at retail stores that nonsmokers and children are exposed to. Szymanczyk TT, 4/7/05, 18194:6-22.

428. In the 1990's, Philip Morris decided to market its Parliament brand of cigarettes to younger people by associating the brand with themes and images that resonate with youth. Parliament advertisements contained images associating the brand with youth appealing themes of escape, romance, and sociability. Philip Morris successfully made its Parliament brand appealing to younger people as demonstrated by the company's internal marketing documents. An August 2000 report, "Parliament Image Study," concluded that compared to 25- to 34-year-olds, "Young adult smokers [the 18-24 year olds] are more likely to find Parliament appealing." Biglan WD, 175:9-185:7; 2080534400-4483 at 4479 (US 45340) (A).

429. Through its marketing, Philip Morris associates its Virginia Slims brand of cigarettes with themes and images resonate with adolescent girls. Virginia Slims advertisements conveyed that Virginia Slims smokers were modern, attractive, self-confident, stylish or fashionable, independent, and slim. These themes are attractive to adolescent girls who are keenly attentive to cues about how they can be attractive and self-confident women. Furthermore, associating the brand with being slim is appealing to adolescent girls. A 1994 article by French, Perry, Leon, and Fullerton published in the *American Journal of Public Health*

reported that adolescent girls with weight concerns are significantly more likely to be smokers. Biglan WD, 186:8-202:22; VXB3210209-0211at 0210 (US 72896) (A).

(b) Lorillard Marketing Appeals To Youth

430. Lorillard consistently associates its Newport brand of cigarettes with themes and images that are appealing to youth. Through its marketing, Lorillard associates Newport and Newport smokers with popularity and social acceptance, fun and excitement, as well as athleticism and relaxation. Newport advertising has consistently communicated themes of popularity and social acceptance by featuring images of young attractive people having fun together. Lorillard also associates the Newport brand and Newport Smoker with popularity by placing Newport advertisement in celebrity magazines such as *People*. Newport advertising communicates to adolescents that they can be popular and gain the acceptance of their peers by smoking Newport. Issues of fitting in and having others like them are dominant concerns during adolescence. Biglan WD, 211:1-220:8; Krugman WD, 97:21-98:2.

431. Lorillard has long understood that Newport's success is linked to the company's ability to associate the brand with popularity. An August 30, 1978 internal company memorandum to the CEO of Lorillard, Curtis Judge, proclaimed "NEWPORT in the 1970's is turning into the Marlboro of the 60's and 70's. It is the ‘In' brand to smoke if you want to be one of the group." A July 1994 report entitled "An Evaluation of the Newport ‘Pleasure on Wheels' Promotion," prepared for Lorillard by Meyers Research Center, specified that one of the primary objectives of the promotion was to "Reinforce Newport's image as the ‘peer brand' among young adult smokers." Lorillard's current chairman, CEO, and president Martin Orlowsky, testified at trial that "[p]eer acceptance is an important business issue in terms of brand selection, because it

is a factor affecting brand choice among younger adult smokers." Orlowsky WD, 58:3-4; 03537131-7132 at 7131 (US 22357) (A); 91840214- 40311 at 0218 (US 74415) (A).

432. Lorillard's advertisements also effectively communicate that one can have fun and excitement by being a Newport smoker. Newport advertisements include images of young people riding a roller coaster or kayaking. Lorillard's own research demonstrates that it has been successful in associating its Newport brand with adolescent appealing themes of fun and excitement. A September 1988 study prepared by the Lorillard Marketing Research Department entitled "Newport Image Study" specifically sought to "determine current attitudes toward the Newport and its smokers across certain geographic regions." The report concluded that, in all geographic regions, "Newport smokers were viewed as party-goers, those that do their own thing and fun- loving" and "were viewed younger and more fun- loving than Kool and Salem smokers." Many adolescents crave excitement and are interested in having fun with their peers. Biglan WD, 221:1-224:21; 89579737-9797 at 9741, 9784 (US 67673) (A).

433. Lorillard through its marketing also associates the Newport brand and Newport smokers with athleticism. Newport advertisements show young people enjoying numerous sports, including football, tobogganing, skiing or ski jumping, archery, hiking, basketball, soccer, rock or mountain climbing, wind surfing, fishing, water volleyball, rollerblading, surfing, and baseball. Newport's association with athleticism is appealing to adolescents, many of whom are interested in sports. Newport advertisements communicate that smoking should be associated with the athletic activities featured in Newport advertisements. Biglan WD, 226:1-228:17.

434. The brand image for Newport and the themes and images portrayed in Newport advertisements have been remarkably consistent for the past 30 years. Lorillard's "Pleasure"

advertising campaign for Newport has not changed fundamentally over the past 30 years. Orlowsky WD, 30:14-31: 5.

435. The Vice President and General Counsel of Lorillard, Ronald Milstein, testified that the company did not change its principal advertising campaign for Newport, the "Pleasure" campaign, after the company entered into the Master Settlement Agreement ("MSA") in 1998. The MSA required Lorillard to appoint an executive level manager in charge of identifying methods to reduce youth access to tobacco and the incidence of youth consumption of tobacco products, and Milstein held this position from April 1990 to September 2000. Lorillard continues to utilize the "Pleasure" campaign themes and images in its point of sale advertising for Newport. Milstein never discussed with Lorillard's chairman, CEO, and president Martin Orlowsky, whether the company should consider reducing the visibility of the "Pleasure" campaign at retail stores as part of its obligation under the MSA to reduce youth tobacco consumption. To the contrary, the number of stores receiving payments for the display of promotional items as part of the Excel program (Lorillard's retail merchandising program) has increased since the MSA. Milstein acknowledged that in 1999 Newport was the second leading brand smoked among youth ages 12 to 17, and did not dispute that the number of youth ages 12 to 17 who smoke Newport has increased from 21% to 23% over the last several years. Milstein TT, 1/10/05, 9312:1-9314:9; 9417:18-9421:25.

(c) Brown & Williamson Marketing Appeals To Youth

436. B&W's marketing for its Kool brand utilizes themes and images that are appealing to adolescents: B&W effectively associates Kool and Kool smokers with masculinity, fun and excitement, and membership in a young, cool, in-group. Biglan WD, 243:13-21.

437. B&W sought to develop and maintain a masculine image for Kool in order to make the brand attractive to young smokers, especially young male smokers. Its 1985 Kool Media Plan concluded that: "While the brand has broader appeal beyond young men, the young male smoker has been isolated as the key prospect that the media plan must deliver against . . . The [advertising] creative property is judged to be a strong masculine proposition for the brand and as such a valuable targeting device for young male smokers." A May 1987 study entitled "Kool Impact Awareness & Usage Study Pre-Wave," prepared for B&W by Kapuler Marketing Research, concluded that "KOOL Full-Taste smokers were best described as being ‘masculine' and ‘rugged'." B&W associates the Kool brand with masculinity through its advertisements depicting attractive young men smoking Kool, looking confident, and engaging in activities that are of interest to many men. By associating the Kool brand with images of handsome, self-confident, and socially successful men, the company communicates to adolescent boys that they can achieve a masculine self-image by smoking Kool cigarettes. Biglan WD, 244:1-250:3; 670660378-0420 at 0380 (US 53870) (A); 465647509-7599 at 7522 (US 67875) (A).

438. B&W's marketing of Kool is attractive to youth because it associates the brand with fun and excitement. The images of motorcycles that have appeared in Kool advertisements communicate fun and excitement. B&W's 1984 "Kool Biker Ad Campaign Test Market Work Plan" explained that the "strategy behind this campaign is to integrate two elements into one message that will appeal to young adult males: (1) the unique menthol sensation of Kool; and (2) an attractive person who uses the product . . . The ‘Biking' experience, as depicted in the ads, provides a brief escape from the ordinary life to enjoy the freedom and excitement of the open road." Biglan WD, 251:1-253:16; 635900092-0117 at 0094 (US 54346) (A).

439. Through its marketing, B&W also associates Kool with being a member of young, cool in-group. The company wanted the Kool brand to be perceived as the "in brand," among young people. A March 6, 1985 internal company memorandum identified as one of the "Key Issues" facing Kool the fact that it had "lost its in-brand status." The memorandum concluded that "Marlboro and Newport are growing because they are ‘in-brands' for young adult target audiences. They have peer group acceptance and high perceived popularity." Adolescents' social success depends upon their ability to appear to be "up with"or "into" the latest trends and fashions. Biglan WD, 254:1-257:7; 554000052-0060 at 0052 (US 20937) (A).

440. B&W has historically associated Kool with music in order to make the brand more appealing to young people as demonstrated by the company's internal marketing documents. A 1981 study entitled "Final Report Kool Campaign Qualitative Evaluation," prepared for B&W by Kapuler & Associate Marketing Research, concluded:

> It appears that the younger the respondent, the more importance he attaches to the fact that the music is contemporary. . . Some people also use music to feel part of a special group. This is primarily done by younger people who tend to be more influenced by their peers than older people . . . . Based on this research, it appears that the use of music in advertising was very effective. It is doubtful whether any subject other than music could have elicited such rich imagery from people who were not in any way extraordinary.

Biglan WD, 257:8-260:2; 665000008-0091 at 0039, 0040, 0042 (US 69063) (A).

441. In the mid-1990's, B&W sought to increase Kool's market share among young people through its "B Kool" advertising campaign. The B Kool advertisements featuring attractive young women gazing at a unidentified young man holding a pack of Kool cigarettes in their hands were appealing to youth. The B Kool advertisements associated smoking Kool with masculinity, excitement and fun, and being a member of a young in-group. The former Director of Marketing Services and Operations at Brown & Williamson, Sharon Smith, testified that the B

Kool campaign was intended to associate Kool with themes and images of masculinity, independence, confidence, and being "cool." The B Kool campaign was effective in creating an image of the Kool smoker as young and socially successful. A January 19, 1999 report for B&W prepared by Bates USA on the B Kool campaign indicated that those who were aware of the campaign gave higher ratings of the brand on "kept up with the times," "younger adult," "sophisticated person," "keeps up with latest trends," and "popular person." Biglan WD, 260:3-268:21; Krugman WD, 99:13-100:10; Smith WD, 16:20-17:8; 309031048-1071 at 1051 (US 22660) (A).

442. B&W's recent marketing campaigns for Kool have associated the brand with music popular with youth. In 2000, Brown & Williamson launched the House of Menthol advertising campaign for Kool associating the brand with house music, which is popular with adolescents. A 2000 Report "Kool: The Road to Menthol Authority" found that consumers perceived the House of Menthol campaign as: "Most contemporary, 'hip', urban and ASU26; Kool portrayed as keeping up with times; Communicates that Kool invented category." B&W's 2004 Kool Mixx campaign associated the Kool brand with hip-hop music. According to Peter Zollo of Teenager Research Unlimited, hip-hop or rap is currently the most popular music among adolescents. Biglan WD, 271:1-280:16; 250170002-0092 at 0043 (JD-012836) (A).

(d) R.J. Reynolds Marketing Appeals To Youth

443. R.J. Reynolds effectively incorporates into its marketing for its Camel, Winston, and Salem brands themes and images attractive to adolescents. Marketing campaigns for Camel dating back to the 1970's have emphasized youth appealing themes and images. The 1970's "They're not for Everybody" and the "Meet the Turk" campaigns for Camel were developed to attract young male smokers. Consumer research on the "Meet the Turk" campaign indicated that

the campaign was targeted "directly at the young male utilizing ‘Turk' to create an image/aura around the brand that reflects the attitudes, values, lifestyle of the young male,"and that "‘Turk' advertising is on target. . . it appeals to young adult males (18-34)." Biglan WD, 305:14-308:22; 505775556-5598 at 5567, 5580 (US 21797) (A).

444. From 1980 to 1987, RJR ran the "Bob Beck" advertising campaign for Camel. The "Bob Beck" campaign associated Camel with masculinity through advertisements depicting the Camel smoker as an independent, rugged outdoorsman in dangerous, exciting situations. Consumer research confirmed that the company in the 1980's was successful in associating Camel with masculinity. A May 1983 report prepared for RJR, "The Camel Brand Image," concluded that, "Camel is imbued with an almost indisputable masculinity." In the mid-1980's the company sought to update the campaign to make it more appealing to young people by incorporating the theme of popularity and peer acceptance into the campaign. In a March 12, 1986 memorandum addressed to D.N. Iauco, Vice President of Brand Management and titled "Camel New Advertising Campaign Development," R.T. Caufield of R.J. Reynolds Brand Group stated that "advertising will be developed with the objective of convincing target smokers that by selecting CAMEL as their usual brand they will project an image that will enhance their acceptance among their peers." What resulted were "Share a New Adventure" advertisements featuring young people in social situations which communicated to adolescents that their peers would like and admire them if they smoked Camel. Biglan WD, 309:1-320:16; 503455432-5554 at 5442 (US 50398) (A); 503969238-9242 at 9238 (US 20725) (A).

445. In 1988, RJR launched its most famous Camel marketing campaign – the "Joe Camel/Smooth Character" campaign featuring the Joe Camel cartoon. Through its Joe Camel/ Smooth Character campaign, RJR was extraordinarily successful in communicating to

adolescents that Camel smokers were popular and admired members of their peer group, sexually attractive to women, experience much fun and excitement, and rebellious nonconformists. The Joe Camel campaign also associated Camel with images of masculinity, sports, and relaxation. All of these themes are important to many adolescents. Biglan WD,320:17-341:4; 521890951-0955 at 0952 (US 66555) (A); see also US FF § III.E(4), supra.

446. After the Joe Camel campaign, RJR sought to make its Camel brand appealing to youth through marketing campaigns such as "Viewer Discretion Advised," which featured shocking, irreverent, or amusing events. These advertisements associated Camel with numerous adolescent appealing themes, including sexual attraction, good looks, defiance of authority, excitement, and humor. RJR's "Viewer Discretion Advised" Camel campaign advertisements were appealing to youth because of their irreverent tone and spoofs related to movie ratings. Biglan WD, 344:4-346:6; Krugman WD, 98:12-99:10.

447. RJR also incorporates youth appealing themes and imagery into its marketing for its Winston and Salem brands. RJR's marketing campaigns for Winston in the 1970's and 1980's associated the brand with masculinity by featuring rugged-looking men and slogans such as "When your taste grows up, so should your cigarette." In 1998, RJR introduced the Winston "No Bull" campaign, which communicated that the Winston smoker is self-confident and independent through its use of images of assertive, attractive, young people. RJR's market research indicates that the campaign was effective, as demonstrated by a January 8, 1999 Winston/Marlboro Image Study which concluded that "[t]he power of the Winston positioning is with the confident, no bull person going after the things he wants in life to ensure he gets them." RJR's current advertising campaign for Winston, "Leave the Bull Behind," associates the brand with romance and escape by featuring images of sexy young men and woman in romantic situations. These

advertisements appeal to youth who are interested in ways to appear attractive to the opposite sex. Biglan WD, 347:4-355:2; 519923696-3787 at 3698 (US 68740) (A).

448. Through its marketing, RJR associates its Salem brand with youth appealing themes and images. In the 1970's, RJR associated Salem with masculinity through its "Enjoyment" advertising campaign. The 1977 "Salem Brand Review 20-Year Marketing History" described the "creative strategy" for the Enjoyment campaign as follows: "Create a positive/clearly defined brand user image: Masculine, active, contemporary, emulatable." In the 1980's RJR launched the Salem Spirit marketing campaign which communicated that the Salem smoker was attractive, fun, and popular. Salem Spirit advertisements featured attractive people in recreational settings. These advertisements appealed to adolescents who desired to be in the recreational situations depicted, and to have the social and athletic skills that the young people in the advertisements appear to have. RJR next implemented the Salem Green campaign in the mid-1990's to make the brand more appealing to younger smokers. The campaign successfully created an image of Salem as a contemporary, trendsetting brand for people who want new experiences. An October 24, 1996 report prepared for RJR indicated that the following attributes were associated with the Salem Green campaign: "In tune with what's happening, Do their own thing; Free spirited and fun." Adolescents have a strong desire to be accepted by their peers, and keeping up with the latest trends and fashions is an essential part of gaining that acceptance. Biglan WD, 359:10-376:18; 520371448-1628 at 1580 (US 71114) (A); 516937537-7833 at 7593 (US 68552) (A).

449. A ban which prohibits Defendants from marketing cigarettes in ways which have the effect of appealing to youth – whether through imagery or otherwise – is necessary to prevent and restrain Defendants from fraudulently marketing to youth in the future. The Court

recognizes that this is a generally-worded basic injunction, and therefore Court-appointed officials are needed as an enforcement mechanism to ensure Defendants' compliance.

(2) Defendants' Price Promotions Are Disproportionately Appealing to Youth; Despite Knowing This, Defendants Continue the Practice

(a) Defendants Understand That Cigarette Prices Affect Overall Smoking Behavior

450. Defendants know that changes in cigarette prices affect cigarette smoking and smoking prevalence (prevalence is the number of smokers) of both teenagers and adults. The following documents provide a glimpse into Defendants' decades-long knowledge concerning the impact of cigarette prices on overall smoking behavior.

451. In its "Interim Report to Stockholders" for the first quarter of 1969, Liggett stated: "There is strong evidence to indicate that the consumer demand for cigarettes is elastic, as it is for most other products, and that the state cigarette excise taxes do affect sales wherever they are imposed. According to the U.S. Department of Agriculture, in 28 states where cigarette prices have increased 12 per cent in the last two years, sales have declined by 6 per cent; whereas in 21 other states where the price has increased 1 per cent, sales have increased almost 1 per cent." 500397668-7690 at 7675 (US 22711) (A). This document demonstrates Liggett's knowledge that higher cigarette taxes, which increase cigarette prices, will reduce their cigarette sales. Chaloupka WD, 95:1-18.

452. Similarly, in a March 3, 1975 Economic Forecast produced by analyst Myron Johnston for Philip Morris, Johnston reports that:

> Still another factor is the price elasticity of cigarettes, i.e., the change in cigarette sales that will result from a change in the retail price of cigarettes. My calculations, using a variety of methods, show the price elasticity to be -0.43. This means that a ten percent increase in the retail price of cigarettes will, other things being equal, lead to a 4.3 percent decline in unit sales. Since the average

> retail price per pack of cigarettes is about 45c [cents], over twice the wholesale price, a ten percent increase in the wholesale price of cigarettes would, other things being equal, cause only a 2.1 percent decline in unit sales.

Johnston also notes "the Department of Agriculture, calculated price elasticity at - 0.42, remarkably close to my own figure." 1000739883-9907 at 9904 (US 21601) (A) (emphasis in original). This document shows that Philip Morris had quantified the affect of price increases on cigarette sales, was aware of comparable outside estimates, such as those from the USDA, and knew that higher cigarette prices would reduce cigarette sales. Chaloupka WD, 95:19-96:13.

453. In a September 1977 document prepared for the Tobacco Merchants Association and produced from RJR's files entitled "A Temporal Cross-Section Analysis of Cigarette Price Elasticity in the United States," Herbert Lyon of the University of Houston and M. Lynn Spruill of the University of Kentucky analyzed the impact of cigarette prices on cigarette smoking at the regional level. The summary states:

> In this study, price elasticities of cigarette demand for the United States and nine individual regions were estimated by covariance regression analysis. Six cross-section samples provided the data base for the analysis. Based on earlier experimental work the estimates in this study can be considered the least biased yet developed. The value of the cigarette price elasticity of demand for the United States was estimated at -.445. This finding reinforces some of the earlier work in this area. Collectively these studies indicate that cigarette price elasticity of demand is about -.50.

502016148-6154 at 6154 (US 49016) (A).

454. An August 1994 report entitled *A Study of the Effect of Pricing Changes in Michigan Two Months After Tax Increase* by SE Surveys, Inc., prepared for Lorillard, describes the findings from tracking surveys conducted in Michigan just prior to the May 1, 1994, 50 cent per pack increase in the state cigarette excise tax and approximately two months after the tax increase; the state sample was augmented by samples of black smokers and smokers in the Grand

Rapids marketing area. All three surveys indicated that, in the two months after the Michigan state cigarette excise tax increase, overall smoking prevalence in Michigan had fallen by 7%, that smoking prevalence among blacks had fallen by 4%, and that smoking prevalence in the Grand Rapids marketing area had fallen by 10%. 82885447-5500 (US 22724) (A). This document shows that Lorillard commissioned its own studies of the impact of state tax increases on cigarette smoking, and that Lorillard knows that increases in state cigarette taxes lead to smoking cessation and that some population sub-groups are more responsive to the price increases resulting from state tax increases. Chaloupka WD, 101:7-22.

(b) Cigarette Prices Affect Teenage Smoking Behavior Two to Three Times More Than Adult Smoking Behavior

455. Econometric studies conclude that smoking by teens is two to three times more sensitive to price than smoking by adults. This is true for several reasons. First, teenage smoking prevalence is mostly affected by the number of teenagers who start smoking. Adult smoking prevalence, on the other hand, is largely affected by the number of adults who quit smoking (rather than the number who start smoking, because there is little smoking initiation after age 19). Because adults have been smoking for a long time and are addicted, quitting smoking is very difficult. Addiction makes it difficult to change smoking behavior in response to a price change. For those teenagers who are not yet addicted, their smoking behavior is more responsive to price changes. Because there are more teenage smokers who are not addicted than there are adult smokers who are not addicted, teenage smokers are more sensitive to price changes than adult smokers. Second, peers are very important to teenagers. When prices go up and fewer teenagers start smoking, their friends will not start smoking or will stop smoking due to peer influence. Many teenagers get cigarettes from their friends. When cigarette prices increase, teenagers have fewer cigarettes to share, and those who have cigarettes are less likely to

share them. Third, because teenage smokers have less money or less discretionary income than adults, they spend relatively more of their income on cigarettes than adult smokers do, so they are more responsive to changes in price. Fourth, teenagers are more apt to think in the present, and as a result they will focus more on the monetary costs than on the long-term "costs" – e.g. the health consequences – of smoking. Consequently, they will respond more to price than will adults who generally give more weight to the long-term consequences of smoking. Fifth, because parental smoking affects teenage smoking, changes in cigarette prices that affect parental smoking will affect teenage smoking. Chaloupka WD 34:3-12; 43:8-46:9.

456. A recent study looking at data from 1991 to 2003 shows that as cigarette prices increased, youth smoking prevalence fell, and, as cigarette prices decreased, youth smoking prevalence increased. This study also showed that a drop in prices on Marlboro Friday in 1993 significantly increased youth smoking prevalence. In addition, the study indicated that significant price increases following settlements in the late 1990s and recent numerous state tax increases had led to reductions in teenage smoking prevalence. Id. 40:23-42:10; 43:1-4.

457. In *2002 Nicotine & Tobacco Research,* a peer reviewed article co-authored by Frank J. Chaloupka, it was shown that higher prices have an increasing impact as an individual's level of cigarette consumption gets higher. Another of these econometric studies by John Tauras, Patrick O'Malley, and Lloyd Johnson, done as part of the Bridging the Gap project, concluded that price had relatively little impact on the initiation of any smoking, but that teenage initiation of daily and heavy daily smoking is very responsive to price. Id. 35:9-19; 36:11-20.

458. The CDC estimates that 2,000 12 to 17 year olds become daily smokers each day. Given the Tauras, O'Malley, and Johnson estimates on the effects of price on initiation of daily

smoking, a 10% drop in cigarette prices would increase the number of teenagers who become daily smokers by as many as 87,600 each year. Id. 37:15-20.

459. Teenage smoking is affected by price in four key ways. First, reductions on cigarette prices encourage some teenagers who would not have otherwise taken up smoking to begin to smoke. Because, according to the Surgeon General, 90% of smokers try their first cigarette before they turn 19 years old, most of those who begin to smoke are teenagers. Second, decreases in cigarette prices lead teenage smokers to smoke more cigarettes. Some will smoke more frequently (on more days); others will smoke more cigarettes on the days that they do smoke; some will both smoke more frequently and smoke more cigarettes when they smoke. Third, decreases in cigarette prices reduce the number of teenage smokers who try to quit smoking. Fourth, reductions in cigarette prices will lead some teenagers who had quit smoking to take up smoking again. Id. 39:2-40:12.

(c) Defendants Are Well Aware That Teenagers Are Much More Price Sensitive than Adults

460. Defendants are well aware that cigarette prices affect teenage smoking behavior much more than adult smoking behavior.

461. In two memoranda to Jon Zoler concerning a study by Jeffrey Harris entitled "The 1983 Increase in the Federal Cigarette Excise Tax," Philip Morris's Myron Johnston discussed the implications for Philip Morris of adolescent smokers' greater price sensitivity. In his July 15, 1987 memorandum, Johnston stated:

> The conclusion of greatest interest to us, and one with which I cannot disagree, is that by increasing prices by more than the amount of the excise tax, we priced ourselves out of the market, or, as he puts it: "If the change in the federal excise tax actually induced a full $0.16-per pack increase in the nominal price of cigarettes, then I compute that, **as a result of the federal excise tax increase** and the resultant oligopoly response, about 2 million

> adults stopped and **600,000 teenagers (aged 12-17) did not start."**

2058122171-2172 at 2171, 2172 (US 22717) (A) (emphases added).

462. On September 3, 1987, in his second memorandum discussing Harris's article "The 1983 Increase in the Federal Cigarette Excise Tax," Johnston gave his views on "how we should pass on the price increase in the event of an increase in the excise tax." He states that:

> Jeffery [sic] Harris of MIT calculated, on the basis of the Lewin [sic] and Coate data, that the 1982-83 round of price increases caused two million adults to quit smoking and prevented 600,000 teenagers from starting to smoke. Those teenagers are now 18-21 years old, and since about 70 percent of 18-21 year-olds and 35 percent of older smokers smoke a PM brand, this means that 700,000 of those adult quitters had been PM smokers and 420,000 of the non-starters would have been PM smokers. Thus, if Harris is right, we were hit disproportionately hard. We don't need to have that happen again.

2022216179-6180 at 6179, 6180 (US 76177) (A) (emphasis in original).

463. These Philip Morris documents are important in several ways. First, they show that Philip Morris knew that federal excise tax increases affected teenage and adult smoking. Philip Morris knew that its own pricing behavior – raising prices before the tax increase – in anticipation of the tax increase further reduced teenage and adult smoking. Second, Philip Morris knew that its business was particularly affected by the tax increase and their own price increases given their high market share among teenage smokers for their brands particularly Marlboro. Third, it is clear that this knowledge affected Philip Morris's thinking about how to respond to future tax increases. Chaloupka WD, 103:17-108:8. See also Levy WD, 96:1-97:13; Levy TT, 2/9/05, 12745:6-10 (acknowledging that when Philip Morris decided how to respond to proposed increases in cigarette excise taxes, executives at the highest level were well aware of this research showing that higher excise taxes reduce youth smoking). Furthermore, Philip

Morris currently admits that increased cigarette price is a variable that would lower youth smoking rates. See US FF § III.E(6)(a), supra.

464. RJR shared Philip Morris's interest in econometric studies on differences in price sensitivity of smoking by age. In a September 20, 1982 RJR memorandum from G. Novak to J.W. Johnston and H.J. Lee, Novak states:

> Our Forecasting Group has determined that younger adult smokers, particularly younger adult male smokers, tend to be very price sensitive. The effect of a price increase on younger adult male smokers could be three to four times greater than on smokers in general, in terms of negative impact on volume. This has obvious implications to the growth of Marlboro, as well as implications to our own Project VB.

500151647-1647 (US 21785) (A).

465. A January 3, 1984 memorandum from Margaret Parham of RJR's Marketing Development department summarized "three major MDD sources of evidence regarding price sensitivity by age/sex. The key data supporting the conclusion that younger adult males do exhibit price sensitivity" came from three sources: an internal "1983 Segment Description Study," the internal "Project VB ASSESSOR Analysis," and the NBER studies. 503981058-1058 (US 22714) (A). These documents show that RJR was doing its own internal research on the affects of price on smoking behavior among younger smokers, and that this research showed that "younger adult male smokers" are highly sensitive to price. It also showed that RJR recognized the importance of this for brands which were leading brands among teenage smokers such as Marlboro, as well as RJR's own brands, and that RJR was developing price-related marketing strategies to respond to this greater price sensitivity. Chaloupka WD, 110:1-25.

466. A March 20, 1992 Lorillard memorandum from Lorillard's S.R. Benson to S.T. Jones discusses the price sensitivity of smoking by age. Based on data from Lorillard's 1991

National Cigarette Tracking Study for "full price brand smokers," Benson states, "[w]hile we know that older smokers have historically represented a greater share of the off price category, there is some evidence that the younger adult smokers currently smoking a full price brand many be demonstrating a sensitivity toward price." He further states:

> It is clear that the younger adult, 18-24 smoker group, although still smoking a full price brand, 'claim' a greater sensitivity to price than the older age groups. Furthermore, among those who claim to shop for price, it is the younger age group that exhibits the highest switching rates. While we know that switching rates have traditionally been higher among younger adult smokers, this information lends further support to that finding. It is the older smokers who are more brand loyal and probably less likely to 'shop around.' We know that younger adult smokers may be in a lower economic group and this information may reflect that phenomenon.

82849666-9667 at 9666 (US 55569) (A). This document shows that, based on its own internal tracking data, Lorillard was aware of the greater price sensitivity of younger smokers. Chaloupka WD, 111:16-112:12.

(d) Even After the MSA, Defendants Have Increased Their Price Promotion Activities Because They Know That Teenagers Are More Sensitive to Price

467. Defendants have in the past, and continue to this day, to use their knowledge (that cigarette prices affect smoking behavior generally, and that cigarette prices affect teenage smoking behavior to a much greater degree than adult smoking behavior) in developing and implementing price-related marketing strategies.

468. Over time, Defendants have increased the amount spent on price-related marketing, both absolutely and as a share of their overall marketing expenditures. Defendants have placed an increasing emphasis on price-related marketing strategies, as shown by both the sizable increases in the absolute amount of expenditures on marketing activities that directly

affect price, as well as by the increased share of overall marketing expenditures that goes to these marketing activities that directly affect price. Chaloupka WD, 73:3-14.

469. Defendants' price-related marketing has become increasingly dominated by promotional allowances and retail value added. There has also been a growing emphasis on price-related marketing activities to the major cigarette companies as a proportion of overall marketing spending, in both absolute and relative terms. From 1975 to 1981, the balance between image-oriented marketing and price-related marketing was relatively stable. In 1975, expenditures on image-oriented marketing activities accounted for more than three-quarters of total cigarette marketing expenditures, with spending on print and outdoor advertising accounting for most of these expenditures. In contrast, expenditures on price-related marketing activities accounted for just over one-fifth of the total, with spending on promotional allowances accounting for most of this. By 1981, total marketing expenditures had more than tripled, while the balance between image-oriented and price-related marketing had shifted slightly, with spending on image-oriented activities accounting for about two-thirds of the total, and spending on price-related marketing accounting for over one-fourth of the total. These trends did not continue. Over the next ten years, this balance shifted markedly in the other direction. Defendants' overall marketing increased sharply and more and more of the marketing dollars went to price-related marketing. The increasing trend towards price-related marketing continued through 1993, with spending on price-related marketing activities increasing both absolutely and as a share of the total. Chaloupka WD, 79:2-86:4.

470. After the MSA (which went into effect in 1998), the overall cigarette marketing expenditures rose sharply and tobacco companies increased their share of spending on price-related marketing. In inflation-adjusted terms, the Cigarette Company Defendants nearly

doubled their cigarette marketing expenditures between 1997 (the last full year prior to the MSA) and 2002 (the most recent year for which tobacco company data are reported by the FTC). Over the same period, the share of Defendants' spending on price-related activities rose from just over 80% to over 92%. In contrast, Defendants' inflation-adjusted spending on image-oriented marketing fell somewhat from 1997 to 2002. Id. 88:21-89:6. This increase in cigarette marketing expenditures was due to the Cigarette Company Defendants' increases in spending on price-related marketing, primarily for promotional allowances and retail value added. Defendants' total marketing expenditures went from $5.7 billion in 1997 to $11.2 billion in 2001, an increase of $5.5 billion. Expenditures on retail value added during this time went from under one billion dollars to nearly $4.8 billion in 2001; expenditures on promotional allowances went from almost $2.4 billion to almost $4.5 billion in 2001. Together, promotional allowances and retail value added went from $3.4 billion to $9.2 billion between 1997 and 2001, a total increase of $5.8 billion. Because Defendants' total marketing expenditures only increased by $5.5 billion, their increase in promotional allowances and retail value added together account for more than the total increase in marketing expenditures. Chaloupka WD, 89:7-18.

471. This price-related marketing has had a significant effect on teenage smoking initiation. Marketing activities that significantly reduce cigarette prices will increase the initiation of regular smoking and daily smoking by teenagers, and will increase the number of cigarettes smoked by teenage smokers beyond what would have been the case in the absence of these marketing activities. Based on the 2002 FTC data, marketing expenditures that directly reduced the price of cigarettes amounted to about 46 cents per pack. In November of 2002, as reported in the annual *Tax Burden on Tobacco*, average cigarette prices, not including generic brands and not including temporary price reductions caused by the price-related marketing

described above, were just under four dollars per pack. Given this, price-related marketing activities reduced the average price per pack by at least 11.6%, which, based on the estimates described above, means that as many as 100,000 teenagers would have initiated daily smoking in 2002 as a result of these marketing activities. Given the likelihood that Defendants' marketing activities are concentrated on their leading brands which are the brands most likely to be smoked by teenage smokers, it is likely that these price-related marketing activities resulted in even larger increases in teenage smoking initiation. Chaloupka WD, 93:13-94:7.

472. It is indeed true that teenage smokers are more likely to smoke the leading brands. In 1994, the CDC published a report documenting for the first time that the vast majority of adolescents smoke just three brands of cigarettes – Marlboro, Newport and Camel – and that adolescents are much more likely to smoke these brands than are adults. Eriksen 1/17/05 WD, 73: 11-16; (US 17684A) (A) (MMWR 43(32): 577-581, 1994). This report also showed that these three brands were the brands with the largest advertising expenditures. This pattern of adolescents smoking fewer brands, but more advertised brands, continues today. Subsequent peer-reviewed research shows that, after controlling for possible confounding variables, adolescent brand preference is in fact about three times more sensitive to advertising expenditures than is adult brand preference. Eriksen 1/17/05 WD, 73:16:22; Pollay, et al., Journal of Marketing 60:1-16, 1996) (US 17684) (A). See also US FF § III.E(6) (discussing young people's price sensitivity).

473. It is also true that teenage smoking behavior is specifically sensitive to changes in price of the premium brands (such as Marlboro, Newport, and Camel), and since the MSA, more and more of Defendants' marketing budgets have been concentrated on the youth brands. See generally Chaloupka WD, 73:3-94:7. For example, about 80% of Lorillard's current marketing

budget is devoted to Newport. Lindsley TT, 17225:7-9. Specifically, beginning around 1992, price promotions were becoming "a more important part" of Lorillard's marketing program for Newport. Lindsley WD, 48:6-8. In 1999, Lorillard started its "buy-down program" which reimbursed retailers for selling Newport at a certain discounted price. This enabled Lorillard to engage in much more widespread discounting than coupons. When the "buy down program" was initially started, Lorillard discounted up to 50% of its volume. At present, it is discounting nearly 80%. Lindsley WD, 48:6-21. Price promotion has become the "main thrust" of Lorillard's marketing activity. Lindsley WD, 48:22-23. Moreover, Philip Morris's price promotion expenditures for Marlboro increased from 1990 to today. Szymanczyk TT, 18415:16-25.

(3) Defendants' Packaging and Selling "Kiddie Packs" Disproportionately Markets to Youth; Despite Knowing This, Defendants Continue the Practice

474. As discussed immediately above, Defendants fraudulently market to youth by exploiting their price sensitivity. A ban on marketing, manufacturing, or distribution of cigarettes in packs containing fewer than 20 cigarettes ("Kiddie Packs") will prevent and restrain Defendants from fraudulently marketing to youth in the future.

475. The prohibition of the sale of individual cigarettes or packs with fewer than twenty cigarettes was included in the proposed regulations on tobacco products promulgated by the FDA in 1996 intended to reduce youth access and the appeal of tobacco to youth. In the 1998 Surgeon General's Report *Tobacco Use Among U.S. Racial/Ethnic Minority Groups*, the Surgeon General commented that "the FDA regulations hold promise for reducing tobacco use by all young people." HHA0430685-1029 at 0960 (US 64831) (A).

476. The 1997 Proposed Resolution would have banned the sale of packs with fewer than 20 cigarettes. The Master Settlement Agreement included a temporary ban on the sale of packs with fewer than 20 cigarettes which expired on December 31, 2001. However, in a

number of communities around the country retailers have been opening up cigarette packs and selling cigarettes individually. Myers TT, 5/18/05, 21647:8-21648:1; Myers WD, 24:19-25:3; MSA § III(k) at 28 (JD-045158) (A).

477. In the 2000 Surgeon General's Report *Reducing Tobacco Use*, the Surgeon General specifically addressed the issue of the sale of packs with fewer than 20 cigarettes. The Surgeon General stated that "research has shown that young people account for many sales of smaller cigarette packages . . . probably because of their low price and ease of concealment. These findings have led some jurisdictions to prohibit the marketing of packages containing fewer than 20 cigarettes." VXA1240104-0567 at 0278 (US 64316) (A).

478. Dr. Eriksen recommended restricting promotional devices that lower the price of cigarettes. Eriksen WD, 5/9/05, 24:18-25:2, 28:15-29:8. Selling cigarettes in packs containing fewer than twenty cigarettes has the effect of reducing the price of cigarettes. Youth have less disposable income, and banning the sale of packs with less than twenty cigarettes would make purchasing cigarettes more expensive.

(4) Defendants' Manufacturing and Selling Flavored Cigarettes Disproportionately Markets to Youth; Despite Knowing This, Defendants Continue the Practice

479. Defendants continue to market to youth through the sale and marketing of flavored cigarettes which appeal to youth. A ban on the sale and marketing of flavored cigarettes is necessary to prevent and restrain Defendants from fraudulently marketing to youth in the future.

480. Flavored cigarettes are appealing to youth. Organizations such as the American Legacy Foundation have spoken out against marketing flavored cigarettes because these products are attractive to teens and encourage them to smoke. Preliminary results from the American

Legacy Foundation Media Tracking Survey administered in January 2005 indicate that teens who reported having seen an advertisement for flavored cigarettes were more than three times more likely to have tried the product than those who reported not having seen any ads. Healton WD, 66:15-67:8.

481. Defendants have long known that flavored cigarettes appeal to children. A September 1972 B&W Project Report from the firm Marketing Innovations, Inc. entitled "Youth Cigarette – New Concepts" suggested that the company develop "youth-oriented" cigarettes with new types of flavoring, such as Coca-Cola and Apple. The report suggested developing a "sweet flavor cigarette" because "[i]t's a well known fact that teenagers like sweet products." 170042014-2014 (US 20291) (A).

482. B&W knows that starter smokers (i.e. youth) do not initially like the taste of cigarettes. A February 17, 1987 memorandum entitled "Kool Isn't Getting the Starters" from D.V. Cantrell at B&W to I.D. Macdonald, B&W Marketing Vice President, discussed "product reasons for Kool's decline in attracting starters." Cantrell described "low tobacco taste (this is an acquired taste with use)" as an attribute that is "important to a beginning smoker." He went on in his memorandum to note that "Menthol brands have been said to be good starter products because new smokers appear to know that menthol covers up some of the tobacco taste, and they already know what the menthol tastes like, vis-a-vis candy." 621079918-9921at 9918, 9920 (US 30792) (A).

483. RJR believed that developing a flavored cigarette would improve its competitive position among young smokers. A December 18, 1972 memorandum by A.P. Ritchy, an RJR employee, recommended "conducting the second phase of research to determine if the concept of a fruit wine flavored cigarette is viable among young adult smokers (18-35)." The company

conducted initial focus group testing "to provide a basis for developing lines of questioning for further research" on a fruit wine flavored cigarette. The memorandum went on to explain the rationale for a fruit-wine-flavored cigarette: "Competitive brands, e.g. Marlboro and Kool, have exhibited exceptional strength in the under 35 age group, especially in the 14-24 age group. RJR Brands do not generally skew toward the younger socio-economic groups, and a product strategically targeted at this group would complement our current product line." 501283430-3431 (US 20675) (O).

484. A document produced by BATCo discusses "Project Saturn," an Imperial Tobacco project designed to "acquire an understanding . . . of an array of cigarette taste and other sensory characteristics that would appeal to and create preference within various segments of the smoking population." The project explored adding flavors including "berry," "maple," "spearmint," and "vanilla" to cigarettes. 400229127-9148 at 9127, 9131-9132 (US 47489) (A).

485. Defendants continue to develop and market flavored cigarettes designed to attract youth. Susan Ivey, chairman and CEO of RJR and former chairman of B&W, testified about B&W's 2004 introduction of Kool Smooth Fusions, which are Kool mild cigarettes with "top flavors" such as Caribbean Chill, Midnight Berry, Mocha Taboo and Mintrigue. A March 18, 2004, B&W press release announcing the introduction of these cigarettes, entitled "Kool Introduces Smooth Fusions: Innovative Menthol Experiences With A Revolutionary Pack Design," quoted Ludo Cremers, divisional vice president, brand marketing as saying: "Kool established the menthol category and continues to reinvent to give consumers a product that fits the lifestyle of today's urban, multicultural smokers." The press release went on to state that, "[r]esponding to the demand of the hip trendsetting consumers, Kool Smooth Fusions packs will be introduced in bar, restaurant and night club venues, making it available to the most up-to-date,

plugged in smokers. Further expansion is planned for later in the year." Ivey TT, 11/16/04, 6170:17-6172:14; TLT0962005-2006 at 2005 (US 87745) (A).

486. The National African American Tobacco Prevention Network (NAATPN) issued a statement on November 8, 2004 that the organization was "outraged at Kool's new development . . . of a line of new cigarette flavors, such as 'Caribbean Chill and Midnight Berry'" and requested that B&W "immediately suspend the sale . . . of flavored cigarettes aimed at young consumers." (US 89170) (A).

487. Andrew Schindler, RJR's former CEO, has acknowledged that products such as cherry flavored and lemon flavored cigarettes could appeal to children. Nevertheless, since 2001 RJR has marketed Camel exotic blend flavored cigarettes such as "Dark Mint," "Cinnzabar," "Mandalay Lime" and "Crema." RJR also introduced Camel "Bayou Blast" berry flavored cigarettes around Mardi Gras in 2003 and 2004. During the summer of 2003, RJR marketed Camel "Beach Breezer" with a "swirling layer of tropical fruit flavor" and "Margarita Mixer" with "splash of lime." RJR has placed advertisements for Camel exotic blend flavored cigarettes in magazines with significant youth readership such as *Sports Illustrated*. Schindler WD, 208:23-209:3, 210:7-211:24, 214:6-215:19; ADV0340049-0051 (US 10761) (A); (US 89356) (A).

488. During the summer of 2004, RJR marketed flavored Camel Kauai Kolada and Twista Lime cigarettes. RJR ran a national advertising campaign to promote these cigarettes. One of the color ads for these two blends featured a provocatively posed brunette in a grass skirt and bikini top laying under a tiki umbrella and across the top of brightly colored packs of these cigarettes. The Governor of Hawaii wrote to the then-CEO of RJR, Andrew Schindler, criticizing the company for targeting young people with these cigarettes, stating that:

> I find it particularly disturbing that the R.J. Reynolds Tobacco Company is targeting young people with a marketing campaign that attempts to associate these flavored cigarettes with exotic tropical drinks. Enticing this vulnerable population with flavored cigarettes only serves to get them addicted at a very young age.

Tommy Payne, the Executive Vice President for External Relations at RJR, responded to Governor Lingle's letter on behalf of Schindler, and denied that these cigarettes targeted youth. Governor Lingle not only expressed her anger over these cigarettes to Schindler in a letter, but also issued a public statement specifically addressing "Kaua'i Kolada Cigarettes in which she proclaimed: "Using the name a Kaua'i and Hawaii images to market cigarettes to young people is disgusting . . . . The tobacco companies are preying on our youth by enticing them with flavored cigarettes." Schindler TT, 1/24/04, 10829:22-10844:12; Schindler WD, 209:4-19; (US 89357) (A); (US 90119) (A); (US 90117) (A); (US 90118) (A).

489. RJR ignored the criticism it received over its Camel Kauai Kolada and Twista Lime cigarettes, and a mere few months later marketed and advertised Winter Mocha Mint and Warm Winter Toffee flavored Camel cigarettes. RJR placed advertisements for these cigarettes in the youth-oriented magazines *Rolling Stone*, *Glamour*, *Cosmopolitan*, and *Elle*. In a January 5, 2005 letter to Schindler, the Michigan Surgeon General and Michigan's Director of Community Health expressed their outrage at RJR's latest marketing of flavored cigarettes:

> The latest blatant attempt by your company to entice youth into a lifetime of cigarette smoking and tobacco use has come to our attention. . . . Manufacturing cigarettes the same way an ice cream or candy bar company would manufacture its goods is an overt and offensive attempt to lure children, teens and nonsmokers into the harmful and deadly web of tobacco usage. . . With this letter we are calling for you and your company to discontinue this egregious and patently offensive practice of manufacturing and marketing flavored cigarettes.

(US 90114) (A); Myers WD, 31:3-5; (US 90116) (A); Schindler TT, 1/24/04, 10845:16-10851:8.

490. RJR continues to market Camel exotic blend flavored cigarettes. Schindler acknowledged that, despite the criticism the company has received for targeting youth through the marketing of flavored cigarettes, he would refuse to make a recommendation that the company stop marketing flavored cigarettes. He further testified that, to his knowledge, RJR has no plans to change with respect to its marketing of flavored cigarettes. Schindler TT, 1/24/04, 10830:17-10834:6; 10845:16-10846:17.

(5) Defendants' Motor Sports Sponsorships Target Youth; Despite Knowing This, Defendants Continue the Practice

491. Defendants fraudulently market to youth through their sponsorship of motor sports which garners their brands substantial national media exposure on television, radio, and in newspapers as the United States fully detailed in Section III.E.(7)(C)(iii), supra. Despite the broadcast ban on television advertising, the television exposure Defendants receive through their sponsorship of motor sports is valued at millions of dollars. Id. Defendants also use their sponsorship of racing events to market their cigarette brands at the point of sale. Id.

492. Auto racing events sponsored by defendants are attended by millions of individuals, and are watched on television by millions more people. In 2002, the television ratings for NASCAR racing were second only to football. Krugman WD, 108:12-112:14.

493. As Dr. Krugman testified with respect to Defendants' sponsorship of motor sports: "these events sponsored by the tobacco companies are important tools for the companies in presenting positive cigarette brand images to potential and current smokers including young people." Krugman WD, 111:7-112:7. Defendants' sponsorship of auto racing effectively associates their brands with themes and images that attractive to youth, such as masculinity and fun and excitement. As Dr. Biglan explained, "auto racing is a particularly rich source of images

of excitement for many and adolescents are high in their need for excitement." Biglan WD, 356:3-13.

494. As discussed above, see US FF §§ V.A(2)(b) & (c), supra, Defendants responded to the 1971 Broadcast Ban by sponsoring motor racing events that result in widespread television coverage of cigarette brand names and imagery. Prohibiting Defendants from sponsoring motor sports will prevent and restrain Defendants from fraudulently marketing to youth in the future.

CONCLUSION

Based upon a review of the totality of the evidence in the trial record:

1. The Court hereby finds that each Defendant – Philip Morris, R.J. Reynolds, Brown & Williamson, Lorillard, Liggett, American, Altria, BATCo, CTR, and the Tobacco Institute – has participated in an association-in-fact Enterprise comprised of Defendants and other employees, agents, and organizations.

2. The Court further finds that each Defendant has committed substantive RICO violations under 18 U.S.C. § 1962(c) and has conspired to violate RICO in violation of 18 U.S.C. § 1962(d).

3. The Court finds that Defendants have continued to engage in misconduct in furtherance of the objectives of the Enterprise and conspiracy and Defendants' scheme to defraud.

4. The Court further finds that there is a reasonable likelihood of ongoing and future RICO violations by Defendants.

5. The Court hereby finds that, pursuant to its grant of authority under 18 U.S.C. § 1964(a), the United States is entitled to equitable relief against Defendants.

Respectfully submitted,

PETER D. KEISLER
Assistant Attorney General
